

third international conference  
of the journal *Scuola Democratica*

# education and/for social justice

3-6 June 2024, Cagliari (Italy)

Education is a battleground of power, identity, and inequality. This volume unravels the tensions between exclusion and inclusion, privilege and marginalization, tracing how policies, epistemologies, and ideologies shape who belongs—and who is left behind.

# PROCEEDINGS

01

Inequality, Inclusion, and Governance

# YOUNG PEOPLE'S TRANSITION FROM EDUCATION TO THE LABOUR MARKET AND TERRITORIAL INEQUITIES: OUTCOMES FROM INAPP PLUS SURVEY

Laura Evangelista<sup>a</sup>

Concetta Fonzo<sup>a</sup>

<sup>a</sup>Istituto nazionale per l'analisi delle politiche pubbliche (INAPP)

Since 2005, the INAPP-Plus Survey has monitored Italy's labour market dynamics, particularly focusing on job supply. Conducted by INAPP (formerly ISFOL), this national longitudinal survey includes 45,000 interviews and addresses key labour issues such as youth employment, gender participation, and regional disparities. Its latest edition specifically examines the challenges faced by young Italians (aged 18–29) in transitioning from education to employment. The study reveals persistent difficulties, including precarious job offers, underpayment, and roles with limited responsibilities or risk of under-classification. These issues are unevenly distributed across geographic areas and educational qualifications. Additionally, compared to their European peers, Italian youth face greater obstacles in accessing stable and rewarding employment, highlighting structural inefficiencies in the national labour market. The paper provides an in-depth analysis of these barriers, integrating qualitative and quantitative data, and explores the role of gender, urbanization, and access to guidance services in shaping labour outcomes. It situates these findings within broader socioeconomic and territorial inequalities, emphasizing the low valorisation of youth in Italy's production system.

education, training, labour market, transitions, territorial inequalities.

## INTRODUCTION

The transition from education to employment is a critical phase in the life course of young people, shaping their economic and social trajectories. Across Europe, this transition has become increasingly complex, marked by structural changes in labour markets, evolving skill demands, and shifting demographic trends. These challenges are particularly pronounced in Italy, where the interplay of economic, social, and institutional factors exacerbates difficulties for young people seeking stable and meaningful employment.

In the European context, disparities in youth employment outcomes are closely tied to differences in educational systems, labour market structures, and socioeconomic conditions. Current levels of youth unemployment must be examined within the broader context of heightened labour market flexibility, the expansion of higher education, rising youth migration, and the enduring impact of family histories of long-term unemployment. Unlike previous economic downturns, the response to recent challenges has been marked by a substantial increase in European-wide policies and investments aimed at complementing and reinforcing national initiatives to address these issues (Eichhorst et al., 2015). Studies highlight that young people often face prolonged periods of unemployment or precarious work, with these trends being particularly acute in Southern Europe (Eichhorst & Marx, 2015). The inadequacy of school-to-work transition mechanisms, coupled with limited opportunities for vocational training and apprenticeships, has been cited as a key barrier (Brunello & Wruuck, 2021).

The high incidence of underemployment and temporary contracts, particularly for young people, reflects structural inefficiencies in the labour market and limited alignment between education and employment demands (Maguire, 2015).

In Italy, the situation is further compounded by demographic challenges and regional inequalities. Recent data show that Italian youth are among the most disadvantaged in Europe regarding employment opportunities, with low participation in high-quality vocational training and apprenticeship programs (Istat, 2022). In the 2023 INAPP-Plus survey, some specific questions were included to highlight the difficulties young people (18-29 years old) face in the transition from school to work and, in case they are employed, what those difficulties have been (Bergamante & Luppi, 2024).

## **1. DIFFICULTIES IN THE TRANSITION FROM EDUCATION TO LABOUR MARKET**

The situation of young Italians, compared to their European peers, shows greater difficulties in gaining solid access to the labour market and a low appreciation within the production system. The economic crisis has affected this scenario, mostly by postponing the autonomy projects of young Italians and prolonging the transition to adulthood. As the Italian National Institute of Statistics explained, the joint analysis of the timing of the exit from the family of origin and of the motivations suggests that the postponement of the transition to adulthood is increasingly taking on a structural character, due to the chronic nature of the main factors that determine it: prolonged education and training pathways, difficulties in entering and remaining in the labour market (Istat, 2022).

An analysis of the data shows that the greatest difficulties encountered by young people in the transition from school to work refer first and foremost to the perceived poor quality of the job offer with short or underpaid contracts (48% of young people, with a peak of 53% in the 18 to 24 age group) or with modest positions and the risk of underemployment (37% of young people, with a peak of 45% in the 18 to 24 age group).

Subsequently, among the obstacles encountered by young people completing their education, are the absence of adequate job placement services and the feeling of being alone in tackling the complexity of entering the workforce (36% on average and 44% for the youngest) and only lastly, lack of preparation for work (31% of the total and 38% for those aged 18-24). It is thus evident that as age increases, the difficulties encountered in the transition decrease. We can assume that this is due to the maturing of experience, but perhaps, more importantly, there is a link with the employment situation, which is likely to change during the decade between the ages of 18 and 29, during which young people shift from job seeking to employment.

The data show that the differences, apart from by age group, are to be read in relation to being or not being employed. In fact, 68% of young first-time jobseekers state that they encountered difficulties related to unsatisfactory contract offers because they were short or underpaid, and there is a slight difference by age (70% in the 18-24 age group and 66% in the 25-29 age group). The share of the unemployed who highlight that contract offers are unsatisfactory is also high (62%); only 44% of the employed, on the other hand, refer to this issue and, among these, the gap increases as age increases: 49% among 18–24-year-olds and 41% among 25-29 year olds. In our interpretation,

this data is not so much related to a change in the dynamics of matching in the labour market, which is unlikely in just a few years, as in the hypothesis that with the employment situation the memory of dissatisfaction with the offer is attenuated in individuals. Moreover, it is likely that those who accept a job offer tend to ‘convince’ themselves that the offer is more satisfactory.

Although to a lesser extent, responses related to unpreparedness or inadequacy for the job are also affected by the employment condition: 42% of young people seeking their first job and 36% of unemployed young people perceive it, compared to 29% of employed young people.

More age-related elements are the difficulty in finding adequate job placement services and the feeling of not being accompanied in the transition: despite being stated by 46% of young people seeking their first job, 41% of unemployed young people and 35% of employed young people, it is interesting to point out that the difference between the 18-24 year-old employed group and the 25-29 year-old employed group reaches fourteen percentage points (43% and 29%). This suggests, on the one hand, that with the maturing of experience, there is an increased ability to navigate the services made available to citizens to accompany their entry into the world of work, and on the other hand, that employment services are not always perceived as a determining factor in finding a job. In Italy, in fact, informal channels are the dominant tool for job search, especially for young people (Bergamante & Luppi, 2024). Sending CVs and direct applications to companies are the methods most commonly used by young people, along with relying on friends, relatives or acquaintances and reading job offers in the press, while employment centres are used by only 40% of young people; little interest is observed for temporary employment agencies and participation in public competitions (Bergamante & Canal, 2018).

Analysing data, we have found that gender does not have a significant influence on the difficulties encountered by young people in the transition from education to the world of work and instead confirms age-related differences. Small noteworthy differences between the two genders are only found among the younger age group, but with opposite values: young women experience more complexities due to short or underpaid contractual offers than their male peers (56% of women aged 18 to 24 and 51% of men), who instead experience more problems related to the job description and classification proposed and considered inadequate (49% of men aged 18 to 24 and 41% of women).

## **2. HOW GUIDANCE AND QUALIFICATION LEVEL IMPACT TRANSITIONS**

The study focused on the relationship between the difficulties encountered in the transition from school to work and the qualification held by young people. For almost all types of difficulties, the highest percentage is found in young high school graduates, followed almost always by young people with a middle school diploma. An important exception to this scenario lies in the unsatisfactory contractual offers, particularly reported by young graduates. This highlights a significant dissatisfaction among highly educated youth, further fuelling the well-documented phenomenon of the so-called “brain drain.” On the other hand, as already highlighted by other analyses (Bergamante & Canal, 2018), the prevalence of overeducation is greater than that of undereducation, especially for those under 30; from the employers’ perspective, this results in a production system that offers inadequate opportunities and undervalues the human capital of young people, often pushing the most qualified and eager for a job suitable for their education to move abroad.

Difficulties in the transition can also be linked to ineffective guidance services within the educational pathway. Studies highlight how young people are aware of the low level of guidance they have had during their school career, the lack of practical experience, the inadequacy of specific and transversal skills and a poor preparation on how the labour market works: only one young person out of three thinks that school is useful to understand how the world of work works and evolves (Rosina, 2019).

## **3. TERRITORIAL INEQUALITIES IN FACING THE CHALLENGES**

With reference to geographical area, the constituency of the South and Islands generally has a higher number of young people who say they encountered difficulties in the transition from school to work, while the trends in the answers in the other areas of the country are different for each type of difficulty.

About half of the young people aged 18-29 in the South and Islands (52%) and the Centre (50%) found the contract offers unsatisfactory; the incidence decreases, albeit not considerably, in the North (45% in the North-West and 46% in the North-East).

With regard to underemployment and the lack of job placement services, the incidence of problems experienced by young people in the North-West is very close to that of their peers in the South and islands, while it decreases in the Central and North-Eastern regions.

These data certainly relate to the methods of job searching, which more often takes place through informal channels – requests to relatives and friends, sending CVs, searching on the Internet and consulting newspapers – rather than through intermediation channels. The use of agencies, especially private ones, is generally more widespread in the northern regions compared to those in the south, indicating a lower efficiency in some areas of the country, of the institutions in charge of facilitating the matching of labour supply and demand (Fadda, 2022).

Other studies emphasize that the uniformity of transition systems cannot be taken for granted (Raffe, 2014). Instead, significant territorial disparities persist, linked to variations in employment and unemployment rates. Italy exhibits particularly high levels of regional inequality, reflecting the country's longstanding territorial divisions, especially—but not exclusively—between the Center-North and the South. For example, in 2019, Veneto and the Province of Bolzano reported youth employment rates (ages 15–24) of 38.2% and 25.6%, respectively, alongside NEET (Not in Employment, Education, or Training) rates of 8.7% and 11.1%. By contrast, Calabria and Sicily, at the other end of the spectrum, recorded employment rates of just 14% and 10.4% and significantly higher NEET rates of 28.4% and 30.3%. Similarly, the long-term unemployment rate for young people aged 15–29 shows stark regional differences. In Northern Italy, this rate stands at 4.7%, rising to 7.8% in Central Italy, and reaching a striking 21.9% in the South (Cefalo & Kazepov, 2020). These data underline the deep-rooted territorial inequalities that characterize Italy's labour market, significantly influencing the transitions young people face when entering the workforce.

## **CONCLUSIONS**

The findings of this study underline the multifaceted challenges young people face in transitioning from education to employment. Structural inefficiencies in the labour market, insufficient alignment between education and job opportunities, and the underdevelopment of vocational training apprenticeship and guidance programs emerge as critical barriers. These issues are exacerbated by demographic challenges as well as pronounced territorial disparities.

Italy's case highlights the interplay between individual, institutional, and systemic factors that complicate school-to-work transitions. Young people frequently encounter precarious contracts, underemployment, and insufficient

support systems, with notable dissatisfaction among graduates, reflecting a mismatch between qualifications and labour market demands.

Addressing these challenges requires a multifaceted approach. Policies should aim to enhance the dual system of education and vocational training, which has shown promise in other European contexts. Furthermore, strengthening institutional capacity for job placement services and increasing investment in underdeveloped regions could help bridge territorial gaps. European-wide initiatives, such as the Youth Guarantee program, could serve as models for targeted, region-specific interventions, promoting more equitable transitions for all young people. Finally, the findings underscore the urgency of fostering a dynamic labour market that values and effectively integrates young talent. Enhanced coordination between educational institutions and employers is critical to aligning skill development with labour market demands. By addressing structural inequalities and supporting targeted interventions, Italy and other European nations can mitigate the challenges of school-to-work transitions and ensure a more inclusive and sustainable future for their younger generations.

# EDUCATION, EVOLUTION OF WELFARE MEASURES AND NEW INEQUALITIES

Raffaele Sibilio<sup>a</sup>

Paola Buonanno<sup>a</sup>

Angelo Falzarano<sup>a</sup>

<sup>a</sup>University of Naples “Federico II”, Italy

## INTRODUCTION

The European social model, in crisis in its original configuration, is taking on new forms in response to the risks to which citizens are and will be exposed (Beck, 1999) in the economy and in the knowledge society (Foray 2006; UNESCO 2005). These changes are largely attributable to the global economy (Bauman 2001; Gallino 2000), to the increasingly competitive and deregulated market trends, and to the implications of the digital revolution that is redefining the nature of work and social relations.

In 2009, the Council of the European Union, through the communication *A strategic framework for European cooperation in education and training* (ET 2020)<sup>1</sup>, stated that “Education and training have a crucial role to play in meeting the many socio-economic, demographic, environmental and technological challenges facing Europe and its citizens today and, in the years, ahead”. This recognition marks a crucial point (Ranci, 2004; Naldini, 2006; Paci, 2007; Margiotta, 2011) as it highlights how education and training no longer concern only the individual sphere but are increasingly becoming fundamental pillars for ensuring social cohesion and sustainable economic development.

## 1. EDUCATION AS A PILLAR OF WELFARE: THE LEARNFARE APPROACH

Learnfare policies (Lodigiani, 2020) fit into this framework. This term was born in analogy with the concept of workfare, and which makes the achievement of specific educational objectives a condition for subsidies or job opportunities. They constitute enabling measures aimed at creating favorable conditions for individuals to improve and actively participate in economic and social life.

---

<sup>1</sup> Council of the European Union. (2009). Council conclusions of 12 May 2009 on a strategic framework for European cooperation in education and training ('ET 2020'). Official Journal of the European Union, C 119, 2-10.

Learnfare policies are based on the assumption that the acquisition of skills, knowledge and abilities represent one of the keys to successfully addressing the challenges of contemporary society such as the digital and technological transition that require increasingly specialized knowledge. They are a resource to address the precariousness of work that requires constant updating to respond to the changing demands of the market, to put a stop to educational and social inequalities.

However, these policies are not free from paradoxes or risks. However, these policies are not free from paradoxes or risks. It is on this theme that the Panel entitled *Education, evolution of welfare measures and new inequalities*, wanted to collect contributions encouraging reflection on how learnfare initiatives can produce dual effects: if on the one hand, in fact, they promote a proactive welfare, which aims to prevent social exclusion through investment in people's skills, on the other hand, they expose themselves to significant critical issues. Often, these initiatives aim to create accessible, equitable and inclusive training spaces, but they transfer the burden of responsibility for maintaining their employability onto individuals, ignoring the structural dynamics that create inequalities: learning does not always and only depend on a desire for activation, it is closely linked to the learner's ascribed character endowments, in fact, the context plays a decisive role in the propensity to learn. People with fewer basic cultural resources and opportunities for access to training courses risk being further penalized, producing the distorted effect according to which a social policy can reproduce inequality. In our country, for example, the emphasis placed on self-training and the concept of 'lifelong learning', which theoretically now represents a recognized right, has not yet found full and concrete implementation.

## **2. CONCLUDING REFLECTIONS**

Through the proposed Panel we wanted to develop a debate on how much and how learnfare policies are sometimes conditioned by a utilitarian vision of education, which reduces it to a mere tool for employability and economic productivity and on how much the intrinsic value of education as a vehicle for personal and cultural emancipation, which does not necessarily produce an immediate profit, is underestimated.

In order for learnfare to contribute to a real transformation of welfare, it is necessary to adopt a balanced and inclusive approach, which takes into account the paradigm of complexity (Morin, 1999) to understand society in its

dynamic, multidimensional and uncertain nature. It must take into account not only individual initiative but also the macro level, structural investments in education to ensure universal and quality access to education, from basic to higher levels, including training courses for adults and the elderly. Active inclusion policies are needed that aim to reduce the economic, cultural and social barriers that actually limit participation in learning courses and a more balanced balance between individual responsibility and collective support is required to recognize that learning must be adequately supported. In this perspective, great interest has been given to the analysis of phenomena that have shifted the focus from a vision centered on individual capabilities, centered on personal characteristics that allow the conversion of available resources into tools to pursue one's goals and build one's agency, towards an assessment of living conditions that determine different degrees of freedom. (Sen, 2000). This shift in focus involves a close observation of the social, economic, political and cultural context as an asset that significantly affects the actual opportunities of each individual and, in particular, educational opportunities understood as a tool for emancipation. This perspective, on which reflection has been encouraged, allows us to understand more clearly how social structures, public policies, norms and institutional dynamics concretely influence the opportunities that people have to develop and put into practice their potential starting from the analysis of political-institutional and governance capacities at national, regional and local levels, to plan interventions, to manage their concrete implementation starting from the needs and specific territorial features; to measure the concrete tendency to promote inclusion and active citizenship; to generate an attribution of value to the search for innovative interpretative and pedagogical models that offer a non-reductionist reading of reality and favor the development of educational practices oriented towards learning as a tool for building personal agency.

A truly effective and efficient learnfare requires the implementation of a complex and integrated system of services, designed to be not only continuous and constant over time, but also equipped with a high degree of flexibility, modular in relation to the specificities of the contexts.

It is crucial to invest in educational and training policies in the early years of life in a structural way. Only through a synergic coordination between institutions, local authorities, schools, families and communities will it be possible to face the social and economic challenges of contemporary times.

Each body involved, however, should share a unanimous vision of learning as a

universal right and of culture as a central value of current and future democratic societies.

# NEW WELFARE AND SOCIAL INEQUALITIES. THE ITALIAN CASE OF VOCATIONAL EDUCATION AND TRAINING

Paola Buonanno<sup>a</sup>

Raffaele Sibilio<sup>a</sup>

Angelo Falzarano<sup>a</sup>

<sup>a</sup>University of Naples “Federico II”, Italy

In recent decades, national and supranational institutions have redefined welfare models to respond to financial crises, digital and ecological transitions, population aging, and unemployment and pandemics. The Council of the European Union has highlighted the crucial role of education and training in addressing current socio-economic, demographic, environmental and technological challenges. In relation to these, the reactive capacity of Italian education systems should constitute a bulwark in the face of new forms of risk and requires decisive interventions in this direction. The article analyzes the most recent ways of implementing education and training policies in our country that put the development of the individual and society at the forefront, highlighting how the measures undertaken in terms of welfare, in reality, can produce distorted effects that consist in generating or maintaining social inequalities rather than limiting them. Through the processing of secondary data, we therefore examine their actual effectiveness in responding to a widespread demand for equity across the country, mainly in relation to the institutional capacity to strengthen the educational offer in the field of education and vocational training, to create human resources capital, and to guarantee everyone an equal opportunity to implement their personal agency.

welfare; learnfare; education and training; inequality; capabilities

## INTRODUCTION

The European welfare state, born to mitigate the imbalances caused by the capitalist economy, reached its peak between the 19th and 20th centuries with the expansion of social security and the generalization of rights. However, in recent decades, globalization (Bauman, 2001), the digital revolution and market

transformations have put this model into crisis, highlighting new risks (Beck, 1999). To address these challenges, the European Union has adopted a paradigm of inclusive growth (Europe 2020 Strategy), focusing on employment, skills, fighting poverty, and modernizing social protection systems.

Rapid social and economic evolution, fueled by the knowledge society (Alessandrini, 2001) and growing tertiarization, is transforming work models. This will soon make current skills obsolete, requiring new skills and knowledge for the professions of the future, many of which are unknown today (Giddens, 1994). Since the 1990s, in order to mitigate the negative effects of a welfare system, welfare-to-work models have emerged, especially with the Lisbon Agenda of 2000. These systems are based on the idea that people must take action individually to quickly reintegrate into the labor market, with the threat of suspension of economic support in the event of non-compliance. Consequently, human capital has become a central element to invest in, to be developed and continuously updated throughout life. The welfare models adopted can be distinguished into two main approaches: the liberal workfarist models, which impose rigid conditions focused on immediate employment, and the enabling models of social-democratic inspiration, which privilege training, empowerment and personal growth as tools to improve employability and individual well-being. The 'learnfare' approach falls within this second approach (Lodigiani, 2020), a system in which everyone is put in a position to learn in an active welfare mechanism in which education, professional training and continuous learning are configured not only as a tool but also as a right-duty for the exercise of active citizenship, for employability and work and social inclusion. Born from North American programs for school reintegration, 'learnfare' is configured as an active welfare measure and focuses on the synergy between institutions to address the risks of global transition and values lifelong learning as a key component of active citizenship.

In this context, we analyzed in a limited way the Italian model of vocational education and training paths (referred hereafter as leFP), integrated in upper secondary education, through which it is possible to fulfill the obligation of education and training. Although leFP are aimed at promoting equity and inclusion, they reveal a paradoxical effect in their implementation: instead of reducing social inequalities, they risk perpetuating them on a national scale. This phenomenon highlights the need to shift the focus from the sole individual capacities of activation of each individual to the responsibilities and institutional capacities set up to guarantee the rights established by the Constitution and current legislation.

## **1. LEARNFARE AND THE VOCATIONAL EDUCATION AND TRAINING (IEFP) SYSTEM**

The IeFP courses, introduced experimentally in 2003 and made official in 2011 within the national education system, allow the achievement of the qualification at the end of the third year and the diploma at the fourth: qualifications present in the appropriate National Repertory, shared between the State and the Regions with Agreements of 27 July 2011 and 19 January 2012, referenced at level III and IV of the European Qualification Framework (EQF), therefore usable on the national and community territory. Since 2016, as a further method of implementing the IeFP courses, the dual system has been introduced, which provides for a significant amount of hours of practical training to be used in work contexts. The IeFP training offer is ensured and organized in the regional territories by accredited training institutions and state and private higher education institutions under a subsidiarity regime, if provided for by regional planning, as well as by companies in the case of courses aimed at apprenticeship students, always following the shared national Repertory of professional figures for both three-year courses (22 qualifications) and four-year courses (21 diplomas) accompanied by minimum training standards. This offer has as its objectives the personal and professional development of young people, the acquisition by the latter of basic skills and specific professional skills that can be fluently experienced in the world of work and exported elsewhere. If we consider the organization of these courses as a form of 'learnfare' to guarantee social and civil rights throughout the country, we must consider it a battered and limping welfare practice as it asserts itself by presenting significant disparities between the different areas of the country. In Northern Italy, characterized by a dynamic productive fabric and a strong synergy between training institutions and businesses, these paths are a driving force for young people who, freed from school dropout phenomena, find employment more easily. Furthermore, they actively participate in the vocational training chain, which also includes IFTS and ITS paths. In Southern Italy, however, IeFP paths are often a secondary, fallback choice, undertaken by students with a difficult school background, where the number of young people who are Not engaged in Education, Employment or Training (NEET) reaches critical peaks.

With the reform of Title V of the Constitution, since 2001, the Regions have had exclusive competence in matters of education and professional training, without prejudice to the State's task of establishing the essential levels of

performance (LEP)<sup>1</sup>, principles of national unity, over which there is a lack of real control. The lack of uniform application of the regulations has led to heterogeneous results: while some Regions have adapted rapidly to the required standards, others have recorded delays and failures, thus amplifying territorial disparities in training and employment results.

## **2. THE CASE OF THE PNRR**

The PNRR, i.e., the National Recovery and Resilience Plan, was approved in 2021 by Italy to relaunch its economy after the COVID -19 pandemic and aims to rebuilding an economic and social fabric by combining and incentivizing opportunities related to the ecological and digital transition as well as improving the quality of work and citizenship services, primarily those focused on health and education. The Plan mentions leFP paths only once in Mission 5 – Component 1 – Investment 1.4 “Dual system” for which a total of 600 million euros have been allocated to strengthen the dual system, make education and training systems more in line with the needs of the labor market and promote the employability of young people and the acquisition of new skills especially in the most marginal and peripheral areas.

The resources for leFP courses have been distributed by the Regions mainly based on the number of students enrolled, using the data collected by the National Institute for the Analysis of Public Policies (INAPP). This criterion, however, penalizes the development of leFP courses in Southern Italy, favoring Regions with already consolidated systems, mainly located in the North of the country. Here, in fact, there is greater integration between the world of training and that of work, consequently, the Southern Regions, which have a less flourishing productive fabric, receive a significantly lower share of resources, as demonstrated by the Directorial Decrees that decree the allocation of these. As an example, we refer to Decree no. 100 of 18 April 2024 which, adopting the criteria established by the Decree of the Ministry of Labor and Social Policies no. 38 of 7 March 2024, allocates 97.014.815,00 euros to Lombardy, equal to 40% of the resources available for the 2023 financial year, out of a total of 240.000.000,00 euros.

These dynamic highlights a strong polarization: the dual system, rather than reducing territorial inequalities, risks perpetuating them, strengthening the systems that already function and neglecting the areas with greater difficulties. This disparity between North and South raises questions about the actual

---

<sup>1</sup> Legislative Decree 226/05.

capacity of the PNRR measures and not only, to guarantee equal opportunities for access to a national training system that should be fair and homogeneous.

## **CONCLUSIONS**

In the context of 'learnfare' policies (Margiotta, 2011) it is essential to shift the focus from individual capabilities to the responsibilities of institutions in creating adequate contexts for the full use of opportunities.

According to Sen's (2000) capabilities approach, the freedom of each individual to pursue their own goals does not depend only on the goods they possess, but also on their personal ability to convert them into tools for their own development. This concept, taken up by Nussbaum (2002) and other scholars, underlines how personal capabilities are determined by institutional, social, and legal factors. Consequently, institutions have a crucial role in ensuring equal opportunities for everyone to develop their potential. It was, therefore, a missed opportunity for the territories less equipped with professionalizing paths not to be adequately supported by the resources of the PNRR which, in the description of Mission 5, admits this risk, underlining that, despite the progress made, social and family support policies still need strengthening. In the context of leFP courses, it is necessary to strengthen multilevel governance that sees the role of the State strengthened in fact in supervising and therefore guaranteeing compliance throughout the territory of the essential levels of performance, overcome the criterion of the Notices, and make the system more stable, update the skills of teachers and trainers, and ensure equal opportunities for all to participate in a solid professionalizing chain with the Higher Technological Institutes (ITS Academy) and the Higher Technical Education and Training (IFTS).

It is highlighted that the lack of homogeneity in the implementation of leFP courses coincides with other economic and social inequalities in our country. The training offer is more fragile where it should be more present and solid, where the productive fabric is weak, where the education system is unable to address the problem of school dropout and where the number of Not engaged in Education, Employment or Training (NEET) increases dramatically. While on the one hand the principle of incentivizing the performance of the most virtuous regions is acceptable, on the other it is essential to guarantee young people throughout the national territory the right to access this type of training offer equally regardless of the region they belong to, whether it is more or less equipped in terms of productivity.

A change of pace requires social change, the adoption of a renewed culture, open to the influences of social innovation, described by Moulaert et al. (2013) as a new operational approach, based on new social relations and new ways of responding to collective needs, accompanied by a reconfiguration of social dynamics and a process of empowerment. This perspective is particularly significant if oriented to 'free' education from the rigidities imposed by expectations of success and requests for purely economic results. According to Moulaert et al. (2009), in fact, "those initiatives that aim to promote social inclusion through transformations in the behavior of individuals and institutions" are considered socially innovative.

# TOWARDS CLIMATE JUSTICE IN EDUCATION: A TRANSFORMATIVE CHANGE

Angelo Falzarano<sup>a</sup>

Raffaele Sibilio<sup>a</sup>

Paola Buonanno<sup>a</sup>

<sup>a</sup>University of Naples "Federico II", Italy

The devastation of the climate crisis is experienced very differently among the people, communities and places most at risk: transformative climate action requires conceptually and empirically connecting the climate crisis with social injustice, economic inequality and health. Education in society is also called upon to contribute to climate justice and global sustainability, with actions to build a more just, stable and healthy future. Education is a critical sector of society in terms of preparing for the future and schools are among the most stable and forward-looking organizations in many communities. To reimagine what is possible, the climate crisis must be addressed in education alongside systemic change for social justice and structural change focused on economic justice, racial justice and energy justice. This paper aims to contribute to the debate on climate justice and education. It presents key evidence from an exploratory study in primary schools on climate change education as a response to the climate crisis. Attitudes and behaviors towards climate justice are explored for possible transformative change. The different visions that emerge underline the complexity of the phenomenon and the methods of intervention.

climate justice, education, sustainability, climate crisis, social injustices, economic inequalities, health.

## INTRODUCTION

The ecological context is characterized by global warming, resource scarcity and biodiversity loss, the accumulation of which gives rise to an amplification effect with uncertain consequences. Social conflicts related to environmental issues increase over time, drawing attention to the unequal distribution of environmental degradation and to the reduced access to resources and land,

which reinforce existing social inequalities (Singer, 2018). The degradation of the living environment presents health risks and accentuates the social gap and spatial segregation of the poorest populations: the environment becomes a question, no longer of conservation, but of social justice, and, even more, of social cooperation. The correlation between environmental disturbances and the most precarious territories (ex)poses the populations concerned to new forms of inequalities that accumulate with social and political ones (Taylor, 2000).

## **EUROPEAN CLIMATE JUSTICE FRAMEWORKS AS TRANSFORMATIVE OPPORTUNITIES IN EDUCATION**

The right to a healthy environment for all and a fair distribution of environmental benefits and damages make the quality of the living environment and access to environmental goods a matter of justice. To align social processes and climate justice objectives, two policy frameworks have been used: the Green New Deal (GND) and energy democracy. The GND connects large public investments in clean energy with those in jobs, health and education to strengthen the sustainability and resilience of communities, to build justice beyond the narrowest conventional climate policies. Energy democracy focuses on the main driver of climate change, the dependence on fossil fuels and the resulting power dynamics, to reclaim energy decision-making and restructure energy systems for more equitable and renewable energy. This is not an easy challenge due to the significant changes that affect communities (Falzarano, 2024).

This contribution is mainly conceptual because, despite the targeted efforts to systematically review current school climate commitments, we have partially succeeded in identifying empirical examples to demonstrate the new paradigm shift proposed with the two climate justice frameworks. Exploring the transformative potential of specific climate justice initiatives in education represents an educational growth that starts from schools.

The commitment to climate justice is certainly an innovative opportunity in education.

## **METHODOLOGICAL NOTE**

The contribution aims to participate in the debate on climate justice and education commitment. The approach includes the application of two climate justice frameworks, the Green New Deal and energy democracy, to explore how education can promote and accelerate a transformative climate justice

response to humanity's intersecting crises.

Here we present the main evidence emerging from an exploratory study conducted in schools in the Campania Region that carried out climate change education projects during the school year. The project managers of 44 comprehensive institutes out of 518 – classes of lower secondary schools – that have carried out initiatives on climate crisis and social justice in line with the paradigm shift required by the EU were interviewed.

The analysis of attitudes and behaviors towards the phenomenon were also useful to identify possible transformative changes and to implement ad hoc training initiatives. The different visions that emerged underline the complexity of the phenomenon.

## **TOWARDS CLIMATE JUSTICE IN EDUCATION**

General incentives for sustainability expand the capacity of schools to implement targeted initiatives on climate justice. The necessary paradigm shift requires a renewed commitment to schools to guide students towards a more just and stable future from a climate perspective. As reference institutions, schools are among the most stable and far-sighted organizations in many communities.

Recently, the role of education in society is expanding with new opportunities and responsibilities. Following the measures of the PNRR, schools are called to contribute to the ecological transition and to the broader global sustainability. In the context of these macrophenomena, the transformative action of schools for the climate requires conceptually and empirically connecting the climate crisis with social injustices, economic inequalities and health. The devastation of the climate crisis is experienced very differently among the people, communities and places most at risk. Climate justice articulates a paradigm shift in how education seeks to respond to the climate crisis, promoting actions to build a more just, stable and healthy future (Sen, 2010).

Education can create multiple opportunities to resist, reverse, and repair climate injustices by leveraging its role to catalyze social change toward a more equitable, renewable energy future. Indeed, Green New Deal policies and energy democracy provide the framework for revisiting a wide range of proposed transformative climate justice initiatives in education.

## **FIRST RESULTS FROM THE SURVEY**

The main findings recorded by the referents in the context of the project initiatives are reported.

1. Most schools are beginning to use their influence and impact to encourage and prioritize social innovation and social change for climate justice.
2. Social actions toward climate justice are localized.
3. Basic behavioral changes alone are insufficient to address climate injustices, but they are certainly an approach to reducing climate impacts.
4. Students have debated a lot about whether climate justice requires not only shifting resources away from fossil fuels and carbon emissions, but also actively engaging in disruptive systemic change, encouraging healthy ecological actions.
5. Through a commitment to transformative climate justice, students around the world could realign and refocus their community engagement efforts to shape a more just, stable, and healthy future.
6. To reduce the suffering of the most vulnerable families and communities, massive direct investments are needed in building resilience, including access to food, clean water, and education in frontline communities. Climate justice requires “fundamental changes in how we (a) build and sustain relationships, (b) manage uncertainty, distress, pain, and shock, and (c) redistribute wealth, opportunity, risk, and responsibility.”
7. Addressing the challenges and opportunities for education to advance climate justice requires collective resourcefulness, innovative teaching and learning, networking strategies, and a compelling vision for the future. Harnessing the potential of schools requires creativity and institutional resourcefulness among those within education institutions and political leaders.
8. Growing recognition that the climate crisis is a symptom of broader socioeconomic and political dysfunction.
9. The urgent need for social transformation has become more evident with the pandemic and the increased concentration of wealth in the hands of a few.

10. Schools have the potential and opportunity to harness substantial intellectual, financial, physical and labour resources to promote transformation and reduce the devastating human suffering resulting from economic and climate injustices.
11. Although, at the macro level, it is not yet entirely clear to what extent education can contribute to the transformative changes that society needs to address crises, at the micro level, schools shape the contexts of belonging.

### **FIRST THOUGHTS: EDUCATION AND CLIMATE JUSTICE**

Disparities in current climate impacts exist at multiple levels, including global inequalities, inequalities within countries, and regional inequalities, particularly across race, class, gender, and disability. Initial inequality means that disadvantaged groups suffer disproportionately from the negative impacts of climate change, resulting in greater inequalities later on. The global injustice that countries that have contributed least to the climate crisis are among the most vulnerable is now widely recognized (Gough, 2017). Given the pervasiveness of these inequities, a transformative climate justice lens is critical to effective climate action including through the power of schools. While technology is an essential part of the transition to a more just, equitable, and climate-stable future, investments in the physical sciences and technological innovation have not yet been adequately balanced with investments in the humanities and social sciences, social infrastructure, social innovation, and social justice.

This lack of investment has failed to strengthen social bonds, thereby reducing community resilience, or our ability to collectively cope with and recover from crises. The lack of investment in social innovation and social justice has also limited our imagination about the role and potential impact of education in society.

It is clear that this narrow focus is starting to change as there is growing recognition that addressing climate change will require investment in transformative social, institutional, financial, and policy changes.

If social science research and social innovation were prioritized and funded at a higher level, technological innovation would be more effectively coupled with research to accelerate the social change that accompanies it. As influential and innovative institutions, education has the opportunity to lead by example and shift the conversation from an isolationist climate approach to a more holistic

and integrated commitment to climate justice through the functions and initiatives of schools both individually and in networks.

It is also necessary to recognize that schools shape the communities in which they are located.

## **CONCLUSIONS**

As the climate crisis continues to exacerbate vulnerabilities around the world, a paradigm shift in how education engages in transformative social change could alter policy options for a more climate-just and stable future.

This paper suggests that when climate justice becomes a prominent topic in education, students not only begin to distance themselves from the status quo, but also participate in mitigating, albeit within their own limits, climate vulnerabilities and injustices.

Schools are critical places for the production, perpetuation, and dissemination of knowledge: in this era of climate change and instability, they can apply knowledge to promote systemic social change. To fulfill their mission of promoting the common good through learning and innovation, schools can reorient their educational and research initiatives towards building transformative climate justice in society, including through social partnerships (Steele, Rickards, 2022).

Educational institutions can become both exemplars and agents of social change. Climate justice requires a community engagement approach that extends beyond the individual educational institution. Climate justice efforts provide a cross-sector and interdisciplinary approach to identifying research priorities, educating students, engaging with local governments and communities, and supporting employees.

Considering the reality of a finite world, its ecological irreversibilities, leads to translating these interactions into existential interdependencies and reveals the tenuous relationship between the conditions of social equality and environmental limits. Social justice in a limited world requires thinking and inventing mechanisms of ecological cooperation, that is, cooperation between men and with nature, which can no longer be considered outside of environmental changes. It is about changing our view of our space of coexistence made of encounters and symbiosis and not of dysfunctional relationships between different agents.

# MAPPING NEETS IN EUROPE AND ITALY: POVERTY, INEQUALITY AND CRITICAL POLICY ROLES

Mirella Ferrari

University of Milan-Bicocca

Education and social justice represent two critical issues for young adults especially when related to contemporary times that have to face political uncertainties; rebalancing of geopolitical forces worldwide; epidemics that have just passed, the consequences of which have yet to be deeply investigated; energy, territorial, as well as food wars that are still ongoing; artificial intelligence; and finally other phenomena such as nationalistic protectionism and the claims of the female gender especially in the countries of the Eastern Mediterranean area. Young adult education represents a crucial moment in Italian welfare, as it provides an opportunity to match labor market (Strecker, López, Cabasés, 2021) supply and demand, is to some measure linked to the biographies of individuals and the development of society in a vision of social equity. Unfortunately, the various welfare initiatives over the years have not been free from evident social distortions and inequalities. It is in this scenario that our reflection on NEETs is inserted. This paper aims to represent the phenomenon in its current state, comparing it with the most recent studies (Ferrari, 2018). It wants to give evidence of the European and Italian situation in order to stimulate debate, and to consider the different policies developed in the last decade by the Italian State specifically dedicated to young NEETs. It wants to offer a tool for reflection on the same target audience, reconsidering the limitations and paradoxes that this targeting brings. It also wants to point out the inadequacy of Italian policies (De Luca Picione, et al.2023) designed to minimize and counteract the phenomenon, which includes individuals as diverse as e.g.: mentally ill; dissatisfied with the work and school environment; and economically disadvantaged youth. While on the one hand we see the anthropocentric view, which attributes educational and employment failure to individuals, essentially offloading the responsibilities of the state and local governments onto individual social actors. On the other hand, the neoliberal view tells of young people not studying and not working because of distrust in the future (Bonanomi, Rosina, 2022). The Toniolo Report 2023 highlights how education impacts life trajectories and is a determining factor in the transition to adulthood and satisfactory self-expression, and so in the well-being of individuals and social participation

(Caroleo, Rocca, Mazzocchi, 2020; Newman et al, 2014). Fragility and perceptions of the future (Bauman, 2000) are felt to be more critical and negative, so NEETs express a higher risk of marginalization and, therefore, social inequality (Vieira, Pappàmikail, Ferreira, 2021). In this view, individual abilities are diriment, unfortunately too often conditioned by education, training and job search systems. So the challenge for employment services is to work on the frustration caused by employment uncertainty; on the content of interventions, which are often outdated; on the role of emotions at play (Ylistö, Husu, 2021); as well as on the fragmented and scarce social policies aimed at young people, which make Italy (Mussida & Sciulli, 2023) the tail end in Europe (Assmann & Broschinski, 2021) in terms of employment services and support during periods of inactivity.

Education, Inequality, Inclusion, NEET, young adult, Welfare State Introduction

## 1. INTRODUCTION

The term NEET was first identified in 1999, in a document from the Great Britain Cabinet Office (Ferrari, 2018). Many years have passed since then: this conference seems to us an opportune moment to reflect on the phenomenon, its evolution, and its implications.

At a macro level, Italy ranks last among EU countries for young people aged 15 to 29 who are not studying, not working, and not engaged in training programs. According to data published by Eurostat (2022), NEETs in Italy are 17.7%, followed by Romania (14.5%) and Greece (14.1%). At a meso level, youth Observatories, OECD, ISFOL, and ISTAT in 2018 showed data approaching the number of 2.5 million NEETs. Today, the figure is almost 2.2 million: the decline affects all categories included in the definition, and it has a significant impact on the reduction of potential labor force. At a micro level in 2021, Sicily was at 30.2%; Campania at 27.7%, and the northern regions were also affected by the phenomenon, with 17.3% of NEETs in Lombardy and 13.5% in Emilia Romagna, as confirmed by the latest ISTAT data.

Reducing this rate is one of the European objectives concerning social rights. The goal is to lower the NEET rate among young people aged 15 to 29 to 9% by 2030.

Since the publication of our latest research (Ferrari, 2018), which highlighted the complex context in which the phenomenon manifests itself: a context where family, education, and work do not operate on separate planes but coexist, giving rise to complex and diverse dynamics; we have first witnessed an increase in the phenomenon, followed by a partial yet significant decrease in numbers.

Young adults seem increasingly less capable of “aspiring” to a social position that can guarantee them access to housing autonomy; family building; and job stabilization (Baillergeau & Duyvendak, 2019; Appadurai, 2004). They seem less able to desire; build; or plan a future where they are protagonists, increasingly displaying a coexistence of adult-like behaviors alongside adolescent behaviors, clearly expressed within their family of origin (Bericat, Cassinello, 2012; Hardy & Carlo, 2008).

Uncertainty appears to outline the medium-term existential planning in the narratives of young adults in an increasingly fluid context (Bauman, 2000).

If isolation and loneliness were typical attributes of NEETs a decade ago, today they also appear as typical attributes of the phenomenon related to well-being and health (Neuman, 2014; Bonanomi & Rosina, 2022).

As the relevant literature shows, school and family are closely related to the phenomenon (Inchley, et al., 2016). On one hand, despite numerous school reforms (Schizzerotto, et al., 2018) schools still exhibit discrepancies. What emerged before the pandemic was an inability to use media and ICT technologies in teaching, an issue at least partially overcome by the necessities imposed on schools by COVID-19, which led to the development of various remote teaching models. This not only modernized traditional teaching methods but also contributed to a reevaluation of the teacher’s role. The different approach to teaching has stimulated better access to the school system, although in some cases highlighting inequalities between those who could afford computers and software and those who could not.

Central and local policies, more closely tied to the territory, have not been able in recent decades to create effective policies to reduce socio-economic and cultural gaps; territorial disparities; linguistic differences; or different religious affiliations. Inclusion, apart from a few happy cases, is yet to come (Panichella, et al., 2021; Gorinas, 2014; Penninx, 2005).

Policies for young people have not instilled trust in institutions among young adults. The consequence of these missed active policies and the lower attention to the school system, even in terms of economic investments by the central government, has inevitably impacted the role of teachers, partially delegitimizing the role of the school and the work of teachers in building a more equitable and inclusive society.

While school was and remains one of the central “strategic tools” aimed at minimizing and solving the NEET phenomenon, the *family* is the second central factor in studying the phenomenon, as shown by scientific literature (Saraceno, et al., 2020; Alfieri, Sironi et al., 2015; Bynner & Parsons, 2002).

The link between family and school is very strong: in fact, the family entrusts educational institutions with the task of transmitting knowledge, regulating behavior, and expressing themselves within the framework of a typically public organizational culture (Chambers & Gracia, 2021; Epstein, 1990).

It is undeniable that in recent decades, economic challenges have overlapped with political difficulties in the fields of education and welfare, as well as active policies for schools and families, generating crises; conflicts; distress; and social disparities. These issues have been further exacerbated by the current global geopolitical context, which has shown pandemics; wars; energy crises; and environmental disruptions over the past five years. In this complex scenario, the “youth extended in space and time” (Ferrari, 2018) becomes a strategy, a means of mitigation and shelter from the deprivation and fragmentation of young people’s expectations. Frustrated by the inability to access growth processes, young people voluntarily or involuntarily prolong adolescence.

## **2. YOUTH AND CHALLENGE OF AUTONOMY**

The National Youth Council and the Italian Youth Agency have recently presented the new report “Youth 2024: A Generation’s Balance Sheet” (2024), concerning the condition of youth in Italy. The report outlines the opportunities and challenges faced by young Italians, with the aim of devising new policies and adjusting the existing welfare system to meet emerging needs.

The demographic reduction of young people; the brain drain phenomenon; job insecurity; and territorial and gender inequalities impact the NEET phenomenon. Demographics, education, and employment are the main issues. Italy today faces a significant demographic challenge, highlighted by a substantial decline in births. Over the past two decades, we have witnessed a reduction of almost 3.5 million young people under 35, with a decline rate of

about 21%. This phenomenon has particularly affected the female segment, with a decrease of almost 23%. Additionally, there is a worrying “brain drain” with nearly 18,000 young graduates opting for emigration in 2021, an increase of 281% over ten years, comparable to the emigrations of the 1950s.

This scenario is accompanied by growing instability in the job market, where 41% of those under 35 are involved in precarious work, accentuating a condition of uncertainty and job discontinuity. This complex and unstable picture is compounded by territorial disparities, with Southern Italy recording significantly higher youth unemployment rates compared to the North, and where the average annual salary of young workers is significantly lower.

The significant changes in demographic structure, which stem from natural dynamics, are directly linked to the attractiveness of territories and the resulting migratory processes. Over the past twenty years, while the North has seen a 16.9% decrease in young people; the Central regions a decrease of 18.9%; the decline has been 27.3% in the South where, according to the latest available data, 36% of young Italians reside, compared to 45.1% in the North and 18.9% in the Center. The demographic winter particularly affects Southern Italy.

These unfavorable conditions are reflected in the ability of young people to access stable job opportunities and adequate remuneration, negatively influencing their quality of life and future expectations, thus further encouraging the phenomenon (Delli Zotti, & Blasutig, 2020).

If the issue of high skills is increasingly central to innovation processes and competitiveness among systems, it is particularly striking how the incidence of graduates in the 25-34 age group (29.2%) in Italy is significantly lower than the European average (42%). Unfortunately, the three-year degree has not resolved the issue of the lower number of graduates in Italy; indeed, we observe that graduates constitute only 29%, and many are fleeing abroad (+281% in 10 years). The issue of the lack of highly specialized and trained education contributes to the exacerbation of the phenomenon.

Another critical problem is unemployment, which affects the South more than the North, at a rate three times higher: in 2023, unemployment increased by 1.3 percentage points compared to 2022. The difficulty in finding employment is also correlated with the phenomenon we are analyzing; indeed, fewer job opportunities stimulate attitudes of disenchantment and disaffection towards production (Rhodes-Purdy et al., 2023)

Adding to this challenging context is the particular situation of “youth employment,” which is increasingly unstable and discontinuous, now even in

the public sector. In Italy, young workers in the private sector (5.5 million, or 91.5% of all young employees) experience widespread and growing job instability: 40.9% of those under 35 have precarious contracts (temporary or seasonal), compared to 59.1% with stable contracts, i.e., permanent or apprenticeship contracts (it was 59.4% in 2018).

A collective effort is needed to promote quality education; job placement; social and gender equity; and to strengthen youth representation at all decision-making levels. The aforementioned contractual precariousness translates into structural discontinuity in employment and wages: in 2022, only 39.0% of young private sector employees received 12 or more monthly payments from their employer, while 32.7% were paid for less than 6 months, with devastating effects on their quality of life, life projects, and future pensions. We also believe that low wages contribute to reinforcing this phenomenon. In the last 5 years, we have witnessed a decline in salaries: in 2022, the average salary (15-34 years) of young adults in the private sector was 15,616 euros, while the average recorded in the public sector was higher, specifically 22,839 euros. Given this scenario, it is quite natural to expect a lack of trust in the future, institutions, and policies, which seem very distant from the real needs of young people.

We note that the working dimension is particularly involved in becoming adults, in embarking on paths of autonomy, and in planning one's future. Employment is strongly correlated with the dimension we are analyzing, as it represents a necessary precondition for taking control of one's life and could serve as a tool to counteract the NEET phenomenon.

The *Report* analyzed so far also shows that alongside stable employment, the transition to adult life requires the fulfillment of other material conditions such as: the availability of affordable housing (33.7% of responses); and the ability to save to cope with unforeseen events (20.6%). In fact, about 36% of the cohort analyzed is waiting to complete their studies (36.7%); 11.6% to find a job, even a temporary one; and 9.1% to have a stable relationship before leaving their parental home.

In light of these observations, we have reflected on the needs and urgencies necessary for achieving adulthood; independence from the family of origin; and full autonomy.

What do those under 35 need to become autonomous?

The primary condition seems to be finding stable employment. Similarly, to start a family, almost 70% of young people indicate the need for an adequate economic situation. Regarding parenthood, more than 60% of respondents

express a future desire to have children.

The experience of the pandemic and its profound impacts appear to have altered the hierarchy of factors determining young people's quality of life: the sample places health (both physical and mental) first, with an average rating of 8.9/10, ahead of family (8.6/10) and friends (8.3/10), the three contexts most affected by lockdown and social distancing measures. Although still important, education and culture (8.2/10), money (7.9/10), and affective relationships (7.1/10) rank slightly lower in the indicated hierarchy.

These data highlight the urgency of targeted social policies to improve the living conditions and prospects of young people in Italy, through the promotion of a more stable and inclusive labor market, greater valorization of skills, and renewed intergenerational dialogue.

At the bottom of young people's concerns are fears of having to work on holidays and/or at night (8.6%) and of having to move to another region or country (13.8%), painting a picture of young people that is completely antithetical to the superficial narrative of "lazy," overprotected individuals, too often instrumentally portrayed by the media or other commentators.

### **3. THE LIMITATIONS OF THE DEFINITION NEET**

The complexity of contemporary life forces young people to experience a prolonged, fragmented, and unpredictable adolescence (Pais & Ferreira, 2010). The "youth issue" has been on the European agenda for years, as it is transforming from an issue to a "social alarm" (Vieira, et al., 2021). Over the years, the NEET phenomenon has sparked numerous reflections and studies (Cojocaru, et al., 2022, Hango, et al., 2021; Wong, 2016). If we look at recent literature (Mussida, 2023; Caroleo, Rocca et al., 2020; Alfieri et al., 2020), what emerges very clearly are, first of all, the different indicators used in the various definitions the term encompasses; the diverse trajectories it implies; and the numerous and dissimilar situations that the NEET condition offers for analysis.

The differences among various studies in the literature are so vast as to be hardly comparable: for example, in Japan, the definition encompasses a different cohort than in Europe (D'amico, 2024; Zhang, 2022; ). Generally, the phenomenon concerns the age group 16-35 years, but in Japan, it even extends up to 65 years (people with such characteristics and such an advanced age are called "madao" in Japanese, meaning "useless old man").

In Norway, for example, active youth policies do not take into account the particular phase of transition to adult life, which would require special policies,

as it is known that this phase of life exposes young people to a condition of vulnerability (Gjersøe, 2020), and often some are pushed towards yo-yo paths that is, pathways of entering and exiting the NEET condition, constantly oscillating between education and job opportunities (Du Bois-Reymond, Andreu, 2012).

We then wonder how much welfare policies can influence the phenomenon not only in qualitative terms concerning young adults but also in quantitative terms relating to the phenomenon itself.

Moreover, there emerges a “judgmental tension” in the indicators used in the definitions, which mostly point to a condition of “social deficit,” not aligning with the standardized social model for youth integration (“they do not... study; they do not... work; they do not... train”). We notice in the definition a reference to a negative condition of youth. Therefore, the first reflection concerns the approach to research itself. We wonder if the literature produced so far has not revealed scientific shortcomings in addition to data on the phenomenon and definitions (Holte, 2018).

Similarly, we question whether, in exploring the phenomenon by cloaking it in elusiveness, ambiguity, and potential failures in different existential trajectories, the studies conducted so far have also contributed to constructing a negative and marginalizing narrative of a segment of young people who escape social models and are relegated to invisibility (Gaspani, 2018).

In our opinion, some critical issues arise in this regard. We naively ask: “If millions of young people do not study, work, or train, where do they end up?” It seems like a marginal issue, but it could provide answers to social policies concerning school, family, and work, and offer life trajectories different from established models.

Can young people who do not adhere to the rule-based social system propose different existential models? If so, which ones? Youth policies tend to regulate divergent and not socially shared models. The risk we run in not considering “different” life trajectories, relegating them to the margins, can be that of social exclusion.

Do NEETs genuinely express the will not to study, work, or train? Granted that part of the youth population might also express a divergent social stance, we wonder if another part, rather, challenges the regulated models and the intergenerational contract supported by the European Community, which tends to shape youth life trajectories in performances, times, and spaces it deems suitable for the global productive system. In the context of recent Eurofound

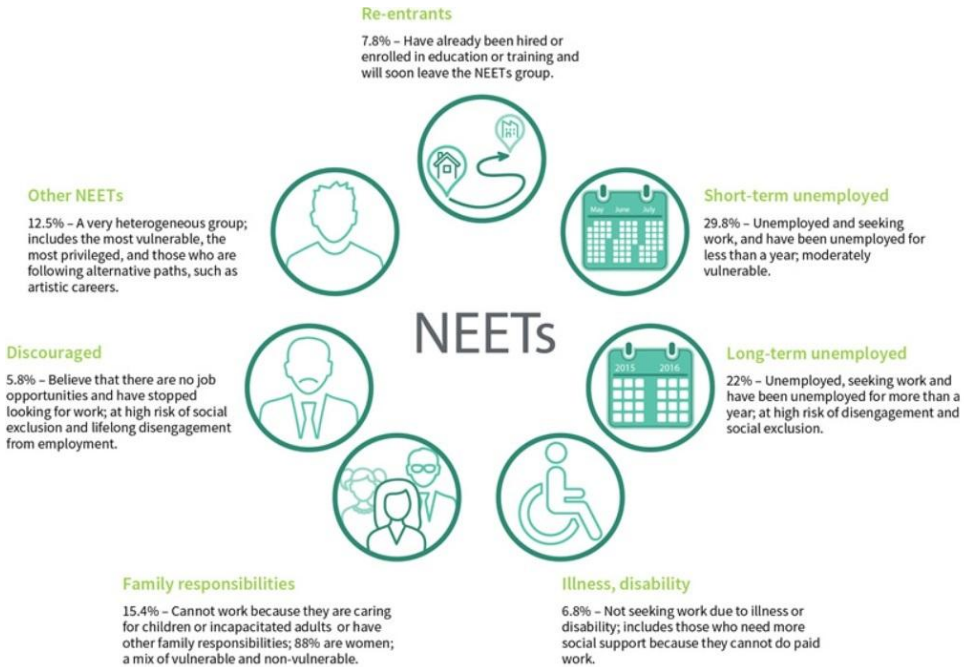

research (2024; 2021; 2016; 2012), an attempt has been made to highlight the heterogeneity of the sample, potentially providing insights into the scientific explorations conducted so far.

The 2016 study on the diversity of NEETs already provided a divergent perspective and introduced a new categorization into 7 subgroups, aiming to better understand the composition of this youth cohort. This example already highlighted the critical nature of the sampling, as shown in Image 1. Each of the listed subgroups is composed of a mix of vulnerable and non-vulnerable young people, who do not accumulate human capital through formal channels, both voluntarily and involuntarily.

The 2021 Eurofound study on the impact of the COVID-19 pandemic on young people will include an update on the diversity of NEETs based on 2019 data, contributing to the definition of heterogeneity, which is always changing over time. Indeed, the sample includes a multitude of young people with very different characteristics:

- “Returning” (yo-yo youth), those who have been employed and will leave the NEET cohort but are known to potentially re-enter it shortly (Biggart & Walther, 2016; Du Bois-Reymond & Andreu, 2012);
- “Short-term unemployed,” those who have been out of work for less than a year and are at moderate risk of vulnerability;
- “Long-term unemployed,” those who have been out of work for more than a year and are at high risk of social marginalization;
- “Sick and disabled,” who need specific social policies to counteract social exclusion and often cannot work;
- “Care-givers,” who cannot work because they take care of children, the elderly, and the sick in their families;
- “Discouraged,” those who believe there are no job opportunities and have stopped looking for work, and are at high risk of social exclusion;
- “Other NEETs,” which include the most vulnerable, the privileged who can afford not to work, and those following “alternative paths” such as an artistic career.

Fig. 1. NEET; types and differentiations. Source: Eurofound (2023)

This brief enumeration already reveals some critical issues:

- The extreme heterogeneity it encompasses, without a real scientific explanation or even a systemic reason: the sick; the disabled; members of high social classes who can boast an income and do not have the obligation to work; dancers; artists...
- A strongly judgmental position by Europe in modeling educational and career paths, which does not allow for paths that are not aimed at producing economic capital. Think of artistic careers, which are defined as “alternative.” Alternative to what?
- A judgmental and implicitly marginalizing position towards those who express the will to take care of children, relatives, and the sick in the family by choice or necessity.

The axis on which the scale of greater or lesser inclusion moves is correlated with traditional jobs, not considering temporary or artistic jobs, and places inactive individuals and long-term unemployed on the same level, without bothering to make distinctions, which are at the basis of individual choices. The

vulnerability expressed by the European model is obviously related to employment status.

We notice, therefore, that there are strong limitations both in the definitions chosen at the European level and in the approximation of the different cohorts of the sample at the demographic and causal attribution levels in the proposed model.

Therefore, it is necessary, in exploring the phenomenon, to already highlight these limitations, as well as other limitations we have identified in the policies adopted so far.

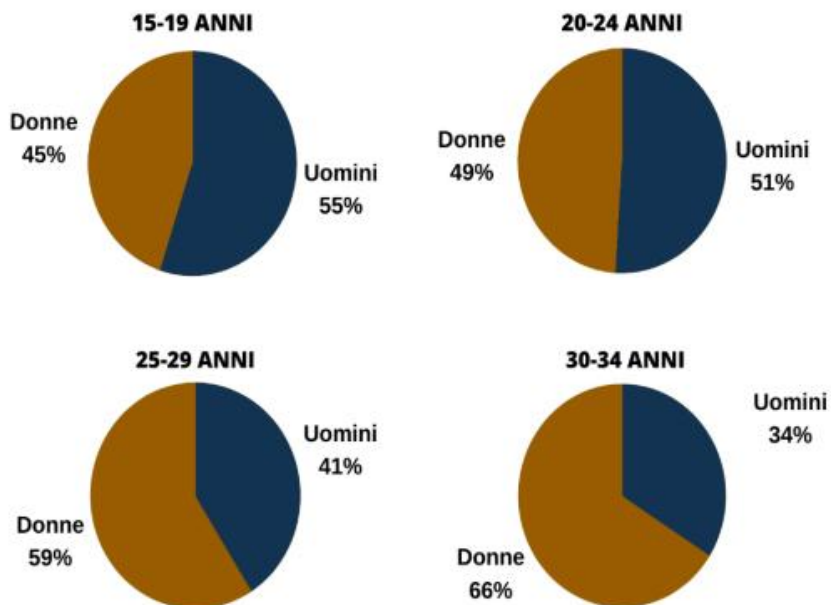

#### **4. NEET BEFORE AND AFTER THE PANDEMIC**

The pandemic crisis has also impacted the cohort of NEET individuals (Caroleo et al., 2020). However, what emerges from the most recent studies (Palmer & Small, 2021) is that the post-COVID NEET condition is greatly influenced by the age of the sample. Indeed, there are significant differences between young adults who are experiencing the transition from adolescence to adulthood (18-24 years old) and young adults who have already been engaging with the labor market for some years (25-34 years old).

These differences are attributable to the heterogeneity of the population segment and the difficulty in measuring such a segment (Jongbloed & Giret, 2022; Cavalca, 2021, 2015; Caroleo et al., 2020). There are also substantial differences between the countries of Northern Europe, where the population enters the labor market around the age of 21, and Italy, where the transition to autonomy is extraordinarily prolonged, sometimes reaching up to 34 years of age (ISTAT, 2024). However, the entire Mediterranean area (Italy, Spain, and Greece) is involved in this postponement of youth autonomy.

One of the most evident causes seems to be found in long-term unemployment, which would affect a positive outlook on the future and one's own existence, discouraging young people year after year in the search for new job opportunities (Caroleo et al., 2020; Bell & Blanchflower, 2010). The influence of negative past experiences would lead to what Ryan has called the "*scarring effect*," that is, contributing to solidifying the negative component of the past experience, overlaying a predetermined negative judgment onto the experience yet to come, to the point of conflating the dimension of search with the dimension of failure (Ralston, Everington et al., 2022).

Fig. 2. NEET in Italy according to gender and age. Source INAPP (2022).

Focusing, then, on case studies within the Mediterranean area, it emerges (Caroleo et al., 2020) that NEET rates have decreased, but the cohort of younger individuals (18-24) remains persistent, with the greatest difficulties encountered precisely in the transition from the world of education to the world of work. Indeed, we know that 1 in 3 young people aged 18-24 is a NEET, and 1 in 10 aged 14-19 is out of the education system. The pandemic has also accelerated the trend that we could define as “generational asymmetry,” which hinders pathways to youth emancipation (MLPS Report, 2020). Young people, especially those with lower educational qualifications, seeking their first employment, have been more disadvantaged after the pandemic, and when they have succeeded in securing employment, they have often been employed in less qualified roles, consolidating a trend that has been on the rise for some years of overeducation correlated with underemployment.

When considering the territorial dimension, the existence of a macro-block in the central-northern area, which is in line with or below the European average (15%), and a macro-block that persists in the southern area, where the most

critical issues are highlighted, with the NEET rate reaching almost 31% in Sicily (INAPP, 2022), becomes apparent.

Despite the multitude of factors that can determine the persistence of young people in the NEET condition, those that the Ministry of Labor generally indicates as the main risk factors are 7:

- Having a low level of academic performance;
- Living in a family with low income;
- Coming from a family in which a parent has experienced periods of unemployment;
- Growing up with a single parent;
- Being born in a country outside the EU;
- Living in a rural area;
- Having a disability.

The strategies to reduce inactivity, especially in the post-pandemic phase, risk proposing solutions not very different from those implemented to tackle long-term unemployment.

The recent reforms of the Italian labor market are explicitly based on the logic of “flexicurity” and mainly aim to support job transitions, combining active policy measures (e.g., employment services and training courses) with income support measures. In these active policies, albeit interesting, we glimpse a possible risk of crystallizing the yo-yo effect, once again anchoring flexibility to the world of work.

It would be necessary to work on unemployment benefits, avoiding the marginalization to which especially young people are exposed during the transition to adulthood, when they explore the different dimensions and numerous work contexts that the global world offers them between one job and another.

The latest Legislative Decree No. 60 of May 7, 2024, “Further provisions on cohesion policies,” focuses heavily on the reform of cohesion policies within the National Recovery and Resilience Plan (PNRR), aimed at accelerating and strengthening the implementation of interventions funded by the cohesion policy 2020-2027, which aim to counteract the disparities of the territorial macro-blocks mentioned earlier. Among the interventions aimed at young people, we recall:

- **Youth Bonus:** The measure grants private employers exemption from paying 100% of the social security contributions for their employees, up to a maximum limit of 500 euros per month for each worker nationwide, reaching 650 euros for the regions of Abruzzo, Molise, Campania, Basilicata, Sicily, Puglia, Calabria, and Sardinia. The measure will be active for the years 2024-2025 for those who hire non-managerial personnel under 35, who have never been employed with an indefinite-term employment contract.
- **Women's Bonus:** The measure grants exemption, for a maximum period of 24 months, from paying 100% of the social security contributions due by the private employer, up to a maximum limit of 650 euros per month for each female employee, hired indefinitely between 2024 and 2025, falling into the following categories:

Women of any age, without a regularly paid job for at least 6 months, residing in the regions of the Single Special Economic Zone for the South;

Women of any age without a regularly paid job for at least 24 months, residing anywhere. The exemption does not apply to domestic work and apprenticeship contracts.

- **ZES Bonus (Single Special Economic Zone for the South),** which provides exemption from contributions for up to 24 months, and up to 100% for each employee hired as a subordinate, non-managerial position, until December 31, 2025.

Indeed, given the scope of these recent active labor and youth policies, we once again question whether these measures are delineated by a hegemonic culture typical of a certain value system (Drakaky et al., 2014). Considering the magnitude of the phenomenon, which transcends national and continental boundaries, we question the possibility of an institutional failure regarding the model of social development that contemporary society seeks to pursue. Reviewing the numerous studies and reports that address the phenomenon even in geographic areas distant from our own (Zudina, 2022; Berlin, Kääriälä et al., 2021; Mauro & Mitra, 2020), what we find is a strong correlation between three main factors:

- the variable of the labor market, increasingly unstable and flexible (Ralston, Everington et al., 2022), which does not aid young people in embarking on and stabilizing the path to autonomy;
- the variable that pertains to the school-to-work transition, in which a solid scientific educational preparation would help counteract

unemployment and vulnerability (Pesquera, 2022).

- Finally, the variable concerning more economic aspects, which refer to concepts such as the tax wedge, inactive insurance, minimum wage, and various others, which vary greatly from country to country.

It appears that, despite the decrease in the unemployed in Italy, the condition of NEETs has not been emancipated from gender differences; educational level; school qualifications; family background; territorial socioeconomic disparities; immigrant status; overeducation, just as before the pandemic. And if some factors have worsened, such as the latter, microeconomic indicators still strongly emphasize the phenomenon, prejudicing the life trajectories of young adults.

## **5. NEET: WELL-BEING AND HOPE FOR THE FUTURE**

Among the various dimensions that scientific literature has investigated and correlated with the NEET phenomenon, which we have not yet mentioned in our review, emerges the poverty of the family of origin and the condition under examination here.

Scientific literature (Mussida & Sciulli, 2023; Papadakis et al., 2020; Mascherini, 2019) has highlighted that in the 22 European Union countries analyzed, poverty and the NEET condition are correlated. Sometimes another variable that plays a part in the phenomenon is represented by early school dropout (Parker, 2022; Bynner & Parsons, 2002), and another impacting factor is the condition of disability (Mascherini, 2019).

Unemployment also increases the risk of poverty and inequality: it seems to be a vicious circle from which it is difficult to escape (Drakaki, et al., 2022; Gregg & Tominey, 2005). Research also shows that one NEET in the family exposes the entire family to the risk of poverty (Mussida & Sciulli, 2023).

Some studies show how the NEET condition affects the well-being and mental health of young adults (Tanton et al., 2021; Robertson, 2019; Reine et al., 2004), stimulating negative attitudes towards the future.

Other research presents correlations between the NEET condition, drug consumption, and crime (Filomena & Picchio, 2023; Coles et al., 2010; Gregg & Tominey, 2005).

We have already mentioned the scarring effect that the condition imposes on individuals' lives. It is therefore reasonable to hypothesize that there is a correlation between the NEET condition and its negative effects on the health

and well-being of individuals over the course of their lives. In particular, studies have been conducted in Italy on belonging to this varied cohort and on happiness (Rapporto Giovani, 2023). What has emerged is that education is a fundamental determinant in individuals' life trajectories and social success, and in turn, it is a predeterminant of individuals' well-being and health.

Policies for employment and young people must therefore be well-targeted and minimize educational and training inequalities from an early age and promote transitions to adulthood that are as collaborative and supportive as possible, because the NEET phenomenon should not be seen only as a cost to society but also as a missed opportunity for entire generations.

## **6. LIMITATIONS OF CURRENT POLICIES, NEET, AND POTENTIAL SOLUTIONS**

Having overcome the issue of modeling a hegemonic schema of young adulthood, conceived and proposed by several technologically advanced countries including Europe, which outlines the autonomy of young people according to perspectives of capital production, in line with the capitalist development model, we can now proceed with the reflection concerning the measures that the Italian central government has put in place to overcome the NEET condition, which currently represents a limit to the development of the standardized model, and precisely for this specificity needs to be investigated more thoroughly than has been done so far by research bodies.

If the aim is to counteract the phenomenon, acting not so much on the inclusion of divergent models, but on the marginalization of the same, with a relative numerical decrease of the phenomenon in quantitative terms, in our opinion investing in the quality of learning and skills can represent a winning strategy in reducing the NEET cohort in the medium and long term.

Examining the National Intervention Plan on NEETs, developed by the government, we identify two critical issues:

- a. the emergence of the phenomenon. It is not easy to intercept the many young people involved in the NEET condition given its heterogeneity. Relying on quantitative data, we have found, poses strong limitations to the definition of the cohort, and to the necessary distinctions of the different subgroups that compose it. Quantitative research at the macro level, therefore, does not give us a precise picture of the phenomenon.
- b. the fragmentation of services and the different responses developed at both central and local government levels partially render the services offered (desks, informational services, training activities, orientation,

counseling, placement services, etc.) ineffective. It would be appropriate to provide unitary responses and create territorial networks that dialogue with each other in offering services to counter the phenomenon. This variety of services often leads to disorientation and dispersion of public energies and resources.

Furthermore, given the high degree of internal heterogeneity within the cohort, it is necessary to design different policies. The internal heterogeneity within the concept of NEET emerges strongly when analyzing the reasons that keep young people out of the educational system and the labor market. The reasons for inactivity are attributable to a multiplicity of profoundly different conditions. It is to be considered, for example, the gender dimension, which creates a strong polarization because reasons for inactivity related to caregiving responsibilities, such as motherhood (in Italy, in 2020, 26% of NEET women are mothers, compared to a much lower 2% of fathers), represent a more decisive factor for women than for men.

The risk factors highlighted in the literature (Damaske et al., 2024; Bolívar, 2019; Brand, 2015; Mythen, 2005) coming from a low-income family; having a disability; growing up with a single parent; being from non-EU countries; and living in a rural area with low industrial and technological development, could already provide a map of territorial risk that stimulates specific policies to counter the phenomenon. For example, the use of AI could help prevent the phenomenon at least in part, and systematize the various services at a more organic level than the current one.

We observe that despite numerous studies, the main problem has persisted for decades, namely the activation of policies aimed specifically at preventing and managing the social risk underlying the phenomenon, which correlates poverty and social exclusion with this condition (Mussida & Sciulli; 2023).

The main challenge arising from the analysis and observation of the most advanced European experiences in youth policies inspired by social innovation lies in effectively integrating the need for strategic governance with the potential present in the territories. Essentially, it is about identifying mechanisms capable of reconciling the energies that emerge from the grassroots level, namely those of the various actors present in the territory, with the need to guide interventions within a unified national framework according to strategic governance.

So far, the problem of emergence has been addressed with traditional approaches: namely, through information desks, guidance and training, often in a rather haphazard manner among those who spontaneously participate in

various initiatives, mostly supported by regional policies for youth employment. Drawing on examples from European case studies (Petrescu et al., 2022; Mascherini, 2019; Carcillo & Königs 2015), it would be beneficial to promote interventions aimed at identifying inactive individuals on different Italian territories, even through widespread awareness campaigns, so that the services offered are known and individuals are sensitized. Moreover, specific and personalized intervention plans should be implemented, such as those for educational interventions aimed at young people leaving school (Youth Guarantee), to ensure effective integration between the labor market and employable young people, respecting the actual territorial needs.

### **6.1. Possible strategies for designing tailored policies at the local level**

One could hypothesize a first “pilot phase,” involving only certain territorial areas to proceed with mapping the phenomenon (quantification of the phenomenon; tools to intercept young adults and previous best practices; possible channels to identify the NEET condition and identification of territorial subjects that can be involved). Subsequently, through interviews with key informants and the involvement of youth associations and organizations; cooperatives working with young people; Youth Information Centers/Youth Spaces; and other entities identified by the Municipalities, information on actions to be taken could be collected. Only then could a much more customized service be offered than the current one, as it considers the phenomenon in a real territory and not at a theoretical level. In this specific case, initiatives capable of involving hard-to-reach young people, such as those who have dropped out of school; who face substance abuse problems; the homeless; the disabled; the economically disadvantaged, etc., who have not been identified until then to receive public support, would need to be defined.

This phase would be followed by engaging young people, which requires a particular effort because it is necessary to overcome the sense of distrust that young adults show towards institutions, and the disillusionment they have towards public policies. A particularly engaging avenue for younger people is gaming (Delli Zotti & Blasuting, 2020) and all activities related to the arts such as music or theater (Seddon et al., 2013), social media (Thornham & Gómez Cruz, 2017), as well as sports. These spheres of competence and knowledge seem to be more engaging than other areas of learning. There are numerous experiences already experimented with regarding techniques and methods for engaging young people, aimed at improving digital skills through gaming (Bonanomi & Rosina, 2022).

The last but essential step would follow, which is the phase of designing active policies for young adults and combating the NEET condition, a phase that we could call activation, namely the moment when the active involvement of a series of responsible subjects for active policies in favor of young people is envisaged, starting with the Employment Centers; accredited training Institutions, which offer the “Youth Guarantee” service, as well as many youth associations that are present in our territory.

Analyzing youth policies and the various measures implemented at local and central levels, among others, the GIOVANI 2030 portal (G2030) emerges: this is a platform that offers all the useful information to navigate through the various welfare measures. It is a first effort towards a unified construction of opportunities and projects for young adults. The tool aims to stimulate social inclusion and minimize inequalities, offering everyone the same opportunities to access welfare, a crucial point, as we have seen (Drakaki, 2022), to counter the NEET condition.

## **CONCLUSION**

Our scientific inquiry has revealed that, while education and social justice represent two critical concerns for young adults today, school and family outline the two central pivots, which impact on the life trajectories of individuals. However, we note from our research that also another dimension is involved in the transition to adulthood: that of employment. In fact, a stable and adequately paid occupation can offer a guarantee of planning for the future and reduce the disillusionment shown by young adults towards public institutions and social welfare systems.

Training, for young adults transitioning to autonomy, represents a crucial moment in their personal biographies and implies an active learning oriented towards productivity, as it represents a meeting point between the demand and offer of employment: continuous training is therefore a valuable tool for the autonomy of young people.

With this contribution we aimed at focusing our attention on those young people who are labeled as “NEET”: as this condition increasingly appears to be emergent and has significant implications for public welfare. Several years after our initial publication, we wanted to re-examine this target group to thoroughly understand its paradoxes and limitations. We aimed at verifying whether the labeling of this cohort, which has been ongoing for decades by public and private institutions, research centers, and universities, was mapped according

to principles of equity and free of judgmental positions.

From our scientific exploration, we have also noticed the emergence of an anthropocentric view that attributes the educational and occupational failures of individuals to single social actors, essentially shifting responsibilities away from central and local governments; on the other hand, over the decades, a neoliberal view has gained ground, depicting young people who neither study nor work as a result of a lack of trust in the future and a physiological inertia towards productivity of capital.

In our view, there is a need for collective commitment to promote quality education; job placement; social and gender equity; and to strengthen youth representation at all decision-making levels. The data at our disposal underline the urgency of social policies aimed at improving the living conditions and perspectives of young people in Italy. This can be achieved through the promotion of a more stable and inclusive labor market, greater appreciation of skills, and a renewed intergenerational dialogue.

The “judgmental tension” in the terms used in definitions and reports produced at the European level, which mostly refer to a condition of “social deficit” that does not fit the standardized social model for youth integration, do not foster an inclusive environment and unfortunately create new inequalities.

We wonder, therefore, if the scientific literature produced so far has not highlighted scientific shortcomings as well as data on the phenomenon and definitions.

Can young people who do not adhere to the standardized social system propose different existential models? If so, what are they? Do youth policies tend to standardize divergent and socially unshared models?

The risk we run in not considering “different” life trajectories, relegating them to the sidelines, could be social exclusion.

“Youth prolonged in space and time” (Ferrari, 2018) perhaps represents a refuge, a resilience strategy, or possibly a tool to mitigate the deprivation and fragmentation of young people’s expectations. Young people who, frustrated by the impossibility of accessing processes of growth and autonomy, willingly or involuntarily extend adolescence.

From our investigation, the “territorial issue” emerges persistently, outlining two macro-regions at the national level: the Center-North in line with the European average percentage of NEETs, and Southern Italy with a higher number of NEETs. However, factors such as coming from rural areas also weigh on the

condition, and certain social groups show a greater risk: children of separated parents, children of immigrants, people with disabilities, and those from families at risk of relative and absolute poverty. All these conditions seem to correlate with a higher risk of encountering the condition examined so far. An effort to solve the “territorial issue” seems to be made by Decree-Law No. 60 “Further Provisions on Cohesion Policies” of 7 May 2024 within the PNRR, which aims precisely at counteracting the disparities of territorial macro-regions with dedicated ‘bonuses’ for SEZ areas.

In our opinion, alongside current policies, measures of unemployment benefits should be introduced, avoiding the marginalization to which especially young people are exposed during the transition to adulthood, when they explore the various dimensions and numerous work contexts that the global world offers them between one job and another.

We then discussed the modeling carried out by the European Union regarding young adult models, according to which it is important for youth autonomy to be delineated and described by a standardized and shared model, where capital production and autonomy go hand in hand. We do not evade the social development model with our considerations; we simply want to foresee less marginalizing and more inclusive models of youth development, ones that consider trajectories towards autonomy that do not solely pivot on economic production. Instead, we want to consider those that are based on other dimensions not exclusively aimed at individual economic success and the pursuit of social prestige. For instance performers and artists, who are often included in the NEET group. But why do we consider an artist not autonomous? Why are they considered incapable of providing for themselves, relegating them to a position of vulnerability? We might consider their economic position vulnerable, but not necessarily non-autonomous because of it.

If the aim is to counter the phenomenon, not acting mainly on the inclusion of divergent models, but on their marginalization, with a relative decrease in the numerical terms of the phenomenon, in our opinion, investing in the quality of learning and skills can represent a winning strategy in reducing the NEET cohort in the medium and long term. Considering also developmental models that are more focused on knowledge and learning, and less work-centric, where active citizenship and personal development can include periods of skill and knowledge exploration alongside periods of work, without automatically falling into the cohort of the unemployed, avoiding social stigma and marginalization, we believe, can help to downsize the phenomenon.

In a globalized world, where the possibilities for personal expression, even within the workplace, can be numerous and diverse, and where it's likely that every young person will undertake various jobs throughout their life, it's also reasonable to take into consideration social safety nets allowing deviation from rigid developmental trajectories. Therefore, implementing interpretive approaches and educational practices, even for young adults, could be a solution to better engage with and map this phenomenon.

We notice that the various welfare initiatives over the years have not been free from distortions and, unfortunately, have led to pronounced social inequalities. Fragmented and insufficient social policies aimed at young people have made Italy the last in Europe in terms of employment services and support during periods of unemployment, lacking not only economic but also educational support during periods of inactivity.

A redefinition of the NEET issue and its precise territorial mapping is urgently needed for a deeper reconceptualisation of the phenomenon. Of course, scientific research, policies, and lifelong learning programs throughout the EU must be reconsidered for this target group.

Italy must undergo a thorough examination of how learning and training are organized in workplaces, not merely in quantitative and economic terms, but in how effectively the learnfare contributes to the efficiency and competitiveness of the country. This shouldn't lead to paralyzing standardizations, but should rather consider differentiated autonomy models based on age and location, respecting individual needs.

As the cohort is highly heterogeneous within itself, it's necessary to design different policies. The internal heterogeneity within the concept of NEET emerges strongly, when analyzing the reasons that keep young people out of the education and labor market. The reasons for inactivity stem from a multiplicity of profoundly different conditions.

The engagement of young people must necessarily follow this phase, which requires a particular effort, because it's essential to overcome the sense of distrust that young adults have repeatedly shown towards institutions.

These are crucial factors that should be carefully analyzed, leveraging the potential offered by the new technologies currently available. For example, the use of AI systems could enable the construction of a risk map in Italy, allowing for the design of appropriate policies, to prevent the NEET condition and activate interventions.

# SOCIAL INTEGRATION AND INCLUSION OF STUDENTS WITH SPECIAL NEEDS IN THE ITALIAN HIGHER EDUCATION SYSTEM: A CASE STUDY

Valentina Ghibellini<sup>a</sup>

<sup>a</sup>University of Sassari

## 1. UNIVERSITIES BETWEEN INSTITUTIONAL AND SOCIAL MANDATES

The ways in which universities foster social inclusion vary widely. Understandably, multiple dimensions of inequality are encompassed within this concept, including economic, ethnic, gender, and differing abilities that individuals may bring with them.

These changes bring new requirements and purposes to the academic education system, driving a vision of universities as institutions that are progressively more open to the wider citizenry and to their local communities (Paletta, 2004; Ballarino et al., 2010).

Within this framework, providing a structured scenario is not a simple task.

It is possible to identify mainstream trends, but the methods vary depending on the context: geographic, regulatory, institutional, etc.

According to literature (Indogenist et al., 2021; Criaco et al., 2013; Kibona, 2020; Boni & Walker, 2013; Sovi & Chavooshi, 2019; Aluko&Aluko, 2011) two general trends might be identified.

The first trend sees universities assuming a responsible role for fostering what is defined as *Human Capital*, based on individual learning or meeting the requirements for growth and development related to the knowledge economy. The second trend sees universities providing education that contributes to promote processes that empower capabilities (Sen, 2010; Nussbaum, 2014) useful in supporting social equity and inclusion.

In the next paragraph, the case study (Corbetta, 1999; Yin 1984) explores the experience of the University of Sassari (UniSS). The main aim is to identify how UniSS implements support for Students with Special Needs (SSN) and facilitates integration processes, such as academic access, educational success, and social inclusion related to student life experiences.

The research adopted both standardized and non-standardized approaches involving UniSS' staff as key informants. Data collection tools included semi-structured interviews, discussion games, a survey and participant observation. Secondary source analysis focused on national and regional laws, Ministerial Decrees, UniSS' regulations and the two last strategic plans, national statistical data and from the student office.

According to the methodology, it is important to reiterate the non-generalizable nature of the study aimed to explore.

## **2. STUDENTS WITH SPECIAL NEEDS DEFINITION**

In national and international literature (Arengi et al., 2020; D'Alonzo, 2017; Tinklin & Hall, 1999; Holloway, 2001), the concept of SSN is typically linked to special education, encompassing students with disabilities, Specific Learning Disorders (SLD), or other Special Educational Needs, that require individualized learning programs and accessible services or facilities. In order to operationalize research object, in this case study we adopt a broader definition promoted by the *UniSS' student career guide*, since 2018:

- Students with disabilities, handicaps, and SLD, as defined by Italian regulations;
- Incarcerated students enrolled in the Penitentiary University Pole (PUP), who face restrictions on personal freedom or other restrictions outside prisons;
- Alias students, who are undergoing gender transition;
- Injured students, who are with temporary disabilities or illnesses;
- Pregnant or new mother students;
- Sensitive students, who have experienced violence, abuse, discrimination, or other traumatic events, such as terrorism, natural disaster, epidemics, or come from conflict-ridden areas or famine-stricken countries, including refugees or asylum seekers;
- Caregiver students.

## **3. DETERMINANTS OF SOCIAL INTEGRATION IN ITALIAN UNIVERSITIES**

From the regulations' analysis, it emerges as in Italy different kind of protection across various societal sectors for people with special needs exist. The educational system is one of the sectors prioritizing strategies to guarantee

equal opportunities, participation and integration for vulnerable groups (Striano, 2010; Santagati, 2011; Bellacicco, 2018), often in inconsistently ways and lacking uniform protections.

As shown in Table 1, the legislative framework impacts on two different levels, and in some case, normative is not focused on universities but converted from other area, such as legislation for workers. The first level refers to the effects on the governance, in which it is evident a widespread presence of Rector's Delegates, alongside the establishment of a national coordination body, aimed at promoting shared inclusion policies through knowledge exchange among the members.

The second level refers to management processes. The effects are visible on universities instruments and strategies to foster and implement the access to the educational system and guarantee the right to education (distance learning, tuition fees exemption, devices, etc.).

For instance, area of Disability, Handicap or SLD students underlines a strong protection of the right to education for students with a certified deficit. Norms outline standardized, precise, and detailed national procedures and tools aimed at guaranteeing access to the educational system, supporting attendance and academic success, as well as facilitating personalized assessment methods conducive to academic achievement. Moreover, the law provides to guarantee the existence of Rector's Delegate.

Another example refers to the PUP. Over time, national regulations have generated specific directives and implemented binding protocols to manage the educational system at both the national and local levels and have implemented the National Committee of the Rector's Delegates.

As shown in table 1, a different situation emerges when considering other special needs categories, where both the activation and the organizational and management methods leave greater discretion to single universities.

As is clear from secondary sources, the legislative system fosters universities in implementing primarily social integrative processes in order to achieve *Human Capital*.

The access to the academic system appears largely aimed at promoting knowledge quantifiable in ECTS in order to certificate competences available to satisfy job market and improve knowledge economy. Less emphasis is placed on promoting processes that support social inclusion. These latter ones appear to be more influenced by a spontaneous initiative of universities.

Tab. 1. Italian legislation and processes for SSN.

SSN	Normative		
	Specific regulation for university	Discretion in process management	Rector's delegates
Disability/Handicap/SLD	Yes	Low	National University Conference of Delegates for Disability (CNUDD)
Penitentiary	Yes	Low	National Conference of Rectors' Delegates for Penitentiary University Pole (CNUPP)
Sensitive	Yes	Medium	International business commission/Negotiation, International cooperation and sport commission
ALIAS	Yes	Medium	Gender policies commission
Maternity	Yes	Medium	
Injuries	Yes	Medium	
Care giver			

In this framework, UniSS is not an exception. A review of various planning documents from UniSS highlights that the promotion of substantive equality—particularly in relation to teaching practices and their implementation—must be ensured across all areas of the SSN. Central to the integration policy is the provision of measures to facilitate course participation, supplementary educational activities, tax exemption, exam procedures, personalized study options, etc.

Referring social inclusion processes, in the next paragraph we analyse the case of UniSS' PUP.

#### 4. PRACTICES OF SOCIAL INCLUSION FOR STUDENTS IN JAIL

According to Saraceno (2013) and Castel (2010), the process of social inclusion is determined by two conditions: the active participation of individuals and the sense of affiliation.

From this perspective, the PUP case stands out as particularly relevant to our analysis.

As data shown, the students of the penitentiaries are considered at risk of social exclusion due to “social and relational isolation”, as reported by 60% of respondents. While the restriction of personal freedom and access to the system is guaranteed by law, the analysis also highlights the importance of academic and student life at UniSS. This approach aims to align the educational path with the broader goals of penal measures, particularly the rehabilitation of the offender.

This objective is achieved through three focused actions by UniSS. The first involves the “physical” interaction between students and the “academic world”, in order to reduce the perceived distance between the university structure and its members.

This is highlighted by initiatives that are typically carried out in university spaces being replicated within the prison. For example, students are given the opportunity to take exams and defend their thesis inside the prison in front of an examination committee, receive physical copies of requested books through library loans in collaboration with tutors, and participate in events like *European Research Night* (ERN) in the ambit of project SHARPER.

As the PUP coordinator puts it: “When the box of books arrives, it’s a celebration, and it’s one of the best ways to make them feel involved.” Regarding ERN, he adds, “I have t-shirts made for them from the project’ SHARPER, because of our third-mission initiative.”

The choices made reflect a strong desire to listen to and respond to the students’ needs to interact with both teachers and peers, and to be included in academic processes. As one student remarked:

To counter the risk of social and relational isolation, it would be useful to propose meeting days between university and penitentiary students, and vice versa. Sometimes, the boundaries are not as clear-cut as we think (Student 1).

Another student emphasized, “Creating real opportunities for interaction with professor would be important” (Student 2).

The second focus is on the method of embedding. UniSS fosters active involvement of incarcerated students in processes aimed at enhancing the educational programs tailored to them, adopting a bottom-up approach. Recently, this led to the creation of a theoretical/practical course in social and/or traditional agriculture within two Sardinian prisons. As the coordinator reports:

The student collective (...) developed a proposal to present to the PUP administration. (...) We did not impose a project from above; we started from their needs, from their lived experiences.

As one faculty member explains: “I arrived there with bags full of plants, so they didn’t just listen to a lecture, but touched the materials, which was already a lot for them”.

The third focus refers a sense of belonging and identification among incarcerated students within the student community.

This is underscored by the recent opportunity provided by UniSS for all students to undertake internships in prison in order to further peer to peer education. As the coordinator notes: “[This allows] them to connect with their peers enrolled in the PUP. Our goal is to bring ‘free’ students inside the prison.” This need is also reflected in student requests “[it is necessary] more supportive environment” (Student 3) and “collaborative activities with other students” (Student 4).

## **CONCLUSION**

In summary, the findings indicate at national level a growing sensitivity within universities toward embracing diversity and promoting social inclusion for SSN. The data suggest that universities respond to societal demands through a variety of principles and practices.

A preliminary approximation reveals two poles on a continuum where these principles and practices can be situated.

The first pole is structural, with the university system mirroring the dynamics of national social policies, which often regard beneficiaries as mere “service users” (Dal Pra Ponticelli, 2010; Gui, 2004). In this context, legislation plays a key role, guiding universities’ actions and interventions, affecting the protection of the right to study, and shaping governance processes to foster *Human Capital* through an accessible academic learning and education.

This framework aligns with the concept of social integration, as it pertains to a legal system aimed at ensuring access through formal measures, respecting differences, and applying the principle of substantial equality in accessing services and resources (Saraceno, 2013). This setup enables students to access differentiated and, in some cases, personalized learning and training opportunities (institutional mandate) (Douglas, 1990; Colozzi, 2009), supported by “dispensative”, “suspensive,” or “integrative” tools.

The second pole is more emancipatory and process-oriented, viewing the university as an inclusive space and a “site of social practice” (Merler, 1984), that promote social change, integrating and actively engaging with communities and stakeholders. The case study illustrates that, while the results are not generalizable, this pole aims to reduce inequalities by valuing differences and capabilities (Sen, 2010; Nussbaum, 2014) and acknowledging the socio-relational sphere, a hallmark of social inclusion in higher education.

In this framework, the focus is on promoting an environment that values equity and individuality, fostering an active participation and sense of belonging and “affiliation” (Saraceno, 2013; Castel, 2000; Striano, 2010) for community identification.

# HOW CAN EDUCATIONAL RESEARCH ASSUME AN INTERSECTIONAL APPROACH? A CASE STUDY ON HOMELESSNESS IN BRESCIA

Monica Amadini<sup>a</sup>

Annalisa Pasini<sup>a</sup>

<sup>a</sup>Catholic University of Sacred Heart

The study, entitled “Road Companions” (Compagni di strada), was conducted by the Research Center on Family and Childhood Education (CesPeFI) of the Catholic University of Sacred Heart between September 2022 and October 2023. Its objective was to investigate the specific intersectional phenomenon of homelessness in the urban context of Brescia, Northern Italy. The investigation employed a qualitative methodological framework, specifically ethnography, to enhance the ability to identify and make visible the numerous invisible subjects involved in the specific interstitial dynamics, intersectional contexts, and processes that characterise the phenomenon. The findings substantiate the assertion that the selection of particular typologies of educational approaches is of critical importance in addressing the reproduction of mechanisms of selection and exclusion, particularly when such approaches are informed by an interlinked perspective that takes into account contextual factors, individuals, social and territorial variables, as exemplified by the case of homelessness.

educational research approach; intersectional processes; homelessness.

## INTRODUCTION

The complexity of the phenomenon of homelessness – which combines in itself components of housing deprivation and social hardship, according to strongly processual dynamics (Consoli & Meo, 2020) – increasingly highlights the need for multidisciplinary and intersectional readings: indeed, the experience of

homelessness is typified by a multiplicity of forms of marginalisation (Pleace, 2016), both material and immaterial. Material forms of marginalisation include the absence of employment, housing, economic resources and health. Immaterial forms of marginalisation include the lack of familial and social relationships and the absence of professional networks. These experiences collectively constitute the most severe form of social exclusion. Consequently, an intersectional approach to the study of homelessness is a valuable methodology for identifying the exclusionary processes and social injustices that underpin the phenomenon of “poverty careers”, which ultimately culminate in the experience of homelessness itself.

In this regard, United Nations “Inclusive policies and programmes to address homelessness” recently declared:

Homelessness is a complex intersectional issue that highlights the challenges faced by Governments in protecting, respecting and fulfilling the human rights of populations in vulnerable situations. Homelessness occurs globally, transcending economic and governance systems and requiring more comprehensive approaches. Factors such as evolving inequality, unfair distribution of resources, changing family dynamics and the commodification of housing contribute to the phenomenon. (UN, 2023, p. 18).

In fact, evidences from homeless people’s life condition indicate that since this population lives in complex conditions of social unrest, very often correlated to other kinds of criticalities (such as health and mental diseases, addictions, alcoholism, troubles with justice, etc.) (Batterham, 2019), multidisciplinary and integrated approaches ensure a better analysis of this phenomenon.

Furthermore, evidence drawn from social workers’ professional experiences indicates that approaches characterised by interdisciplinary collaboration and interconnectivity facilitate a more efficacious engagement with the homeless population. (Consoli & Meo, 2020).

## **1. RESEARCH PROJECT “COMPAGNI DI STRADA” (ROAD COMPANIONS)**

The investigation was conducted in the Brescia urban area (Northern Italy) between September 2022 and October 2023 by the CESPEFI (Research Centre on Family and Childhood of the Catholic University of Sacred Heart, Brescia Campus). It was carried out with the collaboration of the non-profit voluntary association “Un Medico per Te” (A Doctor for You) and the participation of the “Cabina di Regia sulla Grave Marginalazione”, the Control Room for Severe

Marginalisation of the Municipality of Brescia<sup>1</sup>.

In particular, the association, composed of doctors who work on a voluntary basis for the health of homeless people, requested that the research centre conduct a study aimed at deepening their knowledge of Brescia's homeless population. This would enable them to provide a more adequate response to the health demand of their patients, who are refractory to care and difficult to reach. Ultimately, this would guarantee them the right to health, which is often denied by multiple complex dynamics.

### 1.1 Research plan

The research was undertaken with the following aims:

- (1) to gain insights into the subculture of homeless people within the urban area of Brescia;
- (2) to examine the knowledge and practices acquired by social workers employed in Brescia's diverse services for individuals experiencing homelessness.

Consequently, the research plan explored the following topics:

- “sliding mechanisms” and exclusion dynamics;
- distinctive features of homelessness' condition;
- way-out mechanisms/elements of personal resilience;
- hierarchy of homeless' priorities;

---

<sup>1</sup> The Statistics and Data Study Centre of the Municipal Registry Office of the City of Brescia estimates the resident population in 2023 at 200,691 citizens, of whom 552 are homeless - however, this figure only includes the generality of citizens with a fictitious residence in via S. Marie del Mare, and therefore does not take into account the additional presence of other people in the area who are known to be homeless in reality (perhaps even known to low-threshold services), but who are not known to be registered. (<http://dati.comune.brescia.it/dataset/popolazione-residente-per-genere-01-01-2024>). The Municipality of Brescia has a large number of services for severely marginalised adults. In particular, in November 2017, the act of constitution of the “Cabina di regia” (control room) and the “Tavolo tecnico” (technical working group) on serious marginalisation was approved. It intervenes in the following areas: management of the Cold Emergency Plan, definition of the general design of interventions, comparison of the strengths and criticalities of services, identification of proposals for new emergencies and activation of experimental services. The ‘Cabina di regia’ is a stable co-programming body, while the ‘Tavolo tecnico’ deals with the study of specific situations. Both bodies can, depending on their purpose, extend their participation to other municipal actors or to representatives of third sector organisations or other bodies active in the fight against severe marginalisation. Nine actors of the third sector are present together with representatives of the municipality. The coordinating function of this system is in the hands of the Municipality of Brescia. This mode of constant comparison allows the service system to develop joint projects between the municipal administration and the third sector organisations (Comune di Brescia, Ambito 1 Brescia e Collebeato - Piano di zona 2021-2023).

- functional approaches to engaging individuals experiencing homelessness;
- perspectives from service providers for homeless people, with a particular focus on the insights of social workers.

The initial phase of the research, which had an exploratory nature, involved the creation and analysis of focus groups conducted with health workers and social workers who are employed in the homelessness field. The objective of this phase was to assess the most effective strategies for approaching homeless individuals based on the experience of services that are specifically dedicated to this population. Additionally, this phase aimed to facilitate the sharing of knowledge, attention, and sensitivity gained by experts in this field. In accordance with the evidence that emerged during this phase of the research, it was deemed appropriate to adopt an ethnographic approach (Bove, 2019), involving pure observation at very low threshold services, participatory observation at low/medium threshold services and finally interviews with homeless people living in housing services.

Therefore, the researchers carried out:

- n. 1 preparatory meeting with Control Room for Severe Marginalisation of the Municipality of Brescia;
- n. 2 observations at the breakfast distribution by religious and volunteers at Brescia railway-station square;
- n. 1 outgoing participatory observation with City Angels Association
- n. 1 participatory observation at “L’Angolo” Day Centre
- n. 1 participatory observation at the Help Centre
- n. 1 participatory observation at “Perlar” Day Centre
- n. 4 interviews with individuals residing in San Vincenzo, Caritas, and Asilo Pampuri’s social housing accommodation<sup>2</sup>.

## 2. RESEARCH RESULTS

In relation to the subject of the present discussion, namely the intersectional approach in educational research, the findings concerning the distinctive characteristics of the experience of homelessness, as they emerged from the study, are discussed in greater detail below. In our view, these findings

---

<sup>2</sup> One participant had spent one year experiencing homelessness, two had accumulated years of experience in this context, and one had been prevented from residing on the street due to health-related circumstances. The sample included one women and three men, with ages ranging from below 40 to nearly 60 years.

demonstrate the composite nature of the phenomenon, highlighting the necessity to conceptualise it as an intersectional ‘sum’ of multiple phenomena and processes, to be understood both in their specificity and in their intersections.

### **2.1. Distinctive features of homelessness’ condition**

The research findings revealed a notable recurrence of specific elements and processes with a high impact on the living conditions of homeless individuals.

As for elements that pertain more to a personal sphere, the focus was on:

- high communicative fragility of the homeless people – the homeless people were observed to manifest a high level of communicative fragility. It was noted that this was due to a combination of factors, including an insufficient command of the Italian language, a form of cognitive decline, and in one case, psychiatric pathologies. It seems reasonable to assume that this aspect may have a detrimental impact on the relationship, in two distinct ways. Firstly, for those experiencing homelessness, speaking in such a challenging manner requires a significant degree of effort, and when this effort is unsuccessful, it can give rise to feelings of impatience, frustration and shame, which further alienate the individual from the relationship, leading to a sense of withdrawal. Secondly, the operators are also required to make a considerable effort to understand and express themselves in a way that is accessible to those experiencing homelessness;
- important incidence and impact of addictions – all of the individuals who were interviewed had experienced addiction, whether to psychotropic substances and/or alcohol, or gambling. Furthermore, both operators and volunteers concurred that the majority of homeless people are in such a life condition as a direct result of an addiction, provided that it is active;
- unaccompanied foreign minors and women – despite their dramatic nature, this research has only been able to partially intercept certain presences. The subject under discussion is the presence of younger foreigners who were previously unaccompanied foreign minors. It would appear that upon reaching the appropriate legal age, these young people are not promptly offered accommodation. In some instances, this may result from a desire to pursue alternative migration routes, while in others it stems from misinformation. As a consequence, they find

themselves without a secure place of residence, vulnerable to recruitment by criminals. The other presence that has just been intercepted (in particular in Brescia urban parks, during the night) and seemed very critical is that of women, particularly foreign citizens. These women appear to be in a state of vulnerability, both physically and mentally, and are subjected to a form of control exerted by their male counterparts. They appeared to be frightened, and in almost all cases, they reported living in emergency situations;

- increase in the number of homeless elderly people – it has been observed by numerous operators over the past five years at least that there has been an increase in the number of homeless persons over the age of 65. This represents a new category of service users, and it is necessary to initiate a joint reflection, in order to establish a congruent approach, between the services and policies that pertain to serious adult marginality and those that pertain to the elderly.

Furthermore, additional considerations pertaining to environmental factors are as follows:

- extreme complexity of life situations – from the narratives of the interviewed persons experiencing homelessness and the operators, situations emerge which escape any classification because they include multiple and very specific cases. This refers to a sort of perceived climate that concerns both the operators and the homeless people: the checkmate in which certain situations place the persons generates feelings of impotence, surrender, often even disinvestment, distrust;
- medical discharge and health protection of homeless people – many social and health workers are noticing an increase in ‘medical discharges’, i.e. the problem of finding accommodation for homeless people coming out of hospital, in need of convalescence and/or care and protection. This issue is becoming very important and needs to be addressed through officially structured institutional channels.

The homeless population of Brescia is therefore composed of “sub-populations” or crossed by specific “sub-phenomena” that require special attention, also from a health point of view: the presence of very young foreign adults, women in a particularly fragile state, people with addictions, the elderly, people with specific health problems requiring a semi-hospital regime, as well as situations of particular existential complexity and significant communicative fragility.

The intersectional approach of this educational research study is therefore, in a sense, the consequence of the recognition of the nature of the phenomenon, redefined in the light of the professional experience of social actors and confirmed by the observation of the target population itself. In this regard, the adoption of an ethnological framework has certainly fostered this “intersectional awareness”.

### **3. CONCLUSION. ADVOCACY AND MULTIDISCIPLINARY RESPONSES FOR AN INTERSECTIONAL APPROACH IN EDUCATIONAL RESEARCH.**

In conclusion, if it is evident that

intersectionality today represents many things at once, it is an analytical method, a theoretical framework, a critical model, a heuristic device (Bruce & Yearley 2006), an ideological view and, above all, proposes an interdisciplinary (Lykke, 2010) and transdisciplinary approach and analysis (Santoni, 2022, p. 253).

and that “the Italian academy itself, as well as social research of an empirical nature, increasingly use this approach to investigate both emerging and structural forms of inequality” (Santoni, 2022, p. 253), specifically in relation to educational research, an intersectional research approach can help to counter the reproduction of exclusion and inequality, also through a kind of “advocacy” function, as it helps to make visible who and what is often kept invisible – in this case the homeless population. Finally, from a pedagogical point of view, recovering the complexity of the phenomena is often the first step towards thinking about ways of intervening in reality: in fact, we would like to point out that the results of this research have been the subject of further discussion with the doctors of the association “Un medico per Te”. In particular, Cespefi accompanied the clinicians on a critical path of reading and appropriating the results, with the aim of producing a sort of code of ethics or behavioural vademecum to support doctors in their relationship with homeless patients, in order to make the care relationship more effective and incisive. Here again, the openness of the intersectional approach to interdisciplinary working methods is reaffirmed – in the conviction that complex phenomena in turn require composite views and responses.

# NEW EDUCATIONAL PARADIGMS AFTER THE PANDEMIC? THE CHALLENGE OF THE EDUCATIONAL COMMUNITY

Francesca Bianchi<sup>a</sup>

<sup>a</sup>University of Siena

The *Viceversa: Towards a Circular Education Model* Project has recently been funded by the Con I Bambini Foundation with the aim of enhancing an educational community in Certaldo (Tuscany). The community is a network of actors who have responsibilities in the education and care of children. The more community-oriented conception partly explains the legitimacy of care in teaching as one of its components. The interest in an open and equality-oriented education, capable of integrating the emotional sphere, is linked to the development of a perspective centered on valuable relational configurations where various actors can be involved and mutually influence each other. The purpose is to strengthen the educational community building a network of collaborative relationships, fueled by a plurality of actors living in the Empolese Valdelsa territory. The actors recognize the educational contribution they provide in their areas of intervention to ensure the well-being of children, mitigating phenomena such as social discomfort and school related distress (dropout, NEET, etc.) particularly after the pandemic (Colombo, Romito, Vaira, Visentin 2022). The intention of the community is to create an educational and care structure capable of supporting the system of relationships among the actors, providing multidimensional responses to the educational needs of young people.

educational community; young people; care and social inclusion; participation process

## INTRODUCTION

In our societies, new challenges have recently involved schools and educational institutions. Among the main factors, we can consider the effects of the Covid-19 pandemic, the socio-economic crisis (2008), the difficulty of integrating people coming from different countries (for their heterogeneity in terms of

ethnicity, culture, religion) and the consequences of new technologies on learning process. Moreover, we must take into account that traditional agencies (family, school, church, political parties) are no longer essential reference points for the socialization and youth growth compared to media, social networks and social groups that appear to be more in tune with youth needs.

Referring to the effects of the 2020 pandemic, it gradually became evident how much collective thinking and action would be needed to overcome the difficulties that arose between schools and families (Colombo, Romito, Vaira, Visentin 2022). The third sector organizations have reacted to the pandemic emergency with social responsibility, supporting processes of civic welfare beyond the scope of extracurricular activities. These efforts have ranged from volunteering to charity supporting socio-healthcare networks, often assuming the risks associated with the shortage of protective devices (Merico, Scardigno 2020). The possibility of integrating education in different places, following the perspective of polycentric educational processes, has shown the opportunity to start from outdoor education, sports/artistic forms, associationism and the experiences of socio-educational animation for young people (Merico, Scardigno 2020).

During that period, in our country, efforts were made to counter the rise in inequality, poverty and educational failure by developing “broad and advanced” educational communities (Luisi 2020, p. 902). This approach involved territorial organizations among schools, the promotion of teacher communities and the strengthening of network activities within – and between – institutions. As a result, local and neighbourhood-based forms of mutual support spread among schools.

Therefore, the approach of formative polycentrism has become relevant and timely once again, with the presence of multiple learning opportunities that redefine the functions of schools, attributing importance to multiple actors in education, whereby “every social space possesses its own formative significance” (Cesareo, 1974, 45; Besozzi, 2020).

## **1. EDUCATION AS A SHARED RESPONSIBILITY: INTERDEPENDENCE AND CARE**

Today, the series of challenges facing educational systems across Europe can only be overcome through a joint effort by all those involved. Education is a shared responsibility of the whole community, working with different types of teachers, educators and professionals. The international scientific community has already provided a wealth of research showing the relationship between

community involvement and educational success (Gatt, Ojala & Soler, 2011).

We must consider the educational practices, starting with recognizing our interdependence (Lynch 2022, Puig de la Bellacasa 2017). The educational context is made up of individuals who live in a state of strong connection and are therefore called to respond to the care needs that surround them (Morin 1994, 2014). In this perspective, it is essential to care for students by involving them in open dialogue and helping them feel like integral members of the educational community. Therefore, school becomes a “public-civil space” (Benasayag & Schmit 2003), a democratic environment aimed at promoting forms of coexistence and direct engagement of the students. This implies considering both the *content* delivered by educational institutions, which should be able to pay attention to others and to give care as well as the *practices* implemented.

The new ethics of care, as a conception of social relationships within and beyond the contexts usually defined by its standard references, considers *care* an indispensable paradigm for addressing the challenges posed by a global society that shows serious critical issues (Lynch 2022, Barnes 2015). A caring citizen would not just learn about the care of self, intimate others or colleagues, but also about the unknown, universal other to whom one is relationally defined in the global economic and social system (Lynch 2022). We need to understand how to sustain our relational life; we need to be educated on how to provide the proper support for the community (Lynch, Lyons & Cantillon 2007).

The educational field appears particularly interesting to investigate because there has recently been a discussion about the opportunity to acquire greater care-oriented goals concerning all the actors involved (Lynch 2022). For these reasons, it becomes essential to reflect on the practices implemented in educational contexts that aim to develop a new conception of care (Lynch 2022).

## **2. THE EDUCATIONAL COMMUNITY**

An educational tool aimed at enhancing these characteristics is the “educational community”. Educational community has gained centrality in scientific debate because this concept has been entwined with the principles of permanent education and horizontal subsidiarity (Zamengo & Valenziano 2018, Faure, 1973). Although there is not a singular definition, the educational community is one that is made active through the exercise of participation and educates its members in citizenship and care. Its functioning is based on the realization of educational interventions through:

- The emancipation of individuals;
- The presence of real purposes;
- The identification of a wide range of actors involved in educational work, together assuming shared tasks and responsibilities.

The educational community is capable of (Del Gottardo 2016, 64):

gaining power over the management and resolution of its own daily problems, becoming a provider of services in a real implementation of the principle of subsidiarity and in the realization of community work.... [It] involves connecting citizens with formal and informal support networks that they can find in the territory but also in promoting all those networks of reciprocity and solidarity that spontaneously emerge within a community.

The community is established as the privileged space for authentic encounters and education takes on the role of promoting an aware citizenship, oriented toward building relational networks and sharing common projects (Broccoli 2019, Pedone, Moscato, Tumminello 2024).

Constituted by collaborative processes among local actors who share the commitment to promote inclusive and generative educational practices (Cau, Maino, Maturo 2021), the community is educational because it interprets needs and values of the participants and the potential of the institutions themselves. It is an *agora* in which the exercise of active citizenship is facilitated, characterizing itself as a place of participation and because it mobilizes resources and efforts to overcome discomfort and disadvantage, ensuring equal opportunities for young people (Paparella 2009).

The educational community is engaged in concrete actions, taking care of the activities, promoting transformative interventions and linking knowledge to life, trying to stimulate the students' autonomy. The model aims to develop a school more connected to life, one that is capable of triggering processes, builds connections with the world and creates alliances with families and territories (Furfaro 2022). This approach implies that a successful school will necessarily be involved in community building and regeneration as a value and a purpose. This is what Sergiovanni (1994) terms the '*gemeinschaft*' school; the school which above all values kinship, neighbourliness and collegiality above rational, contractual relationships ('*gesellschaft*').

### 3. THE VICEVERSA PROJECT

The *Viceversa: Towards a Circular Educational Model* Project stems from the significant experience of the participatory “Libera Tutti” Park in Certaldo (2017). The aim is to enhance the educational community that formed around that experience, building a network of relationships. All actors in the educational process are actively involved including students, teachers, parents, institutions and local entities in the Empolese Valdelsa area.

Figure 1. The Libera Tutti Park

The project’s initial phase was designed to give participants the opportunity to discuss their ideas of what may be valued as common good (Laval, Vergne 2022), what the educational community should strive for in terms of principles and actions most suited to convey them<sup>1</sup>.

The main goals were to raise awareness through debates, events, communication, to train with a training program, co-design with students and institutions in the community, formalize a community educational pact, mapping experiences in the area and networking the educational communities of the territory.

---

<sup>1</sup> For information about see: <https://percorsiconibambini.it/viceversa/scheda-progetto/>

From September to November 2023, Viceversa hosted two roundtable events open to the public and a learning course aimed at those intending to participate in the project (almost 40 participants).

The activities took place over these months and were curated by the University of Siena (Department of social, political and cognitive sciences – DISPOC) with Narrazioni Urbane APS (a cultural association focusing on urban social renewal).

Project activities took place in a cultural hub (a slaughterhouse recently renovated). Most of the residents of Certaldo town who volunteered to be part of the *Viceversa* project have an active involvement in education and care because they work in formal education or in the field of social and community services.

Figure 2. The activities of the Project

During the first meetings with the researchers of the University of Siena, it was essential to start by problematising both the urgency for action in education and the notion of *community*. This was necessary to reflect on whether a place to belong was something constructed via the recursive negotiation of values, interests and objectives.

The second half of the learning course (from December 2023 to April 2024), was divided into 4 units, each led by a different educator affiliated with 3 local nonprofits:

- Polis Social Enterprise (dedicated to promoting cultural/artistic activities);
- Spazio Ipotetico (which organises circus and dance workshops);
- Circo Libera Tutti (engaging participants in juggling and other circus disciplines, conjoining educational and expressive aspects).

These meetings were meant to involve participants in practical experiences and provoke self-reflection through simulation and play thereby challenging the members to rethink their assumptions about gender, (dis)ability etc. The educators' role was that of facilitators, proposing activities and moderating the critical reflection. Participants were encouraged to express their own positions related to gender identity, ability, ethnicity, class, while at the same time sharing their life experiences.

Play with musical improvisation, juggling exercises, performance techniques readapted from Augusto Boal's Theatre of the Oppressed, created ways for participants to communicate with each other (without necessarily having to speak).

The core purpose of the experiences was to reevaluate what they might have taken for granted about one another and themselves (including needs, capabilities and comfort).

Since mid-April 2024, Viceversa Project has entered in its co-planning phase, aimed at systematising the community's identifying principles and sketching ideas for future educational actions. In this phase, both first and second-grade high schools were involved with the finality to collect the needs of the students (around 300 participants).

The outputs of the Project include:

- Activities that participants are developing with local schools;
- A "Values Charter", a document attesting to the identity, intent and substantive deontology of Certaldo's educational community.

## CONCLUSION

Viceversa Project adopted a holistic and inclusive approach to education, considering individuals' diverse needs and learning contexts. This approach aimed to recognize and value real-life experiences and relationships with the local area to promote empowerment and development for both students and the broader community. It highlighted the essential connection to be emphasized between the educational framework and the broader social and political sphere, capable of actively involving students, families, schools and institutional actors. The outcomes from the discussions at the working tables and the various activities carried out reveal the participants' desire to share experiences that provide opportunities for dialogue and reflection, aimed at co-constructing new educational and transformative paths. These efforts are directed toward a new community architecture that is genuinely inclusive, sustainable, democratic and educational (Pedone, Moscato, Tumminello 2024).

For the future, there is plenty about the project that remains to be seen:

- Whether individual transformations will converge into a *concerted, sustained effort for change* and keener understanding;
- How fruitful the *community's impetus will be* and *how long* it will last.

# THE PARTICIPATION AMONG YOUNG MEMBER AS AN OPPORTUNITY FOR SOCIAL TRANSFORMATION: SOCIAL JUSTICE WITHIN THE ITALIAN COOPERATIVE CREDIT BANKS

Alba Francesca Canta<sup>a</sup>

<sup>a</sup>University of Roma Tre

Adopting the perspective of the capability approach and emphasizing the importance of being active agents within society, the present contribution aims to present the results of a research conducted in 2023 on the generation of young members of two Italian Cooperative Credit Banks, the Young Members Laboratory (Rome) and the Young Members Committee (Ravennate), born to give concreteness to the principle of democracy and valorize young member as a cultural and organizational resource necessary for social change. The main goals were to study, through mixed methods, the enabling and procedural aspect of the possibility for young members to take part in the groups, the characteristics of this participation and its intrinsic significance for the youth. The research results show that, within both groups, the participation assumes different intensities and modalities and the essentiality for these young people of the involvement as an end in the wave of the capability approach's studies. However, although the democratic process of these groups needs a deeper implementation, youth participation assumes an inescapable role.

Youth; Generation; Democratic participation; Capability approach; Agency

## INTRODUCTION: YOUTH AND PARTICIPATION

The role of culture is now widely recognised in various disciplines. Several cultural processes and *habitus* make it possible to differentiate and explain the origin and evolution of different social groups and organizations. It is also true in the field of economics, where it is feasible to distinguish between economic approaches, based on the monetary quantification of wealth and the

participation of a select few, and development approaches, based on a multidimensional concept of growth and prosperity and the essentiality of educational, cultural, political and structural elements and agency as a founding element of a democratic society. The crisis we are experiencing in its multiple dimensions, such as financial, geopolitical, cultural, and educational, has provoked new questions, criticisms and conflicts especially regarding people participation, agency and democratic governance (Caldéron Gutierrez, 2017) that remain critical questions in many areas of society (Sorice, 2019).

Among the many approaches that have emerged over time within the development paradigms and based on the democratic dimension, in the knowledge that the debate is still very much in the past (Latouche, 1998; Arndt, Volkert, 2011; Sen, 1999), is the Capabilities Approach (CA), theoretical framework of this paper and set up by A. Sen. Amid the fundamental pillars the author defines to reach human development is the agency, the action of the person who actively promotes change according to her needs and goals for personal and communitarian well-being (Ardigò, 1980). One of the possible expressions of agency is participation, which assumes both intrinsic relevance, as an activity of value, and instrumental relevance, as a means of achieving multidimensional well-being (Sen, 1999). In particular, the author attributes priority to the right of participation even before the possible spheres of its application. In this sense, Sen speaks about the enabling and procedural aspects that qualify this right, with the former relating to the possibility of getting involved in activities and the latter the process adopted.

Amidst the institutions developed within this context and based on active and democratic participation are the Credit Cooperative Banks (CCB) discussed in this paper, which were born from social rather than economic issues. Some Italian CCBs, in particular, have given concreteness to the principle of democratic participation through the constitution of a young members group (YM Group), born around 2015, at the suggestion of Federcasse, with youth generally between 18-35 years old. The main goals of these groups are to listen to the young people of the territory and the bank, increase their level of participation and create a new form of *intergenerational mutuality* to implement socially, educationally and culturally responsible transformation. As there is no standard form of shaping them, YM Groups can promote different participative modes depending on their structure and integration, thus entrusting young people with a more or less entrenched transformative role.

Youth reality, from the sociological point of view, represents a salient cultural

and organizational resource, often forgotten but capable of bringing about innovative social and cultural transformations (Mannheim, 1928). For this reason, and because of the importance of participation in the lives of young people, it seemed essential to investigate this reality and how young people themselves, sharing values and principles, reflect, act and adopt common strategies of action (Archer, 2006). In particular, this paper will present empirical research conducted between 2022 and 2023 on the young generation of two Italian BCCs carried out in an attempt to deepen, through mixed methods, the relevance that participation takes on for young people and the types, forms and characteristics of the participation process.

## **1. THE RESEARCH DESIGN**

After mapping the YM Groups in Italian CCBs, I focused on two specific case studies: the Young Members Laboratory of the CCB of Rome (Centre) and the Young Members Committee of the CCB of Ravennate (North). In an attempt to understand the actual possibility of young people being active agents in the bank and territory, according to the enabling and procedural aspect discussed in the CA, the main research questions were:

- How are the structure and the democratic process within both groups configured?
- What is the importance of participation among the young members of both groups?

Through mixed methods, I tried to corroborate research hypotheses and answer the research questions (Creswell, Plano Clark, 2001). The qualitative part involved secondary source analysis, interviews with the Supervisor of the two groups (2), semi-structured interviews with the young members (9) and participatory observation. For the quantitative part, a questionnaire was administered to the youth to understand the mode and intensity of participation and its significance. The sample addressed was reasoned based on two criteria: age and YM Group member status.

## **2. SOME RESEARCH FINDINGS: STRUCTURE, CHARACTERISTICS AND IMPORTANCE OF PARTICIPATION**

The first result that emerged from the research concerns the structure. Both YM Groups involve approximately 10-12 young people between 18- and 40-years old living in six different territorial areas, according to the bank, thus

representing six different Territorial Praesidia<sup>1</sup>. The Board of Directors chooses young people for the YM Group according to their status as CCB members, proximity to the world of cooperation and/or representativeness of the most widespread activities in the territory. The young members of the groups differ from the other youth members of the CCB but not of the core group: there is, therefore, a “double track of participation” (Supervisor YM Committee). One of the tasks of the young members of the two YM Groups is to represent the other young CCB members and to reduce the gap between them and the top generation by creating events for them. Despite this, as highlighted during the semi-structured interviews, there are no opportunities for exchange and confrontation between young people with different statuses, and often the other young people in the bank are not aware of the existence of the YM Group.

Figure 1: Characteristics of participation in the YM Laboratory and Committee. Source: Personal elaboration from primary data

<b>CHARACTERISTICS OF PARTICIPATION</b>	<b>YM LABORATORY (CCB OF ROME)</b>	<b>YM COMMITTEE (CCB OF RAVENNATE)</b>
Will and possibility (Nie, Verba 1995)	Active but limited participation	Active but limited participation
Enabling and procedural aspect (Sen 2004)	Limited enabling aspect; Limited procedural aspect;	Limited enabling aspect; Integrated procedural aspect;
Intensity (Argawal 2000; Crocker 2007)	Consultive participation; Petitionary participation;	Deliberative participation; Petitionary participation; Consultive participation;

A further aim of the research was to highlight some of the main characteristics of participation by considering the enabling (possibility of involvement) and procedural aspects (use of participatory tools) (Sen, 1999), the dimension of

---

<sup>1</sup> CCB Ravennate covers the areas of Faenza, Ravenna, Lugo, Imola, Forlì and Cesena; BCC Rome covers the areas of North Rome, Rome and Province, South Rome, West Veneto, East Veneto and Molise-Abruzzo.

willingness and possibility<sup>2</sup> (Nie, Verba, 1995) and the intensity<sup>3</sup> (Agarwal, 2001; Crocker, 2007). Comparing the situation in both groups, a distinct level of integration and participation of the youth has emerged (see Figure 1).

Firstly, in both groups, it is possible to witness the presence of the dimension of possibility and willingness to participate, albeit in a limited way: as mentioned before, the CCB chooses the young members participating in the two groups and they cannot voluntarily apply for this role. Therefore, the enabling aspect is also limited, even if it seems higher among the Young Members Committee since they can sometimes also apply voluntarily, as the Supervisor said.

Concerning the procedural aspect, the situation is peculiar. The type of participation of members is generally limited to the arrangement of events in the territory and bank and therefore appears to be an active but contained participation and, above all, does not seem to concern economic-financial choices. Moreover, the top management makes final decisions. The situation looks better within the Committee since young members have a more organisational role that includes participation in Local Committees, which are hierarchically higher branches of the whole structure with more significant tasks of solidarity in the territory.

Finally, regarding the intensity of participation, the type of involvement of young members of the Laboratory is similar to consultative participation, where the 'non-elite' (youth of the groups) participate and express their ideas but do not make decisions, which are the responsibility of an 'elite' (top management); petitionary participation, where the 'elite' must listen to the 'non-elite' even if the first group takes final decisions. In addition to this, we can observe the deliberative participation in the CCB Ravennate Committee, which envisages a more intense involvement of young people who take part in the scrutiny, discussion, choice, and implementation of decisions, albeit always limited and not relating to the entire banking structure.

Despite the structure of the two YM Groups and the difficulties related to the participatory process, the interviews and the questionnaire nevertheless revealed the widespread importance of participation as an intrinsically valuable activity in the wake of several studies (Putnam, 2004; Crocker, 2007). As two

---

<sup>2</sup> Nie and Verba (1995) distinguish between willingness and possibility to participate (active participation), lack of willingness and possibility (extraneousness), possibility but lack of willingness (self-exclusion) and willingness but not possibility (exclusion).

<sup>3</sup> Agarwal (2001) distinguishes different levels of involvement: nominative participation, passive participation, consultative participation, petitionary participation, participatory implementation, bargaining, and deliberative participation.

young members stated when asked “Do you think participating in the YM Group affects your personal life?”:

(Reflects) It is a good question! Without question, it is a chance, a rare opportunity, let me say, for the small number of people who can take part in these initiatives; right now, I feel privileged to be part of it (M, YM Laboratory). Certainly (it makes me feel) valuable because it is not an opportunity given to all members, so the fact that, for some reason, they have chosen you is very gratifying! (L, YM Committee).

Furthermore, the questionnaire revealed that many young ‘quite/very much agree’ that “participating and being able to express their ideas is of great value” to them, makes them “feel part of a community and a group and value”, “contributes to their well-being and that of outsiders, and enables them to develop greater trust in institutions”.

To the question “Do you think participating in the YM Group gives a deeper meaning to your life?” “If yes, why?” put in the questionnaire, with seven closed-answer alternatives and being able to choose only two of them, many young people replied positively, stating they acquired new skills and goals, that participating allowed them to contribute to the well-being of other people and to make use of their abilities.

In addition, almost all the young members of the Laboratory and the Committee agree that the CCB promotes the participation of young people, families and businesses in the economic and social life of the area. Thus, there is a widespread positive perception amidst young people in YM Groups concerning the work and values promoted by the bank and the groups themselves.

## **CONCLUSION**

In conclusion, integrating the different research instruments, some reflections emerged. The two youth groups promote a controversial participatory process. While, on the one hand, it is defined by the element of possibility and willingness for young people to participate, on the other hand, the access is possible according to specific factors delineated by the Board of Directors, which thus makes limited the enabling aspect, an essential factor for concrete active participation as identified by the CA. Similarly, the procedural one is also lacking, given the limited tools available to young people, although the situation seems better in the YM Committee.

Figure 3: Mean of involvement of young people in the two YM Groups. Source: Personal elaboration from primary data

D14 Su una scala da 1 a 10, quanto ti senti coinvolto a livello emozionale e pratico dalle attività organizzate dal gruppo Giovani Soci?

Despite this situation, the young members of the Laboratory and Committee agreed that participation had an intrinsic importance that allowed them to feel part of a community and a group, to share principles and relationships and to feel involved emotionally and practically in the group. At the question “From 1 to 10, how involved do you feel emotionally and practically by the participation in YM Group?” it reached an average of 8.0 (see Figure 3).

# JUVENILE OFFENDERS AND EDUCATION: WHICH TOOLS TO PURSUE SOCIAL JUSTICE?

Arianna Monniello<sup>a</sup>

<sup>a</sup>Sapienza University of Rome

In line with international regulations, the Italian juvenile justice system is designed to protect the best interests of minor offenders and aid their personal development. Detention is considered a last resort for young offenders, but many come from marginalized backgrounds, making community-based measures difficult to implement. To ensure the principle of “residual nature of detention” in all situations, Italian law allows juvenile offenders to be placed in residential care facilities where a professional team of educators designs a personalized educational project to facilitate reintegration into the community. The project involves various educational settings such as schools, training centres, and cultural and sports associations, adopting an educational continuum perspective. The contribution presents some results that emerged from doctoral research, which aims to explore the educational practices adopted by educators working with juvenile offenders in residential care. The data results from interviews with coordinators and managers of residential care for youth in the Lazio region (Italy). The results highlight the heterogeneity of practices adopted by communities for minors in their collaboration with other key actors and educational contexts involved in the minors’ educational path, emphasizing their importance for the reintegration of minors.

adolescent offenders; residential care; educational practices.

## 1. RESIDENTIAL CARE IN THE ITALIAN JUVENILE JUSTICE SYSTEM

The juvenile justice system addresses crimes committed by young offenders, balancing public safety with the protection of minors’ best interests (UN, 1989). In Italy, the juvenile criminal procedure (Decree of the President of the Republic 448/88) emphasizes aligning statutory provisions with minors’ personalities and educational needs. The system is founded on four core principles that guide its approach:

### 1. The Principle of Suitability

This principle emphasizes that statutory provisions must be tailored to the personality and educational needs of the minor. It is designed to protect the minor's status as a developing individual and to support their personal growth. To promote rehabilitation and reintegration, adolescent offenders are not only handled by the penal system but are also supported by social services, which assess their living conditions and implement personalized educational programs.

### 2. The Principle of Minimal Offense

This principle seeks to avoid unnecessary marginalization or increased exposure to criminal behaviours within the prison system. It prioritizes measures that offer the minor the best opportunity to reform and reintegrate into society.

### 3. The Principle of Destigmatization

This principle minimizes the negative labelling of minors in conflict with the law, aiming to prevent long-term social exclusion. Detention is applied only when necessary, ensuring that other measures are prioritized to promote rehabilitation over punishment.

In alignment with these principles, Italian legislation provides additional measures to support the effective application of these guidelines. Specifically, it guarantees minors' educational rights by addressing their developmental needs while fostering their reintegration into society. The legislative framework thus aims to rehabilitate young offenders through education and social services, prioritizing their development and reintegration over punitive approaches.

Many juvenile offenders come from socially marginalized backgrounds, which makes it difficult to apply community-based criminal measures. For that reason, especially for minors from deviant families or unaccompanied foreign minors, there is a high risk of reproducing the mechanism of injustice and marginalization. To ensure the principle of 'residual nature of detention' in all situations, Italian law allows juvenile offenders to be placed in residential care facilities. The Court can order this measure in the application of precautionary measures as well as non-detention measures. The Court decides the application of this penal measure in the case of the absence of family and/or inadequate living conditions, as well as financial and social support.

According to the latest available data (Ministry of Justice, 2023) there are 618 educational communities in Italy dedicated to the care of juvenile offenders,

although their distribution across the national territory is uneven. Out of the 14,754 minors under the care of juvenile social services, 1,034 are placed in educational communities managed by social cooperatives. Residential care facilities are governed by regional regulations and are structured to resemble a family environment. Those designed for young offenders are referred to as 'educational communities'. In these settings, a team of professional educators works on a rotational basis, either daily or hourly, rather than residing permanently within the community. Beyond their caregiving responsibilities, educators develop tailored educational plans and motivate minors to follow them through to completion. The educational communities respond to a dual institutional mandate: ensuring the execution of the sentence and facilitating the minor's reintegration into their social context of belonging (Mastropasqua et al., 2020). These facilities operate based on key principles, such as fostering the minor's personal, social, and familial strengths, minimizing the length of their stay in the community, and promoting participation in external activities.

In working with adolescent offenders, community educators play a key role in designing and implementing an individualized educational program. This program is considered a central tool for the involvement of juveniles within the community and must be developed with particular attention to their personalities, educational needs, and overall goals of empowerment and resocialization. In the specific case of adolescent offenders, the educational program must be in line with court guidelines and is subject to the supervision of the Office of Juvenile Social Services. Educators in residential facilities are only one of the main actors involved in the educational path of an adolescent offender. Individualized programs also rely on the involvement of local services, such as schools, training centres, and cultural and sports associations. Therefore, the educational experiences of minors living in residential care are carried out in several different educational settings, in addition to the residential care itself. The educational experiences lie not only in formal education but also in the non-formal and informal, in an educational continuum perspective (Merico & Scardigno, 2022). Collaboration with these local services is fundamental to ensure the successful reintegration of adolescent offenders into society, which is the primary goal of the juvenile justice system. Such collaboration also helps mitigate the risk of stigma by supporting the offender's social reintegration.

## 2. EXPLORATORY STUDY ON EDUCATIONAL PRACTICES WITH ADOLESCENT OFFENDERS PLACED IN EDUCATIONAL COMMUNITIES

### 2.1. Research design

The exploratory study is part of a doctoral research project and aims to investigate the educational work of residential communities for minors with adolescents involved in the juvenile justice system. The study was developed with the specific aim of exploring the educational practices and tools employed by residential communities working with adolescent offenders. Additionally, it seeks to identify the factors that either hinder or facilitate the implementation of effective educational practices within these settings. These objectives aim to provide a comprehensive understanding of how such communities address the educational needs of young offenders. The study's objectives are further clarified through the following research questions, which guide the investigation:

- What tools and practices do educators in residential care for youth adopt to accompany adolescent offenders on their educational paths?
- What elements facilitate and hinder the success of the interventions put in place by educational communities?

Tab. 1. Ecological model for the evaluation of residential care: indicators for each subsystem. Source: Palareti & Berti, 2009, p. 1085.

<p>MICROSYSTEM: relational climate in the community</p> <ul style="list-style-type: none"><li>◆ Quality of adult–child relationships</li><li>◆ Protective and scaffolding function of everyday routines, rituals and rules</li></ul>
<p>MESOSYSTEM: system of child relationships (community/family/school/free time)</p> <ul style="list-style-type: none"><li>◆ Multiple and adequate relational opportunities</li><li>◆ Continuity and coherence between settings</li><li>◆ Continuity and coherence in a longitudinal dimension: importance of care plans as tools for bridging current and past care and for catering for future needs</li></ul>
<p>EXOSYSTEM: system of relationships among institutions and subjects that deal with the child and his/her family</p> <ul style="list-style-type: none"><li>◆ Informational continuity</li><li>◆ Management continuity</li><li>◆ Network founded on recognition of interdependence</li></ul>

MACROSYSTEM: socio-cultural context of the intervention

- ◆ Explicit and implicit theories at the basis of the intervention
- ◆ Aims attributed to the intervention (State assistance/education/therapy)
- ◆ Legal rules and procedures regulating the running of residential communities and the relations between them, social and health services and public institutions

The research adopts a qualitative approach, utilizing semi-structured interviews as the primary tool for data collection. These interviews were conducted with coordinators and managers of residential care facilities for youth in the Lazio region, Italy, specifically those working with juvenile offenders. The sample included 27 educational communities for minors, selected from 35 residential facilities approved by the Ministry of Justice, with 21 interviews completed. The collected data were analyzed using thematic analysis (Braun & Clarke, 2006), supported by MAXQDA software to ensure a systematic and detailed interpretation (Gizzi & Rädiker, 2021). The data analysis followed a mixed approach, with codes and themes developed using both top-down and bottom-up methods. Specifically, a systematic perspective was applied to organize the educational practices identified during the analysis (Bronfenbrenner, 1979; Palareti & Berti, 2009) (Tab. 1).

## **2.2. Results and conclusions**

This contribution will focus on the findings related to practices carried out at the mesosystem level. The mesosystem refers to the network of interactions and relationships surrounding the adolescent, encompassing connections between their family, school, community, and free time activities. It represents the interconnection between these different contexts and emphasizes how their alignment and coherence can influence the adolescent's development. External activities are an integral part of the individualized educational plan, designed to enrich the adolescent's experiences and promote their engagement across various contexts. At this level, the quality of relational opportunities, the consistency across different environments, and the continuity of care over time are critical factors. Practices within the mesosystem aim to foster collaboration, maintain stability, and address the evolving needs of the adolescent, ensuring that each context contributes positively to their growth and development.

The themes and codes that emerged from the analysis of the interviews regarding educational practices at the mesosystem level are presented in Table 2.

The findings underscore the educational community’s pivotal role within the mesosystem, highlighting its collaborative efforts with community agencies, social services, families, and health services. This integrated approach provides minors with comprehensive support, addressing their educational, social, familial, and psychological needs.

Key practices include fostering school attendance, vocational training, and community engagement through socially useful activities, sports, and volunteer programs. Notably, criminal mediation emerges as a critical intervention, aiming to rehabilitate and reintegrate minors facing delinquency into society. Collaboration with social services emphasizes tailored interventions, consistent monitoring, and shared responsibility for the well-being of minors. Family involvement is strengthened through educational support, mediation, and collaborative efforts to ensure stability. Additionally, the connection with health services provides essential pathways to counter addiction, mental health support, and psychotherapy.

Overall, the results demonstrate the importance of interventions that actively involve other educational agencies in the minor’s developmental journey. Networking and collaboration among these systems represent a necessary key to promoting a holistic and effective approach to the educational and social inclusion of minors. The presence of different settings contributes positively to the development of a minor only when these environments are effectively interconnected through active collaboration, open communication, and a mutual exchange of information. When the connections between various contexts are weak, uncoordinated, or entirely absent, the mesosystem becomes fragmented, creating an unfavourable condition for the minor’s growth and development (Bronfenbrenner, 1979). Creating educational opportunities beyond those provided by the community constitutes a fundamental tool for ensuring access to social justice. By expanding the scope of education to include diverse and inclusive settings, individuals are empowered to overcome systemic barriers and inequalities. Such opportunities enable the development of skills, knowledge, and social connections that are essential for equitable participation in society. This approach underscores the importance of education as a transformative force in promoting fairness and addressing structural disparities.

# INTERSECTIONS BETWEEN DISABILITY AND MIGRATORY BACKGROUND IN EDUCATIONAL CONTEXTS: A CRITICAL PERSPECTIVE

Maria Giulia Pascariello<sup>a</sup>

Anna Fausta Scardigno<sup>b</sup>

<sup>a</sup>Università degli Studi di Bari "Aldo Moro"; <sup>b</sup>Università degli Studi di Bari "Aldo Moro"

This contribution explores the relationship between disability and migratory background in educational contexts, developing some themes of reflection that emerged during a Focus Group held within a regional project (Lombardy) aimed at improving the accessibility of local services for people with disabilities and a migratory background. The article investigates the potential of an intersectional, non-sectoral approach through the tools of Disability Critical Race Studies.

disability; migration; intersectionality; education;

## INTRODUCTION

This article presents reflections that emerged during the research project *Gender Studies and Diversity Management for Inclusive Public Administrations*, conducted as part of the PhD program in Gender Studies at the University of Bari. The research explores the intersection of disability and migratory background, with particular attention to recognizing the processes of disablement and the role of educational contexts in promoting social justice. The research employs the Realistic Evaluation method (Pawson, Tilley 1997) to identify contextual mechanisms that contribute to the implicit reproduction of inequalities and power asymmetries (M+C=O). The article examines one of the focus groups conducted during the empirical phase of the research, part of the CI SIAMO project – *Competencies and Integration Between Services to Encourage Access and Improve Opportunities for People with Disabilities and Migratory Background*, promoted by Fondazione ISMU ETS. The theoretical and

epistemological approach of the analysis is based on Disability Critical Race Studies which examines the relationships between ableism and racism and explores the construction of the hegemonic concept of normality.

## **1. FRAMEWORK: DISABILITY AND MIGRATION**

The relationship between disability and migration is a topic that is underexplored in the international academic literature. Disability remains marginal in studies on international migration, while disability studies have often neglected factors like migratory and socio-cultural backgrounds, to the point of being provocatively labelled *White Disability Studies* (Bell, 2006). At the international level there is a significant lack of statistical and scientific data; the available data are non-standardized and not disaggregated by type of disability or specific dimensions such as gender or, indeed, socio-cultural background. This lack of information contributes to a possible underestimation of the issue and its implications. Various estimates from international organizations suggest that this is a significant population from a quantitative standpoint. Furthermore, it is important to specify that *disability* encompasses a highly heterogeneous set: it may refer to pre-existing impairments, those acquired during migration, impairments resulting from harsh living, working, or housing conditions, or disabilities related to aging. At the same time, the issue of migration is equally vast, encompassing different legal conditions, statuses, and social definitions. Both issues are intrinsically connected to the social dimensions in which they are embedded. While both disability and migration are subjects of separate studies and interventions, most existing policies follow a *satellite* model with little or no communication between the two areas or the services responsible for them (Zanfrini, Formichi 2022). This hinders full access to rights and perpetuates discriminations embedded in institutional practices. In this context, my research explores the role of the educational setting as a field (Bourdieu, Passeron 1972) in which to identify the interstitial mechanisms that contribute to the re-production of power asymmetries (Foucault, 1977).

### **1.1. Empirical Research: Starting from Direct Experiences**

CI SIAMO project led by Fondazione Ismu ETS (lead partner), in collaboration with Ledha APS and Caritas Ambrosiana, is a regional project in Lombardy aimed at overcoming the institutional invisibility of people with disabilities and a migratory background, while highlighting the critical issues within the local service system. During the first phase of the project, Focus Groups (Bichi, 2007) were conducted, using a semi-structured guide, to identify the needs of people

with disabilities and a migratory background and to value their experiences. These groups included individuals directly involved – *experts by experience* – as well as local stakeholders. This contribution explores some of the insights that emerged during the Discussion Group titled *Minors, Schools, Educational Practices, and Diagnostic and Therapeutic Issues*, which was attended by 20 participants, including representatives from local school offices, neuropsychiatry professionals, teachers, educators, and social workers.

## **2. EDUCATIONAL CONTEXTS**

### **2.1. Monocategorical analyses and multiple discriminations**

The first key finding that emerged from the Focus Groups is that schools represent one of the few contexts where it is possible to reach individuals with disabilities and a migratory background, addressing their diverse needs. Participants reported an increase in the number of young people with a migratory background – both disabled and non-disabled – within schools. This aligns with available data show that students with disabilities from families with a migratory background are significantly represented in schools (Bolognesi, Dainese 2020). In Italy, the right to education is a fundamental right guaranteed to all minors on the territory, without discrimination based on citizenship or the regularity of their stay. This positions the educational services context as the primary – and most accessible – point of reference for many young people with disabilities and a migratory background, as well as their families.

We, who work at the school office, clearly have connections with schools, families. We collaborate with neuropsychiatrists, medical professionals, and municipalities—essentially, with everything that revolves around students with disabilities or a migratory background. (Representative Territorial School Office)

The school functions as a bridge between the directly involved individuals and their families, and the providers of social and healthcare services, local services, and civil society. The school is the area with the most available information, in terms of numerical data, the extent of the phenomenon, and specific qualitative analyses focused on school inclusion. However, the available literature is mostly characterized by monocategorical and unidimensional analyses in which disability, migratory background, or socio-economic factors are represented as separate variables, with one axis often being prioritized over others. This is evident in the words of a representative from the Territorial School Office:

I would provocatively say that, paradoxically, a certified disabled student is sometimes almost more protected than a newly arrived student who has emotional and sometimes psychological vulnerabilities. (...) I would like to bring this aspect to the table, because if we focus too much on disability, we risk losing sight of what the main vulnerability actually is.

Disability and migratory background are not typically framed as interconnected identities or social dimensions. However, one teacher remarked: “There are also newly arrived students with disabilities”. Subsequently, another participant (School Educator) emphasized the importance of considering multiple complexities: “Often, the risk of discrimination is multiple, not just two intersections. There are linguistic, social, and economic disadvantages”.

Studies on students with disabilities and a migratory background have shown that the gender variable is often overlooked. However, Feminist Disability Studies have long highlighted, even within educational contexts, the multiple forms of discrimination faced by individuals socialized as women, particularly those belonging to minority groups (Taddei, 2022). The gender category warrants further analysis, especially in light of the international shift from integration model to full inclusion in schools, as promoted by the Salamanca Statement and UNESCO (2020). In this context, it is essential to implement systemic actions that transform learning environments into spaces capable of ensuring the right to quality education, participation, and academic success for all students, regardless of cultural, social, linguistic, gender, mental, or physical differences (D’Alessio, 2015). The shift in focus from an individual’s condition to the interaction between individuals and their surrounding environments should result in the recognition and removal of barriers to learning. However, the reality in schools still appears distant from this perspective, as an exploratory study by Chieppa (2017) highlights. Evidence suggests that an assimilationist and normalizing approach continues to dominate, struggling to view disability, socio-cultural background, and gender through an intersectional, rather than summative, lens. Differences among students are still interpreted as deficits, pathologies, or inferiority, which must be compensated by offering additional resources (Migliarini, Elder 2024).

## **2.2. “One thing is certain: our task is not to create new disabilities”<sup>1</sup>. Recognizing disablement mechanisms**

Despite the social interpretations of disability and the ratification of the UN Convention on the Rights of Persons with Disabilities (2006) have fostered a

---

<sup>1</sup>Representative of the Territorial School Office during the FG.

shift from a strictly medical view to a human rights-based perspective focused on social inclusion, however, international disability literature continues to prioritize a biomedical approach (Colombo et al., 2022). At least in the educational field, several scholars claim that the transformation of terminology has not been supported by explicit theoretical positions in favor of systemic change and thus has not resulted in a true paradigm shift (Vislie, 2003; Migliarini, Elder 2024). Although disability is still predominantly identified with pathology, during the Focus Group, several interventions pointed out that what is defined as disability is often connected to – or entirely determined by – the spaces in which this definition takes shape:

There are so many issues at the table, and these multiply when it comes to foreign students because the emotional aspect is central. Many students are uprooted from their country at 14 and placed in the Italian school system don't understand why they are here; they have friends and family elsewhere. Sometimes it takes them a long time to learn, and it's not a disability issue. Sometimes, however, there are objective problems. (...) Then there are also economic issues not to be underestimated. (Representative Territorial School Office)

This intervention emphasizes that what is sometimes interpreted as learning difficulties or disability is often the result of barriers encountered in a new and perceived hostile context. This perspective aligns with the UN Convention's definition of disability, which sees it as an interaction between individuals and contexts. It also resonates with earlier social models, which assert that a full understanding – and elimination – of disability cannot address factors like income, mobility, or institutional practices in isolation (UPIAS, 1975). In the school context, monodimensional approaches can become mechanisms for reproducing inequalities. The failure to recognize the backgrounds of students and their families can hinder an effective support process. Language and cultural barriers, complex bureaucratic practices, the use of specialized language, and the lack of cultural mediation practices prevent access to services:

This is a denied right: there is diversity, but it is assumed that everyone is the same. (...) This is an important point: the right to have one's difference recognized. (Representative of the Territorial School Office)

In other words, despite the emphasis placed on inclusivity and the importance of respecting the diverse cultural identities of people with disabilities (UN, 2006), there remains an attitude that denies the existence and legitimacy of

different interpretations of disability, health, and care concepts, other than the Western canon and the biomedical model focused on diagnosing pathologies understood as *deficits*. However, paradigms, classifications, nosographic etiologies, and diagnostic tools are strongly connected to interpretative and symbolic horizons of a cultural nature. These symbolic-cultural dimensions are translated into practices and policies within services. On the other hand, framing the topic by privileging a single analytical dimension and the dominance of the medical interpretation of disability, exposes the risk of pathologizing behaviors that are not understood or *culturizing* disorders that cannot be identified (Goussot, 2015). The failure to recognize cultural differences can contribute to minimizing or perpetuating discrimination and disadvantages, leading to forms of *racism without race*: this would be visible, for example, in the phenomenon of the over-representation of unaccompanied minors or asylum seekers in the categories of Special Educational Needs (Migliarini, 2017). Even during the FG, healthcare professionals reported the complexity of drawing the line between individual clinical issues or communication/language difficulties arising from interaction with a new social environment:

We are often called for cases involving children with severe vulnerabilities who need to create an entire project where social, cultural, and economic barriers are very high. (...) We risk diagnosing adolescents who in other contexts would not have been diagnosed, so we also have a responsibility in this sense and in the value that these adolescents attribute to themselves. (Child Neuropsychiatrist)

It is not about minimizing the importance of medical intervention when necessary and it is indisputable that it plays a fundamental role in improving people's lives; what is being questioned here is the dominance and hegemony of this perspective in the assessment of individuals and the failure to recognize cultural and social dimensions. Among these, socio-economic conditions are particularly relevant:

There are students with significant potential who are often underestimated, and there is an early tendency to steer them, even with the guidance provided in middle school, toward lower levels of education. Their social and family background almost becomes indicative of their destiny. Instead, there could be resources that could emerge. (School Inclusion Coordinator)

Intersectionality places subjectivities within multiple relations of power, interrogates positions, and requires ongoing interaction between knowledge and fields that appear separate; a critical tool that is indispensable to recognize

implicit mechanisms of disablement and ensuring that identity and social factors are never again *ascribed indicators of one's destiny*.

# HUMAN CAPITAL AND R&D: UNLOCKING INNOVATIVE ENTREPRENEURSHIP THROUGH HEIS IN ITALY

Piero Esposito,<sup>a,b</sup>

Francesco Ferrante<sup>a,b</sup>

Sergio Scicchitano<sup>b,c</sup>

<sup>a</sup>University of Cassino and Southern Lazio, Italy; <sup>b</sup>Global Labor Organization (GLO), Germany; <sup>c</sup>John Cabott University, Italy

Higher Education Institutions (HEIs) are central to fostering innovative entrepreneurship and regional development by increasing human capital and facilitating knowledge transfer through R&D. This paper explores the interplay between graduate supply and R&D in driving innovative startup creation across Italian provinces (2015–2021). The findings highlight a synergy between these factors: public R&D boosts graduate impact in the South, while university R&D complements the dense graduate presence in the North. These dynamics call for tailored strategies to optimize HEIs' roles as engines of economic growth, particularly in lagging regions.

entrepreneurship, higher education, innovation, startups, knowledge spillovers

## INTRODUCTION

Higher Education Institutions (HEIs) are critical in fostering regional development and innovation by serving as hubs of knowledge creation, skill development, and entrepreneurial activity. Over the past decades, HEIs have transitioned from traditional roles in teaching and research to active contributors to local ecosystems, directly impacting economic and social outcomes (Benneworth & Fitjar, 2019). This expanded role is particularly relevant in addressing regional disparities, as HEIs catalyze local development by producing human capital and driving innovation. HEIs contribute to regional economies by supplying skilled graduates and facilitating knowledge transfer

through research and development (R&D), fostering innovative entrepreneurship, a key driver of economic growth and competitiveness (Callon, 1994). However, the impact of HEIs on entrepreneurship is uneven across regions, with variations driven by institutional quality, R&D intensity, and absorptive capacity (Rodriguez-Pose & Ganau, 2022).

This paper examines the interplay between graduate supply and R&D activities as complementary factors influencing innovative entrepreneurship in Italian provinces (2015–2021). It investigates HEIs' roles in startup creation by producing skilled human capital and enabling startups' innovation capacity through research and technology transfer mechanisms (Del Monte & Pennacchio, 2020). A novel dataset explores these relationships, accounting for regional heterogeneity and institutional quality as mediators of HEIs' effectiveness.

Italy is an interesting case study, marked by large differences in the rate of innovative entrepreneurship and socioeconomic development across regions and by the prevalence of micro and small firms, whose management strategies and styles have been shown to adversely affect their ability to absorb externally generated knowledge, to the detriment of productivity (Esposito & Ferrante, 2024; Cardullo et al., 2024). Meanwhile, despite having a very low share of graduates in its labor force, Italy is a net exporter of graduates and faces a significant skills mismatch in the graduate labor market (Esposito & Scicchitano, 2022).

HEIs are key contributors to regional development, serving as hubs of knowledge creation, talent cultivation, and innovation. Their influence on local economies operates through direct and indirect mechanisms. Directly, universities produce graduates with the skills and expertise necessary for innovation and entrepreneurship, contributing to the strength of local entrepreneurial ecosystems. Studies have demonstrated a strong correlation between the concentration of skilled graduates and increased entrepreneurial activity, particularly in regions with robust institutional and economic frameworks (Benneworth & Fitjar, 2019; Marques, 2017). Indirectly, HEIs enhance regional innovation by establishing infrastructure to support entrepreneurship, including incubators, spin-offs, and knowledge transfer activities, which build the region's capacity to develop and absorb innovations (Papatsiba & Cohen, 2020; Ferrante et al., 2019). The extent of their impact depends on the quality of local institutions, the availability of complementary resources, and the absorptive capacity of firms (Agasisti et al., 2019; Del Monte

& Pennacchio, 2020).

The interplay between R&D activities and the supply of skilled human capital is central to fostering innovative entrepreneurship. R&D lays the foundation for knowledge spillovers, which drive technological advancement and support the emergence of innovative firms. Public and university R&D systems are essential in promoting startup formation, especially in knowledge-intensive sectors (Aghion et al., 2015). Meanwhile, graduates act as conduits of knowledge, bridging the gap between research and application. Their skills and expertise enable startups to harness R&D outputs effectively, enhancing productivity and competitiveness. This synergy is particularly pronounced in technology-driven industries, where the combination of research and human capital yields substantial economic benefits (Colombo & Piva, 2020).

Our study shows that public R&D is crucial for southern provinces, while university-driven R&D enhances innovation in the North. These insights call for place-based policies to integrate graduates into entrepreneurial ecosystems and address regional R&D disparities. This study makes three key contributions to the literature. First, it provides empirical evidence of the complementarity between graduate supply and R&D in fostering innovative entrepreneurship. Second, it highlights regional disparities in these dynamics, offering insights into how HEIs can tailor their strategies to local needs. Third, it emphasizes the dual role of HEIs as providers of human capital and facilitators of innovation, showcasing their potential to act as agents of local development in diverse economic contexts. The paper is structured as follows. Section 1 describes the dataset and empirical strategy used in the analysis. Section 2 presents the results. Section 3 concludes with policy implications and recommendations for future research.

## **1. DATA AND METHODOLOGY**

The empirical analysis aims to assess the effect of new graduates' supply and its interaction with R&D activities on the propensity to set up innovative business ventures. To this aim, we built a panel dataset of Italian provinces (NUTS-3 level) covering 2015-2021. We ran Fixed Effects regressions by controlling for province characteristics in terms of specialization, level of development, entrepreneurship intensity, and institutional quality. We also control for other channels through which universities can impact the creation of start-ups. The estimated equation is the following:

$$ST_{i,t} = \alpha + \beta_1 LG_{i,t} + \sum_{k=2}^4 \beta_k RD_{i,t}^k + \beta_5 LG_{i,t} * RD_{i,t}^k + \sum_{k=6}^h \beta_k X_{i,t} + \theta_t + \varphi_i + \gamma_1 * \varphi_{i,t} + \varepsilon_{i,t} \quad (1)$$

Where LG is the flow of local graduates; RD<sub>k</sub> is R&D expenditure (k=public, private, universities) which is interacted with LG. The vector X includes the following variables: stock of tertiary educated workers (TerStock), Overeducation (OE), number of active spinoffs (SpinOff), research productivity (ResProd), active licenses (Lic), institutional quality index (IQI), Value Added per capita (VApc), number of active enterprises (Enter), shares of manufacturing, ICT and private services (ManSh, ICTsh, and PvtSvcSh). The terms  $\varphi_i$  and  $\theta_t$  and province and time-specific fixed effects. We interact time dummies with area dummies (area=North-East, North-West, Center, South, and Islands) to control for general heterogeneity.

Data on innovative startups are provided by the Ministry of Enterprises and Made in Italy. As for the supply of new graduates, data come from the Ministry of University and Research (MUR). The stock of graduates in each province is obtained by aggregating individual-level data from the Italian Labour Force Survey. Overeducation is calculated by aggregating individual self-assessed data from the INAPP-PLUS survey. The number of university spinoffs and licenses are obtained from the annual NETVAL Survey on the growth and exploitation of public research results. Research productivity is calculated as the number of publications per researcher. Data on the number of publications are from OpenAlex, the open catalog to the global research system. The number of researchers (professors, assistant professors, or post-docs) is from MUR. Data on R&D expenditure are provided by ISTAT, the Italian National Statistical Institute. As for the context indicators, data on the total number of enterprises and Gross per capita Value Added in each province are provided by ISTAT. The economic structure of provinces is measured as value-added shares of manufacturing, private services, and ICT (source: ISTAT). Finally, the quality of institutions is measured by the Institutional Quality Index built by Nifo and Vecchione (2014). The final dataset includes 107 provinces observed between 2015 and 2021 for a total sample size of 749 observations. All variables except institutional quality, overeducation, and research productivity are standardized to the provincial population.

We estimate the model on the whole sample and perform a heterogeneity analysis by splitting the sample into North and South. The former include the macro-regions North-East and North West as well as Rome and the provinces of

Tuscany and Marche. Southern provinces include the macro-regions of the South Island, the provinces of Umbria, and those of Lazio, excluding Rome. This analysis is critical since it allows for understanding whether university graduates effectively stimulate innovative entrepreneurship in less-developed provinces.

## 2. RESULTS

Table 1 reports estimation results on the whole sample of Italian provinces. The first column shows that the supply of graduates is positively related to innovative startups independently of the amount of R&D expenditure. Columns 2-4 show the interactions between local graduates and R&D expenditure. The significant interactions are those between LG and, respectively, public and university R&D. These results indicate that the effect of LG increases in regions where R&D expenditure is above average.

Standard errors in brackets. \* significant at 10% level; \*\* significant at 5\*\* level; \*\*\* significant at 1% level.

In Table 2, we report estimation results for Northern and Southern provinces. Estimated impacts are higher in southern provinces, where the interaction between LG and public R&D is also significant. In addition, in the south private and university R&D expenditure is positive and significant independently of the level of graduates. In Northern provinces, the significant interaction is between LG and universities' R&D. The results indicate that Southern provinces benefit more than Northern provinces from the presence of new graduates, particularly when a high level of public R&D expenditure complements it. In Northern provinces, HIEs alone can stimulate innovative entrepreneurship by combining education and research.

### 3. CONCLUSIONS

The findings of this study provide compelling evidence for the crucial role of HEIs as drivers of local development through their contributions to innovative entrepreneurship. By increasing the supply of skilled graduates and engaging in R&D activities, HEIs can significantly influence the creation of innovative startups, thereby fostering regional growth and reducing economic disparities. However, the effects are not uniform across regions, underscoring the importance of contextual factors and the complementarity between human capital and R&D investments.

In particular, the analysis demonstrates that the positive impact of graduate supply on innovative entrepreneurship is amplified in regions with strong public or university-based R&D activities. This complementarity highlights the dual importance of human capital as a fundamental input for innovation and R&D as a mechanism for knowledge generation and application. In northern provinces, where university R&D is more prevalent and private-sector ecosystems are better developed, the alignment between graduate skills and research capabilities drives high rates of innovative entrepreneurship. Conversely, in southern provinces, where private-sector R&D is weaker, public R&D investments play a pivotal role in enabling graduates to contribute effectively to entrepreneurial ecosystems. These results underline the differentiated pathways through which HEIs can enhance local innovation depending on regional characteristics (Benneworth & Fitjar, 2019; Agasisti et al., 2019).

The findings point to significant challenges in lagging regions, where the lack of robust institutional frameworks and entrepreneurial support structures constrains the ability of HEIs to leverage their contributions to local development fully. The mismatch between the supply of university-generated knowledge and the capacity of local firms to absorb this knowledge often results in underemployment or outmigration of skilled graduates. This dynamic further exacerbates regional inequalities, highlighting the need for targeted policy interventions to create an enabling environment for innovative entrepreneurship (Evers, 2019).

The implications of this study for policy are twofold. First, there is a clear need to invest in public and university-based R&D in regions with underdeveloped innovation ecosystems, particularly in southern provinces. Such investments can enhance local firms' absorptive capacity and foster graduates' integration into high-value entrepreneurial activities. Second, efforts to strengthen the

quality and alignment of entrepreneurial ecosystems with local labor markets are essential. In this regard, HEIs can lead by fostering collaborations with local stakeholders, offering entrepreneurial training, and supporting startup incubation and technology transfer initiatives (Ferrante et al., 2019; Marques, 2017).

In conclusion, the evidence presented in this study underscores the transformative potential of HEIs as agents of local development. By strategically combining their teaching and research missions with targeted regional engagement, HEIs can drive innovation, foster entrepreneurship, and contribute to sustainable economic growth. Future research should explore the long-term impacts of these interactions, particularly in the context of evolving regional and global challenges, to further elucidate the role of HEIs in shaping equitable and resilient innovation ecosystems.

# MIGRANTS' CHILDREN, NATIVES AND UNDEREMPLOYMENT: DIFFERENCES IN INVOLUNTARY PART-TIME WORK ACROSS EUROPE

Giorgio Piccitto<sup>a</sup>

<sup>a</sup>University of Milano-Bicocca

Despite their growing importance in society, empirical findings reveal heterogeneous outcomes for second-generation individuals in terms of socio-economic achievement, including variations in employment likelihood and job quality. A particularly under-explored labor market issue is underemployment, proxied by involuntary part-time work: a condition reflecting unfulfilled employment potential and a loss of human capital. To address this gap in the literature, by applying multivariate statistical models to the Eurostat EU Labour Force Survey microdata, we examine the differences in underemployment between migrants' children and natives and across 9 European countries. The results highlight the existence of gaps between immigrants' children and natives in certain countries, with individual education emerging as a significant factor influencing the association between migration status and the likelihood of involuntary part-time employment.

immigrants' children; underemployment; labor market; involuntary part-time; second-generation; employment

## INTRODUCTION

Children of immigrants are becoming increasingly integral to European societies, drawing growing research and policy interest. The sense of "outsiderness" they experience (Beaman, 2017) leads to challenges in their integration across various dimensions (Fajth and Lessard-Phillips, 2023). Among the different dimensions, the labor market integration is a critical area of focus to test processes of inter-generational transmission ethnic stratification

and social inequality (Zhou and Bankston, 2016).

Various theories have been applied to describe the patterns of integration of immigrants' children into local societies. The assimilationist perspective, in line with the straight-line assimilation theory describing the first wave of European migration to the U.S. (Warner and Srole, 1945), suggests that the later the generation, the better individuals will be integrated into the receiving society (Alba et al., 2011). Some studies emphasize that children of immigrants often excel in their achievements, driven by "immigrant optimism" (Kao and Tienda, 1998) and the so-called "immigrant bargain" (Louie, 2012), which fosters strong motivation and determination (Ichou, 2014). This evidence of heightened ambition among immigrants' children was also observed in earlier migration waves, particularly in the early 20th century, when the enrolment rates of second-generation individuals were generally comparable to or higher than those of native white populations (Jacobs and Greene, 1994). In contrast, the theory of segmented assimilation posits that certain groups of immigrants may face the risk of acculturating to low-aspiring minority peers in urban environments, which can hinder their integration and upward mobility (Hirschman, 2001; Haller et al., 2011). The segmented-assimilation hypothesis provides a framework for understanding the discrepancies in research findings regarding the educational enrolment of recent immigrants and their children in the Western societies (Portes and Zhou, 1993)

Anyway, empirical results have shown heterogeneous outcomes for second generation individuals in terms of labor market achievement, like their likelihood of being employed and the quality of their job (Heath and Cheung, 2007; Heath and Li, 2023); so far, the comparative research on the gap between immigrants' children and natives has provided inconclusive and ambiguous findings (Bucca and Drouhot, 2024). Moreover, these mechanisms remain poorly understood in countries that have only recently emerged as migrant destinations, such as those in Southern Europe (Gabrielli and Impicciatore, 2022). Additionally, differently from the literature on first-generation migrants (Platt, 2005; Avola and Piccitto, 2020; Panichella et al., 2021; Piccitto et al., 2024), analyses devoted to inquiring the immigrants' children gap in labor market achievement seldom account for their social origin; as an important factor of social stratification, the social background of origin may play a role as a driver of the destiny of second-generation individuals (Kanitsar, 2024).

An important labor market outcome which has been overlooked by this literature is that of involuntary part-time, defined as the condition of someone

who would like to work full-time, but who has been unable to obtain full-time employment (Stratton, 1996): hence, this status reflects a condition of underemployment and a waste of human potential (Banerjee et al., 2024); it intersects other demographic individual characteristics and it can lead to economic hardship (Morrison and Lichter, 1988).

In order to fill this gap in literature, we compare the differences in underemployment between natives and immigrants' children in 9 European countries.

## **1. DATA, METHOD AND VARIABLES**

Multivariate statistical techniques are applied to the individual data of two Eurostat "ad hoc modules" of the 2014 and 2021 EU Labour Force Survey (LFS). This dataset represents the main source of statistics to study the European labor markets. The variables included in these data allow to precisely define the individual migrant's generation: indeed, the EU Labour Force Survey contains the information on the respondent's year of arrival in the 'local' country, as well as the information on the country of origin of his/her father/mother.

The sample is made by men and women aged 16-64, distinguished on the basis of their migration status as follows: a) native: born in the 'local' country with both native parents; b) second-generation: born in the 'local' country with both foreign parents, plus those born abroad with both foreign parents but migrated in the 'local' country when younger than 7 years. The used definition of second-generation individuals excludes those born from a 'mixed couple' (having one native and one foreigner parent). Indeed, children of 'mixed couples' have higher resources of country-specific cultural and social capital (Laureau, 2015), and this may improve their achievement in the 'local' context (Azzolini and Barone, 2013; Piccitto, 2023).

The outcome considered as proxy of underemployment is the likelihood of having an involuntary part-time job (value = 1 if the interviewee declares of having a part-time job because he/she "could not find a full-time job"; value = 0 if the interviewee declares of having a part-time job for other reasons).

To pursue our research goal, multivariate statistical analyses are used. In particular, several linear probability models are run (one for each country included in the analysis: Austria, Belgium, Denmark, France, Germany, Italy, Spain, Sweden, Switzerland), in order to inquire the association between migration status (distinguishing natives and second-generation individuals) and probability of having an involuntary part-time job. In our models we control for a

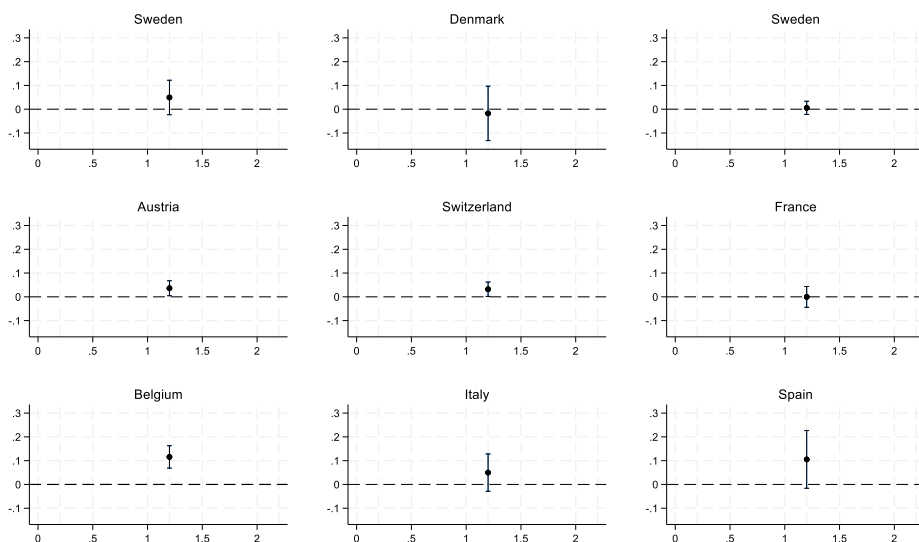

set of relevant socio-demographic individual characteristics: age; gender; education (upper secondary or less, tertiary or more); social background of origin, proxied the parental highest level of education (upper secondary or less, tertiary or more). We include in our equations also year fixed effects.

We specify two different sets of models. In the first (M1), we focus on the association between migration status and underemployment, net of the covariates described above. In the second model (M2), we include in our equation an interaction term between migration status and individual level of education; model 2, hence, allows to account for the conditionality of migrants' labor market outcomes on their level of education (Avola et al., 2023).

## 2. RESULTS

The results of model 1, aimed at highlighting if it exists a gap between migrants' children and natives in the chance of being in a condition of underemployment, are shown in Figure 1.

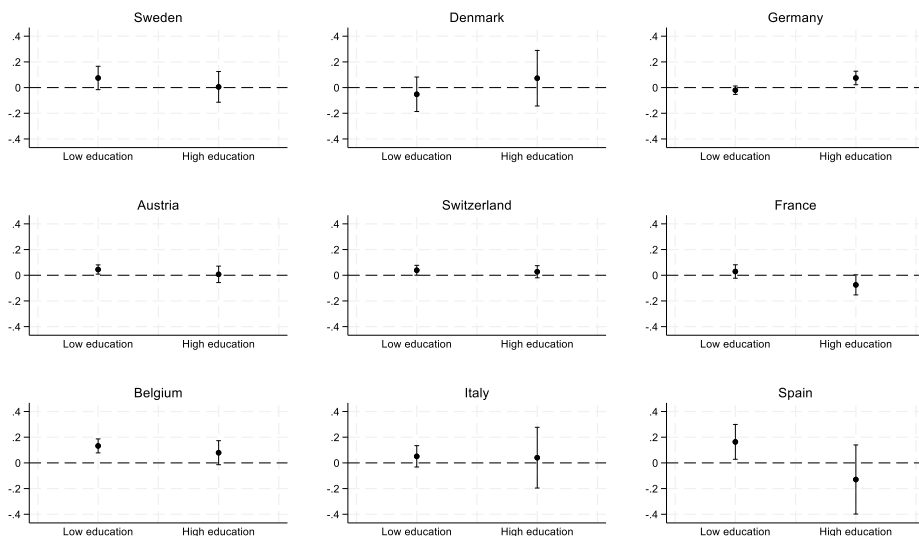

Fig. 1. Difference in likelihood of having an involuntary part-time job between second-generation individuals and natives. Notes: the dots represent the  $\beta$  coefficients based on the ordinary least squares models after controlling for age, gender, education, social origin. The lines represent 90% confidence intervals (c.i.).

The findings reveal that, in most of the countries included in our analysis, the probability of being an involuntary part-time worker is similar for second-

generation and native individuals. The differences between the two groups are not statistically significant at  $\alpha=0.90$ . However, in some countries, children of immigrants are more likely to be underemployed than natives. For instance, in Belgium, 28.1% of second-generation individuals are employed in involuntary part-time jobs, compared to 16.5% of natives. A higher likelihood of underemployment is also observed for second-generation workers in Austria ( $\beta=0.04$ ; c.i.=0.00; 0.07) and Switzerland ( $\beta=0.03$ ; c.i.=0.00; 0.06). In these countries, as in Belgium, second-generation individuals are significantly more at risk of being in involuntary part-time employment.

Fig. 2. Difference in likelihood of having an involuntary part-time job between second-generation individuals and natives by individual education. Notes: the dots represent the  $\beta$  coefficients based on the ordinary least squares models after controlling for age, gender, social origin. The lines represent 90% confidence intervals (c.i.).

The results of model 2, that quantifies the gap between migrants' children and natives in the chance of being in a condition of underemployment separately for highly- and lowly-educated individuals, are presented in Figure 2.

When looking separately at individuals with low and high education, a distinct pattern emerges in some cases. Indeed, in some countries the gap in likelihood of having an involuntary part-time job among second-generation individuals and natives appears only among low educated: it is the case of Spain ( $\beta=0.16$ ; c.i.=0.03; 0.30), Belgium ( $\beta=0.13$ ; c.i.=0.08; 0.19), Austria ( $\beta=0.04$ ; c.i.=0.01; 0.08) and Switzerland ( $\beta=0.04$ ; c.i.=0.00; 0.08).

Hence, it emerges that, for second-generation individuals in these four countries, their migration status is associated with underemployment only in the group of low educated people: education is an important factor in predicting the difference in underemployment between second-generation and native workers. Further research could shed light on the different factors influencing the involuntary part-time status for immigrants' children and their autochthonous counterparts (Busilacchi et al., 2024).

# EDUCATIONAL AND ECONOMIC STATUS DIFFERENTIALS: A COMPOSITION APPROACH TO SOCIAL ORIGIN DIMENSIONS

Federica Rizzi<sup>a</sup>

Orazio Giancola<sup>a</sup>

<sup>a</sup>Università “La Sapienza”, Roma

In Italy, the benefits achieved by investment in education as human capital have not effectively reduced the influence of social origin, which continues to shape educational paths and outcomes, leading to inequalities in job access and income (Ballarino & Schadee, 2006; Ciarini & Giancola, 2016; Schizzerotto et al., 2018, Rizzi, 2023). The study analyses the link between socio-economic and cultural factors and educational attainment and analyses the cumulative effect of these variables on occupational outcomes among Italians aged 25 to 68. Employing Blau & Duncan's (1967) “OED” (Origin, Education, Destination) model, the analysis explores variations in social origin across these dimensions using Multiple Correspondence Analysis (MCA) on European Social Survey data (2012, 2016, 2018, 2020). Results show how social origin influences educational achievement, affecting labour market access and relative income levels. Although education can reduce the impact of socio-economic background on job prospects, individuals' social origins still exert a strong influence. This suggests that education reduces inequality, but it doesn't entirely erase it.

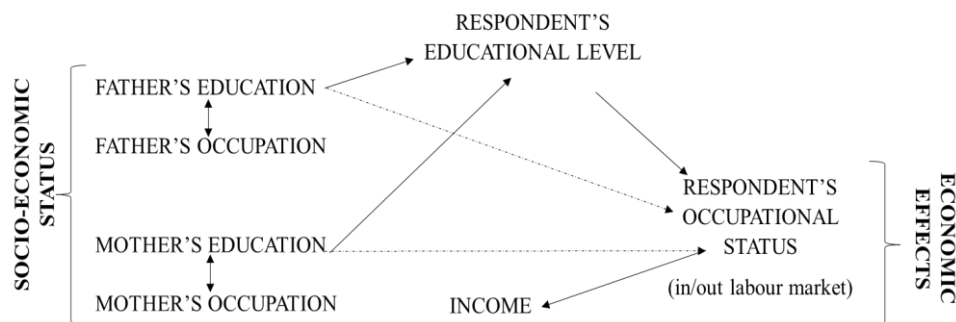

educational attainment; social inequalities; occupational outcomes; European Social Survey (ESS); Multiple Correspondence Analysis (MCA)

## 1. THEORETICAL FRAMEWORK AND AIMS

The literature on educational returns highlights its link to positive outcomes, including better job prospects and income (Becker, 1964; Sen, 1999), as well as non-economic benefits like improved quality of life and poverty reduction (Solga, 2014). Despite reforms improving access since the 1960s, the Italian education system still shows unequal outcomes influenced by socio-economic

background and ascriptive factors (Barone, 2009; Ballarino et al., 2016). These variables impact students' aspirations, performance, and expectations, shaping their future roles in the labour market and society (Checchi & Ballarino, 2006; Pensiero et al., 2019; Giancola & Salmieri, 2020). The unequal distribution of resources can lead "privileged" and "disadvantaged" academic pathways, with higher socio-economic groups achieving better education and jobs through economic means, social networks (Coleman, 1988), and cultural capital (Bourdieu, 1972). Conversely, lower-class individuals often face barriers that limit their opportunities for social mobility (Zella, 2010; Barone & Guetto, 2016). Based on this topic, this article examines the direct and indirect impact of socio-economic factors on education and the economic returns of educational investments. Research on social origins and life outcomes is depicted by the OED model (Blau & Duncan, 1967), showing how social origin (O), education (E), and outcomes (D) contribute to socio-economic inequalities (see Figure 1).

Fig. 1. The OED model revisited. Source: Blau e Duncan, 1967. Author's elaboration

Social origin affects educational achievement (O→E), links education to economic success (E→D), and directly influences life outcomes (O→D) (Ballarino & Bernardi, 2020). Family resources shape educational attainment by providing economic support and cultural capital which increase the likelihood of experiencing educational success (Bourdieu & Passeron, 1972; Bukodi & Goldthorpe, 2013). On the other hand, education directly impacts access to highly skilled, socially recognized positions in the labour market (O → D). Human capital theory (Becker, 1964, 1975) and economic approaches (Spence, 1973; Stiglitz, 1975) view education as both a "social mobility elevator" and a *signal* of skills, motivations, and traits used to handle the labour market. Socio-economic background can also directly influence career outcomes via parental support and social capital (Coleman, 1988; Bourdieu, 1972). Higher social background families build safety nets that shield children from downward mobility risks,

regardless of educational attainment (Ballarino et al., 2016). Studies support this model (Bukodi & Goldthorpe, 2015; Bernardi & Ballarino, 2016; Hällsten & Yaish, 2022), often using class schemes based only fathers' occupation and overlooking non-employment status.

In this study we propose a composition approach (Di Franco, 2016) that synthesizes social origin variables providing an alternative to the traditional causal approach used in these analyses (Erikson et al., 1979; De Lillo e Schizzerotto, 1989). The aim is to reconstruct social classes based on respondents' parents' socio-economic background, using the cultural capital framework (Bourdieu e Passeron, 1972). Specifically, the objectives are:

- develop a class scheme based on parental social positions (Bourdieu's social space, 1972) using a non-inferential approach;
- analyse how social origin shapes educational outcomes and class disparities;
- examine the indirect impact of socio-economic background on employment and income, focusing on inherited social space on employment status and income attained;
- investigate the mechanisms of intergenerational inequality by showing gender variations.

## 2. DATA AND METHODS

We explore these relations using four waves (2012, 2016, 2018, 2020) of Italian data from the European Social Survey (ESS) for a total of 20.686 cases. We excluded under 25yo and over 68yo subjects to avoid the spurious effect of the impact of those in training (<25) and who are retired from labour market (>68)<sup>1</sup>. It highlights how expanding education delays labour market entry by increasing participation in education and training. The selected sample is 14.098 cases, of which 49.2% were men and 50.4% women. From the dataset's 1,120 variables, we use respondents' highest educational qualification, employment, and income to analyse education's economic returns. These dimensions combined the ISCO 08 classification<sup>2</sup>, including respondents' non-employment status (11.2%), with data derived from reported annual household income. To reconstruct "cultural capital" (Bourdieu & Passeron, 1972), the study collected data on parents' education and jobs, using the updated International Socio-

---

<sup>1</sup> This decision addresses Italian pension policies that specify an age of 67 for retirement.

<sup>2</sup> The employment status variable was recoded into five categories as follows: 'Low' (11%); 'Medium Low' (20.4%); 'Medium' (19.4%); 'Medium High' (21.7%); 'High' (15.7%).

Economic Index of Occupational Status (ISEI) by Ganzeboom et al., 2010. Parents' employment status was defined using the ISCO-08 classification, including non-employment for both, due to the high proportion of non-working mothers in the sample (64%; 8640 cases). Excluding this condition might introduce substantial bias into the analytical findings.

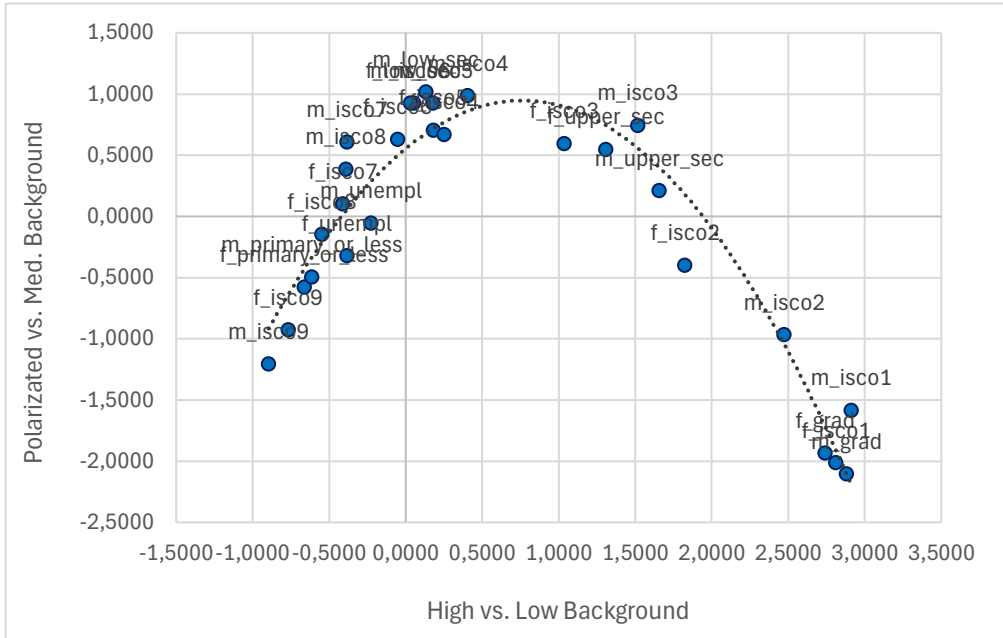

The analysis suggests three methodological steps.

- First, we use Multiple Correspondence Analysis (MCA) to define the inherited social space, based on the social field (Bourdieu, 2018) elements of socio-economic background.
- Next, we apply Cluster K-means Analysis (CA) to analyse the relationship between educational attainment and background dimensions.
- Finally, we map the variables on the inherited social space to examine distribution and intergenerational mobility.

## **2.1. Composition approach**

The social origin dimension was developed using a composition approach with nonlinear multivariate analysis for categorical variables, focusing on identifying connections rather than cause and effect. Specifically, we use Multiple Correspondence Analysis (MCA) and Cluster Analysis, avoiding probabilistic models and providing an alternative to the standard inferential approach (Di Franco, 2016). MCA enables simultaneous analysis of a set of categorical variables by extracting dimensions or factors that synthesize and reproduce the associations among the variables considered. On the other hand, Cluster Analysis classifies data by grouping similar cases together, offering another tool for interpreting the patterns identified through MCA. In terms of composition, the interplay between variables is shown in a multidimensional space, with closer proximity indicating stronger interdependence and larger distances suggesting weaker associations. Using MCA, we included parental occupation (ISCO) and education, producing two dimensions saved as matrix scores. The x-axis represents social origin stratification (low vs high), while the y-axis reflects class bias in average background (polarized vs medium). These dimensions were showed in a scatterplot (Fig. 2) with the original variables.

Fig. 2. The OED model revisited. Source: Blau e Duncan, 1967. Source: Autor’s elaboration of ESS (2012, 2016, 2018, 2020) data.

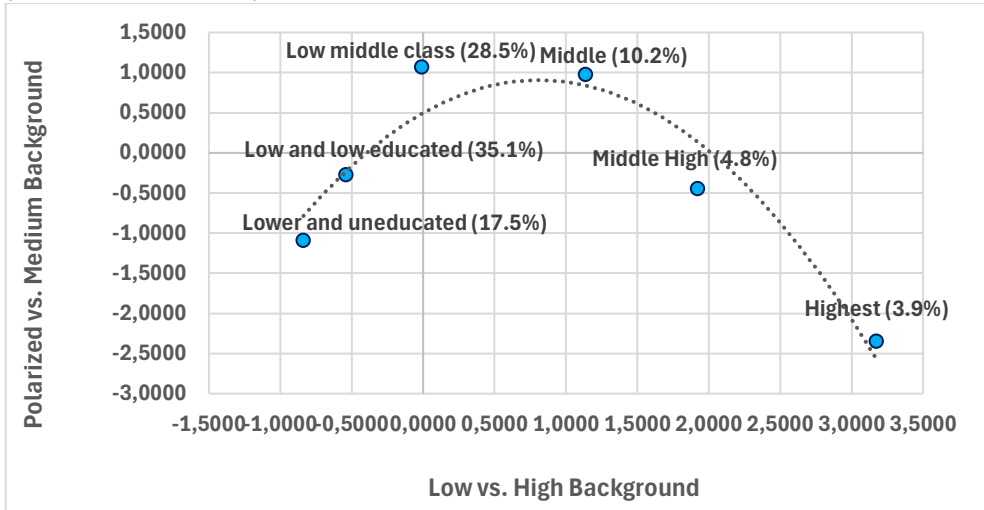

ISCO is scaled from 1 (highest) to 9 (lowest). As shown, a linear progression can be traced for both educational levels and ISCO occupations, except for the non-occupational status. Those with the lowest ISCO levels and education are distributed in the lowest social origin quadrant, while higher ISCO levels and university degrees fall in the high socio-economic origin area. Individuals in non-occupational status show greater association with a lower-middle socio-economic background, suggesting that their position also depends on factors other than social origin. Following the disposition on the inherited space, we employ a Cluster Analysis (k-means) to construct social classes reflecting the socio-economic background of the respondents. The analysis generated seven clusters, of which the last two were merged using a hierarchical criterion (dendrogram).

We plotted the average social origin scores for the clusters in a scatter diagram (Fig. 3) and showed the distribution in percentage terms. This representation revealed a clear differentiation among social classes based on the dimensions of stratification and class bias. The clusters align with the axes: lower classes (left) show negative polarization, while middle and upper classes (right) display positive polarization. The trend curve reveals a widening gap in average

background for lower socio-economic groups, narrowing at the middle class, and expanding again for higher socio-economic backgrounds.

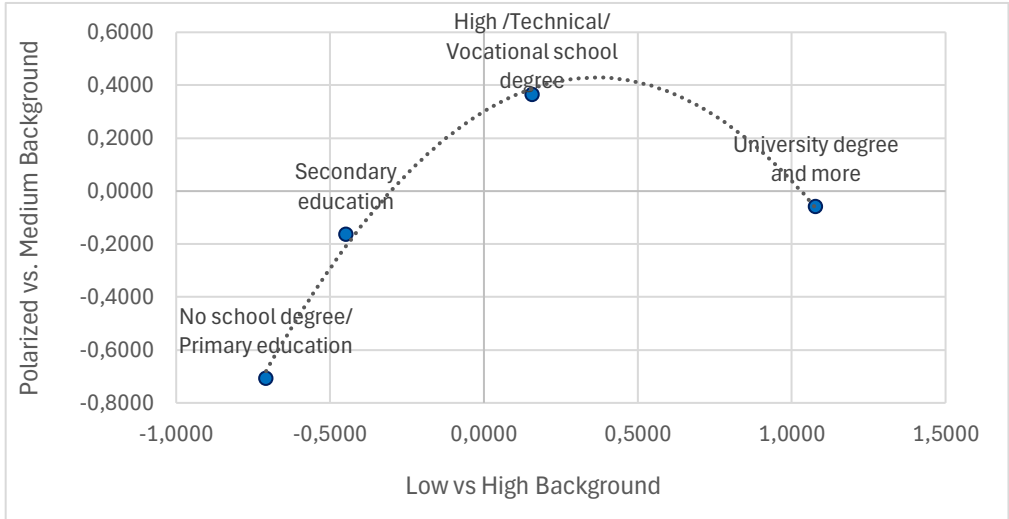

Fig. 3 Scatter plot of clusters produced using K means analysis. Source: Autor’s elaboration of ESS (2012, 2016, 2018, 2020) data.

### 3. RESULTS

We conducted an analysis of variance to show how ascriptive variables (gender, age) and acquired factors (education, employment, income) differ within the inherited social space. Younger age groups (25-34 and 35-44 years) are clustered towards the upper right, showing a higher socio-economic background and closer alignment with the average background. In contrast, older age groups (45-54 and 55-68 years) are located towards the lower left, reflecting a more modest background and a class polarization further from the average background. Gender appears neutral across both dimensions, while age shows a linear trend, increasing with social origin. Educational qualifications distribute along social origin (Fig. 4): individuals with no or primary education cluster in the lower-left, reflecting low socio-economic backgrounds and strong polarization. Tertiary education appears in the lower-right, indicating high socio-economic backgrounds but negative polarization, suggesting elite status. Middle school qualifications show a slightly higher position with reduced bias and medium socio-economic backgrounds. At least, high school diplomas are centrally placed, showing balance between social origin and polarization, with greater social heterogeneity.

Fig. 4 Educational Attainment distribution in the inherited social space. Source: Autor’s elaboration of ESS (2012, 2016, 2018, 2020) data.

Regards occupation (Fig. 5), people in high-status professions (ISCO 1-2) often come from privileged backgrounds, leaning toward higher social classes. In contrast, low-prestige jobs requiring basic skills (ISCO 6-9) are associated to lower social origins. Non-occupational individuals, like parents (Fig. 2), show average socio-economic backgrounds, slightly polarized toward lower classes. ISCO 3 and 4 show medium polarization with better social origins than ISCO 6-9, though less stratified than ISCO 1-2. ISCO 5 and 7 are also moderately polarized but lean negatively on the socio-economic scale.

The income deciles (Fig. 6) show a clear pattern: lower income groups (“J” and “R”) cluster on the left, reflecting persistent socio-economic disadvantage and low income. This pattern highlights the association between occupational status to earnings, showing how difficult it is for those less fortunate to climb the social ladder. Conversely, higher deciles (“K” and “P”) are on the right, linked to privileged origins and upper-class polarization. Middle deciles (“M,” “F,” “S”) hold a central, non-polarized position, suggesting limited mobility for those with average socio-economic backgrounds. Individuals within the uppermost decile cluster within the quadrant characterized by high social origin, thus showing a propensity for preserving their inherited status with limited upward mobility.

Tab. 1 Income distribution in the inherited social space. Source: Autor's elaboration of ESS (2012, 2016, 2018, 2020) data.

	<b>Occupational status recod</b>						<b>Totale</b>
	Out.occu	Low	Middle Low	Middle	Middle High	High	
<b>Lower and uneducated</b>	3,2%	3,3%	4,4%	3,5%	2,1%	1,0%	17,6% (2332)
<b>Low and low educated</b>	4,5%	4,3%	8,3%	7,4%	6,7%	4,0%	35,2% (4668)
<b>Low middle class</b>	2,5%	2,3%	4,8%	5,5%	9,0%	4,7%	28,8% (3826)
<b>Middle</b>	0,6%	0,4%	0,8%	1,5%	3,6%	3,1%	10,1% (1336)
<b>Middle High</b>	0,2%	0,1%	0,3%	0,7%	1,4%	2,1%	4,7% (627)
<b>Highest</b>	0,2%	0,1%	0,1%	0,2%	1,0%	2,0%	3,6% (477)
<b>TOT</b>	11,2% (1484)	10,4% (1385)	18,7% (2482)	18,8% (2490)	23,9% (3171)	17,0% (2254)	100,0% (13266)

Occupational status recod\*Social Origin class.% total. Valid Cases: 13266; Chi-quadrato: 2429.289; gl 25; sign .000; Contingency coeff.: .393

An analysis of intergenerational mobility (Tab. 1), which assesses the influence of family socio-economic background on respondents' life destinies, reveals a pattern of restricted upward mobility for individuals from lower classes, enhanced mobility for those from upper classes, and moderate mobility for individuals from middle socio-economic classes. People with limited socio-economic resources often face challenges finding stable, leading to lower-status jobs or unemployment. These individuals experience both reduced job opportunities and limited intergenerational mobility, alongside greater hurdles in their social climb. Conversely, individuals from "middle high" and "highest" social backgrounds keep an occupational advantage, leading to a higher probability of reaching top positions.

This trend highlights these individuals' ability to maintain their socio-economic advantage, increasing the likelihood of upward mobility. While here is some

short-range mobility, immobility is more common, especially for women (0.409)<sup>3</sup> compared to men (0.393).

## CONCLUSION

We can draw one methodological conclusion and one relating to theoretical and substantive aspects. From a methodological view, the compositional approach has shown its strength in synthesizing the different dimensions of social origin. This method offers several advantages: on one hand, it overcomes issues related to multicollinearity between individual variables, which is a common challenge in regression models. One advantage of these techniques is that it can address multicollinearity, a problem commonly found in regression models. It also allows to include categories that are often overlooked, such as non-occupational status, especially for mothers. The latter, in the surveys, are usually in a non-occupational status of a housewife that is excluded from the analyses. This approach is replicable in other studies and allows the use of generated clusters as dummy variables in analytical models, enhancing flexibility. On a theoretical and substantive level, the results confirm Bourdieu's (1972) framework of social and cultural reproduction and the link between social origin, education, and life outcomes (Blau & Duncan, 1967).

In addition, the data show mostly short-range mobility, with a clear tendency towards intergenerational immobility, reflecting structural challenges in overcoming social inequalities.

# BEING NEET IN ITALY IN THE POST-COVID-19 ERA

Marialuisa Villani<sup>a</sup>

Riccardo Prandini<sup>a</sup>

<sup>a</sup>Political and Social Science department University of Bologna

Over the past three decades, the term NEET (Not in Education, Employment, or Training) has gained global prominence in describing young individuals disengaged from education and the labor market. Originally coined in the late 1990s to describe British youth aged 16–18, the term now encompasses a heterogeneous social group with diverse characteristics depending on the context. In Europe, NEETs are primarily analyzed in terms of risks of social and economic exclusion for individuals aged 15–29, reflecting challenges in education and labor sectors. In Italy, the NEET phenomenon became significant in the late 1990s and worsened during the 2008 economic crisis and the COVID-19 pandemic. Despite a decline in the NEET rate from 26% in 2021 to 23% in 2022 (OECD) in Italy, it remains a critical issue. Factors such as educational poverty, school dropouts, and inadequate labour policies contribute to this persistent challenge. This paper examines the Italian NEET condition using data from the 2018 and 2021 waves of the PLUS survey (Participation, Labour, Unemployment, Survey) conducted by INAPP. Our findings aim to provide a nuanced understanding of this complex phenomenon and inform policy interventions.

NEET, education inequalities, labour market inequalities, youthness, social exclusion

## INTRODUCTION

The term “NEET,” which stands for “Not in Education, Employment, or Training,” first emerged in Great Britain in the late 1980s. Initially used in the British context NEET has gained recognition across various European Union member states. The Employment Committee of the European Commission (EMCO) officially adopted the NEET terminology as part of the European Union agenda with the Horizon 2020 strategy in 2010 (Mascherini & Ledermaier, 2016).

Following its introduction into European public policy discourse, the NEET concept quickly became a vital framework for identifying the various vulnerabilities that young individuals face throughout their life paths. The economic crisis that swept through Europe between 2008 and 2009 led to increased rates of youth unemployment and inactivity, making the NEET issue a significant concern for the European Union (Avis, 2014; Mascherini & Ledermaier, 2016). Over the years, the term NEET has been interpreted in various ways by researchers and policymakers, resulting in a diverse group of individuals being classified under it.

In Italy, the NEET phenomenon gained significance since the late 1990s, with economic crises such as the 2008 financial downturn (Agnoli, 2014) as well as the COVID-19 pandemic, contributing to increased NEET rates in the country. According to OECD data for Italy in 2021, there was a NEET rate of 26% among young people aged 15 to 29. In 2022, this rate decreased slightly to 23%, though the NEET issue persists as a pressing concern in our context.

In this paper, we explore the factors that influence the likelihood of being NEET and the protective factors against this status of educational and labour exclusion. For our analysis, we will utilize data from the 2018 and 2021 waves of the PLUS survey (Participation, Labour, Unemployment, Survey) conducted by the National Institute for Public Policies Analysis (INAPP).

## **THE NEET PHENOMENON**

Contemporary scholarship has yielded substantial empirical and theoretical contributions regarding the NEET phenomenon across multiple disciplinary domains (Furlong, 2007; Maguire, 2015; Pacelli et al., 2023). Our systematic analysis reveals three primary theoretical frameworks through which researchers have conceptualized NEET status: educational trajectories, labour market integration, and transitions to adulthood. Recent scholarship has further enhanced these theoretical paradigms by incorporating analyses of gender disparities (Zuccotti & O'Reilly, 2018; Odoardi et al., 2023) and mental health outcomes (Quinlan-Davidson et al., 2023; Buckman et al., 2023).

Within educational discourse, two salient findings emerge: the correlation between early educational disengagement and subsequent NEET status, and the protective function of tertiary education against NEET outcomes (De Luca et al., 2020; Warburton et al., 2024). This educational paradigm intersects with scholarly examination of school-to-work transitions, wherein researchers have illuminated persistent structural inequalities that manifest during this critical

developmental period (Dorsett & Lucchino, 2014; Lazzarini et al., 2020). Such analyses are intrinsically linked to broader labour market dynamics (Caroleo et al., 2020). Furthermore, theoretical frameworks examining the transition to adulthood conceptualize NEET status as a potentially transitory phase that, if prolonged, may precipitate sustained social marginalization (Van de Velde, 2019). This body of literature emphasizes that NEET status should not be attributed solely to individual agency but rather understood within the context of broader societal transformations, necessitating a reconceptualization of contemporary transitions to adulthood (Carcillo et al., 2015; Van de Velde, 2019).

## **DATA AND METHODOLOGY**

In this study, we utilize Survey (PLUS) data conducted by INAPP for the 2018 and 2021 editions. The analysis focuses on individuals aged 18 to 74 years. The data represent respondents' statements rather than directly collected administrative data.

To address the NEET (Not in Education, Employment, or Training) condition, we created two sub-samples of young individuals aged 18 to 29 for each edition considered. In the 2018 wave, the sub-sample represented 7,396,403 young citizens, with 8.3% classified as NEET. In the 2021 edition, the sub-sample represented 7,256,649 youngsters, of which 9.2% were NEET. We organized our analysis into three parts. In the first part, we conducted a distribution analysis of various ascriptive variables, including socio-economic origin, educational background, age, and gender. We created a dummy variable to represent NEET status<sup>1</sup> (see Table 1). Additionally, we developed new variables, such as an index for parental education<sup>2</sup> and a dummy variable representing whether the individual has a child or not.

In the second part of the analysis, we performed a binary regression model analysis for the editions from 2018 and 2021. For each edition, we designed three models to assess the influence of gender, educational background, age, area of residency, the parental education index, and whether the individual has

---

<sup>1</sup> The indicator (NEET) identifies young people aged 15-29 who are neither employed nor in education or training in the four weeks preceding the interview. This includes any school or university education or training activity.

<sup>2</sup> The parent education index is an additive measure based on the educational backgrounds of both the mother and father interviewees. We conducted a contingency test on the variables representing the educational and professional backgrounds of parents. The relationship between parents' educational backgrounds was stronger compared to their professional backgrounds.

a child on the probability of being NEET. In the final stage of the analysis for the 2021 edition, we decided to split the regression model to include all the variables considered, with a distinction made by gender.

## BEING NEET IN ITALY

ISTAT data shows that the average percentage of NEETs in Italy was approximately 23% for both 2018 and 2021. In 2018 and 2021, the NEET population showed a female prevalence of approximately 25%, compared to 21% for males.

In both editions of the PLUS survey analysed, the sub-sample consisted mainly of individuals aged 18 to 24, accounting for around 60% of the respondents. This group was almost evenly divided in terms of gender. At the time of the interview, nearly 60% of the participants had obtained a secondary school diploma (ref. Tab1).

Tab. 1. Distribution of youngster characteristics participant source (PLUS)

Youngster	2018	2021
Female	48,70%	48,40%
Male	51,30%	51,60%
Primary/Middle school diploma	26,90%	24,50%
High School Diploma	57,60%	57,60%
University Diploma	15,50%	17,90%
Age 18-24	56,70%	60%
Age25-29	43,30%	40%
Nord-West	23,40%	23,70%
Nord-East	16,80%	17,80%
Center	18,30%	18,90%
South	26,90%	26,90%
Island	14,60%	12,70%

Table 2 presents three binary logistic regression models derived from the PLUS 2018 edition. The first model (Mod 1) includes gender, age, educational qualification, and geographical area of residence as independent variables. The findings indicate that being female increases the likelihood of falling into the NEET category by 2.5 times. Additionally, belonging to the 25-29 age group raises the risk by more than threefold. This result is also identified in research on the NEET phenomenon, indicating that older NEET individuals are at a greater risk of remaining NEET for a longer duration (Vugt et. al 2022; Odoardi et. al 2023). The geographic location in the northern regions of Italy plays a crucial role in decreasing the likelihood of youth becoming NEET.

Obtaining a university degree, in comparison to holding only a low secondary school diploma, results in an 80% reduction in the probability of entering NEET status (Vugt et. al 2022).

In the second regression model (Mod. 2), the presence or absence of children is introduced as an additional predictor alongside the previously considered variables. While gender and age maintain their statistical significance as determinants of NEET status, parenting emerges as the most significant factor for increasing this probability, independent of the other variables. The third model (Mod. 3) incorporates the parental education index to explore the relation between family cultural capital and NEET status.

The analysis of the logistic regression model, from PLUS 2018 wave, reveals a significant interaction effect involving the female gender, the age demographic of 25-29, and the presence of children, which notably elevates the likelihood of individuals being classified within the NEET (Not in Education, Employment, or Training) category. This empirical finding is corroborated by recent scholarly literature (Avagianou et al., 2022; Odoardi et al., 2023), highlighting how the gender disparity, shaped by both structural and cultural determinants, distinctly influences the socio-economic landscape within the Mediterranean region of the European Union. The impact of residential area is somewhat reduced in the third model, yet the existing north-south gap remains evident from previous models. The significance of educational attainment as a crucial protective factor against the risk of becoming NEET has been thoroughly documented in contemporary literature (Vugt et al., 2022). As elaborated in the initial segments of this article, the configuration and level of stratification within the educational system exert a profound impact on the duration of NEET status.

In Table 3, we present the results of our analysis of the PLUS 2021 dataset. In the first model, age does not show significant statistical relevance; however, gender is confirmed as a key factor increasing the risk of being classified as NEET (Not in Education, Employment, or Training). Notably, the geographic disparity has widened compared to the surveys conducted in 2018. Having a high level of education is the most effective protective factor against the risk of becoming NEET, with individuals who hold a bachelor's degree experiencing a 77% decrease in their likelihood of falling into this category. Another important finding is the evolving impact of parenthood as a risk factor. While this variable was identified as a significant determinant in 2018, its influence has doubled by 2021. The analysis shows that individuals with children are approximately 4.5 times more likely to be in NEET status compared to those without children. Regarding the gender variable, although it continues to negatively affect women more than men, its overall impact has lessened. This phenomenon is likely due to the influence of the parenting variable, which has partially absorbed the effect.

Based on the findings, we conducted separate analyses of the PLUS 2021 dataset for males and females, using all variables from Model 3 (Tab 3) to examine how other intervening variables interact within these two gender groups (Tab 4).

Logistic regression models 1 and 2, as presented in Table 4, yield significant insights into the factors affecting NEET (Not in Education, Employment, or Training) status, differentiated by gender. Being in the 25-29 age group functions as a protective factor, with a marginally higher incidence observed among males relative to females.

Educational attainment emerges as a critical protective factor, particularly for women: possessing a high school diploma reduces the likelihood of NEET status by 49%, while obtaining a college degree decreases this likelihood by 68.8%. Furthermore, parental socio-cultural background serves as a protective

element for both genders, although it exerts a more pronounced influence on females.

Of particular significance is the impact of parenthood: while it elevates the risk of NEET for both genders, the degree of this impact is notably differentiated. For women with children, the likelihood of being NEET is approximately 7.5 times greater than that of women without children. Conversely, for men with children, the likelihood is roughly double that of their childless peers. This finding suggests that the responsibility of caregiving predominantly rests with women. (Odoardi et.al, 2023).

## DISCUSSION AND CONCLUSION

In this paper, we aimed to identify the determinants of becoming a NEET both before and during the COVID-19 pandemic.

Higher education serves as a crucial protective factor against NEET status in

Italy, emphasizing the urgent need for educational policies that address systemic inequalities, tackle early school leaving, reduce university dropout rates, and enhance student guidance services. Geographic location emerges as another critical determinant, with residence in the Northeast significantly mitigating NEET risk. This regional advantage stems from the distinctive structure of Italy's employment market, characterized by pronounced territorial disparities. The northeastern regions benefit from a particularly dynamic economic framework, supported by well-established industrial districts and an extensive network of small and medium-sized enterprises (Cinquegrana et. al, 2023; Lovaglio & Berta 2024). This environment significantly facilitates the integration of the youth workforce into the labour market, thereby reducing the prevalence of NEET status among young individuals in these areas.

The Italian social system reveals a concerning lack of support policies for parents, particularly women, seeking employment and economic independence. The 2021 PLUS survey results demonstrate that the pandemic emergency substantially amplified existing gender inequalities. The persistent gender gap associated with motherhood and unemployment risk potentially constitutes a form of economic violence – a phenomenon that remains understudied in current research. This highlights an important avenue for future investigation: examining the relationship between unemployment and gender-based violence, which deserves greater scholarly attention and analysis.

It is important to emphasize that the NEET condition is not static; rather, it can be viewed as a temporary state from which one can escape. The NEET condition becomes problematic when there is a prolonged stay in this state.

# INDIGENOUS HERITAGE, WAR REFUGEES OR LANGUAGE FOR ACADEMIC PURPOSES: EXPLORING LANGUAGE CENTRES' SOCIAL JUSTICE AND VULNERABLE COMMUNITIES EMPOWERMENT POTENTIAL

Libor Stepanek<sup>a</sup>

<sup>a</sup>Masaryk University Language Centre

Universities are adapting to significant changes driven by globalization, knowledge economies, and environmental challenges. So are Language Centres (LC) with their traditional focus on language education. LCs now address broader institutional objectives, including internationalization, intercultural awareness, democratization, and inclusivity. These expanded responsibilities align with the Third Mission of universities, a commitment to societal contribution, encompassing social, economic, and cultural development. The Masaryk University's Language Centre (CJV) is presented as an example of the new role of LCs. These evolving roles include offering courses in underrepresented languages, integrating international teaching assistants, and linking university students with local communities. A notable recent Third Mission activity, the EPSULA Project, aims at preserving the linguistic heritage of indigenous Latin American communities through technology and education. The CJV's response to crises shows potential of LCs' societal impact. Following Russia's 2022 invasion of Ukraine, the centre swiftly organized intensive Czech language courses for Ukrainian refugees, enabling over 480 students to integrate into Czech university programmes. This effort highlighted the CJV's adaptability and its capacity to foster inclusivity through comprehensive linguistic and cultural support. The example of CJV demonstrates how innovation and commitment can transform language centres into agents of positive global change.

Language Centre; Third Mission; inclusivity

## INTRODUCTION

University Language Centres (LCs) are adapting to significant changes driven by globalization, knowledge economies and environmental crisis. Due to those unprecedented challenges, universities have been reshaping their missions, extending their focus beyond education and research to include a broader societal contribution, their Third Mission (Compagnucci, Spigarelli, 2020). The Third Mission emphasizes the role of academia in fostering social, economic, and cultural development within their regions and beyond, while promoting social responsibility. LCs have never existed in isolation from their universities (Wulkow Memorandum, 2018), and similarly to their universities, the LCs have been forced to redefine their roles, too. They have been moving from their traditionally unique focus on language education to multifaceted service institutions which address broader institutional objectives at the intersection of diverse agendas, including internationalization, intercultural awareness, democratization, and inclusivity (Wulkow Memorandum, 2019).

Taking the example of the Masaryk University Language Centre, this text presents some of the LC's activities related to the Masaryk University (MU) Third Mission and analyses the most complex one, namely language support to Ukrainian refugees in 2022, to show typical characteristics of LCs which help them react to global events responsibly.

### **1. ROLLING BACK THE FEDERAL ROLE IN EQUITY MASARYK UNIVERSITY LANGUAGE CENTRE, *CENTRUM JAZYKOVÉHO VZDĚLÁVÁNÍ (CJV)***

The CJV serves as an example of a complex LC. With over 120 staff members teaching approximately 10,000 students each term, it is the largest LC in Czechia. Apart from its first and second missions in teaching and research, it engages in a wide range of activities related to diverse Third Mission initiatives. They include offering courses in lesser-taught languages, such as Swahili, creating modules on critical thinking and fake news in foreign languages, involving international students as teaching assistants (CJV, 2024) or connecting university students with local elementary and secondary schools, museums, and libraries (CJV, 2022). More globally, the CJV has also contributed to a bi-lingual programme development in Tunisia (CUDIMHA, 2022) and most recently, it has been coordinating a project which aims “to preserve cultural heritage, including the languages of the indigenous communities of Latin America that have never been recorded in writing” (EPSULA, 2024).

The EPSULA Project demonstrates how LCs can impact global social justice. The

initiative, developed with partners from Ecuador, El Salvador, Spain and Finland, has achieved significant impact already. The Ecuador and El Salvador academics have collected and recorded authentic audio and video materials among the indigenous communities, based on which the European teams developed educational modules. They are now being used in Ecuador and El Salvador. The social impact has also been visible in the Czech Republic, where a series of exhibitions on the Latin American communities (MZM, 2024) attracted local schools, expanding their awareness of diversity of world cultures, and motivated Latin American communities to be more active in the Czech society, fostering, thus, greater inclusivity and cultural awareness.

## **2. LANGUAGE SUPPORT FOR UKRAINIAN REFUGEES**

The rapid response of the CJV to the Ukrainian refugee crisis in 2022 illustrates its adaptability and potential for societal impact. Following the Russian invasion, Czechia welcomed over 300,000 Ukrainian refugees, including university students. Within its Third Mission, MU recognized the urgent need for language support to facilitate the prospective students' inclusion into the Czech-speaking academic and social environment. In March 2022 already (the war began on 24.2.2022), the CJV was asked to prepare a plan of a language programme that would guarantee to Ukrainian students a possibility to reach a level of Czech language (around B2 CEFR) which would enable them to join Czech-taught university programmes by September 2022.

Thanks to its experience with tailored courses, flexibility in course development and quality management functioning scheme, the CJV introduced the programme in early April and was established the coordinator of the initiative at MU; Faculties of Education and Arts provided limited support within their limits.

As moving from one CEFR level to another takes typically 100-200 learning hours and since Ukrainian and Czech are both Slavic languages with some shared linguistic features, the language support was planned as a series of intensive courses (20-30 hour/week) in the period May-August, finishing with an exam at the end of August, so that the faculties could enrol the new students in September (the MU academic year starts in mid-September).

The challenges were significant and included unpredictable student arrivals, limited teaching and support staff, and insufficient classroom space. The highest expected number of students was 500 and they were not expected to arrive at once. That is why the system included successive openings with placement tests during May and June, with the last opening at the first week of

July. Organisationally, the most complex challenge was the scale of the programme. To make the language support effective, the maximum number of learners in a group was set to 15, which meant that the CJV had to be ready to accommodate students in 35 seminar groups in intensive courses of 20-30 hours per week for the period from May to August. That caused two major issues, namely classrooms and teaching staff.

The space issue was rather dramatic at the beginning of the programme, when teaching at MU was still taking place, but with the beginning of the exam period in mid-May, more classrooms were free to be used and all the MU faculties collaborated effectively, so that the programme could run.

The most dramatic challenge was to “find” potentially up to 45 teachers of Czech as a Foreign Language (CFL). The number of teachers of CFL in 2022 was rather limited due to a relatively low social demand (Czech language consists of approximately 10 million speakers). Therefore, the programme had to hire teachers from the whole region, and/or train teachers of Czech for the specificities of the CFL methodologies. The programme also encouraged Czech students to become “buddies”, who would practice Czech language with their Ukrainian peers, helping them improve their language and include them to the Czech society more naturally at the same time.

The focus on inclusivity was evident in the form and content of the final exam, which did not assess the CEFR levels of the students but categorised them into three groups according to their readiness to join the Czech-taught programmes. Group A were those who met the required proficiency level and could be admitted to the programmes, Group B were close to meeting the required proficiency level, so they were admitted to the programmes, but they were offered some continuous language support during the term, and Group C were those who did not meet the criteria and were offered intensive Czech courses for another term.

The successful initiative emphasized inclusion, treating refugee students as equals and integrating them into the academic community through additional language, cultural and emotional support programmes. At the same time, CJV’s ability to mobilize resources quickly and effectively (finally, 480 went through the programme) highlighted the importance of flexibility and innovation in responding to crises. This initiative could also show the potential of LCs to act as bridges between vulnerable populations and host communities.

## CONCLUSION

This text offers a deeper understanding of the current role of LCs, while reflecting the broader transformation of universities and their Third Mission focus. By providing traditional language education, supporting linguistic diversity, aiding marginalized communities, and addressing global challenges, LCs can play a crucial role. The work of the Masaryk University Language Centre, which has required addressing fundamental organisational challenges, fostering wide collaboration and embracing the complexity of the services provided, demonstrates how innovative approaches and a commitment to the Third Role can transform an LC into an agent of positive change, both locally and globally.

# SCHOOL SEGREGATION AND SCHOOL DROPOUT IN PUBLIC PRIMARY SCHOOLS: THE CASE STUDY OF BOLOGNA

Irene Giunchi<sup>a</sup>

<sup>a</sup>University of Bologna

The paper investigates the presence and the extent of ethnic segregation in public primary schools in Bologna. It begins with a theoretical discussion of key factors influencing school segregation in the South European context, focusing on the relationship between parental school choice and the ethnic and socio-economic characteristics of urban areas. Through geospatial analyses and descriptive statistics, the study examines patterns of ethnic segregation based on students' places of residence and school enrolment. The findings reveal significant segregation in 25% of public schools and demonstrate how student mobility – both native and foreign – amplifies the impact of residential composition on school composition. Furthermore, the paper identifies a positive association between school segregation and dropout rates, suggesting implications for students' educational trajectories and paving the way for future research on the effects of school segregation.

school segregation, school dropout, school choice, primary schools

## INTRODUCTION

Drawing on insights from North American research, an expanding body of European studies investigates the phenomenon of school segregation, which is defined as the presence of “significantly higher concentration of a minority group in a school than exists in the city as a whole” (Cordini *et al.*, 2019). While the U.S. literature predominantly attributes school segregation to patterns of residential segregation (Reardon, Owens, 2014), European research highlights additional factors that contribute to the emergence of ethnic and social segregation within schools. In particular, the institutional regulation of the education system and parental agency may exacerbate the impact of residential

composition on school segregation (Oberti, Prêteceille, 2017; Boterman et al., 2019). This dynamic is especially pronounced in cities across Southern Europe, where residential segregation mainly concerns the micro scale within neighbourhoods (Bonal, Bellei, 2018; Boterman et al., 2019).

In Italy, research on school segregation has grown significantly over the past decade, largely in response to recent migration flows. Indeed, the phenomenon is particularly studied in northern regions, where foreign populations are more concentrated. Consistent with other Southern European countries, residential segregation in Italy is largely confined to the micro scale within neighbourhoods. However, school segregation has been observed, primarily driven by the mechanisms governing school choice (Cordini et al., 2019). Specifically, municipal authorities define school catchment areas (hereafter CAs) by dividing the city into districts and assigning each area to one or more public schools, based on the proximity between students' homes and schools. While the CAs were once mandatory until the 1980s, they now serve only as a reference. In fact, not all families adhere to the CA; native and socio-economically privileged families often take advantage of this freedom, enrolling their children either in private schools or in schools located outside their designated CAs. In some cases, these choices are driven by a desire for social identification, but more commonly, they reflect a strategy to avoid schools in more disadvantaged areas. Consequently, school choice is closely tied to territorial characteristics, with the intensity and direction of school flows changing according to the socio-economic and ethnic composition of urban areas (Cordini et al., 2019; Wilson & Bridge, 2019).

Against this background, the paper aims to explore how and to what extent ethnic segregation affects primary public schools in the Municipality of Bologna. Bologna has a notably high proportion of foreign minors of school age (20%), significantly exceeding the national average of 11%. While a study on school segregation in Bologna has focused on secondary schools (Santangelo et al., 2018), no studies have specifically addressed primary schools, which have the highest proportion of foreign students<sup>1</sup>. Additionally, although residential segregation among foreign populations remains relatively low at the city level, Bologna demonstrates *interstitial segregation* (Bergamaschi, 2012), with certain micro-areas exhibiting higher concentrations of foreign residents. This micro-scale segregation potentially influences both the composition of local

schools and the school choice behaviours of families living in these areas. Finally, since 2015, the Municipality of Bologna has introduced a system that allows schools to report students at risk of dropping out to the municipality and request support for the implementation of targeted educational interventions. In the absence of detailed data on dropout rates at the sub-municipal level, the case of Bologna presents a valuable opportunity to explore the relationship between school segregation and dropout rates.

## **RESEARCH QUESTIONS, DATA, AND METHODS**

The paper presents the preliminary findings of an ongoing doctoral research project that investigates the existence and extent of school segregation within the municipal area of Bologna. This study investigates the presence of schools with a high concentration of foreign students (non-Italian citizens) and explores how residential composition and parental school choice shape patterns of school segregation. Funded by PNRR resources, the research is a collaboration between the Department of Sociology and Business Law at the University of Bologna and the Municipality of Bologna. Specifically, within the broader context of limited access to disaggregated statistical data at the sub-municipal level, this work relies on detailed data provided by *Area Educazione, Istruzione e Nuove Generazioni*.

The paper addresses the following research questions: 1) to what extent does residential segregation influence school segregation? 2) What is the impact of home-to-school mobility on school segregation? 3) How are the social and ethnic characteristics of residential CAs associated with patterns of student mobility? 4) Is there a relationship between school segregation and school dropout rates?

Within this framework, we analyse data for students residing in the Municipality of Bologna who were enrolled in public primary schools during the 2021/2022 SY (a total of 12,588 students, representing over 95% of all enrollees). The dataset includes detailed information for each student, such as citizenship, school enrolment, and CA, which allows for the identification of students who attend their designated school versus those who choose schools outside their CA. Additionally, by analysing requests for reduced school meal fees, we determine the Equivalent Economic Status Indicator (ISEE) for 56% of the students. Finally, we analyse data on students identified as at risk of school dropout<sup>2</sup> within the same SY. Public primary schools submit this data to the

---

<sup>2</sup> The risk of dropout applies to students who exceed 20 days of unauthorised absence.

Municipality of Bologna to request targeted educational interventions aimed at providing necessary support.

The CA is used as the geographical unit of analysis for mapping and descriptive statistics on the residential distribution of the school population, enrolments, and home-to-school mobility. Although CAs are not legally binding, their geographical boundaries define the residential proximity zones for each school, thus enabling the analysis of mobility while accounting for the geographic distance between students' residences and their schools.

Public primary schools (56 in total) represent the education system with the best-developed territorial distribution and have smaller and more numerous CAs (41) compared to the middle schools (22). However, it should be noted that it was not possible to analyse data on students enrolled in private primary schools, which constitute 14% of the total population.

The analysis is conducted in four steps:

- We measure the segregation of foreign students (students without Italian citizenship) by calculating the Dissimilarity Index (DI). Residential segregation is calculated considering all the 41 CAs of the city, while school segregation is assessed based on the distribution of enrolments across the 56 primary schools in Bologna.
- Using georeferenced tools (*QGIS*), we examine the residential and school distribution of foreign students across the CAs to identify potential discrepancies between residential and school compositions.
- We analyse the between-CAs mobility of both Italian and foreign students, considering the socio-economic characteristics (average ISEE) and ethnic composition (percentage of foreign minors) of the CAs to assess how these factors are associated with student mobility.
- We analyse the distribution of students at risk of dropping out during the 2021/2022 SY to explore potential associations between school segregation and dropout rates.

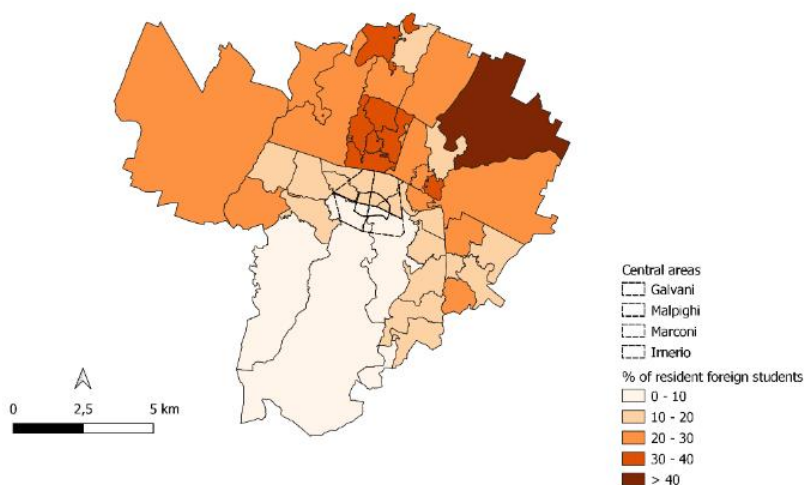

## **FINDINGS**

### **Residential and school segregation**

In the 2021/2022 SY, the proportion of students enrolled in public primary schools in the Municipality of Bologna is 21%. Consistent with findings from other Southern European cities (Boterman *et al.*, 2019), the results of the DI show low levels of residential segregation (0.216), confirming the absence of

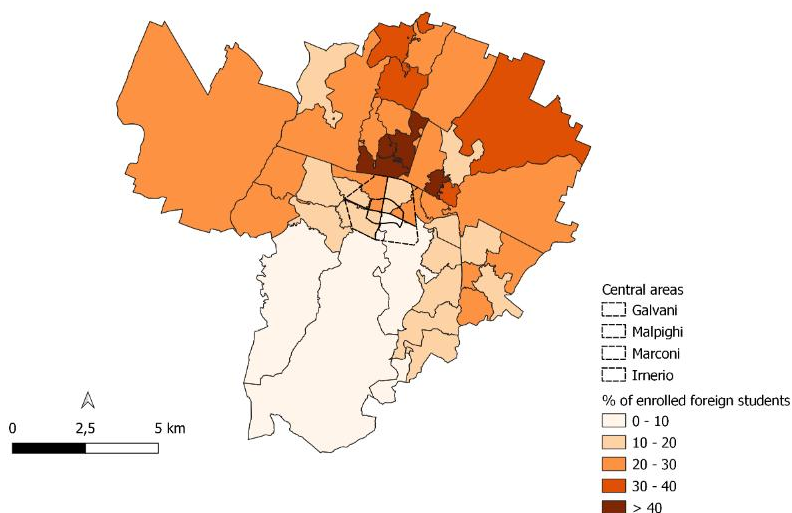

macro-concentrations of the foreigners in the municipal area of Bologna (Bergamaschi, 2012). However, as illustrated in *Figure 1*, the residential distribution of foreign pupils across school CAs is not homogeneous.

Figure 1: School CAs by share of resident foreign students (residential composition). 2021-2022 SY, public primary schools. Source: Author's elaboration based on data from the Municipality of Bologna.

The cartographic analysis revealed a clear distinction in the distribution of the foreign population, reflecting a historical divide between the northern and southern parts of the city (Bergamaschi, 2012). Specifically, a higher concentration of foreign students is observed in the peripheral areas of the northern section of Bologna. This division, marked by an invisible boundary along the railway line, appears to be driven more by socio-economic factors than by ethnic ones. Indeed, the north-south divide is also evident when examining the residential distribution of Italian students, based on the ISEE declared by their families. Nevertheless, even within the northern part of the city, the distribution of students with a migration background is not homogeneous: eight CAs have significantly high foreign student enrolment rates (exceeding 30%), with one CA showing rates above 40%.

Figure 2: School CAs by share of foreign students enrolled (school composition). 2021-2022 SY, public primary schools. Source: Author's elaboration based on data from the Municipality of Bologna.

The distribution of students within schools partially deviates from the previously described pattern. In particular, the DI for foreign pupils increases from 0,216 to 0,268. As evidenced by the comparison of *Figure 1* and *Figure 2*, a strong positive correlation (+81) exists between the residential and school compositions of the CAs. However, the findings indicate that the composition of primary schools not only reflects but also reinforces the spatial distribution of foreign students. Indeed, four schools show foreign student percentages exceeding 40%, whereas only one CA exhibits a similar proportion of foreign children within its residential population.

### Analysing Inter-Catchment Area Mobility

The discrepancies between residential composition (*Figure 1*) and school composition (*Figure 2*) can be attributed to mobility among both Italian and

foreign students. In fact, 36% of Italian students and 45% of foreign students attend schools outside their designated CA. To assess how the ethnic and economic characteristics of the residential area are associated with the decision to attend a school outside the designated CA, we calculate the percentages of Italian and foreign students attending schools outside their CA, in relation to the proportion of foreign children and the socio-economic characteristics of those areas (*Tab. 1*).

Tab. 1. Share of Italian and foreign students attending schools outside their CA. 2021-2022 SY, public primary schools. Source: Author's elaboration based on data from the Municipality of Bologna.

CA Share of resident foreign children	Italians	Foreigners
<10%	25,87%	69,23%
10-20%	42,28%	48,09%
20-30%	26,61%	35,57%
30-40%	48,84%	51,52%
>40%	43,86%	63,06%
CA Average ISEE of families	Italians	Foreigners
0-9.000	53,95%	60,42%
9.000-12.000	31,02%	40,87%
12.000-15.000	34,53%	42,10%
15.000-20.000	42,72%	55,66%
20.000-25.000	28,15%	75,00%

The analysis (*Tab. 1*) reveals mobility patterns that only partially overlap for Italian and foreign students. Mobility among Italian students significantly decreases in more affluent CAs (with an average ISEE > 20,000 euros) and in areas with a lower proportion of foreign minors (less than 10%). In contrast, foreign students – who generally exhibit higher mobility – continue to show considerable movement even in wealthier CAs and those with a lower proportion of foreign students. Both Italian and foreign students are more likely to attend schools outside their designated CAs when residing in economically disadvantaged CAs (average ISEE < 9,000 euros) or in areas with a higher concentration of foreign students (over 30%). Nonetheless, when examining the

mobility of students living in low-income CAs with a high percentage of foreign students (> 30%), clear distinctions emerge between Italian and foreign students. Specifically, 70% of Italian students attend schools where the proportion of foreign students is below 30%, while more than 50% of foreign students enrol in schools with a higher concentration of non-Italian students and greater socio-economic disadvantage.

### **School Segregation and School Dropout Rates**

The analysis of the school distribution of students at risk of dropout reveals that 67% of these students are enrolled in segregated schools. These schools, which account for 25% of the public schools in Bologna, are located outside the central areas of the city (*Figure 2*). They are characterised by a high proportion of foreign students (over 30%) and a significant share of students from economically disadvantaged backgrounds, with their average ISEE being substantially lower than the citywide average of €13,000.

Although the data is partial and further research is needed, the results suggest a positive association between school segregation and dropout rates. Future studies should explore whether school segregation exacerbates disadvantages related to socio-economic or migration status and impacts students' educational trajectories.

## **CONCLUSIONS**

Residential and school segregation is no higher in Bologna than in other southern European cities. Indeed, the Dissimilarity Index (DI) calculation shows no significant macro-concentrations of foreign students. However, 25% of public primary schools, mostly located in the northern part of the city, exhibit significantly higher proportions of foreign students compared to the citywide average and report the lowest average ISEE values at the city level. Additionally, these schools, identified as cases of school segregation, serve over 60% of students at risk of dropping out.

While school segregation tends to mirror the residential distribution of the population, it is further exacerbated by student mobility between CAs. The intensity of mobility among both Italian and foreign students varies according to the ethnic and socio-economic characteristics of urban areas. However, the direction of these mobility flows differs between native and foreign students. Specifically, Italian students tend to enrol in schools with fewer foreign students and lower socio-economic disadvantage, while foreign students appear unable

to escape a state of segregation.

Future research should explore the role of public housing, school admission policies, and educational provision in shaping patterns of school segregation and student mobility. Additionally, the economic and cultural characteristics of both Italian and foreign families should be considered in future analysis. Finally, the observed positive association between school segregation and dropout rates warrants further examination to better understand how segregation may impact students' educational trajectories.

# TERRITORIAL PACTS: POSSIBLE TOOLS TO LIMIT SOCIAL EXCLUSION

Bonci Martina  
University of Macerata

The objective of this article is to investigate the potential of non-formal education in addressing educational disparities, specifically through the examination of Territorial Pacts and to analyse some case studies. There are various types of Pacts that have gained popularity in educational settings, moving from Community Pacts to Educational Community Pacts (Boeris, 2018). The latter has been strongly supported by the Italian Government School Plan in the 2020/21 and 2021/22 academic years, even during the ongoing pandemic crisis (Ministero dell'Istruzione, 2020; Ministero dell'Istruzione 2021). These bottom-up practices aim to establish a strong social connection between the school and the surrounding territory. The pandemic has highlighted the importance of this connection. It is essential to form an alliance between the school, the territory, and third-sector entities to strengthen the educating community and guide students in their growth (Locatelli, 2021). This study aims to present two case studies of collaborative pacts implemented in the aftermath of the pandemic period in Italy, situated in two distinct socioeconomic contexts, to demonstrate the universality and versatility of the pact model in mitigating social exclusion.

Territorial Pacts; Social Justice; Territorial alliance; Third sector

## INTRODUCTION

In the aftermath of the Sars-Covid 19 pandemic crisis, school dropout rates have increased, and Italy currently exhibits one of the highest rates of school abandonment compared to the European average. Data from Save The Children indicate that the school dropout rate in Italy is 12.7%, remaining the highest in Europe, second only to Romania and Spain, and far from achieving the 9% target by 2030 (Save the Children, 2022). At present, 13.5% of minors under 16 years of age experience material and social deprivation; approximately 1 million and

127 thousand young individuals (Save the Children, 2024). Evidently, within this substantial portion of the youth population, territorial disparities between Northern and Southern Italy play a crucial role (Save the Children, 2024). Poverty and school dropout are phenomena that must be examined on currently as they describe the same issue, which can have significant effects on young individuals.

Regarding the relationship between mental health and socioeconomic status, an noteworthy scientific study by Grüning Parache et al. was published in 2024. The study attempts to correlate family composition and socioeconomic status (SES) with the child's psychophysical well-being. The results of the analysis demonstrate that children from single-parent or extended families report more difficulties in relationships and lower levels of quality of life compared to children living in traditional families. However, this data must be interpreted in light of the socioeconomic status levels of the families, as the study shows that family structure is strongly interconnected with the SES indicator. Lower SES levels are recorded for single-parent or extended families compared to traditional ones. It emerges, therefore, that single-parent and extended families may experience more situations of economic difficulty compared to traditional families, and this is linked, according to the study, to a greater likelihood for the child to report behavioral problems and a decrease in quality of life (Grüning Parache et al. 2024). The results thus emphasize that the economic and financial capabilities of the family of origin may influence the child's mental well-being more than their structure. The study, therefore, underscores the importance of combating social inequalities and social poverty as one of the main causes of childhood distress (Grüning Parache et al. 2024).

This study, therefore, reveals that poverty and family economic difficulties can significantly affect the child's psychophysical health, leading to an increased likelihood of developing behavioral problems and, consequently, relational issues with peers. These data form the theoretical background upon which the reflection for this article is based, aiming to present potential tools to attempt to counteract school abandonment and dropout.

## **1. BACKGROUND INFORMATION**

In the aftermath of the pandemic crisis, Italian schools encountered the necessity to extend students' experiences beyond the confines of the educational institution, providing them with immersive and engaging opportunities, in an attempt to overcome the restrictive period recently

experienced. Furthermore, institutions also faced challenges regarding space safety due to post-pandemic containment measures. The disconnect between traditional didactics and children's concrete needs has additionally facilitated the establishment of a new approach to education.

The School Plan 2020-21 appears to offer a solution to these issues. The Plan demonstrates particular attention to addressing educational poverty and school dropout through the promotion of a participatory approach that valorizes experiences and resources already present in the territory. Among the instruments listed to address the pandemic situation and achieve the aforementioned objectives, the Community Educational Pact is proposed for the first time. At this stage, the Pact is presented as the instrument through which to find community-based solutions for adapting more suitable spaces for conducting school lessons. Indeed, these have been useful in allowing schools to remain open and functional without compromising safety, by relocating certain lessons to structures made available by local entities, such as parishes, museums, parks, and gardens (Calvaresi et al., 2021). Following this initial impetus for co-planning through Community Educational Pacts, and with the attenuation of the pandemic emergency, the pacts have reverted to a broader significance and an application more adherent to their original purpose, towards close collaboration between educational institutions and local entities in view of a common educational intent. Consequently, in the subsequent year's School Plan (2021-2022), the Pacts are endorsed as useful instruments for didactic activities complementary to traditional ones. This novel instrument aligns with the principles of scholastic autonomy, particularly with the school's capacity to independently manage relationships with territorial entities with which it collaborates, to implement inclusive educational activities for students. The pact is an instrument of shared administration that applies Article 118 of the Constitution, whereby the State and its associated entities, including schools, must commit to respecting and promoting the principle of horizontal subsidiarity, encouraging "the autonomous initiative of citizens, individually or in association, for the performance of activities of general interest" (Art.118, Italian Constitution). It is imperative to emphasize that Educational Pacts have also emerged as a strategy to combat social exclusion, as indicated by the Recommendation of the Council of the European Union in June 2021. The objective of the Recommendation is to prevent and combat social exclusion, to the extent of suggesting that Member States present, within nine months of the adoption of the Recommendation, an action plan to implement its guidelines until 2030. In this context, the establishment of the Child Guarantee and

Community Educational Pacts become indispensable instruments for implementing a policy supporting minors, also responding to Goal 4 of the 2030 Agenda on providing quality, equitable, and inclusive education, and learning opportunities for all.

## **2. PROJECT DETAILS**

To illustrate the impact and efficacy of the Territorial Pact instrument, two case studies are presented herein. The selected territories are the Municipality of Bobbio and the Adriano district of Milan; two environments diametrically opposed in terms of geographical configuration and socioeconomic composition of inhabitants, yet comparable in their final outcomes.

### **2.1. The Case of the Adriano District, Milan**

The Adriano District is situated in the northeastern periphery of Milan, an area of recent construction. It is considered one of Milan's youngest districts, built between the 1990s and early 2000s, although the core of the district dates back to older constructions that served as a connection between the city of Milan and the countryside of Crescenzago. Demographically, in the areas of Old and New Adriano, a majority of family settlements are recorded, with a more numerous composition compared to the city average; 17% of these families have more than four members. In the Crescenzago and Via Padova area, the southernmost part of the district built in the 1960s, the presence of an older population is recorded; former families from the years of construction (Cognetti, 2020). Despite this presence, the district is predominantly characterized by young and very young inhabitants and foreign residents, exceeding the city average, and by a lower incidence of residents over 65, below the Milanese figure.

The primary school in the neighborhood, named after Vittorio Bottego, has been the protagonist of the Collaboration Agreement signed with the Municipal Authority and local associations. The agreement project was implemented within a broader framework project for urban regeneration of the Metropolitan City of Milan, funded by the Cariplo Foundation. In the Adriano district, specifically, the focus was on the need to revitalize Piazza Costantino, the square in front of the Bottego school, which had lost its original function and had become a parking area for automobiles. The collaboration established between the school and neighborhood associations has enabled students to engage in meaningful experiences and collectively care for a common asset, in this case, the square. The activities also included excursions in the neighborhood, during which children had the opportunity to listen to local histories narrated by elderly

residents. According to the teachers, these activities were particularly significant for young students, especially those with migratory backgrounds, as they provided an opportunity to learn about the history of their new place of residence, fostering a sense of belonging to a broader and more established narrative.

## **2.2. The Caso of Bobbio**

Bobbio, situated in the province of Piacenza within the Val Trebbia, is an Apennine territory of significant landscape interest, located at the convergence of mountains in the provinces of Piacenza, Genova, Alessandria, and Pavia. The geographical configuration of the valley has been a driving factor in the process of creating networks and local synergies among various community stakeholders. Indeed, in 2013, it facilitated the establishment of the Unione Montana Valli Trebbia e Luretta and was subsequently included in the Strategia Nazionale per le Aree Interne (SNAI) beginning with the new 2021-2027 programming period (Comitato Nazionale Aree Interne, 2022; Dipartimento per le politiche di coesione e per il sud, 2023). This Union encompasses municipalities of extremely small dimensions with very low population density. The area is significantly affected by a substantial depopulation phenomenon, attributed to the scarcity of services and infrastructural challenges in accessing these small municipalities. Of the resident population, 10.11% is of foreign origin.

In this area experiencing depopulation, a Community Educational Pact was implemented in 2021, enabling collaboration between the school, the Unione Montana, and local associations. Notably, beginning in 2020, the school became an Istituto Omnicomprensivo, encompassing 14 school facilities distributed across an area of approximately 70 km, traversing 7 municipalities along the Trebbia River Valley. The Community Educational Pact signed in these territories, therefore, was of considerable importance in strengthening the connection between entities and local realities situated at such great distances. The work that followed the pact's signing saw the school take a leading role in mapping community availability and the skills offered. Upon acquiring this information, specific projects were structured for each school facility and, consequently, for each reference community. Each school facility was thus able to present, over time, its applied civic education project, involving the community to concretize the concept of an educating community (Garioni & Bosoni, 2022).

### 3. OUTCOMES AND FINDINGS

The two case studies analyzed demonstrate that collaboration between schools and local entities can have highly positive effects on the entire population by fostering a sense of local involvement capable of overcoming cultural barriers. In the case of the Adriano district in Milan, the population with migratory backgrounds was involved in the design and discovery of the neighborhood to promote integration, at least for the youngest members, into the local reality. Even these small engagement actions can have significant repercussions on the life of a child with a migratory background, uprooted from their culture of origin against their will, in an attempt to restore meaning to their space and time; a neighborhood space and time inhabited and populated by numerous local actors. The broader purpose of the Pacts, therefore, is to create a dense network among schools, municipal entities, and local associations, in order to support the child's growth in all its phases, both within and, more importantly, outside of school. The Pact also provides the opportunity for local entities to fully participate in the education and accompaniment of the growing youth. The network that is created, in this manner, around the student has the potential to generate a sense of belonging, mitigating loneliness and also succeeding in compensating for economic deficiencies and difficulties of the children's families of origin. The community, in this sense, is placed in a position to support the children of the community and, with them, their families, making them feel part of something larger, which is the educating community.

# SHAPING DESIRES. A WORKSHOP TO GIVE VOICE TO CHILDREN FROM POPULAR SCHOOLS

Giulia Franchi  
Università Roma Tre

## THE CONTEXT: A QUALITATIVE RESEARCH ON POPULAR SCHOOLS IN ROME

My contribution is part of a wider research supported by the Education department of University Roma Tre, called *The other school. Popular education experiences between learning and social redemption* (Zizioli, Stillo and Franchi 2024).

The object and at the same time the context of the research is the Network of Popular Schools of Rome, established in 2020 as a result of a horizontal process of share of values, experiences and practices between the different realities of popular school place in several neighbourhoods, mostly peripheral areas of the city.

The research was carried out by a composite group of scholars<sup>1</sup>, with the fundamental contribution of the activists of popular schools, with a non-standard and qualitative approach (Bichi, 2002; Mantovani, 2000).

Among the objectives of the research are:

- To explore practices, identities and relations with community, public school and territory of the Roman popular schools, in order to understand the limits and potential of this experience with respect to the inclusion/emancipation capacity;
- To systematize the popular school experiences and to highlight the values underlying the practices;
- To identify the popular school's educator profile, skills and training.

---

<sup>1</sup> The research team included: Elena Zizioli, project coordinator, and, in alphabetical order, Daniele Babusci, Lorenzo Barbanera, Giulia Franchi, Peter Mayo, Fiorenzo Parziale, Flavia Rossi Jost, Francesco Maria Salimbeni, Lisa Stillo, with fundamental support of popular school activists.

The tools of the qualitative methodology adopted are:

- participant observation: field notes and photo-documentation
- 35 not directive interviews to educators
- 5 focus group with popular school kids
- 2 workshops with popular school kids

As clearly emerges both from the interviews with the activists and from the focus groups conducted with the after-school participants, popular schools make the protagonism of childhood, the right to be heard of girls and boys, the right to be recognized as subjects and active participants in their experience, capable of making choices, the heart of their educational action.

The meaning is to empower them [kids] it is to make them autonomous and aware of what they do; we try to develop critical thinking in them, to help them understand why something was thought, develop it, understand why a conclusion was reached. (int. 4, Spin Time+).

There is also an education in listening during this snack time, which is one of the most important moments, because it is strictly educational (...) everyone must stay in the circle, everyone must take action to do something in common. (int. 1, A Testa Alta).

Here I find people to talk to, and they want to listen to me... if I have nowhere to go, I can come here and see my friends. What I like most about this school is that it is a friendly place, where I find friends and feel comfortable (focus group, MaTeMù).

## **MAKE RESEARCH WITH CHILDREN. DESIGN A WORKSHOP IN SUBURBAN NEIGHBOURHOODS**

The 1989 *UN Convention on the Rights of the Child*<sup>2</sup>, and in particular its article 12 says: “States Parties shall assure to the child who is capable of forming his or her own views the right to express those views freely in all matters affecting the child”.

And in article 13:

The child shall have the right to freedom of expression; this right shall include freedom to seek, receive and impart information and ideas of all kinds,

---

<sup>2</sup> Convention on the Rights of the Child | OHCHR.

regardless of frontiers, either orally, in writing or in print, in the form of art, or through any other media of the child's choice.

The same articles were a precious stimulus for a change of perspective in sociological and pedagogical research, starting from the Nineties, in focusing on the children's perspective and for a conception of research no longer as research on childhood but with and for kids (Mortari – Mazzone 2010). Making the kids direct protagonists, giving them a voice (Amandini 2020), forced scholars to rethink investigative techniques and tools, recognizing their peculiar forms of communication compared to those of adults.

The more traditional qualitative research strategies such as observation, interviews and focus groups and an ethnographic approach have been joined by "unconventional" techniques such as friendship groups, drawing, photography, video, stories and narratives (Lahman 2008). In particular, the so-called Narrative Inquiry and Art-Based Research (Barone – Eisner 2011), also in accordance with the experience of Bruno Munari (1984) who places the workshop at the center as a space for experimentation and production of meaning, have recognized the power of storytelling and artistic practices in allowing kids, even the youngest, to express themselves freely and competently about their experiences and to read and interpret reality, providing original data, and making them truly co-researchers, thanks to the plurality of languages used (Barton 2015).

Starting from these reflections, it was decided to broaden the original research plan by designing an ad hoc reading and drawing workshop entitled *Let's take back the sky!*, aimed at those who attend popular after-school in two different popular schools involved in the research: *Mammuto* and *A Testa Alta*. The popular after-school Mammuto program was born in 2016 in the Rebibbia area from the local experience of the neighborhood committee. Thanks to the commitment of around ten activists, it offers free support in studies, art workshops and play and outdoor activities. It provides moments and spaces for aggregation and sociality, engaging in the fight against marginalization and promoting social issues which affect the entire community.

The popular school *A Testa Alta* was born in 2017 in the San Basilio district, in the north-east of Rome. The social and educational space stands in an abandoned place, occupied and reused to create a place of culture for all the inhabitants of the area, strongly characterized by drug dealing. The activists, around five at the time of research, provide support for homework, play activities and active citizenship projects to children from 4 to 13 years.

During the workshop, in Rebibbia, there were over forty children, coming from very different contexts, the majority with a migratory background, first and second generation, with a mixed age, mostly referring to primary school but also to lower secondary school. Some of them, as the activists tell us in their interviews, come from complex familiar situations or are hosted in “family home”.

In San Basilio, the group is smaller, around 6-7 participants, almost all females, and younger – several of them still attend nursery school –, they mostly come from Italian families and live in the surrounding popular buildings.

Participatory observation, recorded through notes and photographic documentation, was the privileged tool chosen. Conducting the activity directly as researcher, it was decided to provide two other researchers as observers to allow a better triangulation of the evidence that emerged, and a grid was preliminarily prepared which in part reflects the one used with adults in the interviews, to have a structured but open guide to read the main elements that emerged at a verbal and non-verbal level from the workshop.

The proposed activity start from an illustrated book, in its interweaving of images and words, as a powerful activator of identification, dialogue and multiple interpretations: *L'ammiraglio si è preso il cielo* (The admiral took the sky, 2022), written and illustrated by Marianna Balducci, a young and award-winning author who loves to put together photography and drawing. It's a tribute, declared since the dedication, to Gianni Rodari and his nursery rhyme “Il cielo è di tutti”, collected in the book *Filastrocche in cielo e in terra* (1960). With confidence in children's creativity and awareness of the liberating power of the word (Rodari, 1973), the teacher of Omegna will never stop questioning about the relationship between writing for children and political commitment and bringing to mind the *Convention on the Rights of the Child*, he affirms the right to expression and to be heard for children:

Listening to them – states Rodari – is almost more important than talking to them, helping them clarify their ideas is more important than giving them ready-made ideas of any kind. They represent enormous reserves of energy, in a world that must face and solve immense problems (Zagni 1975, p. 32)<sup>3</sup>.

The objective of the activity, in a transformative idea of doing education and research, was to investigate with children their desires regarding their future, but also their environment and popular school, and is divided into some well-

---

<sup>3</sup> Translation by the author.

defined phases (Franchi 2017) designed to be replicable in other similar contexts.

### **CARE, BEAUTY, PARTICIPATION. THE CHILDREN'S RESPONSE**

The first step was the circle time, a moment of mutual knowledge, exchange and meeting with the presentation of the researcher (“who I am” and “why I am here”), presentations of the participants (names, age), and some stimulating questions about the popular school and the neighborhood. In both contexts, the relationship of affection and trust between young people and educators and activists clearly emerges, as well as the awareness of the central role played by the popular school in children’s lives.

The second phase involves participatory collective reading. Everyone is invited to actively participate in a horizontal way so that every voice counts: by reading the illustrations and finding a shared meaning in the words. The mix of artistic techniques and Marianna Balducci’s ability to play on the structure of the book as an object to build her story fascinated and involved children.

In San Basilio, the small number of participants favored participation and understanding and revealed a great ability to decipher images even in those who had difficulty reading the text, confirming that the plurality of languages helps everyone to find their own expressive channel. The same happened with those with a migrant background and a poor knowledge of Italian in Rebibbia.

“The admiral took the sky, even if the sky belongs to everyone, but now everyone remembers it and has stopped staying silent” (Balducci, 2022). The message was perfectly clear in both contexts: the arrogance and obtuseness of power, “he is taking the sky from the earth... NO! Stupid human”<sup>4</sup>, “The sky belongs to everyone, you can’t take it!” (Mammut), as well as the invitation to react, “What would happen if they took it all away? What would you do? “, “I get angry”, “What would you have told him? “, “You can’t imprison animals!” (A Testa Alta), and to collective and direct action, “They all pulled together” (Mammut).

The third part of the activity is the presentation of the artistic workshop: everyone receives a “piece of sky”, making the gratuity and power of the gift concrete. The invitation is to represent through collage and drawing “a desire, something you would like to have or to do in the popular school, in your neighborhood, or try to imagine your future”. Examples created by other children are shown at the beginning to make the request clearer. It is a relaxed time in

---

<sup>4</sup> The translation of the statements recorded by the observers during the workshop is by the author.

which everyone participates with enthusiasm; someone does it alone, someone else does it together with a friend. There is often anxiety to immediately show the result, to share it with the researchers and see one's contribution recognized.

The last fundamental moment is the restitution and group commentary of the collective "sky" built by kids. Among the elements that emerged from the analysis of the drawings and the words with which children interpreted them, we find the request of several transformations of the neighborhood by demanding more green and child-friendly spaces: "I would like the tree to become bigger", "I would like more grass". Even the popular school takes shape in the little pieces of sky and the requests generate moments of collective activation: "I would like a bigger and more spacious after-school". But above all they give shape to the importance that popular after-school has in their lives: "The popular school is everything in life, I would always stay here".

But we find also the right to housing, important battle connected to popular education, which occurs very often in the drawings, especially among older girls and boys and those with a migratory background. Many want a house for themselves and their family, "big and beautiful", a house represented next to that of their friends, or closer to the school. There are those who would like "everyone to feel at home in another house", tracing a red and flowery street between little houses made of sky, and when faced with a request for clarification, a companion explains with great awareness: "I would like everyone felt at ease even outside their own comfort zone". And finally: "care, love, beauty, discovery, participation", as a sort of synthesis of the results of research, on five blue fragments of sky a child wrote the profound value of popular school in their lives.

# POPULAR EDUCATION: A BRIDGE TO PREVENT AND COMBAT EARLY SCHOOL LEAVING AND JUVENILE CRIMINALITY

Angelica Padalino<sup>a</sup>

<sup>a</sup>University of Foggia

Talking about popular schools and popular education leads us to think about the great educators of the twentieth century such as Paulo Freire, Don Lorenzo Milani and Danilo Dolci. Popular school experiences left their mark because they gave voice and opportunities to the least and marginalized. These schools have been an antidote to the condition of educational poverty in various parts of the world (Stillo, 2022). Nowadays, educational poverty is still at the centre of the pedagogical debate due to its connection with other issues such as early school leaving and juvenile crime. Today, many young people, defined “street oriented”, do not know where to go and what to do, so they use to spend lot of their free time on the way, in the streets and squares (Iavarone & Girardi, 2018), where unfortunately many of them also experience first deviant behaviours. In these cases, popular schools can be a bridge on the way, a place of possible inclusion, awareness and empowerment (Sardelli & Fiorucci, 2020). This contribution aims to reflect on the role popular schools can play today in preventing early school leaving and juvenile criminality, offering experiences of transformative education, especially for young people at risk of marginalisation.

popular education; juvenile criminality; educational poverty; early school leaving

## 1. EDUCATIONAL POVERTY: A GLOBAL ISSUE

One of the greatest challenges that has always been shared by countries all over the world is the eradication of poverty in all its forms. Today there are new and old forms of poverty, but one among them particularly requires the attention of educational professionals: educational poverty. It is a form of poverty that especially hinders the development of boys and girls. In fact, one of the earliest

definitions of educational poverty is given by Save The Children, which in 2016 published a report called *Ending Education and Child Poverty in Europe*. In this document educational poverty is defined as a “process that limits children’s right to education and deprives them of the opportunity to learn and develop cognitive and non-cognitive skills they will need to succeed in a rapidly changing world” (Save the Children, 2016, p. 6). We can say that educational poverty is therefore a serious threat (Save The Children Italia, 2015) for the future of children. Indeed, it contributes to “deny opportunities for millions of children and increase their risk of social exclusion” (Unicef, 2024, p. 12). That is why eliminating this form of inequality is for the United Nations (UN) one of the goals to be achieved by 2030. Achieving this goal requires first providing access to quality, equitable and inclusive education that promotes lifelong, lifewide and lifedep learning opportunities (Open Working Group Proposal for Sustainable Development Goals, 2015). Thus, combating educational poverty falls under both Goal 1 “End poverty in all its forms everywhere” and Goal 4 “Ensure inclusive and equitable quality education and promote lifelong learning opportunities for all” foreseen in Agenda 2030. Educational poverty is, in fact, a global issue. It is a complex phenomenon whose dynamics and implications can vary significantly across different regions and countries. However, the main consequences to which it can lead are the same, the most urgent among them are early school leaving and juvenile criminality. Combating educational poverty is therefore a complex but unavoidable challenge for the sustainable development of the planet and the human being.

## **2. EDUCATIONAL POVERTY IN ITALY**

In Italy, more than one million young people, under the age of eighteen, live in poverty (Openpolis, 2024); a condition that, according to Autorità Garante per l’Infanzia e l’Adolescenza<sup>1</sup>, most of the time causes poor school performance, behavioural difficulties, insufficient social integration and the development of deviant behaviour (2022). In fact, Italy is one of the European countries with the highest percentage of Early Leavers from Education and Training (ELET). According to the European definition, ELET are young people between the ages of 18 and 24 who have at most completed a secondary school degree and are not involved in training or education (Eurostat, 2022). Today, therefore, not only many youths in Italy live in poverty, but in addition 11.5 percent of them attend

---

<sup>1</sup> Autorità Garante per l’Infanzia e l’Adolescenza is an Italian authority established in 2011 to protect and promote minors’ rights, in order to respect the Convention on the Rights of the Child (CRC).

school inconsistently, when they attend it. They are often children with absent families who experience the lack of positive references to follow. In addition, the absence of family-support hinders the development of meaningful life skills and leads those in education to exhibit deviant behaviour (Iavarone, 2018). The issue is that juvenile risk and deviance “lurk mainly in those social strata where children have a habit of growing up without significant adults, in contexts where the street is the only possible place to live and generate relationships” (Iavarone, 2020, p. 35). Today, in fact, young people are also defined as “street oriented,” (Iavarone & Girardi, 2018) a term used to denote the habit of spending most of their free time on the street, in roads and squares, because they do not know where to go and what to do. The problem is that on the street they frequently experience the first forms of deviance. For these reasons, juvenile crime is one of the emergencies that, together with educational poverty and school dropout, requires our attention to the world of youth.

### **3. DEVIANT BEHAVIOUR AND VIOLENCE AMONG YOUTH**

Violent crime in the world is a growing phenomenon. According to the World Health Organization (2015; 2024) the number of episodes of youth violence is worrying. The protagonists of these episodes are young people aged 10 to 29 years. In Italy, in May 2024, the Ministry of the Interior published a report stating that in 2023 there were 31.173 registered cases of minors who committed crimes (Servizio Analisi Criminale). The most committed crimes are those of the violent type: robbery, arson and sexual violence. The causes that lead to the manifestation of deviant behaviour among minors can be many, but according to several studies (Backman, 2017; Guetta, 2023; Iavarone & Girardi, 2018) there is a link with educational poverty and school dropout. The element that would unite these three phenomena seems to be the presence of fragile family and social ties, so these are phenomena that draw nourishment from the lack of community and meaningful educational references (Openpolis, 2021; Autorità Garante per l'infanzia e l'Adolescenza, 2022). So, it is necessary to think carefully about the possible educational strategies to be implemented in order to combat these three emergencies.

### **4. REDISCOVERING THE VALUE OF POPULAR SCHOOLS**

One possible solution to provide educational community experiences for these young people may be the rediscovery of popular schools. Talking about popular schools and popular education leads us to think about the past and the great

educators of the twentieth century such as Paulo Freire, Don Lorenzo Milani and Danilo Dolci (Aglieri & Augelli, 2020). Popular school's experiences left their mark because they gave voice and space to the least and the marginalized. They were born as an antidote to the condition of educational poverty experienced by poor people in different parts of the world (Stillo, 2022). However, as mentioned before, educational poverty is still a very current problem. Therefore, for today's street-oriented youth, who recognize the street as their place of belonging, it can be essential to rediscover the importance of community. Then this means that it is precisely in these cases that popular schools can turn into a bridge to the street, a place of possible inclusion, conscientization and emancipation (Sardelli & Fiorucci, 2020). A place that is open to all, a place where anyone, especially those who have no other reference points, can face with relationships, and find meaningful reference points.

The popular school as an alternative to spending leisure time in the squares and streets, for a "new way of 'inhabiting' urban space" (Zizioli, 2023, p. 131). A popular school that experiments and thus presents itself "as a social and neighbourhood presidium" (Zizioli, 2023, p. 131). Today, the transformative value of popular school experiences is already being rediscovered in some realities, but it is not enough. We need to invest and pay attention to this way of doing community, giving support to all those realities of popular education, such as oratories, which softly try to offer transformative educational experiences to young people in difficulty, giving them the opportunity to escape from their marginality destinies (Zizioli, 2024). Pay attention to small educating communities that strive to prevent disorientation and social exclusion of those who are already in a condition of marginality.

## **5. CONCLUSIONS**

It is necessary to recover and revalue the role that popular schools can play in the education of people on the margins and in combating various forms of poverty. Rediscovering the popular school as a place with "humanizing potential" (Stillo, 2022, p. 138) capable of transforming the street into an educational space (Lombardi, 2015) that can counter the inequalities of our time and their related consequences such as early school leaving and juvenile crime. In other words, a space that can offer alternative life opportunities and a chance for redemption for all young people living in fragile contexts (Borgna & Struffolino, 2022; Zizioli, 2023) that risk limiting and compromising their development as persons and as citizens.

# PREVENTING EARLY SCHOOL LEAVING: RISK FACTORS, EFFECTIVE INTERVEN- TIONS AND POLICIES

Valeria Di Martino<sup>a</sup>

Marta Pellegrini<sup>b</sup>

Rosa Vegliante<sup>c</sup>

<sup>a</sup>University of Palermo; <sup>b</sup>University of Cagliari; <sup>c</sup>University of Salerno

## INTRODUCTION

Preventing early school leaving represents a key priority in European and Italian policy. The Council Resolution 2021/C 66/01 established a target of reducing school dropout below 9% by 2030, while Italy's National Recovery and Resilience Plan (PNRR, 2021) highlighted dropout reduction and educational poverty prevention as strategic objectives within Mission 4 and Mission 5. With Italy's current dropout rate at 13.1%, significantly above EU targets, addressing this issue is crucial given its documented individual, social, and economic consequences (European Commission/EACEA/Eurydice/Cedefop, 2014).

The general objective of this panel aimed to focus on three areas related to the phenomenon of early school leaving: investigations of risk factors; evaluations of interventions; and analyses of international, national, and local policies.

## 1. RISK FACTORS: MULTIPLE DIMENSIONS AND METHODOLOGICAL CHALLENGES

School dropout results from multidimensional factors at individual, family, school, and institutional levels (Battin-Pearson et al., 2000; EASNIE, 2019; Hammond et al., 2007; Rumberger, 2011). The panel presented several contributions examining risk factors through diverse methodological approaches.

The methodological challenges in defining and measuring school dropout were highlighted by Beri et al. (2024), while the TALENTED project research (Bonaiuti et al., 2024) offered a comprehensive framework examining multiple dimensions of dropout risk, consistent with contemporary ecological models (Bronfenbrenner & Morris, 2006; Dupéré et al., 2015). The analysis of student-related factors, family variables, and teacher characteristics revealed complex

interaction patterns, with Miranda and Vespasiani (2024) proposing a research-training approach based on Self-Determination Theory to enhance teacher support for student motivation. Particularly significant were the territorial analyses by Gragnaniello et al. (2024) and Moccia et al. (2024) investigating dropout factors in Campania schools and areas affected by organized crime, contributing to understanding how socio-territorial contexts influence educational trajectories.

## **2. INTERVENTION STRATEGIES: FROM THEORY TO PRACTICE**

Internationally, interventions have been developed and evaluated to understand effective approaches for preventing early school leaving and improving key predictive outcomes. The panel presented several innovative intervention approaches reflecting current trends in evidence-based educational practice, ranging from experimental studies to comprehensive territorial programs.

The Kepler lab experience reported by Spampinato and Conficoni (2024) demonstrated through quasi-experimental methods how after-school interventions for underperforming immigrant students improved motivational orientation, self-efficacy, and classroom engagement. Similarly, the “Provaci ancora Sam” project (Pongiluppi & Bianchini, 2024) exemplified successful territorial integration, combining classroom prevention with support centers and adult education to address functional illiteracy and educational disadvantage. Within the PRIN TALENTED framework, Bruni et al. (2024) explored the potential of gamification through elements like points, challenges, and leaderboards to enhance student engagement and reduce dropout risk.

The importance of teaching approaches emerged strongly through the research by Germani (2024) examining 1,092 high school students using Self-Determination Theory, revealing how need-supportive teaching enhances intrinsic motivation while need-thwarting approaches increase dropout risk. These diverse interventions share key elements with successful international programs (Wilson et al., 2011), all emphasizing supportive learning environments, strengthened motivation, and positive teacher-student relationships.

## **3. INTERVENTION STRATEGIES: FROM THEORY TO PRACTICE**

School dropout needs to be addressed through an eco-systemic approach (EASNIE, 2019), involving actions at national, school, and individual levels. The

contributions analyzed multi-level policies for preventing school dropout through systematic evidence mapping.

The policy analysis revealed the importance of coordinated institutional efforts (Burns & Köster, 2016). The Metropolitan Observatory in Catania (Colloca & Piazza, 2024) demonstrated innovative stakeholder coordination, aligning with research on collective impact initiatives (Henig et al., 2016) and networked governance (Provan & Kenis, 2008). Their model of institutional cooperation involves judicial authorities, social services, and educational institutions. The analysis by Frega (2024) of the National Recovery and Resilience Plan contributes to post-pandemic educational recovery policies, while the E4PED project (Di Martino et al., 2024) aims to provide evidence-based practices addressing early school leaving. Within this project, Pannone et al. (2024) develops an Evidence and Gap Map to synthesize international evidence on prevention, intervention, and compensation programs, while Vegliante and Coppola (2024) explore NEET-related policies and school-to-work transition strategies, examining the strengths and weaknesses of current educational and employment policies.

## CONCLUSIONS

The contributions presented in this panel advance our understanding of ESL while highlighting key areas for future research and intervention. The research demonstrates how the complex interplay of individual, family, school, and socio-territorial factors requires sophisticated methodological approaches, though challenges in measuring dropout persist.

Promising intervention strategies integrate multiple professional perspectives and address both academic and socio-emotional dimensions, while policy studies emphasize institutional coordination and evidence-based frameworks. Moving forward, priorities include rigorous evaluation of long-term outcomes and development of flexible, locally-responsive institutional networks.

# DROPOUT<sup>2</sup>: THE DROPOUT ON SCHOOL DATA DROPOUT

Arianna Beri<sup>a</sup>

Laura Sara Agrati<sup>b</sup>

Marco Lazzari<sup>a</sup>

<sup>a</sup>University of Bergamo; <sup>b</sup>Pegaso Telematic University

The paper underscores the complexity of school dropout as a research topic, emphasising the challenges of comparison of data from various sources, crucial for policy and practical interventions. Despite extensive research, there is no universally accepted definition of school dropout, and national and international documents often conflate early school leaving (ESL, ELET) with dropout, leading to inconsistencies in data collection and reporting. This overlap obscures certain groups, such as repeaters and students in “educational mortality”, who, while not formally classified as dropouts, should be included in the discussion. These definitional ambiguities result in incompatible data collection methods and hinder coordination among educational agencies, complicating the development of cohesive intervention strategies. The paper reviews key definitions from various documents, illustrating how this umbrella effect complicates understanding the issue. Additionally, it discusses findings from the doctoral project “School Dropout and Dropout Data”, which systematically analysed 2,078 scientific articles on the subject. The study highlights the need for shared data systems to accurately monitor the phenomenon and develop effective strategies. A reliable understanding of school dropout is crucial to avoid misinterpretation and to guide targeted interventions, particularly at the local level.

dropout; data; systematic review

## INTRODUCTION – WHAT DO WE MEAN BY DROPOUT

UNESCO<sup>1</sup> defines “dropout” as

(...) the proportion of children and young people in the official age range who are not enrolled in pre-primary, primary, secondary, or higher levels of education. It is designed to show how many children or youth in each country or region should be enrolled in school but are not.

Similarly, EACEA (2020) identifies the phenomenon as

Students leaving education and training before completing the upper secondary level and obtaining a corresponding school leaving certificate. This broad definition encompasses the young people who, according to their own country’s definition, are considered to be early leavers. (Cfr. ELET).

In Italy, AGIA (2022) adopts a definition that highlights “non-use, incomplete or irregular use of education and training services by young people of school age”.

There is no globally shared definition of the concept of school dropout (Selda, 2014), nor a standardised method for its measurement (Lindhardt et al., 2022).

In the first phase of this research, a document analysis of the definitions and indicators used for the study of school dropout, both locally and globally, (Beri, forthcoming) was conducted. This highlighted the existence of different categories of definitions of school dropout: a. overlap of the terms “early school leaving” and “dropout” (Marina and Senthilrajan, 2024); b. dropout understood in more “inclusive” terms, including, in addition to abandonment, phenomena such as poor academic performance, repetition, frequent absences, temporary withdrawal, and dropping out of school (Besozzi, 2017); c. analysis of the phenomenon through attendance rates or comparison rates, in a positive light (Gansaonrè et al., 2023).

In addition, the parameters used to identify students considered as dropouts vary from country to country (and sometimes within the same country), highlighting: a. criteria based on age or academic delay in relation to norms (Hysing et al., 2023); b. criteria based on absence (Rodriguez et al., 2023); c. criteria based on possession of a diploma or other institutional qualification (Dekkers and Claassen, 2001).

This confusion leads to variations in “dropout rates” (Paguero et al., 2021) and, consequently, a lack of accurate assessment of the severity and extent of the

---

<sup>1</sup> <https://education-estimates.org/out-of-school/> last access 22/11/2024.

phenomenon, which is a major obstacle to the development of effective educational policies (Belfanz et al., 2020).

## **1. A PHD PROJECT**

This study is part of a PhD project (started in the 2023/24 academic year) at the University of Bergamo, within the doctoral course in “Human Sciences and New Welfare”, titled “School Dropout: the Dispersion of School Dropout Data”. The project’s main objectives are articulated in three phases corresponding to the different years of the doctorate:

In the first year, the project will analyze theoretical constructs and data collection methods regarding school dropout by reviewing national and international literature, with a focus on Italian, European, and global contexts. The second year will involve an empirical study of local realities, utilizing data from the Municipality and Province of Bergamo in collaboration with the University of Salamanca. Finally, the third year will focus on developing synthesis models to enhance the understanding and management of the phenomenon.

Although school dropout has been studied for a long time (Fuller, 1927), most research focuses primarily on causes and effects, overlooking two critical aspects: the precise definition of the concept and the in-depth analysis of measurement and quantification methods.

Early identification of students at risk of dropping out is essential for developing targeted prevention strategies (Pereira et al., 2024). Furthermore, the use of integrated data from various sources provides a stronger basis for policy makers than fragmented studies conducted in specific areas (Sileshi, Jemal, Feyisa, 2024). Based on these considerations, this research project aims to investigate these gaps.

## **2. THE PRESENT STUDY**

### **2.1. Aim**

This study initiates a systematic review of the literature on data related to school dropout (Pellegrini and Vivanet, 2018). It focuses on analysing sources, methodologies, and criteria used, extending on previous research (Beri, Agrati, Lazzari, forthcoming) that excluded grey literature.

The research questions that guided the review, based on PRISMA guidelines (Page et al., 2021), are as follows:

What are the data sources and methodologies used internationally to collect data on school dropout?

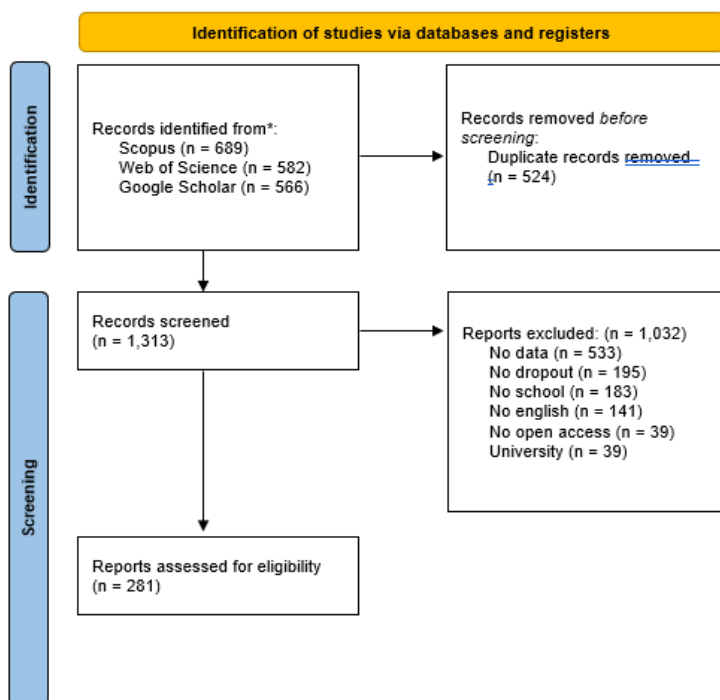

## 2.2. Eligibility criteria

The selected studies meet the following eligibility criteria (Cooper and Hedges, 2019): students up to upper secondary school; focus on school dropout, excluding other types of dropout (e.g., university); published between 2021 and 10 July 2024, in English and open access.

## 2.3. Research strategy

The search was conducted in SCOPUS, Web of Science, and Google Scholar, using the search string: ‘dropout’, ‘school’, ‘data’. Limits were applied regarding publication year and language. Selected studies were exported to Rayyan<sup>2</sup> to remove duplicates. The initial screening assessed titles and abstracts, excluding articles that did not address school dropout or referred to non-educational contexts.

Figure 1 – Study selection process. Adapted from Page et al. (2021)

<sup>2</sup> Rayyan is an online software used to organise, manage, and accelerate the literature review process. <https://www.rayyan.ai/>.

A total of 1,837 records were identified by searching electronic databases. After removing duplicates (n = 524), 1,313 records were subjected to an initial evaluation based on title and abstract. Of these, 1,032 were excluded, progressing to the next stage of more detailed screening of 281 studies (Fig. 1).

### **3. RESULTS**

The initial screening and reading of articles yielded significant preliminary results. The large number of identified studies can be explained by the fact that many of them, while analysing related phenomena (depression, alcoholism, sleep quality, health, etc.), use data on school dropouts. However, there is a lack of studies that explicitly analyse the methodology, collection, and analysis of such data.

Key aspects include the variety of indicators and definitions of “dropout” from broad interpretations (Zanoni et al., 2023) to specific measures like the difference between enrolments and dropouts (Ronak and Rashimi, 2021), with significant methodological consequences.

Another issue is the lack of specific tools to measure school dropout. Many studies use adapted tools (Cho et al., 2023) or rely on a single question (Mbebi, 2023), compromising the reliability of results (Andersen et al., 2021).

Additionally, incomplete or erroneous data can distort the phenomenon (Cho and Bae, 2024). For example, student mobility, can lead to over- or underestimation of dropout rates (Galvis-Restrepo, 2022).

Furthermore, homogenising data from different agencies (Jiménez-Gutiérrez et al., 2024) is a complex process that requires greater initial sharing of meanings (Entwisle et al., 2004).

These aspects highlight the need for accurate longitudinal data, capable of not only to follow student movements (Galvis-Restrepo, 2022) but also to gather useful information for predicting the phenomenon (Balfanz et al., 2020). Indeed, dropout is not a sudden event, but the result of a gradual process of disengagement (Haimovich et al., 2021).

In this regard, data should not be collected exclusively at the end of the school year or study cycles but should also include crucial phenomena such as absenteeism and repetition. Indeed, many studies highlight a significant correlation between these factors and dropout, considering them predictive (Cho and Bae, 2024).

Consequently, the urgency of adopting predictive tools, not just descriptive

ones, emerges, such as those offered by Educational Data Mining (EDM), defined as “the use of data mining techniques to analyse and extract hidden knowledge from the context of educational data” (Oppong, 2023).

In the context of dropout, these techniques would allow the creation of early warning systems (Sandeep et al., 2014). Such systems, based on student data and the risk variables identified in the literature, produce “risk scores” that estimate the likelihood of dropping out for each individual. Students with scores above certain thresholds are identified as at risk, enabling policymakers to undertake targeted support actions (Xu et al., 2021).

Several states in the US and Europe have already implemented early warning systems to identify at-risk students using rich administrative data (Sara et al., 2015). The goal is to maximise the identification of at-risk students while minimising false positives.

## **CONCLUSION**

Despite the extensive literature, school dropout remains complex and under-explored in key aspects such as the definition of the construct and the systematic collection of data. This study highlights the need for international standardisation of criteria and indicators and for integrated and longitudinal approaches for their analysis.

In particular, the importance of predictive analysis tools, such as Educational Data Mining, emerges for the early identification of risk factors and for supporting targeted interventions. These systems, which have already been tested in some international contexts, represent a crucial opportunity to optimise the management of the phenomenon, facilitating personalised interventions and a more efficient use of educational resources.

Cooperation between educational and governmental agencies in defining and sharing of constructs and indicators seems fundamental to a more accurate and inclusive measurement of school dropout, capable of considering even less evident forms of educational difficulties. A coordinated approach based on reliable data could significantly improve the effectiveness of interventions, allowing for more informed and targeted decisions. However, the success of such policies depends on the clarity of the definitions adopted and the accuracy of the reference rates. Errors in these aspects not only risk wasting resources but can also compromise the ability of programmes to achieve their objectives. It is therefore essential to develop well-structured policies to effectively address the global challenge of school dropout.

# REVIEW OF FACTORS UNDERLYING THE SCHOOL DROPOUT PHENOMENON IN INSTRUMENTS USED WITH STUDENTS, PARENTS, AND TEACHERS

Bonaiuti Giovanni<sup>a</sup>

De Angelis Marta<sup>b</sup>

Marras Arianna<sup>a</sup>

Morsanuto Stefania<sup>c</sup>

<sup>a</sup>Università di Cagliari; <sup>b</sup>Università del Molise; <sup>c</sup>Università telematica Pegaso.

School dropout remains a critical challenge for global education systems, with complex causes spanning institutional, individual, and relational domains. This paper examines the predictive factors underlying school dropout and evaluates validated tools for assessing these dimensions. Drawing on the TALENTED Project, the study discusses the roles of teachers, students, and parents and highlights how interventions targeting beliefs, attitudes, and teaching practices can foster student engagement and academic success. The project proposes a selection to use validated instruments, in order to provide an experimental approach to reducing dropout in school context.

drop-out, upper secondary school; review of factors and constructs; academic insuccess; early school leaving.

## INTRODUCTION

The TALENTED project aims to assess how various teaching methods and the broader school environment influence student retention or dropout. Teaching methods include diverse instructional strategies, curriculum designs, and pedagogical approaches that can either foster student engagement or contribute to their disengagement. Additionally, the school climate—encompassing teacher-student relationships, school safety, and peer interactions—plays a critical role in shaping students' attitudes toward their education. By examining how these factors interact, the project seeks to

uncover key insights into why some students become disengaged and ultimately drop out, paving the way for the creation of more effective intervention strategies.

The research is based on Rumberger's (2011) framework, which classifies the causes of dropout into two broad categories: social and school-related phenomena. These include institutional factors (e.g., school policies, teaching practices) and individual factors (e.g., student motivation, coping strategies). Additionally, relational factors (e.g., student-teacher interactions, parental involvement) are also considered within these categories, given their critical role in shaping school dynamics.

## **1. PREDICTIVE FACTORS OF SCHOOL DROPOUT**

To identify predictive factors, the project focuses on examining how elements such as students' emotions and motivations, as well as parents' and teachers' personal beliefs and expectations, influence student engagement, academic performance, and dropout rates. Research indicates that students are more likely to engage in their education when they hold positive attitudes toward learning and believe in their ability to succeed. Likewise, parental expectations and involvement play a significant role in shaping a child's motivation and school engagement. By analyzing these beliefs and attitudes, the project aims to explore how they can be aligned with educational practices to create a more supportive learning environment, thereby reducing the risk of disengagement and dropout. Building on existing literature, we conducted an analysis of key self-report instruments to evaluate their relevance and applicability in research. This effort aimed to identify tools that investigate the influence of teaching methods, teachers' beliefs, and biases on academic failure. Additionally, it examined how students' attitudes, experiences, study strategies, motivation, and engagement impact academic success, as well as the effect of low parental expectations on educational outcomes.

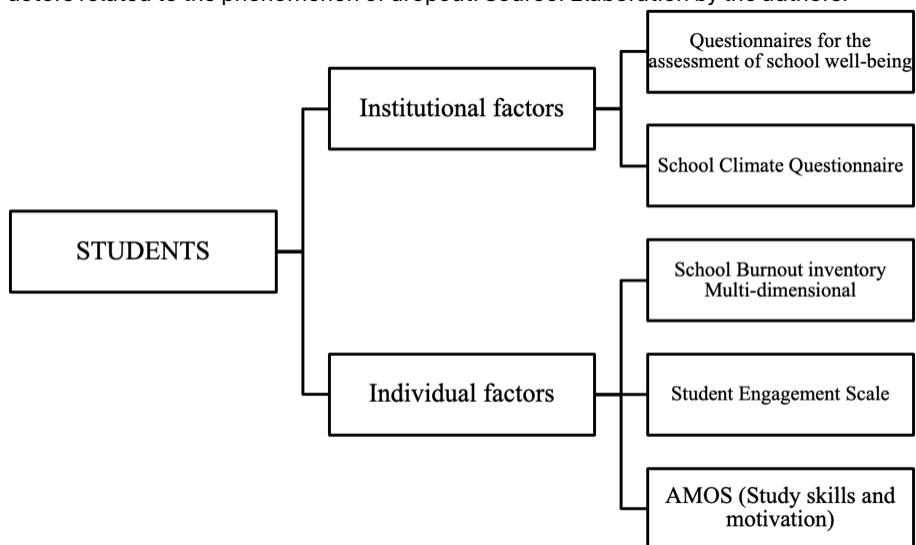

### **1.1. Students**

Individual factors contributing to school dropout include motivation, self-esteem, and academic performance, with students who lack motivation, have low self-confidence, or experience ongoing challenges being at a significantly higher risk of leaving school (Rumberger, 2011).

Institutional factors, as well as school climate and well-being, are a key construct to explore is school well-being, with a particular focus on the

student’s subjective perspective regarding the factors that shape their school experience. The analysis of these factors led to an examination of the tools presented in Fig. 1.

Fig. 1. Factors related to the phenomenon of dropout. Source: Elaboration by the authors.

The *Questionnaire on School Well-Being* (QBS 8-18) (Marzocchi & Tobia, 2024) is a comprehensive tool for assessing various aspects of students’ school experiences, focusing on relationships, emotions, and self-perceptions. It includes subscales such as *Satisfaction and Recognition*, which evaluates acknowledgment and support; *Relationship with Teachers*, analyzing the quality of interactions with educators; *Relationship with Classmates*, exploring peer connections; *Emotional Engagement*, assessing students’ feelings about school; and *Sense of Self-Efficacy*, measuring beliefs about learning and cognitive abilities. Additionally, the QBS includes three items on *Causal Attribution Mechanisms*, which provide insights into how students interpret success and challenges, although they are not included in the overall School Well-Being score. The QBS includes versions for parents and teachers, allowing these stakeholders to evaluate a student’s school well-being from their unique perspectives, complementing the student version for a comprehensive understanding of the school experience.

Another important concept is *school climate* that is widely studied in literature due to its significant correlations with other critical dimensions, such as school dropout. Research highlights how a positive school climate is associated with

improved academic performance (Daily et al., 2020).

To thoroughly assess the school climate, two scales were developed: *Classroom Practices* and *School Atmosphere* (Grazia e Molinari, 2021). The first scale comprises six factors: perceptions of school rules, availability of student support resources, student involvement in decision-making, quality of teaching, teacher encouragement, and classroom management. The second scale includes five factors: student relationships, student-teacher dynamics, overall educational climate, students' sense of belonging, and perceptions of fairness within the school. Together, these scales offer a comprehensive framework for understanding the multidimensional nature of school climate and its impact on the school community.

The *Student Engagement Scale* (Mameli & Passini, 2017) is an Italian adaptation of AES, *Agentic Engagement Scale* (Reeve, 2013). This is another important tool to measure student involvement, that is defined as emotional, behavioral, cognitive and agentic as measured through distinct scales. Its structure is made of 38 items that analyses behavioral and cognitive engagement.

Burnout, widely recognized in the workplace, is also highly relevant in educational settings. Initially associated with teachers, it has recently been adapted to evaluate students' psychological well-being within a different context (Marôco et al, 2020).

The School Burnout Inventory (Fiorilli et al., 2014) is another instrument designed to measure the construct of school-related burnout. It consists of three subscales – exhaustion, cynicism, and inadequacy – which represent distinct dimensions of burnout.

The AMOS (Assessment of Study Skills and Motivation) (Cornoldi et al., 2022) is an all-encompassing tool for evaluating students' learning processes and attitudes in educational settings. It focuses on study strategies, cognitive styles, and resilience, providing insights to improve study skills and motivation. AMOS includes scales for assessing study strategies, learning approaches, cognitive styles, and abilities. Additional tools explore study practices, beliefs about studying, and assess anxiety and resilience. Together, these scales offer a comprehensive understanding of students' academic profiles, enabling educators to address their needs effectively.

## **1.2. Teachers**

*Teacher efficacy* is a key concept in educational psychology, reflecting teachers' belief in their ability to positively influence student learning. It has been defined

as teachers' confidence in their capacity to enhance learning outcomes, even for students who may be considered unmotivated or difficult. Ashton et al. (1984) described it as the belief in their ability to have a positive effect on student learning, while Guskey & Passaro (1994) emphasized it as a conviction that they can influence how well students learn, regardless of challenges.

Studies have shown that teachers with strong efficacy beliefs are linked to positive student outcomes, including higher academic achievement and improved classroom management (Ashton & Webb, 1986). Additionally, these teachers tend to foster greater student motivation and engagement in classroom activities, contributing to an overall more effective and dynamic learning environment.

Teacher efficacy is commonly evaluated using a variety of instruments, with the *Teacher Self-Efficacy Scale* (TSES) (Tschannen-Moran & Hoy, 2001) being the most widely used. Several Italian adaptations of this scale are available, including the SAED (Teacher Self-Efficacy Scale; Biasci et al., 2014) and the TEIP (Teacher Self-Efficacy for Inclusive Practice Scale; Aiello et al., 2016).

Teacher self-efficacy does not operate in isolation but is closely connected to other psychosocial factors that influence motivation and performance. These include professional aspirations, the level of recognition and respect perceived by teachers, and ultimately, their job satisfaction. A significant source of this satisfaction is teachers' sense of competence. Self-efficacy meets intrinsic psychological needs for competence, as described by Ryan & Deci (2000), and also contributes indirectly to job satisfaction by enhancing performance, which can lead to feelings of pride and tangible rewards. This interplay highlights the critical role of teacher efficacy in fostering both professional fulfillment and educational success. One of the questionnaires aimed at evaluating these various aspects is the MESI Questionnaire (Motivations, Emotions, Strategies, and Teaching), developed by Moè et al. (2010). This is a validated and widely recognized tool for analyzing teachers' motivational, emotional, and strategic profiles. It consists of six scales, totaling 130 items, and allows for an in-depth examination of dimensions such as self-efficacy, job satisfaction, incremental conceptions of abilities, and other key pedagogical aspects. This approach is grounded in empirical research showing that positive emotions and motivation, coupled with effective teaching strategies, can significantly influence the quality of instruction. In our study on school dropout, we have chosen to focus on the scales measuring self-efficacy, job satisfaction, and incremental beliefs. According to the literature, these dimensions promote more proactive teaching,

facilitate adaptation to complex situations, and, over time, can enhance students' motivation, thereby helping to reduce the risk of dropout. Employing MESI as an analytical tool is therefore strategic, enabling us to accurately outline teachers' profiles and to implement effective interventions targeting factors that contribute to early school leaving.

### **1.3. Parents**

Parental involvement plays a crucial role in children's academic success, with several tools developed to assess different aspects of this dynamic, but we did not identify any validated instruments available in Italian. International literature offers various tools that connect parental expectations to some factors influencing student outcomes. For example, these instruments assess how parental expectations relate to students' self-efficacy, self-regulation skills, study attitudes, and motivation. Some examples include scales like the *Parental Academic Expectations Scale* (PES), which examines the standards parents set for academic achievements and how these shape their children's performance (Wang & Heppner, 2002), *Parent and School Survey* (PASS), designed to measure parental involvement (Ringenberg et al., 2005). An aspect that can play a significant role in children's success is parental self-efficacy. In this regard, there is an Italian instrument that we have adopted for our research (Pastorelli & Gerbino, 2001). Our research on this type of instrument is still ongoing.

## **CONCLUSION**

The TALENTED Project highlights the importance of implementing evidence-based tools and interventions in addressing school dropouts. Future research should explore the scalability of these tools and refine strategies to adapt them to diverse educational contexts. The project aims to demonstrate how a multidimensional approach can mitigate dropout risks. Integrating tools allows for a nuanced understanding of the interplay between school climate, teacher efficacy, and student engagement. Key implications include teacher training to adopt growth mindsets and improve self-efficacy; encouraging active parental involvement through structured programs; designing interventions that prioritize emotional and cognitive student engagement.

The interrelationship between students, teacher and parents' involvement in students' educations is considered as a key point for the TALENTED project, insofar as we considered such factors as predictive for evaluating the dropout rate.

# GAMIFICATION AS A TOOL FOR PREVENTING EARLY SCHOOL LEAVING: A POSSIBLE PERSPECTIVE?

Filippo Bruni<sup>a</sup>

Livia Petti<sup>a</sup>

Marta De Angelis<sup>a</sup>

<sup>a</sup>University of Molise

Early school leaving is an urgent and complex problem that national and European institutions have long been trying to address (Council of the European Union, 2021; MIUR, 2014). A wide range of factors – both in and out of school – contribute to early school leaving, including household responsibilities, lack of parental guidance, large family size, poor economic conditions, failure in exams, lack of time for study, punishment by teachers, and lack of interest in studies (Baruah & Goswami, 2014). Financial resources, policies, student-teacher-parents' relationships, and academic performance also play a significant role (Orion et al., 2014). Within this framework, an interesting line of research and experimentation can be given by paying attention to teaching strategies and methodologies (Bonaiuti, 2014) that can reduce early school leaving. The present work aims to verify whether the use of gamification in education can contribute to reducing school dropout rates and is linked to broader research promoted by the PRIN project Teaching And LEARNING effectiveness to promote student achievement and prevent school Dropout (TALENTED) which aims to identify a series of didactic approaches to be applied in the school context to prevent school dropout.

gamification; early school leaving; Talented; high school; education.

## 1. EDUCATIONAL STRATEGIES TO PREVENT EARLY SCHOOL LEAVING

Early school leaving is a complex phenomenon that affects the entire education system and encompasses different factors that cause young people to miss and irregularly attend school (Besozzi, 2017). These factors may include low academic performance, disciplinary problems, negative social orientation of

students, failures and frequent and repeated absences. Early school leaving affects all countries of the European Union and is nowadays of major importance in the international educational landscape.

The indicator used to quantify the phenomenon of school drop-out is known as ELET – Early Leaving from Education and Training, which refers to young people between 18 and 24 years of age who have left education with a secondary school degree or with a qualification of no more than 2 years of secondary school (Capperucci, 2016). Analysing ISTAT 2023 data, it is possible to note that the share of young people who have not completed education remains significant in our country (10.5%) even though the gap with the EU average has narrowed considerably over the years (from 4.7 percentage points to only 0.9). In Agenda 2030, the EU set the target of reducing the share of early school leavers to below 9% by 2030. Significant differences remain between Member States with several countries having already reached the target.

Early school leaving is an urgent and complex problem that national and European institutions have been trying to tackle for a long time (Council of the European Union, 2021; MIUR, 2014) because it leads to the increase of economic and social inequalities by counteracting the growth of countries. There are also many research actions working to curb this phenomenon; the PRIN TALENTED project “Teaching And LEarning effectiveness to promote student achievementNT prEvent school Dropout” of which the authors are part is an example. This project aims to identify several teaching approaches to be applied in the school context to prevent school dropout.

There are many studies that focus on the link between school dropout and the family and socio-economic background of the students; in contrast, there are few studies that explore the quality of classroom teaching and the use of active teaching strategies as factors that can contribute to combating school dropout (Lee & Burkam, 2003). However, we know how on the one hand active teaching strategies can influence student motivation (Schiefele, 2017) and on the other hand how quality teaching can play a crucial role in reducing the risk of dropout by improving students’ sense of belonging and satisfaction (Magen-Nagar & Shachar, 2017). A teaching approach that encourages active participation, critical thinking and the development of soft skills, such as collaboration and problem solving, proves to be crucial in maintaining high student motivation and preventing the risk of dropout.

Involvement is an important variable for students to develop meaningful and deep learning. Uninvolved students have lower evaluations (Finn & Rock, 1997)

and, longitudinal studies show that this outcome is correlated with the later decision to drop out (Alexander et al., 1997). Students who are engaged and involved, on the other hand, develop greater learning benefits (Fincham et al., 1989). It is therefore possible to assert that the less involved a student is in his or her studies, the higher the risk that he or she will drop out of school before completing his or her education. It therefore becomes important to use various active teaching methodologies (Johnson et al., 1981) in order to involve the students as much as possible.

## **2. TEACHING STRATEGIES AND PLAY**

In terms of instructional design, it is therefore appropriate to prefer strategies that promote engagement through forms of interaction. Compared to a receptive architecture, characterized by the absence of interaction and the transmissive role of the teacher, it is better to use behavioural architecture, based on the stimulus-response model, which implies forms of frequent interaction or other architectures such as situated guided discovery architecture or exploratory architecture (Clark, 2000; Calvani, 2011; Bonaiuti, 2014).

Within that context, a special space can be assigned to play. Play implies learning. The digital dimension further accentuates such a perspective: video games open new perspectives to learning (Prensky 2007) and identity construction (Gee, 2013). Games and video games, in relation to today's digital culture, allow us to experience our surroundings as a form of problem solving, as in active engagement, linked to experimentation and taking responsibility and with high emotional involvement (Jenkins 2010).

The attempt to use play as a tool for teaching is therefore shareable. However, the difference (Visalberghi, 1958) between properly *ludic* activities and *ludiform* activities, which resemble play but are conceived from the outset as a tool for learning, must be kept in mind. The transition from play/videogame to play as a teaching tool is a complex operation. And, in this sense, a multiplicity of approaches indicated by series of acronyms are proposed and used: Game-based learning (Bonaiuti, 2014), Edutainment (Buckingham, 2007), Serious games, Playful learning (Andreoletti & Tinterri 2023, p. 24), Gamification (Kapp, 2012).

### **3. GAMIFICATION AND EARLY SCHOOL LEAVING**

Without going further into the specifics of each approach, we focus on gamification, which has the advantage of being an extremely flexible approach. Gamification, understood as “the use of game thinking and game mechanics to engage users and solve problems” (Zichermann & Cunningham, 2001, p. XII), can be used in school settings in order to enable students to achieve specific learning outcomes.

In this sense, it is possible to distinguish between the mechanisms and strategies specific to gamification. The mechanisms are scores, levels, rankings, badges. The strategies, on the other hand, are flow, the possible alternation between physical reality, virtual reality and storytelling (Bruni & Silva, 2024). The use of gamification in teaching paths in relation to prevention turns out to have positive effects.

It emerges that by using these elements avoiding rigidly behaviourist approaches, the use of gamification in education has been shown to have a positive impact on student engagement and motivation (Colombo & Tièche Christinat, 2017; Guerrero-Puerta & Guerrero, 2021) found that gamification can improve students’ well-being and school engagement, potentially reducing the risk of dropping out of school. Similarly, Khaleel et al. (2020) found that gamification increases student engagement in difficult subjects, which could potentially lead to improved retention. Harrington & Mellors (2021) and Aleksic-Maslac et al. (2017) both highlighted the positive impact of gamification on student engagement and retention in tertiary settings, further supporting the potential of gamification to reduce school dropout. Thus, the categories of engagement, motivation, and well-being turn out to be central categories on which to focus further research activities.

### **4. MOTIVATION, ASSESSMENT AND FEEDBACK: SOME OPEN QUESTIONS**

From the framework examined, some research perspectives then emerge that imply a rethinking of the use of gamification not only in terms of pure effectiveness, but also in terms of enhancing the aspects that make it more functional in preventing and combating school dropout. In this sense, the aspects to focus on answer the following research questions:

- can gamification positively influence students’ motivation and thus prevent the phenomenon of dropout?
- what relationship exists between gamification and evaluation?

Regarding the first question, despite the proliferation of research on gamification in recent years, only recently have the underlying motivational mechanisms become the topic of empirical research. The two main categories of student motivation are intrinsic and extrinsic (Deci et al., 2001). The use of rankings can create competition among students and reduce their intrinsic motivation, especially when the point system is not provided as a form of feedback (Chan et al, 2018). For this reason, it is preferable to promote student motivation through specific and moderately challenging goals: when users were given a clear goal, in fact, their engagement increase compared to individuals who were told to simply do their best or who were not given an explicit goal (Lam, Hew & Chiu, 2018).

Regarding the relationships between gamification mechanisms and assessment, some commonalities emerge from the meta-analyses on the topic (Bai, Hew & Huang, 2020) that would make such an instructional strategy capable of improving student learning and positively affecting assessment, such as:

- the setting and sharing of specific goals, which helps students to direct their own activities to achieve them;
- recognition of one's effort, which can serve as a source of pride and lead the student to more active participation during classes (including through the use of badges as observable proof of their progress);
- third, gamification can provide feedback on the individual student's performance and the performance of his or her peers, helping students meet their need for competence.

The game-based formative feedback system allows students to quickly receive feedback that identified any errors in comprehension so they could correct them before moving on to the next concept (Bullón et al, 2018).

Thus, gamification can improve participation and be useful in combating school dropout by helping students in many ways, from increasing passing and participation rates to high student satisfaction (Viamonte & Figueiredo, 2019), although the latter is not in itself a guarantee of achieving higher levels of learning (Bruni & Silva, 2024).

# PREVENTING EARLY SCHOOL LEAVING: OBJECTIVES AND MILESTONES OF A NATIONAL PROJECT

Valeria Di Martino<sup>a</sup>

Marta Pellegrini<sup>b</sup>

Rosa Vegliante<sup>c</sup>

<sup>a</sup>University of Palermo; <sup>b</sup>University of Cagliari; <sup>c</sup>University of Salerno

School dropout is defined as the lack of, incomplete, or irregular access to education and training services for individuals of school age (Authority for Children and Adolescents, 2022). This complex phenomenon negatively impacts the economic and productive growth of a country. Dropping out of school before completing one's studies is a key indicator that identifies individuals aged 18 to 24 who have attained at most a middle school diploma or who have interrupted their educational journey. The European Union aims to reduce the rate of early school leaving to below 9% by 2030. The National Recovery and Resilience Plan (PNRR) also emphasizes the need for strategies to prevent early school leaving in Italy, which has the highest rate of NEET (Not in Education, Employment, or Training) among young people. The Evidence 4 Preventing Early School Dropout (E4PED) project is a national research initiative selected under MUR-PRIN 2022 call and funded by the European Union—Next Generation EU, involving three research units from southern regions (Cagliari, Palermo, and Salerno), where school dropout is more prevalent. The project aims to provide education professionals with research evidence and effective practices to address early school leaving. Its objectives include synthesizing international evidence on the effectiveness of educational programs, analyzing the dropout phenomenon in the southern regions, and developing interventions to prevent school dropout in lower secondary schools in the South.

school dropout; early school leaving; evidence-based education; educational policy.

## **INTRODUCTION**

Evidence 4 Preventing Early School Dropout (E4PED) is a project of significant national interest (PRIN 2022, funded by the European Union—Next Generation EU). It involves three universities, specifically Cagliari, Palermo, and Salerno, in conducting research on the phenomenon of school dropout, with particular attention to the realities of Southern Italy. In line with European and Italian guidelines, the project aims to provide education professionals with a reliable source of research evidence and effective practices for addressing early school leaving. Countering school dropout, reducing territorial gaps and educational poverty are some of the main challenges that our country is committed to addressing, as outlined in the National Recovery and Resilience Plan (PNRR, 2021). In particular, among the different missions indicated, the one relating to education and research defines the interventions to be implemented to support creating a sustainable and inclusive educational system.

In light of the current situation and the actions planned to stem school dropout, the PRIN 2022 project fits fully into the national scenario by developing along two lines: on the one hand, aggregating international evidence and territorial factors to provide updated documentation of reliable knowledge, on the other hand designing an intervention program, calibrated on the main contextual characteristics, to be implemented in lower secondary schools.

### **1. THE SCHOOL DROPOUT PHENOMENON**

The Authority for the Guarantee of Childhood and Adolescence defines school dropout as “the failure, incomplete or irregular use of education and training services by young people of school age” (2022, p. 20). From this statement, we can find the set of conditions attributable to the phenomenon that aggregate within it: non-schooling, definitive interruption from the education and training system (abandonment), repetition, temporary interruption of attendance, and the achievement of insufficient levels of basic skills.

The causes of dropout in primary and secondary schools are often linked to family factors, teaching methods, and the socioeconomic status of the family. In tertiary education, these causes are somewhat similar, but there are additional factors such as the student’s personal choices and the influence of the surrounding environment on their personality (Negut, 2020).

Wanting to recall the terminological change that has characterized the different historical moments, we have moved from conceiving scholastic failure as a variable dependent on socio-family factors of belonging to recognizing the

weight derived from individual factors, typical of the subject in learning and from relational factors that refer to the quality of interactions between teacher and student (Batini & Bartolucci, 2016).

In this regard, some argue that we can speak of different dimensions of dispersion or even of dispersions in the plural, given the variety of expressions and conditions through which it manifests itself. Just think of territorial location, age, and gender.

Dropping out of school, for example, goes beyond simple academic results, it is a process of disengagement on the part of the individual that develops over time and whose risk symptoms can be traced in absenteeism as well as exclusion or repetition (Lyche, 2010).

The expression *Early Leaving from Education and Training* (ELET) refers to young people who leave education and training prematurely, who do not continue their studies, or who are not enrolled in any type of training. This term does not only include early school leaving but all forms of leaving that occur before the end of secondary school. Therefore, in most national documents, early leaving “means not having completed compulsory education and not having completed upper secondary school” (European Commission/EACEA/Eurydice/Cedefop, 2014, p. 21). This indicator, used at the international level to measure and monitor progress made about the objectives set at the European level, identifies the category of young people who, between the ages of 18 and 24, complete compulsory schooling at most or leave training prematurely.

In 2023, school dropout in Italy fell to 10.5%, a progressive decline compared to 11.5% in 2022 and 12.7% in 2021. Positive signals also arrived in front of the so-called implicit school dropout, unlike explicit school dropout, which refers to the share of children who do not reach sufficient levels in basic skills (European Commission, 2024; INVALSI, 2023; ISTAT, 2024). Over the past two decades, the adoption of evidence-based educational practices has seen significant growth. Evidence-based education aims to promote effective educational interventions through rigorous evaluations, to determine “what works and in what circumstances” (Calvani, 2012). This approach not only supports the decisions of educational policymakers but also provides valuable help to school professionals (Marzano & Calvani, 2020). According to the European Commission (2017), building a strong evidence base is crucial for enhancing educational systems. Several countries have begun initiatives to connect research, practice, and policy more effectively. Notable examples of this include the Education Endowment Foundation and the What Works

Clearinghouse. In comparison with the international landscape, Italy is falling behind other countries (Pellegrini & Vivanet, 2021).

## 2. THE PROJECT'S OBJECTIVES

Considering the premises put forward, the project intends to adopt an *evidence-based approach* to capitalize on knowledge of the phenomenon, through a current analysis of international evidence on dropout prevention programs in secondary schools.

In this frame, *Evidence 4 Preventing Early school Dropout (E4PED)* aims, in the two years 2023-2025, to:

- summarise international scientific evidence regarding the effectiveness of educational interventions aimed at curbing the problem;
- trace the phenomenon in Italy with a particular focus on the southern regions and the initiatives already present in the territory;
- develop an intervention program for lower secondary schools to be implemented in the school contexts of Southern Italy.

The project aims to conduct an updated systematic review of the effectiveness of programs designed to prevent early school leaving in secondary schools. This is necessary because there are currently no recent systematic reviews on this topic (Tanner-Smith and Wilson, 2013; Wilson et al., 2011). At the international level, there are very few systematic reviews of programs designed to prevent and tackle school dropout. The most recent are the meta-analyses by Wilson et al. (2011) and Tanner-Smith and Wilson (2013), which include studies from 1985 to 2010. In addition to evaluating program effectiveness, the review will also analyze potential predictors and moderators that may influence the outcomes.

The European Commission (2019) emphasized that identifying predictors of early school leaving can aid in developing and implementing a monitoring framework. This framework, along with associated tools, can help schools recognize the risk of school leaving early on, allowing them to provide timely and effective support programs. Although numerous projects have been implemented in our country in recent years (mainly fragmented experiences or good practices, lacking a systematic evaluation of their impact), a common synthesis of international and national scientific knowledge and data is lacking.

Multidisciplinary research has shown that dropping out of school is a serious manifestation of academic distress, often evident through various predictors. Existing literature (Battin-Pearson et al., 2000; Hammond et al., 2007;

Rumberger & Lim, 2008) highlights several key factors associated with this problem: 1) family factors, the economic and cultural circumstances of a student's family play a critical role; 2) school factors, aspects such as the quality of teaching, relationships with teachers and the general school environment can significantly influence students' decisions to continue their studies; 3) personal factors, issues related to self-esteem, motivation and learning difficulties can lead students to drop out of school; 4) social factors, the socioeconomic and cultural context of the area in which a student lives can have a profound impact on their academic performance. The context analysis aims to provide a synthesis framework on the main factors that lead to early school leaving starting from the documentation of national and regional policies, from the best practices implemented, and through a concurrent triangulation design (Creswell et al., 2003) the main social actors will be involved. The information obtained will allow the design of a calibrated intervention program. To this end, the project will act as a reliable source of evidence by synthesizing the best international research with an analysis of the Italian context. This will support contextualizing evidence-based strategies and programs in Italian secondary education.

### **3. THE BREAKDOWN STRUCTURE**

The three objectives outlined are organized into six Work Packages (WP). Each WP contains a series of activities to be carried out. Leaving aside WP 1 (coordination) and WP6 (dissemination), a summary of the others is presented as follows. Starting from the conduct of a systematic review on interventions to counteract early school leaving through a meta-multilevel analysis on the effectiveness of early school leaving prevention programs based on experimental data (effect sizes and moderator analysis). Subsequently, based on qualitative data, a framework of the effective characteristics of the programs will be outlined (WP2).

Analysis of policies to combat school dropout adopted at national and regional levels, with particular attention to the Southern regions. In this sense, the adopted strategy will include the investigation of school websites, regional school office databases (USR), the National Operational Program database (PON), as well as Google and Google Scholar sources. Context analysis, through the construction and administration of questionnaires addressed to the main social actors, i.e. students, teachers, and young NEETs (WP3).

The information obtained will be used to define a program for teachers at lower

secondary schools (WP4). We will use the Educational Design Research approach (EDR, McKenney & Reeves, 2014) to develop our intervention. This activity includes the design and development of materials for students and school professionals. The materials and tools will be based on international evidence and the results of the context analysis. Subsequently, quality control will be activated. Academic and school experts in the field of early school leaving will analyze and verify the quality of the program through systematic tools designed by the WP coordination unit. According to the final phase of the EDR, the program will be reviewed by the multidisciplinary team after data has been collected and analyzed during the testing phase (WP5).

## **CONCLUSIONS**

Knowing to prevent and contrast is certainly the main line of direction that the presented project intends to pursue. The objectives, defined and detailed in specific activity packages, aim to increase the knowledge base on school dropout, paying particular attention to the regions of Southern Italy. In this sense, it contributes to updating the existing literature by providing a systematic review examining the effectiveness of programs designed to reduce school dropout rates, to provide a summary framework on international evidence and the characteristics of the Italian school reality. Subsequently, it will be possible to design, implement, and evaluate an intervention program, built ad hoc, also considering the contextual variability, and to be allocated to lower secondary schools. These actions will converge in a single purpose: to formulate guidelines to be addressed to professionals and policymakers, including a monitoring structure to be reserved for school institutions.

### **Acknowledgments.**

The work was conducted as part of the “Evidence 4 Preventing Early School Dropout (E4PED)” project (CODE 20229TM9ZJ), under the “PRIN 2022 Call” D.D. 104/2022. # SUPPORTING STUDENTS' MOTIVATION: A KEY FACTOR TO REDUCE INTENTIONS TO DROP OUT OF HIGH SCHOOL

Sara Germani<sup>a</sup>

<sup>a</sup>Sapienza University of Rome

This study examines school dropout through Self-Determination Theory (SDT), focusing on the role of teaching style. According to SDT, teachers' behaviors are crucial in supporting or thwarting students' basic psychological needs, which significantly impact their motivation and persistence in education. Using a cross-sectional quantitative approach, the study involved 1,092 high school students who completed measures assessing need-supportive and need-thwarting teaching, intrinsic motivation, and dropout intentions. Results show a significant association between teaching style and intrinsic motivation, which significantly reduces dropout intentions, even as a mediator. Findings suggest the importance of teacher training programs focusing on motivational strategies to improve their practices, as fostering a supportive teaching environment can promote better learning outcomes for students.

school drop out; self-determination theory; students' motivation; teaching style

## INTRODUCTION

In recent years, policymakers have increasingly recognized school dropout as a critical issue in many education systems. The phenomenon of school dropout encompasses not only students who formally leave their studies without obtaining a diploma but also “implicit dropout” which refers to the failure to achieve expected competencies and learning outcomes despite completing secondary school. Addressing the impact of dropout and inadequate basic skills remains a persistent challenge for education and training systems, with profound implications for society, the economy, and individual well-being (UNESCO/OECD/Commonwealth, 2024). At the European level, the goal is to reduce the school dropout rate to below 9% by 2030. The Italian average dropout

rate is still 10.5% (ISTAT, 2024), highlighting a significant gap compared to the European benchmark. These figures highlight the urgent need to better understand the factors behind school dropout. Identifying its causes can help prevent risks and promote protective factors, supporting targeted strategies to prevent early school leaving, boost engagement, and bridge the gap between expected and achieved competencies. The question of why some students choose to drop out has been explored from various perspectives. The complexity stems from the intricate interplay of contextual factors, such as socioeconomic status or school functioning, and individual characteristics, including self-efficacy, self-esteem, engagement, and motivation (Alivernini & Lucidi, 2011; Batini, 2023). Recognizing the need for practical and effective strategies to prevent dropout, it becomes crucial to focus on “malleable factors”. Among these, students’ motivation emerges as a pivotal element and a key area for intervention. Building on this understanding, it is essential to examine school dropout from a motivational perspective. One of the most widely used theoretical frameworks for understanding school dropout in motivational terms is Self-Determination Theory (SDT; Ryan & Deci, 2017). The present study, grounded in the SDT framework, investigates dropout intentions in relation to students’ motivation and one of the contextual factors that, according to this theory, serves as a primary source of support or barrier to their motivation: teachers’ motivational behaviors.

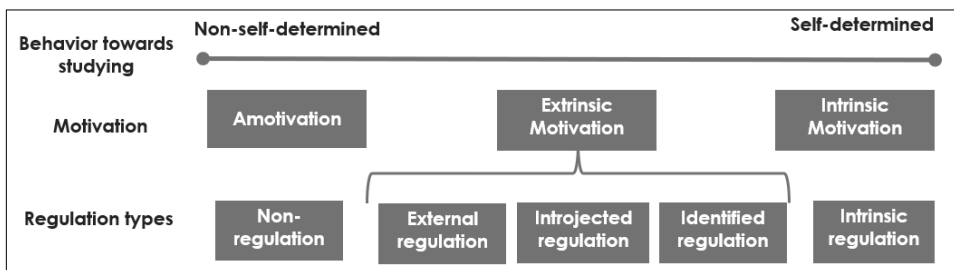

## **1. THE SELF-DETERMINATION THEORY IN THE SCHOOL CONTEXT**

The Self-Determination Theory (SDT; Ryan & Deci, 2017) is a macro-theory that explores motivation, personality development, and well-being, focusing on social and cultural contexts that influence self-determination in behavior. A central aspect of the theory is the existence of three basic psychological needs: autonomy, competence, and relatedness, considered essential for personal growth and well-being (Vansteenkiste et al., 2020). The fulfilment of these needs enables the process of *internalization*, through which individuals regulate their behavior autonomously, perceiving themselves as free and in control of their actions. In the school context, SDT focuses on fostering students’ interest in learning through the self-regulation of motivation. Students consistently seek to satisfy their basic psychological needs, which in the school context refer to a sense of autonomy in school activities, a sense of belonging and connection with teachers and classmates (relatedness), and the perception of effectiveness in their studies (competence). Satisfying these needs supports the internalization of motivation toward activities that are initially regulated by

external factors.

SDT distinguishes different types of motivation along a *continuum* (Fig. 1), from amotivation (lack of intention) to intrinsic motivation (pleasure and satisfaction derived from the activity itself). Between these extremes lie various forms of extrinsic motivation, differing in their degree of self-regulation: from external regulation (driven by rewards or punishments) to introjected regulation (based on self-esteem and guilt), to identified regulation, where the student assigns personal value in school activities (Guay, 2022; Ryan & Deci, 2020). Intrinsic motivation is considered the prototype of self-determination, closely linked to engagement, academic success and well-being. National and international studies emphasize the importance of learning environments that support students' self-determination, fostering not only better educational outcomes but also greater satisfaction, engagement in learning, and reduced school dropout rates (e.g., Alivernini & Lucidi, 2011; Bureau et al., 2022; Howard et al., 2021).

Fig. 1. Self-Determination Continuum. Figure created by the author.

According to SDT, in students' learning environments, the most critical factor for satisfying their basic psychological needs and fostering the process of self-determination is the way teachers interact with them. What teachers "do" and "say" during lessons to engage students in learning activities can be described as their *(de)motivating style* (Reeve et al., 2022), which varies depending on whether it supports or thwarts students' needs. Need-Supportive Teaching involves teachers actively listening to students' ideas, respecting their choices, providing constructive feedback, understanding their perspectives, and regularly checking on their well-being. Need-Thwarting Teaching includes behaviors such as issuing authoritative orders, interrupting students, making negative comparisons, offering public criticism, or using unkind language. Adopting a Need-Supportive Teaching approach can significantly promote a positive and sustainable learning environment. Conversely, avoiding Need-

Thwarting Teaching behaviors is crucial to ensure students' educational journeys are not negatively impacted (Ahmadi et al., 2023; Howard, Slempp & Wang, 2024; Reeve & Cheon, 2021). For these reasons, understanding how different teaching styles influence students' autonomous motivation is crucial for acquiring deeper insights into how they develop and persist in their educational journey.

## 2. THE PRESENT STUDY

The present study is part of a broader longitudinal research conducted in several secondary schools in Rome (Germani, 2023). The general aim of the research was to evaluate how students perceive their teachers' *(de)motivating styles* and how these perceptions affect their psychological needs over time within the school context. The specific aim of the present study was to investigate the relationships between need-supportive and need-thwarting teaching, students' intrinsic motivation, and their intention to drop out. This is a cross-sectional quantitative analysis involving a convenience sample of 1,092 students (mean age = 15.70 years; 60.80% male; 39.20% female) from a high school. Students participated by completing a digital questionnaire distributed through the *Qualtrics* platform during school hours.

### 2.1. Measures

The questionnaire administered to the students included, in addition to questions related to sociodemographic aspects, the following scales:

- *Need-Supportive Teaching and Need-Thwarting Teaching*: these constructs were measured using a previously validated scale (Germani, 2023) based on teachers' motivational behaviors (Ahmadi et al., 2023). The scale evaluates the extent to which students perceive their teachers' interpersonal behaviors as either supportive of or obstructive to their psychological needs. The scale consists of two dimensions: *Need-Supportive Teaching* (Example item: "They try to understand my point of view"), and *Need-Thwarting Teaching* (Example item: "They interrupt me while I am speaking"). It includes a total of 18 items, rated on a 5-point Likert scale (1 = never to 5 = very often). Students were asked to indicate how frequently the behaviors described in the statements occurred.
- *Intrinsic Motivation*: this construct was measured using the *intrinsic regulation* subscale of the Italian version of the Academic Motivation

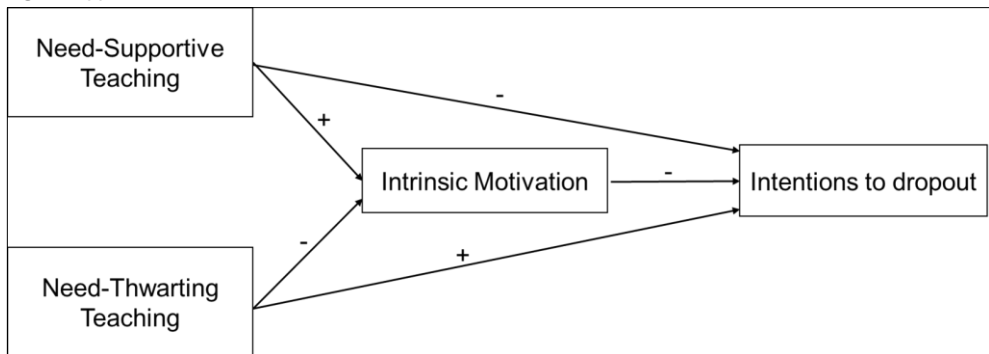

Scale (Alivernini & Lucidi, 2008). The subscale consists of 4 items (example item: “Because school allows me to continue studying topics that interest me”) rated on a 4-point Likert scale (1 = not at all to 4 = very much). Students were asked to evaluate the extent to which each of the listed reasons for attending school corresponded to their personal motivations.

- *Intentions to Dropout*: this construct was measured using 3 items designed to assess students’ intentions to persist in attending school rather than dropping out (example item: “I sometimes consider dropping out of school”) (Alivernini & Lucidi, 2011). Responses were rated on a 5-point Likert scale ranging from 1 (completely disagree) to 5 (completely agree).

## 2.2. Data Analysis

The process of data analysis was carried out using a Path Analysis, assuming (as shown in the hypothesized model in Figure 2) that Need-Supportive Teaching increases intrinsic motivation and is also negatively and directly associated with fewer dropout intentions. Conversely, the model assumed that Need-Thwarting Teaching decreases intrinsic motivation and directly increases dropout intentions. Additionally, the direct association between intrinsic motivation and intentions to drop out was tested.

Fig. 2. Hypothesized model

Following the SDT framework, which posits that motivation can mediate the relationship between context and various outcomes, the model also examined the indirect effects of teaching style (supportive/thwarting) on dropout intentions as mediated by intrinsic motivation.

Descriptive and reliability analyses were conducted as the initial step. The

analytical model was estimated using the Maximum Likelihood method, with a significance level of  $p. < 0.05$ .

**2.3. Results**

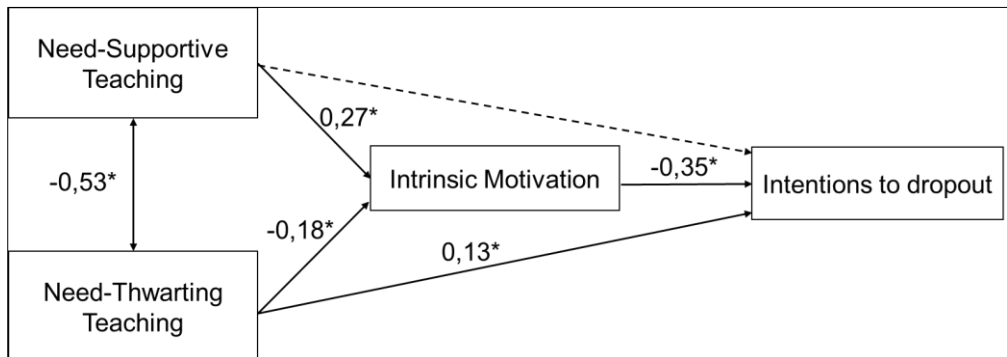

The descriptive and reliability statistics are presented in Table 1, including the mean, standard deviation (SD), and Cronbach’s alpha ( $\alpha$ ) for each construct.

The model (Fig. 3) shows standardized ( $\beta$ ) coefficients, and as we can see, all direct paths are significant except for the one between Need-Supportive Teaching and Intentions to Dropout.

Tab. 1. Descriptive and reliability statistics

Scale/dimension	Mean	SD	$\alpha$
Need-Supportive Teaching	2,37	0,65	0,83
Need-Thwarting teaching	2,34	0,72	0,85
Intrinsic motivation	2,67	0,68	0,83
Intentions to dropout	1,75	0,86	0,86

Fig. 3. Direct paths. The dotted line indicates a non-statistically significant result.  $*p < 0.001$ .

Notably, while Need-Supportive Teaching does not show a significant direct association with dropout intentions, Need-Thwarting Teaching is directly and positively associated with dropout intentions. Additionally, intrinsic motivation is positively influenced by Need-Supportive Teaching and negatively impacted by Need-Thwarting Teaching. Intrinsic motivation also shows a direct and negative relationship with dropout intentions, meaning that students who are more intrinsically motivated have a lower chance or reduced tendency to

develop intentions to drop out of school. Regarding the indirect effects, results indicate that both Need-Supportive and Need-Thwarting Teaching styles indirectly influence dropout intentions through intrinsic motivation:

- Need-Supportive Teaching → Intrinsic Motivation → Intentions to dropout:  $\beta = -0,10$  ( $p < 0,001$ ).
- Need-Thwarting Teaching → Intrinsic Motivation → Intentions to dropout:  $\beta = -0,06$  ( $p < 0,001$ ).

### 3. DISCUSSION AND CONCLUSION

The present paper addressed the critical issue of school dropout using the framework of Self-Determination Theory to understand the role of teachers in preventing this phenomenon. A key aspect is what teachers do and say to engage students in their learning. Therefore, the teaching style, which can be either motivating or demotivating, plays a central role.

Results showed that the teaching style adopted by teachers in the classroom is significantly associated with the interest and enjoyment students exhibit toward school and academic activities. Need-Supportive Teaching plays an important role, especially in fostering intrinsic motivation, which, as observed, contributes to reducing dropout intentions, even when it acts as a mediating factor. Building on the findings, this paper offers some practical and pedagogical insights to address school dropout. By emphasizing the role of teachers' behaviors in supporting or hindering students' intrinsic motivation, the results suggest several potential areas for intervention. For instance, teacher training programs focusing on motivational strategies could not only enhance teachers' ability to support students' psychological needs but also reduce need-thwarting behaviors (Reeve & Cheon, 2021). Additionally, implementing systems for student feedback could help teachers adjust their methods in response to students' perceptions. By addressing these areas, educational institutions can foster a more supportive and effective teaching environment, reducing dropout intentions and enhancing students' learning success.

However, this study has some limitations that should be acknowledged. The research relied on a convenience sample, focusing on students from a general high school, whereas dropout rates are typically higher in vocational schools. Furthermore, only intrinsic motivation was examined, excluding other types of motivation that might have different impacts (Bureau et al., 2022; Howard et al., 2021). Moreover, future research should take a more comprehensive approach, exploring the combined roles of teachers, parents, and classmates in fulfilling

students' needs and motivation, to increase a deeper understanding of the factors contributing to students' overall school success.

# AN INVESTIGATION ABOUT THE RISK FACTORS OF SCHOOL DROPOUT IN CAMPANIA

Gragnaniello Deborah

Tammaro Rosanna

Tiso Maria

University of Salerno

This study delves into the determinants of school dropout in Campania. According to the literature (Trincherò and Tordini, 2011; Batini and Bartolucci, 2016; Nuzzaci and Marcozzi, 2019; Rumberger, 2011; Lundetræ, 2011; Nakajima et al., 2018), there are many risk factors for school dropout. They can be traced back to individual, family, socioeconomic and institutional dimensions. As part of a PhD at the University of Salerno, an empirical investigation was conducted. It involved a sample of students, teachers and school managers from Campania schools where dropout rates are high. A mixed methodology was adopted (Creswell and Clark, 2011). It combines quantitative and qualitative data analysis. The former were collected through semi-structured questionnaires, adapted from validated tools (Batini and Bartolucci, 2016). Qualitative data were collected through interviews and focus groups. The final objective of the research is the design of targeted prevention interventions. The preliminary results of the descriptive analysis of the quantitative data highlight a significant divergence of perceptions between the actors involved. Students place greater responsibility on factors outside their control. While teachers and school leaders focus on the socioeconomic and family context of students.

descriptive analysis; school dropout; risk factors; prevention.

## INTRODUCTION

School dropout is a complex phenomenon. It can be confused with others. This makes its definition difficult. The need to define school dropout in a precise and unambiguous manner is not only linked to a terminological issue, but to the

resulting difficulty in measuring the phenomenon. Indeed, official reports focus on formal abandonments. But, in this case, school dropout is compressed into a more restricted phenomenon.

Specifically, the construct of school dropout recalls the following aspects (Batini and Scierri, 2019): formalized dropouts that occurred before completing compulsory schooling or obtaining a diploma/qualification; irregular frequencies; not frequencies; evasion of obligation; repetitions; attendance and achievement of the qualification without having produced any learning.

The statistical data, however, refer only to formalized school dropouts. They are measured above all ex-post through the comparison between the percentage of qualifications obtained and those not obtained (Batini and Scierri, 2019; Miur, 2021).

According to an international study (Rumberger, 2011), school dropout is caused by a mix of individual, sociocultural and school factors. The individual factors are: attitudes, absenteeism, low learning results; problematic behaviors at school; the failures; changes of residence and school. Contextual factors are: aspects relating to the family context (e.g. educational style and parental support); aspects relating to the social context (e.g. sociocultural characteristics of the place where one lives); aspects relating to the school context (for example, composition of the school population, resources and school climate). Similarly, according to a national study (Nuzzaci and Marcozzi, 2019), the risk factors for school dropout are of three types: push-out factors (e.g. difficult relationships with teachers, failures and uninvolved teaching methods); pull factors -out (e.g. the desire to undertake a career path); falling-out factors (e.g. the feeling of inadequacy, discomfort at school and learning difficulties). they evolve, interact and reinforce each other. In detail, they can be traced back to the context of origin, the school context and the individual characteristics of young people (Solomon, 1989; Batini and Bartolucci, 2016; Batini et al., 2018; Batini, 2023).

## **1. THE DESIGN OF A RESEARCH ON SCHOOL DROPOUT IN CAMPANIA**

Based on the theoretical framework, the general objective of the research is the analysis of the dynamics and determining factors of school dropout, to identify effective prevention and combating strategies. The specific objectives are:

- identification of the determining factors of school dropout;
- collection of opinions on the phenomenon of school dropout and proposals for improvement from pupils, teachers and school managers

- of schools at risk in Campania;
- promotion of the prevention of school dropout.

To operationalize the objectives, hypotheses and research questions were explained. More precisely, the questions posed are the following: which schools are most exposed to school dropout? What are the main reasons that push young people at risk in Campania to disperse? For them, what prevention interventions can be useful?

These are some of the questions that moved the work and guided the formulation of the hypotheses. On the basis of the literature (Benvenuto and Sposetti, 2005; Batini and Bartolucci, 2016; Dell'Anna and Ianes, 2021), it is hypothesized: to find motivations linked to the economic and educational poverty of the social context to which one belongs; to detect motivations linked to the methodological, didactic, evaluative and organizational aspects of training processes aimed at young people; to encourage the reduction of the phenomenon by raising the awareness of stakeholders (pupils, teachers). The research sample was selected using non-probability reasoned choice sampling. It includes schools in Campania at high risk of dropping out. These schools were identified based on the data on school dropout reported in the Self-Assessment Reports (RAV) for the 2021-2022 school year. This type of sampling made it possible to involve a sample of students, teachers and school managers, capable of providing an in-depth and detailed perspective on the phenomenon. Students in the last year of 4 middle schools in the province of Naples and in the two-year period of 102 high schools distributed across the five provinces of Campania were involved. It should be noted that sampling became voluntary when some schools refused the request to participate in the research.

To answer the research questions, a mixed empirical methodology was adopted (Creswell and Clark, 2011). In fact, the research develops in two main phases. Initially, two semi-structured questionnaires were administered, previously validated by Batini and Bartolucci (2016), and adapted to the specific context of this research. The Orienta DropOut questionnaire was addressed to students to collect data on their sociocultural background and perceptions relating to the school experience. At the same time, the Orienta Dropout questionnaire: cognitive survey on school dropout was administered to school managers and teachers to delve deeper into the teaching practices adopted and the dropout prevention strategies implemented.

Afterwards, a case study was carried out in a secondary school which, among

those sampled, agreed to participate in this phase of the research.

In line with the research model proposed by Stenhouse (1985), the present study was divided into several phases. Firstly, we selected the Campania schools with a high rate of school dropout.

Subsequently, we collected the data in various ways: documentary analysis, semi-structured interviews with the school director and a group of teachers; focus group with a group of students; participant observation in a class of the selected school.

The quantitative data was subjected to descriptive analysis and the qualitative data to thematic analysis (Riessman, 2008). The integration of the outcomes will allow the development of a multidimensional explanatory model of the phenomenon, capable of capturing the complexities and interconnections between the different intervening factors. Based on the results of this research, a personalized and contextualized prevention and support intervention will be designed. It will make it possible to reduce school dropout in the school that participated in the case study (Graganiello, 2024).

## **2. THE PERSPECTIVE OF STUDENTS AND TEACHERS: A DESCRIPTIVE ANALYSIS**

The administration of the two questionnaires began in April 2023 and ended in May 2024. The extended administration times are due to the difficulties encountered in establishing contact with schools and obtaining their consent to participate in the research.

Regarding the sample of students, 1097 responded to the questionnaire. The sample is made up of 59.3% males, 39.4% females and 1.3% students who did not specify their gender. The age of the students varies between 13 and 19 years old, with a greater concentration in the 14-15 year old range. This data is consistent with the school years involved. 92.2% of students attend secondary school, of which 94.9% in the province of Naples. This data is confirmed by the sampling of schools located mainly in the province of Naples, where the phenomenon is most alarming.

As regards the educational level of the parents, 42.6% of the fathers obtained a lower secondary school diploma as the highest qualification, 9.2% a three-year professional qualification, 28% a diploma of secondary school, 12.9% have a degree. A residual portion has not completed primary school or obtained a master's degree; while less than 1% have obtained a PhD. Somewhat similar data are recorded for mothers. Furthermore, 93.9% of fathers are employed. While 54.8% of mothers are employed, while 45.2% are not.

From the descriptive analysis of some of the data collected through the questionnaire addressed to the students, we can see, in general, a widespread opinion among young people regarding the crucial role of the teaching methodologies adopted by teachers in determining the risk of dropping out of school. 75.2% of students consider practice as a fundamental complement to theory for effective learning. However, only 39.6% declare that they have experienced a teaching approach that adequately integrates theory and practice. This significant gap suggests that teaching is still focused on frontal lessons and the notional transmission of concepts, rather than encouraging experiential and active learning.

The data is confirmed by their proposals to combat school dropout. A strong consensus emerges on the importance of introducing teaching activities that foster creativity: 60.5% of students “very much agree” and 33.6% “fairly agree” with this proposal. Furthermore, 73.3% of students agree that the design of teaching activities should be based on the cognitive matrix, interests and personal history of the students (Robinson, 2015).

Tab. 1. Item 18 – “In your opinion, how much do the following reasons affect school dropout?”

		Steps likert scale					
		1	2	3	4	5	6
<b>Individual factors</b>							
1.	Deviant behaviors	10,6%	13%	19,9%	22,7%	19,9%	13,9%
2.	Lack of motivation to study	1,8%	7,4%	13,9%	14,3%	33,3%	29,3%
3.	Repetitions	14,3%	17,1%	26,8%	15,5%	15,7%	10,6%
4.	Absenteeism	7,9%	10,6%	17,1%	19,9%	21,8%	22,7%
5.	Unfair assessments	28,2%	26,4%	20,8%	12,5%	7,5%	4,6%
6.	Inability to ask oneself “what I will do when I grow up”	5,5%	17,6%	22,2%	14%	18,5%	22,2%
<b>School factors</b>							
1.	Conflicting relationships with teachers	18,7%	15,5%	22,8%	20,1%	15,8%	7,1%
2.	Non-engaging teaching	15,3%	18,5%	18,9%	14%	22,7%	10,6%
3.	Bad peer relationships	13,4%	16,6%	21,3%	21,8%	18%	8,9%
4.	Absence of decision-making spaces	19%	26,4%	18,5%	16,2%	12,5%	7,4%
5.	Teaching centered on frontal lessons	16,7%	26,4%	18%	10,7%	15,7%	12,5%
6.	Not sharing learning objectives with students	25,9%	22,7%	19,5%	12%	13,4%	6,5%
7.	Absence of network work between school-family-territory	6,5%	8,3%	17,6%	20,4%	21,7%	25,5%
8.	Inadequacy of orientation activities	15,7%	21,9%	19%	18,5%	14,3%	10,6%
<b>Socio-economic and family factors</b>							
1.	Economic poverty	11,1%	14,4%	13,4%	23,7%	24%	13,4%
2.	Educational poverty	5%	8,9%	16,2%	13,9%	29,2%	26,8%

Regarding the sample of teachers and school managers involved, 262 responded to the questionnaire. 24.1% were male, 75.9% female. While the third option did not find any responders. The majority are in the age groups between 40 and 59. Specifically, 30% are concentrated in the 40-49 year age group, while 38.8% are positioned in the 50-59 year age group. The 30-39 and over 60 age groups account for 13.8% and 17.4% of participants respectively. No presence was recorded in the 20-29 age group. The distribution of years of service shows a relatively homogeneous distribution between the bands considered. 53.7% had observed the phenomenon of school dropout with average frequency during their work experience. Only 6% had observed it with very low frequency, while no one denied ever having experienced it. Like what was observed for the students, many teachers and school managers work in secondary schools in the province of Naples.

Item 18 of the questionnaire aimed at teachers and school managers uses a six-step Likert scale to evaluate their perception of the influence of each risk factor on school dropout: a score of 1 indicates the minimum influence, 6 the maximum. Among the individual, socio-economic and family factors, the respondents identified the following as most affected: deviant behaviors of young people (56.5%); poor motivation (76.9%); absenteeism (63.5%); economic poverty (61.1%); educational poverty of families (69.9%). In contrast, school factors were perceived as less influential: dysfunctional teacher-student relationships (57%); uninvolved teaching (52.7%); use of face-to-face lessons only (61.1%); disorganization of orientation activities (56.6%) (Tab. 1).

They recognized the importance of intervening on some scholastic aspects for the prevention of school dropout. Among these: innovative teaching methodological choices (89%); planning of personalized training courses based on students' interests and needs (81.2%) (Tab. 2).

Tab. 2. Item 4 – “In your opinion, how effective could the following actions to combat school dropout be?”

		1	2	3	4	5	6
1.	Promote inclusive teaching based on active methodologies	3,7%	2,3%	5%	25,5%	36,6%	26,9%
2.	Know the personal and family history of each student	1,9%	5,6%	2,7%	26,9%	32,4%	30,5%
3.	Reduce the acquisition of knowledge in favor of the development of skills	6,5%	11,6%	17,6%	19,9%	27,3%	17,1%
4.	Encourage the contribution of each student’s personal experience	3,2%	3,7%	8%	25,9%	30,5%	28,7%
5.	Plan teaching activities based on students’ interests	5%	5,5%	8,3%	23,2%	31,5%	26,5%

## CONCLUSIONS

The study found significant dissonance in perceptions of factors contributing to school dropout among students, teachers and school leaders. Students attribute responsibility for dropping out to factors outside their control. On the contrary, teachers and school managers place emphasis on factors linked to the socio-economic and family context of students.

This divergence is supported by research (Batini and Bartolucci, 2016; Szabò, 2018). Regarding the perceived role of innovative teaching methodologies, students express a desire for active and personalized learning, highlighting a discrepancy between their expectations and the actual experience in the classroom. This result aligns with the conclusions of Batini and Bartolucci (2016), who underline the importance of teaching that can motivate and involve students.

Considering these results, the importance of promoting close collaboration between school, family and territory is confirmed. The construction of solid and lasting relationships represents a condition for the development of personalized and integrated interventions, capable of responding to the specific needs of each student. Strengthening the education system is essential and requires a multidimensional approach capable of investing in various crucial areas. First, it is essential to promote the continuous training of teachers, to guarantee the constant updating of their teaching skills and the ability to personalize learning. Secondly, to strengthen the involvement of families in the educational process. Thirdly, to develop collaborative networks between the school and local institutions (Asquini, 2018).

# PEER FEEDBACK AS A LEVER FOR ENHANCING READING COMPREHENSION IN PRIMARY SCHOOLS: AN EVIDENCE-BASED EXPERIENCE

Antonio Marzano  
Rossella Luongo  
Rossella Vaccaro  
University of Salerno

The scientific debate linked to the topic of student participation in assessment processes has contributed, over the years, to the definition of the construct of “assessment for learning” (Assessment Reform Group, 1999) as an evolution of the concept of “formative assessment”. According to the literature, placing students at the center of the evaluation moment responds to the dual purpose of making them more aware of the learning objects and, at the same time, of building their own evaluation literacy. In this scenario, research has highlighted the key role of feedback in learning processes (Black & William, 1998), considering it particularly effective (Dann, 2018; Parkin et al., 2012) to encourage the development of metacognitive skills and of self-regulation. Its effectiveness appears to increase when it is provided by peers. As noted by Hung (2018), however, experiments related to the topic of peer evaluation are still few in schools, compared to what has been carried out in academic settings. Considering these premises, this contribution intends to investigate what effects the use of peer feedback produces on the quality of primary and secondary school students’ work and how it influences their critical evaluation skills.

peer feedback; assessment; literacy assessment

## INTRODUCTION

The ability of each person to direct their own choices represents, in today’s complex society, a crucial element for building a personal growth path. In this regard, education appears to be a valuable and indispensable means to foster the development of skills that allow the individual to self-orientate and take

control of his choices and his life in its different phases (Batini, 2015). The role played by the formal education system is decisive. A coherent design for the development of these skills requires a teaching posture that allows the construction of learning environments that promote and support reflective and transformative processes (Grange & Patera, 2021). School comes to be understood as a privileged place in which pupils can cultivate the dimensions of the person, of the citizen and of the future worker. For this to happen it is necessary to overcome the vision that separates evaluation from teaching, relegating it exclusively to its function of verifying results, to assume the perspectives of assessment for learning and assessment as learning that constitute evolutions of the broader concept of formative evaluation (Scriven, 1967). The latter, understood as a continuous process that accompanies the entire teaching process, making continuous feedback available on learning processes and products, plays a strategic role in the progressive development of students' self-assessment and metacognitive regulation skills, which play a significant role throughout their lives. In the light of these premises, this paper aims to better define the possibility of implementing the practice of peer feedback in primary school, highlighting its potential, according to what emerged from the experience conducted in some third classes in the Campania region. From a lifelong learning perspective, the objective is also to illustrate the possible ways to introduce this teaching strategy in upper secondary school to contribute to the development of critical skills.

## **THEORETICAL FRAMEWORK**

Peer feedback (PF) is grounded in well-established theories of social constructivism and collaborative learning, which emphasize the social nature of learning and the value of peer interaction in cognitive development. In this theoretical framework, Vygotsky's theory (1934), with the fundamental concept of the "zone of proximal development" (ZPD), emphasizes that students learn best when they can engage in tasks that stretch beyond their current abilities, also with the support of more knowledgeable peers. Within this framework, PF fits in as a practice that not only helps students internalize added information but also enables them to take ownership of their learning process. By giving and receiving feedback, students receive the scaffolding they need to reach higher levels of understanding and skill. Research by Johnson and Johnson (1999) supports this idea by showing that cooperative learning environments enhance both social and cognitive competencies. Through structured PF sessions, students learn to provide constructive criticism and build a sense of mutual

respect and accountability, which enriches the classroom environment. This collaborative process fosters essential social skills, such as empathy and open-mindedness, which contribute to a positive classroom climate where students feel supported and engaged. PF also aligns with theories of metacognition, as it encourages students to actively reflect on their learning strategies, set goals, and self-regulate. Flavell (1979) introduced the concept of metacognition, highlighting its central role in effective learning. PF encourages students to engage in metacognitive activities by prompting them to think critically about their peers' work and their own. This reflective process allows students to develop awareness of their cognitive processes, strengthening their capacity for self-assessment and adaptation. Nicol and Macfarlane-Dick (2006) argue that involving students in feedback cycles supports a deeper understanding of the material and helps develop "evaluative literacy," the ability to critically analyse and assess one's own and others' work. When students participate in PF, they are not only gaining feedback but are also actively contributing to a communal learning experience, where they learn to view mistakes as growth opportunities rather than setbacks. This social-constructivist view positions PF as more than a teaching strategy: it must be seen to foster an inclusive, student-centred environment that values collaborative growth; it becomes a form of shared knowledge construction, where learning occurs through active engagement and dialogue. PF thus facilitates learning as a dynamic, interactive process where students build a more comprehensive understanding of academic content while also developing essential communication and critical thinking skills. According to Topping's research (1998), PF fosters a culture of continuous improvement, where students benefit from mutual feedback cycles that refine their work and broaden their understanding through regular, structured reflection. This process is especially valuable in supporting the development of lifelong learning skills, as it empowers students to become proactive, self-directed learners capable of critical reflection and adaptability. Through the combined influences of social constructivism, cooperative learning and metacognitive theory, PF emerges as a multidimensional strategy that supports students in building not only academic skills but also the social and cognitive tools necessary for meaningful engagement with complex tasks. This framework provides a solid foundation for exploring PF's broader applications in secondary education, where students' critical thinking and evaluative abilities can be further cultivated and applied across different learning contexts.

## **2. METHODOLOGY**

The “Peer Feedback – Reading Comprehension – Reciprocal Teaching” (PF-RC-RT) program was introduced to third-grade classes in the Campania region during the 2023/2024 academic year. This modified version of Reciprocal Teaching (RT) incorporated PF sessions to enhance students’ reading comprehension and encourage evaluative skills. The study involved 25 teachers and about 700 students, who were divided into a control group (CG) and an experimental group (EG). The research was divided into four phases:

- Preliminary assessment and teacher training: teachers from EG received specialized training on PF strategies. They were provided with tools to guide students in offering constructive and effective feedback. This step was crucial for ensuring effective PF implementation.
- Intervention through Reciprocal Teaching with PF: both groups engaged in Reciprocal Teaching activities, a structured reading approach designed to improve comprehension. However, in EG, PF sessions were integrated. Students were organized in pairs, anonymously exchanging summaries and offering constructive feedback. This exercise encouraged students to reflect on their own understanding while critically engaging with their peers’ work.
- Structured feedback and revision process: students in the experimental group conducted peer evaluations based on clear, structured guidelines. After receiving feedback, each student pair reviewed and revised their summaries accordingly. This iterative process allowed students to refine their understanding and practice applying feedback constructively.
- Evaluation and reflection through post-tests and questionnaires: to assess comprehension gains, both groups completed post-tests like initial assessments. Open-ended questions gathered qualitative insights on students’ experiences, exploring the perceived benefits and challenges of providing and receiving feedback. Teachers also provided feedback, noting how PF impacted classroom dynamics and student engagement.

## **3. INITIAL RESULTS AND FUTURE DEVELOPMENTS OF THE PF PROGRAM**

The initial results reveal that PF activities have had a positive impact on reading comprehension and metacognitive awareness among primary students. Students shared that engaging in peer feedback helped clarify their thoughts,

improved the quality of their work, and boosted their confidence in self-assessment. Teachers also observed that PF sessions fostered a supportive classroom environment, enhancing student engagement and mutual respect among peers. The feedback process proved effective in promoting a collaborative approach to learning, where students came to view assessment as a shared effort rather than a solitary task. They noted that both receiving and providing feedback enabled them to identify strengths and areas needing improvement, making learning more meaningful and deepening their comprehension through this iterative cycle. PF also encouraged students to develop metacognitive skills and think critically about their learning. By assessing each other's work, students learned to self-assess and regulate their own learning processes, a critical element for lifelong educational success. Many students said that giving feedback to others reinforced their own understanding as much as receiving feedback did. Teachers, for their part, observed a generally positive change in classroom dynamics, with many students demonstrating greater motivation and a greater sense of awareness of their own learning. Although PF activities were beneficial overall, teachers noted that some students needed additional support to provide constructive and high-quality feedback. This highlighted the importance of structured guidelines and the need to implement these practices continuously to ensure the effectiveness of PF sessions.

The success of peer feedback (PF) in primary education presents an opportunity to extend its practice into secondary education, where students' cognitive, social, and metacognitive skills are more advanced and ready for further development. In this setting, PF could serve as an essential tool not only to enhance academic performance but also to promote the development of skills that can be used in life and work contexts. By embedding PF into secondary classrooms, particularly in technical and vocational training programs, students could better connect academic learning with real-world applications, ultimately facilitating a smoother transition into the workforce. To explore PF's applicability in vocational settings, this study proposes a collaboration with a technical institute and an industry partner, TESI, a company in the aeronautics and technology sector. The collaboration will enable students to experience PF in project-based, professionally relevant scenarios, thereby enhancing their academic experience with industry-aligned skill development. This approach not only provides contextually rich learning opportunities but also helps to reduce the gap between classroom learning and workplace expectations. The model (Marzano, 2023a; 2023b) for PF in vocational education includes defining

shared criteria, task presentation, structured peer review, reflection, and consensus-building. Through this model, students learn to provide constructive criticism and develop an attitude of continuous improvement, which is essential for long-term professional success. The longitudinal approach will allow for tracking PF's effect on students as they transition from the fourth to fifth grade and eventually into the world of work. In vocational contexts, PF reinforces skills like teamwork, adaptability, and communication, essential in today's dynamic professional field.

# THE ROLE OF TEACHERS IN THE FRAMEWORK OF SELF DETERMINATION THEORY: A RESEARCH TRAINING PROJECT

Sergio Miranda

Ludovico Vespasiani

Università degli Studi di Salerno

*Self-Determination Theory* focuses on motivation, well-being and personality development, emphasizing the role of cultural and social contexts in fostering self-determined behaviours. In education, SDT aims at encouraging students' intrinsic motivation and self-regulation in learning, which positively impacts educational outcomes. Teachers play a key role by implementing supportive behaviours that nurture students' intrinsic motivation and self-regulation. Research applying SDT in schools has helped classify teacher behaviours, though questions remain about which behaviours best support students' motivational needs. This study seeks to deepen understanding of factors that promote high school students' motivation, focusing on active teacher involvement. Adopting a Research-Training approach aims to enhance teachers' professional development through training, allowing them to refine and apply techniques in their classrooms. The study includes a theoretical review of SDT and an operational section detailing the project framework, preliminary analysis tools, and proposed structure for classroom training interventions.

self-determination theory; motivation; self-regulation; professional development of teachers.

## INTRODUCTION

Motivation is crucial in impacting various academic success factors, including student performance, engagement in positive social behaviours, well-being, and the risk of dropping out. The recent INVALSI report (2024) reveals that high school students in Campania show unsatisfactory performance in assessed subjects, with notable differences in achieving minimum learning standards across educational tracks. Additionally, data on dropout rates in Naples municipalities (2024a) and Campania's provinces (2024b) indicate that just

over half of first- and second-year high school students in Campania attend irregularly, a concerning statistic, as these students are at high risk of eventually leaving school. In response to these issues and aligned with the National Recovery and Resilience Plan (NRRP, 2021), a Research-Training program is being developed in selected technical schools to enhance teaching methods, refine strategies and tools, and implement effective educational practices.

## **1. OBJECTIVE AND RESEARCH QUESTION**

In line with the established goals, this work has two main objectives: first, to examine the principles of *Self-Determination Theory* (SDT; Ryan & Deci, 2017), and second, to introduce *Project-Based Learning* (PBL; Zhang & Ma, 2023) as an effective teaching strategy for fostering motivational self-regulation in high school students (Chiu, Chai, Williams, & Lin, 2021; Liu et al., 2006; Liu et al., 2009; Wang et al., 2011).

This leads to the main research question: which SDT factors can be applied to PBL practices?

## **2. Self-Determination Theory**

The SDT, proposed by Ryan and Deci (2017), is a broad theory that emphasizes the critical role of the social context in enhancing individual well-being through self-regulated motivation. Self-determination is defined as the ability of individuals to engage in autonomous, self-regulated behaviours aimed at achieving specific goals (Deci & Ryan, 2013) and is closely linked to the concept of the locus of causality (De Charms, 1968), which refers to people's perception of the main drivers motivating them toward their goals.

In the context of education, SDT highlights the essential role of teachers in either supporting or obstructing the self-regulation of motivation. Through the teaching strategies they implement, teachers can influence students' motivation by either fulfilling or thwarting their needs for autonomy, competence, and relatedness (Ryan & Deci, 2017; Reeve & Cheon, 2021; Reeve et al., 2022; Ryan & Deci, 2020).

The need for autonomy refers to the desire for school experiences that allow students to feel a sense of choice and freedom during learning. Teachers can help satisfy this need by understanding students' perspectives and acknowledging their emotions (Black & Deci, 2000). The need for competence involves students' sense of efficacy in academic tasks, which teachers can nurture through constructive feedback (Ryan & Deci, 2020). The need for

relatedness pertains to the desire for meaningful connections with teachers and peers involved in school activities.

Fulfilling these three needs enhances students' ability to self-regulate their motivation, while the frustration of these needs can impede self-regulation.

SDT places different forms of motivation regulation on a continuum (Ryan & Deci, 2017). At one end of the continuum is the absence of motivation, where students lack purpose in their studies and have unclear reasons for their actions. Moving along the continuum, extrinsic motivation is divided into four categories: external and introjected (externally regulated), and identified and integrated (more internally regulated). At the far end of the continuum is intrinsic motivation, where students are driven by the intrinsic enjoyment and benefits of studying, representing the highest level of self-determination.

Numerous studies, both domestic and international, have shown a positive relationship between intrinsic motivation, academic achievement, and students' perceived well-being (Alivernini et al., 2019; Black & Deci, 2000; Bureau, Howard, Chong & Guay, 2022; Filippello et al., 2020; Howard et al., 2021; Reeve & Cheon, 2021; Reeve et al., 2022; Ryan & Deci, 2020), highlighting the importance of creating learning environments that foster the self-regulation of motivation.

### **3. Project-Based Learning**

Activities based on the PBL strategy allow students to start by analysing real-world problems, putting them in a position to develop practical solutions for addressing critical or unique situations they may encounter during their educational experience. Thus, the learning community evolves into a research-oriented community. The activity, focused on problem-solving or project creation, serves to uncover the connections between theory and practice. In this setting, investigative and analytical approaches are geared toward fostering collaborative and meaningful learning (Marzano, Vegliante, Miranda & Formisano, 2017; Miranda, 2021).

PBL involves organizing students into small groups, each tasked with developing a project that progresses through four key stages: ideation, planning, execution, and conclusion (Zecchi, 2012). Each stage includes specific activities, deliverables, and assessment rubrics. In the ideation phase, students define the project concept by addressing: 1) the target audience for the project, 2) the needs and requirements of the audience, and 3) the product features necessary to meet those needs. These steps are structured into a split tree map, which the

teacher assesses using a dedicated rubric. In the planning phase, students determine the tasks required to create the product, assign responsibilities within the group, and establish timelines for each task. The final output for this phase is the work plans, which are evaluated with a specific rubric.

The execution phase involves implementing the plans developed in the earlier stages. The more the teacher provides cognitive resources, the more students will be encouraged to transform knowledge into “know-how”, which helps develop learning-to-learn skills. Finally, in the conclusion phase, students present their product to the class, and the teacher evaluates it using the appropriate rubric.

#### **4. Research-Training as a Potential Unifying Approach**

The principles of SDT and the core features of PBL are central to a research project designed to address the challenges introduced earlier, specifically, improving the self-regulation of motivation through active student engagement in instructional practices. Methodologically, SDT and PBL come together in a Research-Training (R-T; Asquini, 2018) approach, which aims to foster an ongoing dialogue between researchers and teachers. This approach seeks to connect theoretical frameworks with educational interventions that encourage meaningful learning.

In the first phase of the research, a workshop on SDT and PBL principles will be held for teachers, who will then collaborate to co-design customized interventions for their classrooms. This process will include periods for monitoring and reflection, allowing teachers to identify challenges and opportunities, thus supporting their professional development (Reeve et al., 2022).

Through R-T, the PBL strategy will be introduced, building upon SDT’s key principles and sharing classroom practices that promote student motivation. Numerous studies have shown that PBL is effective in meeting students’ basic needs, thus fostering self-regulation (Chiu, Chai, Williams, & Lin, 2021; Liu et al., 2006; Liu et al., 2009; Wang et al., 2011).

PBL provides students with a greater sense of autonomy in learning activities, as they are encouraged to choose, with teachers’ guidance, the topics for lessons. The active role students take in PBL practices allows them to reflect during the process, feel more responsible, and enhance their perception of the effectiveness of the learning environment.

Moreover, PBL improves the quality of relationships among students and

teachers, fostering a positive classroom atmosphere. The collaborative nature of PBL encourages students to interact in pursuit of a shared goal: developing a project. Teachers act as facilitators, offering ongoing feedback and stimulating discussion through guiding questions.

From a methodological standpoint, a mixed methods approach (Trincherò & Robasto, 2019) will be employed to gather essential data to validate the intervention's effectiveness and explore potential relationships between key variables. Specifically, a quasi-experimental design will be used, with structured questionnaires and standardized assessments administered before and after the intervention.

The questionnaires will include scales that measure academic motivation (Alivernini & Lucidi, 2008), satisfaction and frustration of basic needs (Buzzai et al., 2021), perceptions of teaching styles (controlling and supportive) (Jang, Reeve, Ryan & Kim, 2009), and the intention to drop out of school (Hardre & Reeve, 2003). Evaluation tests, developed with input from teachers of the involved subjects, will assess the intervention's impact. Additionally, focus groups with teachers will provide deeper insights into contextual challenges, helping to refine the implementation of PBL based on the specific needs of the classroom.

## **5. Conclusions and Future Directions**

This work is driven by the challenges facing the educational system in Campania, as highlighted in reports on school dropout rates from the USR Campania (2024a; 2024b) and the latest INVALSI report (2024). These challenges prompted a review of the literature to identify theories, concepts, and teaching strategies that could improve student success by focusing on the crucial role of motivation.

The indicated literature review that combining the principles of SDT and PBL could be an effective approach to motivate students and support their academic achievement. The active involvement of those directly affected by the educational experience, facilitated by the adoption of a R-T approach, adds considerable value to this study. The decision to use R-T is motivated by the need to address specific challenges within a network of schools in Campania, requiring tailored solutions.

By looking forward, this study could also examine how students influence teachers' choices of classroom strategies, an area with limited research both nationally and internationally. The focus on this aspect stems from the

recognition that teaching and learning activities, and the motivation they generate, are the result of a reciprocal teacher-student relationship. Therefore, focusing solely on the teacher's influence on student motivation may be too narrow, as students can also affect the quality of educational activities through their behaviours, which in turn can impact teacher motivation (Liu et al., 2024).

# EARLY SCHOOL LEAVING IN CAMORRA TERRITORIES: AN EXPLORATORY RESEARCH ON THE MOTIVATION TO STUDY

Carmen Lucia Moccia<sup>a</sup>

Fausta Sabatano<sup>a</sup>

Paola Aiello<sup>a</sup>

<sup>a</sup>University of Salerno

This research examines academic motivation in children living in multi-problem contexts, where economic and social hardships accumulate, particularly those linked to deviance and delinquency. The study is set in a region of Campania where Camorra, a criminal organization that has deeply infiltrated into the social fabric, is present. In such a multi-problem environment, these challenges can foster, especially during childhood and adolescence, a sense of fatalism and low agency, combined with limited self-determination and self-efficacy. In this study, motivation is described as a dynamic, relational force emerging from the interaction between individuals and their surroundings, as well as from the perception of positive and negative aspects of the context. The research hypothesis is that motivation, conceived in this manner, may represent an area of development potentially resilient to environmental adversities, provided it is supported by intentional, targeted educational intervention. Methodologically, the approach is inspired by the Response-to-Intervention (RTI) model and is carried out within a sequential exploratory research design.

early school leaving; risk factors; inclusive education; disadvantaged contexts

## INTRODUCTION

The phenomenon of early school leaving presents an interpretative complexity that reflects its multidimensional nature. Some elements could be identified, particularly about two opposing viewpoints in this debate: on one side, a “simplistic sociological approach” that links early school leaving to social class and marginalization (Ballarino & Checchi, 2006); on the other, a superficial

criticism of schools' inability to "remove obstacles" in the educational path (Castoldi & Chiosso, 2021). Given these considerations, the approach in this research is connected to a phenomenological perspective that identifies three interconnected dimensions: sociocultural factors, institutional-school factors, and individual factors (Bertolini 1997). It emphasizes how early school leaving, in its various forms, represents one of the main challenges in the democratization of schools and society in general. Schools maintain social cohesion (Dewey, 1916/2018) through their inherent role. In this context, inclusion (Booth & Ainscow, 2011) represents a paradigm leading the transformation of educational contexts (Dainese, 2017). It's a pedagogical principle that recognizes and values individual differences as resources for the entire school community, focusing not so much on individual characteristics but on the environmental barriers to learning and participation.

## **1. APPLYING A RESPONSE-TO-INTERVENTION FRAMEWORK TO ENHANCE MOTIVATION TO STUDY IN PRIMARY SCHOOLS**

The complexity of early school leaving extends beyond what a simple definition can capture. The issue demands consideration from different viewpoints.

Analysis of early school leaving literature reveals two main categories of factors: individual factors, such as performance, behavior, and background; and external factors, which include influences from families, schools, and communities (De Witte et al., 2013; Rumberger, 2011). However, when analyzing these factors, a pattern emerges that gives greater weight to demographic and personal characteristics and family dynamics, considering school factors only secondarily, and to an even lesser extent, factors related to community, labor market, and peer relationships (Thyssen et al., 2010).

A key definition relevant to this topic (Estevao & Alvares, 2014) introduces a distinction between formal definitions, based on the mandatory schooling age, and functional definitions, which assess achieved competency levels. The functional definition states that early school leaving occurs when students leave education without the necessary skills and qualifications for employability, regardless of their age (European Agency for Special Needs and Inclusive Education, 2017).

From an operational perspective, interventions in this area are organized within a three-tier framework: the first level (prevention) aims to address risk factors early before they manifest; the second level (intervention) focuses on managing existing risks; and the third level (compensation) provides alternative pathways

when the educational process has not followed its optimal course.

In this sense, this study explores the role of academic motivation as a potential protective factor, focusing on an intervention aimed at children living in difficult, disadvantaged contexts.

The research hypothesis is that motivation, described as a ‘dynamic’ and ‘relational’ force (1970), while influenced by the sociocultural context, may represent an area of development potentially resilient to environmental adversities when supported by intentional and targeted educational intervention.

In this perspective, understanding motivation as a dynamic process emerging from subject-environment interaction involves moving beyond a deterministic view that would identify it as a static, isolated personal trait. This process tends to develop and modify within a complex system of relationships involving the schools, the families, and the meaning that education can assume in that specific sociocultural context, viewed from an ecosystemic perspective.

The study is set in Pianura, a municipality in Naples, Campania. This area was selected because it has multiple overlapping disadvantages that hinder social progress and democratic participation (Clarke & McCall, 2013)

It’s an area where educational, economic, and sociocultural difficulties accumulate, further complicated by the presence of criminal organizations (Direzione Investigativa Antimafia, 2023) and their explicit and implicit influence on daily life. In this sense, juvenile delinquency and deviance, while not necessarily products of organized crime, are influenced by it both behaviorally and in terms of the value system guiding their life interpretations (Ravveduto, 2017).

The study aims to investigate the potential relationship between academic motivation and disadvantaged contexts; and to identify characteristics of effective educational interventions that promote agency (Aiello, 2018). Agency, from an inclusive perspective, refers to the set of capabilities, competencies, and abilities that enable individuals to act in transformative ways and to “*creare mondi possibili*” (Aiello, 2018), particularly in overcoming both systemic and personal socio-educational disadvantages. For individuals born into disadvantaged contexts, their culturally influenced paths are constrained not only by limited opportunities, but also by challenges in effectively engaging with the opportunities that do exist within their environment

The research employs the Response-to-Intervention (RTI) approach (Johnson et al., 2006) within a sequential explanatory research design (Creswell, 2009). It is

conducted in three phases (A, B, C) from January 2024 to June 2024.

The preliminary exploratory phase involved analyzing *Life Stories* collected through periodic semi-structured interviews with parents of children participating in the Integra project. The selection of the Integra project as a reference context is based on the fundamental dimensions that characterize its approach to educational disadvantage over its twenty-year experience (Sabatano, 2015; Sabatano & Pagano, 2019). The project functions through an integrated community network, promoting dynamic partnerships between schools, families, and health and social services.

Regarding *Life Stories*, the textual corpus was subjected to thematic analysis (Braun & Clarke, 2006) utilizing MAXQDA software (De Gregorio & Lattanzi, 2012; Kuckartz & Rädiker, 2019). Using an inductive approach, the analysis identified recurring patterns in the data. The results revealed complex socio-familial dynamics in most of the sample, in particular early adultisation. The analysis revealed several recurring themes: parents who dropped out of school early, individuals who became parents at a very young age and direct or indirect links to criminal organisations

During Phase A, screening was conducted using the AMOS 8-15 Study Approach Questionnaire (QAS) (Cornoldi et al., 2014), which initially revealed a relatively homogeneous situation with uniformly low motivation patterns across the group.

At Tier 1 (Johnson et al., 2006), the Integra protocol was implemented across all participants. During Phase B, monitoring activities included checklist assessments and focus groups with children and families. For the children, five focus group sessions were conducted, each comprising five participants. The sessions explored two main questions: ‘How has your motivation to study changed since joining Integra? Why?’. Before addressing these questions, the children’s emotional states were assessed using a visual analog. Code frequency analysis revealed several main themes. Skills- Competent and support themes were predominant, with 25 occurrences each, suggesting their central importance in participants’ experiences. Self-confidence recorded 20 occurrences, followed by ambition with 19. Trust in others and rules showed an equivalent incidence of 16 occurrences each. The personalization theme recorded 14 occurrences, suggesting that children are likely to perceive educational intervention as a broad action rather than highly personalized. Focus group data were then compared with checklist results (Seidman, 2006), which evaluated children’s behaviors during the intervention on a 1–5 scale. A

relationship emerged between children who received lower average checklist scores and those who expressed poor study motivation in the focus group. Participants who reported negative changes in their perceived motivation also recorded significantly lower scores, especially on sections related to personal goals, collaboration, and sharing.

In Tier 2, the educational intervention was recalibrated based on data from the monitoring phase. A new measurement in Phase C revealed a clear trend: study motivation increased by an average of 1.32 points, and variation decreased compared to the initial measurement. Additionally, the minimum score rose from 8 to 13, and the standard deviation fell from 2.68 to 2.01 points.

## **CONCLUSION**

Preliminary findings suggest that Integra's educational intervention may enhance study motivation. Initial results from the protocol implementation indicate possible directions for future development, aligning with the incremental approach of the chosen methodology. The data from Phase C indicates a trend towards increased motivation, while the analysis of the different responses to the intervention suggests the potential benefit of a Tier 3 level to address more nuanced needs.

The combined analysis of the checklist data and focus group responses offers valuable insights into the nature of motivation in challenging contexts. The relationship between observed behaviors in checklists and focus group findings—particularly in areas of collaboration and sharing—strengthens the hypothesis that motivation is not merely an individual trait but rather a quality shaped by complex relational dynamics.

The consistency between lower checklist scores and reported low motivation in focus groups, especially regarding collaborative and participatory aspects, reinforces the importance of maintaining a systemic perspective. This finding points to motivation emerging from an interconnected network of influences rather than existing as an isolated characteristic.

# THE INTERPROFESSIONAL COLLABORATION BETWEEN TEACHERS AND SCHOOL SOCIAL WORKERS FOR THE PREVENTION OF SCHOOL FAILURE AND EARLY SCHOOL LEAVING. THE *PROVACI ANCORA SAM!* PROJECT

Paolo Bianchini<sup>a</sup>

Francesco Pongiluppi<sup>a</sup>

<sup>a</sup>University of Turin

School failure and early school leaving remain significant issues in Italy and globally. Since 1989, the “Provaci ancora Sam” (PAS) project in Turin has addressed these challenges in primary schools, lower secondary schools, and CPIA (Provincial Centers for Adult Education), particularly among students with migratory backgrounds. PAS initiatives include “Prevenzione primaria,” which fosters collaboration between school social workers and teachers to engage all students in primary and lower secondary schools, continuing through extracurricular activities led by associations. “Tutela integrata” targets under-15s without a lower secondary diploma, offering support in four community centers across Turin. The “progetto CPIA” operates in three adult education schools, focusing on dropout students and foreign minors, including those with limited literacy or education in their home countries. The PAS’s overarching goal is to prevent social marginalization by fostering inclusive classroom environments, innovative teaching practices, and a supportive atmosphere both in and beyond schools. The inter-professional collaboration between school social workers and teachers aims not only to ensure school attendance but also to cultivate a genuine enthusiasm for learning among students.

school failure; early school leaving; school social workers.

## INTRODUCTION

School failure and early school leaving continue to represent, in Italy as in the rest of the world, a very widespread problem that affects thousands of pupils. The number of students who complete compulsory education is much higher nowadays, however, the knowledge they gain is so fragile and superficial that they tend to forget it shortly after they have completed their lower secondary education, thus creating the phenomenon known as “functional illiteracy” or “implicit dispersion”.

Since 1989, in Turin the *Provaci ancora Sam!* (PAS) project has been dealing with these problems in primary, lower secondary schools and CPIA (Provincial Centres for Adult Education) attended by young adults, especially with migrant backgrounds.

In these pages we will trace some of the lines that characterize the Turin case on preventing and facing school dropout, especially in relation to the impact of school social workers in educational contexts.

### 1. “EXPLICIT” AND “IMPLICIT” SCHOOL DROP OUT

In Italy, schooling is no longer a “social elevator” and now selection is mainly “class-based”. This seems to be the picture that recent data return about Italy. According to the OECD report (*Education at Glance, 2022*), Italy is characterized as one of the countries with the lowest educational mobility in Europe. Apparently, only 8 percent of young Italians between the ages of 25 and 34, whose parents have not completed upper secondary school, obtain a university degree. This is decidedly low compared to the OECD average of 22 percent. The percentage rises to 32 percent among young people whose parents have a secondary school diploma, and reaches 65 percent among those with parents who have a university degree. These are alarming figures revealing that Italy is a country where it is the “lotteria della natura,” and not talent, that determines the educational and life paths of young people (Save the Children 2017, 8).

The registry of the Italian Ministry of Education and Merit today considers 23,000 pupils “at risk of dropping out” in lower secondary school – those of greatest concern – and 112,000 in upper secondary school every year. National data also report that the dropout rate of foreign pupils in recent years has been five times higher than the one of Italian students. Those who are most at risk are precisely the students born abroad.

What is described in the previous lines brings to attention a rather well-known

phenomenon in Italy, namely that of implicit school dropout. However, for several years what has been of concern is the so-called explicit school dropout. Nowadays, in fact, it is no longer only relevant “how many years” students attend school, but “how” and “how much” they learn. According to the 2015 PISA data and the 2019 national standardized test results (INVALSI), one out of four pupils in Italy does not achieve minimum proficiency in mathematics. For Italian, one out of five 15-year-olds has serious difficulties in analysing and understanding the meaning of written texts, and one out of three pupils does not reach proficiency (level 2) in at least one of the three subjects deemed fundamental by OECD for enjoying the full rights of citizenship.

In 2021, the percentage of early school leavers reached 12.7 percent, with higher rates observed in Southern regions, peaking at 21.1 percent in Sicily. This means that more than one out of ten students leave education prematurely. Adding to this challenge are those students who complete their studies but fail to meet the expected learning objectives. The rate of implicit early school leaving at the end of upper secondary school amounts to 9.7 percent nationally, with significant regional disparities and a peak of 19.8 percent in Campania. In a nutshell, this indicates that one out of ten graduates possess skills equivalent to those who leave school after completing lower secondary school.

Unprepared young people face considerable challenges, both in pursuing higher education and in entering the workforce. Compounding the issue, Italy already holds the highest number of NEETs (youth aged 15 to 29 not engaged in employment, education, or training) in Europe.

## **2. THE PROVACI ANCORA SAM! (PAS) PROJECT**

The 2022 *Invalsi Report* (Rapporto Invalsi 2022) which analyses factors influencing proficiency levels in the three assessments that track students’ progress over time (Italian, mathematics, and English), identifies several significant variables. These include gender, schooling, curriculum, social and migratory background, and the characteristics of the region where students live. The data suggest that by the end of secondary school, 7.1 percent of students nationwide obtain a diploma without acquiring the expected skills after 13 years of education.

It is now evident, not only to experts, that the issue of school dropout must no longer be treated as an emergency to be tackled with exceptional measures and tools. Instead, it requires serious attention and long-term interventions as well as comprehensive strategies.

School, extracurricular activities, broader educational community and local social actors must work together to address this challenge through both preventive and remedial actions. For the past few decades, the PAS project has been addressing these challenges in primary and lower secondary schools in Turin (Rivoira 2006). The project tries to counter all forms of school segregation through a cooperative approach centred on educational activities. What truly makes a difference is the joint effort and synergy between school social workers and teachers.

The PAS project has a decades-long history. It was launched in 1989 by the Turin's Council of Education, later joined by the Council of Rights and Social Policies, in collaboration with the Compagnia di San Paolo Foundation, Fondazione per la Scuola and Ufficio Pio<sup>1</sup>, as well as the Ufficio Scolastico Provinciale (succeeded by the Ufficio Scolastico Regionale).

Each year, the project supports several non-profit organizations in order to cooperate with state schools across the city. Such organizations work to prevent and combat both school failure and dropout through their school social workers.

Collaboration between institutions and educational organizations in the area has enabled the creation of a network capable of supporting students on a relational level, promoting their inclusion both in school and within their broader social context.

The coordination of such diverse resources has not only helped schools in preventing and addressing school dropout, but also encouraged the exchange of skills and approaches. Thus, teachers, traditionally more focused on academic achievement, have also gained valuable insights and strategies from school social workers, particularly in fostering students' emotional and social engagement.

The implementation and experimentation of new educational approaches and teaching methods have expanded the scope of educational efforts, well beyond traditional school hours and contexts. Innovative teaching methods are being tested to equip students with the tools needed to develop their individuality and become critical, engaged citizens. The focus is not only on fostering the desire to attend school but also on encouraging students to excel and perform well at school.

---

<sup>1</sup> For further information on the history and mission of Compagnia di San Paolo Foundation and its bodies, such as Ufficio Pio, visit the website here below: <https://www.ufficiopio.it/en/history/> (last visit: December 2<sup>nd</sup>, 2024).

Central to this effort is the promotion of collaboration and the exchange of skills and best practices between teachers and school social workers, enriching their approaches and strategies (Bianchini, Lucatello, Damiani 2021). At the same time, addressing urban inequalities—such as the digital divide, school segregation, educational poverty, and unequal access to services—forms a crucial part of the broader mission to create a more inclusive and equitable educational environment.

These initiatives targeted primary and lower secondary schools, as well as classes for young adults and foreign minors within Provincial Centres for Adult Education (CPIA). Additionally, the associations involved in the project organise extracurricular activities for minors in need to promote educational continuity between school and extra-school (Pongiluppi 2021).

The first action of the PAS project is called *Progetto di prevenzione primaria* (primary prevention project). It aims at reducing school dropout in approximately 200 classrooms, including fourth and fifth grade of primary school, as well as the first, second, and third grade of lower secondary school. In the 2023/24 school year, the project involved 37 schools, 20 associations, and more than 4,500 students.

The activities are carried out by school social workers during four regular school hours each week for the entire school year. They cooperate closely with teachers, co-planning activities based on the specific needs of the class and the teacher's schedule. They also co-manage the classroom time, employing various methods such as co-teaching, hands-on workshops, and group work.

The same activities carried out at the CPIAs focus on 16-18-year-old students of foreign origin and/or recent migrants, often with limited schooling in Italy. These efforts aim at helping them to achieve their lower secondary education diploma as well as continue their education in upper secondary education or vocational training, and, more generally, foster their social inclusion. In the 2023/2024 school year, over 300 students were involved in these initiatives.

The second action of the project is called Tutela Integrata (Integrated Protection). It is targeted at students dropped out of lower secondary school and it is implemented in four classes located in parishes. Four core teachers collaborate closely with school social workers who participate to the lessons for the whole time. These classes involve 50 minors, aged 14-15, who failed more than once and are at high risk of school failure and early marginalization. The aim is to support them in obtaining their lower secondary school diploma and to guide them in continuing their education and vocational training path.

In recent years, the activities of the project have extended beyond the school year and continue during the summer break through the “Summer” initiative (the third action of the PAS). During the summer break, school social workers carry out activities to help students reinforce their socialisation and learning skills, in order to continue the work done throughout the school year. Such activities were previously co-designed by teachers and school social workers to recover and integrate basic, socio-emotional, and citizenship skills. The goal is to better prepare students to face the upcoming school year with greater success.

### **3. SCHOOL SOCIAL WORKERS AND TEACHERS**

Over time the PAS project has experimented several activities planned and led together by both teachers and school social workers. These include actions with the entire class group, as well as support for specific cases outside the school. In practical terms, such work consists of co-programming, co-planning and involving school social workers in class councils. Other key components include laboratory teaching, continuity between primary and lower secondary schools, promoting networking activities outside school, and extensive evaluation and monitoring efforts. Thus, the project fosters inter-professionalism between teachers and school social workers (Bianchini Lucatello, Damiani 2021).

Thanks to the research conducted on the PAS project, the Bachelor’s Degree in *Educazione professionale* of the University of Turin has introduced into its curriculum a course focused on school social workers. This course, consisting of 27 hours of lectures and an internship, is available to both undergraduate students and social workers engaged in activities to counter school dropout. Its objective is to provide participants with the tools needed to work effectively in schools, collaborating with teachers to tackle educational challenges.

Such experience led the University of Turin to create the First Level Master’s Degree in *Expert in Educational and Teaching Processes at School* (ESPEDA). The first edition enrolled 70 students, mostly teachers or aspiring teachers, along with a few school social workers. As of the 2024/25 academic year, the master’s degree is entering its third edition and the number of teacher and school social workers is more evenly distributed.

ESPEDA is designed around a Competency-Based Education and Training (CBET) approach, providing a comprehensive pedagogical framework. The program offers 60 university credits, equivalent to 1500 hours of blended learning, and it is divided into general and workshop-based subjects. It is

specifically tailored for school social workers and teachers allowing trainees to either complete the entire curriculum or select individual modules that align with their professional objectives. Throughout the course, trainees actively collaborate, fostering a shared educational culture and exchanging best practices, ensuring a dynamic and enriching learning experience.

The internship is a central component of the program, divided into two phases. The first phase consists of 100 hours of in-school experience, giving trainees hands-on exposure to classroom dynamics. The second phase includes 50 hours of supervision with a university mentor, fostering critical thinking and analysis of the classroom experiences. These internships take place in schools participating in the PAS project, providing trainees with the opportunity to actively engage in educational initiatives focused on tackling school dropout and promoting inclusion. Trainees gain valuable insights through a multi-professional perspective, working closely with school social workers, teachers and other professionals of social services, providing support to individuals or groups in need. This collaborative environment offers a unique opportunity to develop comprehensive educational strategies that not only address academic challenges, but also consider the social needs of students. By engaging with professionals from different fields, trainees are better equipped with effective solutions that foster both school results and social inclusion of the pupils they will be working with.

#### **4. CONCLUSIONS**

The initial goal of the project, which began over 30 years ago, has evolved into a shared mission among a growing community of stakeholders, including university. The challenge of addressing both implicit and explicit school dropout cannot be tackled with emergency measures or extraordinary resources. As outlined in this article, it is essential to implement long-term actions that build on experience and critically assess the strengths and weaknesses of educational innovations. Looking ahead, one of the key goals will consist of adapting the educational offer for future teachers and school social workers including multidisciplinary approaches and fostering interprofessional collaboration.

In this context, ongoing education for both teachers and school social workers must promote innovative strategies that envision a school open to its community and responsive to change. This includes the hybridisation between the two professions in today's educational landscape.

# STEPPING OUT OF FAILURE STORIES BY STEPPING IN THE *KEPLER LAB*: A QUASI-EXPERIMENT ON AFFECTIVE-MOTIVATIONAL AND INSTRUCTIONAL MECHANISMS OF PROGRESSING

Marco Spampinato<sup>a</sup>

Andrea Conficoni<sup>b</sup>

<sup>a</sup>University of Pisa; <sup>b</sup>IUSVE & Cooperativa sociale La Esse

Kepler is a project realized in Treviso (Northern Italy) to combat educational poverty among lower secondary school students. Most of the students who entered the lab had a migration background, told educators stories of failures and aligned with a self-debilitating condition of *learned hopelessness*. We evaluated the Kepler educational afterschool lab as a group experience mediating students' academic progress through measures of distal and proximal academic motivation, social relation and learning attitude. The quasi-experiment showed, longitudinally, an improvement on the treated group—compared to matched controls—in terms of global self-perceived motivation, self-efficacy beliefs referred to school behaviour, and learning styles. A cross-section model to study the effect of proximal motivation (*flow*) on self-efficacy beliefs shows that a greater quality of experience in the educational lab (higher flow) increases capability to concentrate in academic tasks. Across individuals, this effect is nevertheless fully mediated by *elaboration-based learning strategies* and *positive internal attributions*. This result highlights that affective and cognitive components related to the self—i.e., positive internal attributions—and habits acquired by instruction—i.e., elaboration-based learning strategies—are both needed and conducive to improve core aspects of self-efficacy beliefs.

motivation, flow, intersubjectivity, self-efficacy beliefs, learning style, school achievement.

## INTRODUCTION

A famous aphorism from Aristotle's *Nicomachean Ethics* is that 'it is possible to fail in many ways, while to succeed is possible only in one way' (Aristotle, ca. 350 B.C.E./1925). This aphorism is part of Aristotle's moral reasoning about *eudaimonia*, the highest good for the *polis* represented as a person's flourishing, where well-being is inherent both to living well and doing well. To reach and preserve *eudaimonia*, a person needs an *héxis* (Latin: *habitus*), an acquired capability (or disposition) to navigate contrary emotions through reason and practical wisdom: this habituation to exercise virtues ensures a person's optimal functioning in their everyday activity, a practical reason to consider *eudaimonia* both an individual and collective good.

Students who entered the educational afterschool lab of the Kepler Project, evaluated in this study, shared a variety of 'stories of failures' with educators during their first encounters. As in the aphorism, these stories differed in many respects. However, besides unsuccessful school achievements, most of the stories shared two common aspects: a migration background and an experience of perceived marginalization in the classroom environment.

The Kepler Project is one of 169 initiatives funded by Con i Bambini in the second call for proposals implementing the Fund to Combat Child Educational Poverty (Financial Law 2016). The first call, "Adolescenza" (Adolescence), asked the projects to define their most important outcome as "preventing early school leaving." Conversely, the second call, "Nuove Generazioni" (New Generations), drew greater attention to the contexts of experience that induce school leaving and asked for a more holistic assessment of school discomfort. It also invited thinking about projects' potential outcomes within a process-based understanding of change, where intermediate outcomes, such as improved affective and cognitive attitudes, support "harmonic personal growth" and "prevent phenomena of educational poverty" (Con i Bambini, 2022).

### Policy context

The rate of adolescents and young adults (ages 15 to 24) who abandon formal education before obtaining an upper secondary school degree is particularly high in Italy, especially when compared to other European and OECD countries. This rate is notably higher among native-born individuals with foreign-born parents (28%) and among foreign-born individuals who arrived as children (29%), in contrast to native-born individuals with native-born parents (18%) (OECD/European Commission, 2023).

In Treviso (Veneto Region), where the Kepler Project was implemented, the percentage of residents aged 0-18 who were not Italian citizens increased from 7.8% in 2002 to 21.1% in 2014, with a slight decrease to 17.5% in 2019. Consequently, the local school system enrolled an increasing number of pupils with diverse linguistic and cultural backgrounds. One way to understand some negative consequences of this unprepared change in cultural composition is by examining the percentage of non-Italian citizens attending the three levels of the school system: primary, lower secondary, and upper secondary schools. Figure 1 shows how this percentage decreases from the first to the last level of schooling, as children of foreign-born parents are more likely to leave secondary education before completing it. Compared to the rest of Italy, where the situation worsened over the period considered in the figure, this pattern in Treviso was steeper but stable.

Fig. 1. Career differences between students with and without the Italian citizenship. Source: Ministry of Education and Merit (2024)

Another important aspect of inequality in a school system with an increased variety of student cultural backgrounds arises when considering “school choices” at the end of lower secondary school. At this point in a student’s career, the Italian school system tends to track upper secondary school candidates according to their presumed levels of ability. Students who are not Italian citizens are much more likely to enter professional schools, which hampers or significantly reduces their chances of obtaining tertiary education.

The local school system in Treviso shows some signs of improvement from this perspective over the eight years considered. In 2015-2016, half of the students who were not Italian citizens were enrolled in professional schools. By 2022-2023, most of these students were enrolled in Technical Schools (41%), which allow students to pursue tertiary education. The percentage of students enrolled in Licei, designed to prepare students for tertiary education, also increased from 17% to 24%.

### **Outline of the Kepler Educational Afterschool Lab**

The Kepler educational afterschool lab accepted about 50 students per year across three schools in Treviso. Lab activities started at the beginning of the school year and continued until the end. Students were all in the second and third years of lower secondary school. Those in the third year received individual assistance in preparing for their final examination. During the school lockdowns due to the Covid-19 pandemic, educators met individually with students in the lab, preserving a sense of continuity in lab activities.

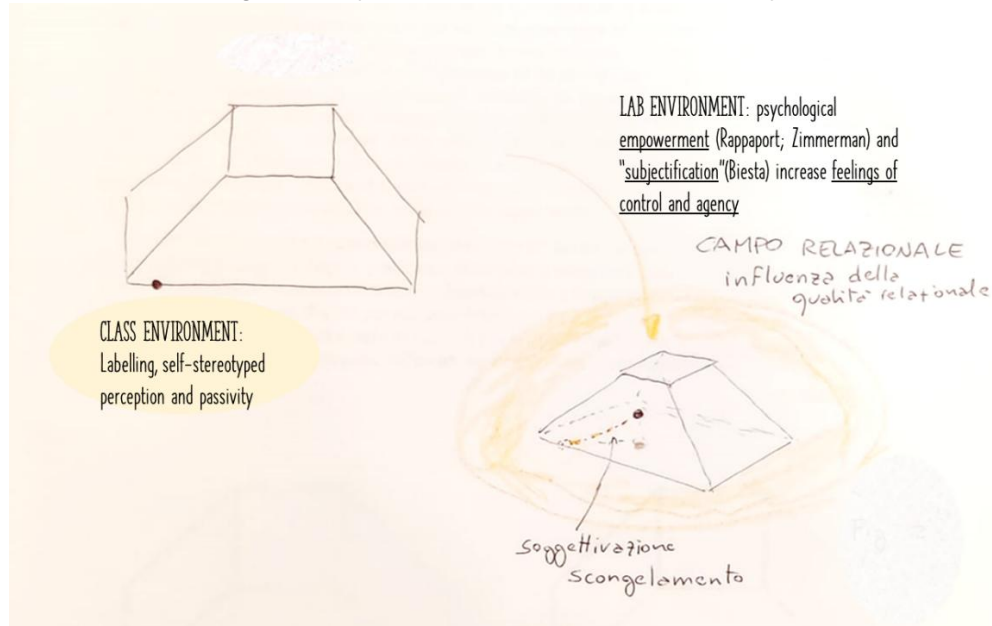

The theory and practice of the lab are briefly described here in words and illustrated using an image. At the beginning of each daily educational relationship, educators listened to stories of failures experienced by each student in the lab, “as a diving suit that they cannot distinguish from their skin” (lab educator’s expression). The upper-left image in Fig. 2 represents the student’s position in the class environment, depicted as a two-dimensional space constrained by perceived performance (grades) and sociocultural barriers. This class experience strongly conditions the student’s feelings of agency, keeping them at the margins. A message arising from this everyday classroom experience is rationalized as “you can’t change” and internalized as “I can’t change”—leading to a phenomenon known as learned helplessness (Kloosterman, 1988). In sum, the force field established in the class environment favours external attributions of failures, low motivation and, consequently, a conservative effect on learning.

The bottom-right image in Fig. 2 represents the lab environment as a wider three-dimensional space where students perceive more opportunities. They can play with peers, make mistakes, present artifacts from their cultural background, and do things they are ashamed to do in the class environment—such as going to the blackboard and explaining how to solve a math problem. Building their new social position from scratch, the developing relationships with educators and peers contribute to a sense of control and agency. The hindering factors of the class environment are reinterpreted in a new collective narrative and group

identity (Rappaport, 1995).

Group members in the lab can both learn and become aware of their learning process, progressively internalizing causal attributions. This process of change in individual psychological functioning—psychological empowerment—is mediated by the intersubjective dimension of the lab group (Rappaport, 1997; Zimmerman & Rappaport, 1998).

Fig. 2. Lab environment compared to the class environment: outline of the subjective experience of students entering the Kepler lab. Source: Lab's sketch by Andrea Conficoni.

## METHOD

We implemented a quasi-experimental research design to assess changes in psychological, social, and academic attitudes of students who entered the Lab in the second and third years of the Kepler Project. During the first academic year of the research design (2020-2021), we administered self-report measures during the first school term (quadrimestre) and at the end of the second term to students attending the lab (treated group). We administered the same self-report measures to students who attended the same classes as the lab participants (comparison group) but only at the end of the second term. During the second academic year (2021-2022), we administered the questionnaire twice, during the first term and at the end of the second term, to both treated and control students.

Self-report measures were administered online, on Qualtrics, using the IT facilities of each scholastic institute. Teachers and educators just supervised the students during the task. We assessed students' social and psychological attitudes within four domains: motivation, social relations and social discomfort, school-related self-concept, and academic learning style.

### **Motivation**

We considered both proximal and distal motivational constructs. A short *Flow* scale (Martin & Jackson, 2008) was included to evaluate proximal feelings of active well-being and task absorption in class and, for the treated group, in the lab. Two measures of academic motivational orientation—*Intrinsic* and *Extrinsic Motivational Orientation in the Classroom*—were adapted from Lepper et al. (2005). Finally, we summed the responses to five items from a large psycho-pedagogical self-evaluative questionnaire (Capuano, Storace, & Ventriglia, 2013) to create a short new measure of *General Feelings of School Motivation* (Cronbach  $\alpha = .77$  for the first term;  $.69$  for the second term).

### **Social relations**

Social isolation, or, by reconsidering the scale's reversed score, a qualitatively and quantitatively perceived assessment of *Social Relations with Classmates*, was assessed with a self-report measure validated in Italian (Alivernini & Manganelli, 2016). Additionally, we adapted four items from Capuano, Storace, & Ventriglia (2013) to build a new measure of *Social Discomfort* (Cronbach's  $\alpha = .67$  for the first term;  $.62$  for the second term).

### **School-Related Self-Concept**

We adapted eleven items from the psycho-pedagogical self-assessment (Capuano, Storace, & Ventriglia, 2013) to form a new self-report measure of *Self-Attribution of Capability* (Cronbach's  $\alpha = .75$  for the first term;  $.73$  for the second term) and *Academic Self-Efficacy Beliefs* to assess self-efficacy beliefs about study subjects and learning activities (Bandura, 2006). Finally, we used six items from the psycho-pedagogical self-assessment to measure *Negative Reputation in the Family*—a negative feedback to self-concept associated with parents' judgments on school performance and behavior (Cronbach's  $\alpha = .88$  for the first term;  $.84$  for the second term).

### **Academic Learning Style**

All self-report measures of academic learning style were constructed using items from Capuano, Storace, & Ventriglia (2013): twelve items were assembled

to measure behaviors associated with *School Anxiety* (Cronbach's  $\alpha = .88$  for the first term;  $.87$  for the second term); five items were assembled to represent *Mnemonic Learning Strategies* (Cronbach's  $\alpha = .69$  for the first term;  $.66$  for the second term); four items were summed to represent *Elaboration-Based Learning Strategies* (Cronbach's  $\alpha = .67$  for the first term;  $.69$  for the second term); and five items were interpreted as an index of Class Involvement (Cronbach's  $\alpha = .62$  for the first term;  $.67$  for the second term), indicating degrees of voluntary involvement in class activities. We also included students' assessments of *Class Performance Goals* and *Class Learning Goals* (Alivernini, Manganeli, & Lucidi, 2017, 2018), aimed at evaluating the influence of different pedagogical orientations on students' motivation.

## RESULTS

A pre-post analysis of self-report measures in the first year showed small improvements in several measures for the group of students in the Lab who answered the questionnaires twice ( $N=25$ ). A paired sample t-test suggested that only the General Feelings of School Motivation increased significantly (Tab. 1). However, considering the clear problem of statistical power, three other measures of change might be considered marginally significant: Self-Attribution of Capability and Elaboration-based Cognitive Strategies, which relate to academic self-concept and students' learning styles, and the items on the flow scale referred to the sense of concentration and control.

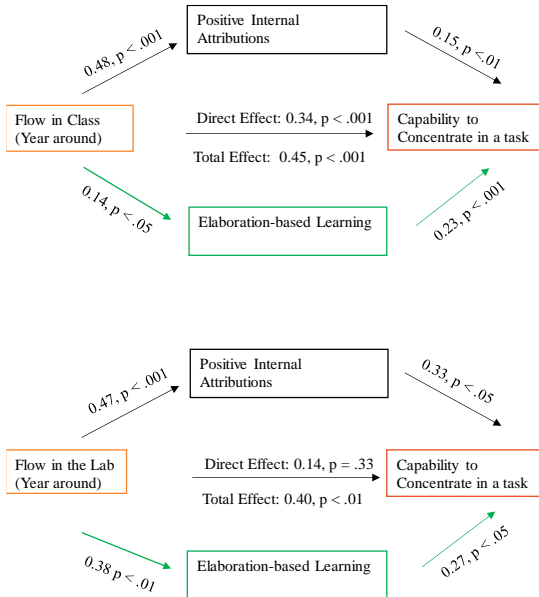

In the second year, we matched the treated group with a control group, using a propensity score, estimated with age, sex, a socio-economic condition index, and a linguistic-cultural background index as independent variables in the logistic regression. A t-test comparing the mean values of the treated group ( $N=50$ ) and unmatched controls ( $N=212$ ) at the first survey (first term) showed a statistically significant difference for almost all the self-report measures, consistently suggesting a sharp disadvantage for the treated group. Conversely, the same comparison between the treated group ( $N=50$ ) and matched controls ( $N=50$ ) showed an advantage for the matched controls only on five measures: Self-Efficacy Beliefs (both measures reported in Tab. 1), Self-Attribution of Capability, and Motivational Orientation (both Intrinsic and Extrinsic Motivation).

The difference-in-difference evaluation design (Tab. 1) does not show statistically significant effects at the canonical statistical thresholds. Nevertheless, we consider meaningful, and not far from being statistically

significant, those outcomes highlighted in bold characters in the table. Improvement refers to Self-Efficacy Belief, especially considering the two items expressing the student’s perceived capability to concentrate on school tasks, general feelings of school motivation, and elaboration-based learning strategies.

Taking these results as important for understanding the mechanisms of progress through the Lab experience, we also tested, cross-sectionally, the hypothesis that experiencing flow in the Lab might increase positive internal attributions, provide instructions to improve elaboration-based learning, and overall increase Self-Efficacy Beliefs through a greater capability to concentrate on academic tasks. The analysis reported in Fig. 3 shows that a causal model where flow enhances the capability to concentrate on academic tasks applies to both groups of students. Nevertheless, for matched and unmatched controls, flow reported in the class environment directly affects the capability to concentrate on a task: learning strategies and internal attributions partially mediate this causal pathway, but the direct effect prevails. On the contrary, for the treated group, the flow level reported in the Lab is fully mediated by better learning strategies and positive internal attribution in its pathway towards an increased capability to concentrate on academic tasks.

# EDUCATIONAL POLICIES AND THE NEET PHENOMENON IN CAMPANIA REGION

Rosa Vegliante<sup>a</sup>

Coppola Margherita<sup>a</sup>

<sup>a</sup>University of Study of Salerno

NEETs are young people between the ages of 15 and 29 who are not in employment, education or training. These are young people who, despite having completed a course of study, have not been able to access the labour market. Some have dropped out of training, deciding not to engage in any activity. Others for contingent reasons (geographical mobility, maternity, illness, family problems or needs) cannot study or work. This means that NEETs are not excluded from the traditional formal channels of building and accumulating human capital. What are the factors that produce the exclusion of young Italians from the education and work system? How and why does this disconnection happen? How do NEETs fit into the broader picture of youth hardship? What strategies, measures and services exist in the areas concerned (Southern Italian Regions) to facilitate the transition from school to work? What are the strengths and weaknesses of these tools? Are they consistent with the goal of socializing at work? What measures and processes should be implemented to prevent slippage into the NEET status and/or to encourage the reactivation of young NEETs? Starting from these questions, this paper aims to map the phenomenon in question, starting from a review of the literature in order to identify strengths and weaknesses regarding policies and services for the transition school work and socializing at work. In this way, a picture of the main educational lines and measures adopted to promote qualification and schooling is given, with particular attention to the Campania Region.

neet; policies; dropout

## INTRODUCTION

The concept of NEET was first introduced in 1999 by the Social Exclusion Unit of the United Kingdom, an agency created to address and prevent social issues

among young people aged 16 to 18 who, by leaving the educational and labour systems, risked finding themselves in marginal situations (Mascherini et al., 2012; Agnoli, 2014). Among the main risk factors for remaining in this condition are foreign origin, gender, residence in areas with high unemployment, school dropout, and low socio-cultural family background (Social Exclusion Unit, 1999).

Twenty years later, the term NEET is used to analyse “different manifestations of a complex and varied phenomenon” (Agnoli, 2014, p. 13). Various studies (ILO, 2015; Eurofound, 2017; OECD, 2017) have shown that NEETs constitute a heterogeneous group, with very different conditions among them. Despite the various definitions in the international literature, there is a consensus in recognizing that they are young people particularly at risk of social exclusion in adulthood (Eurofound, 2016).

Operationally, a person is considered NEET if they are not employed and are not participating in training courses, whether formal or informal. The inclusion of inactive individuals is seen as beneficial, as it highlights the critical situation between youth and employment. This group includes not only those who are unsuccessfully seeking work but also those who have stopped looking. The latter represent the most vulnerable segment, at risk of social marginalization if timely and appropriate active policies are not implemented. However, this aspect is controversial, as among the inactive there are also those who are unwilling to accept a job. If they are not eligible for employment activation programs, their inclusion in the NEET count seems illogical.

It is important to note that among those who claim not to be currently interested or available, there are also individuals working in the informal economy and women engaged in informal caregiving activities. These individuals could be integrated into the labor market if adequate tools were provided to reconcile work and family. This contribution aims to illustrate the opportunities offered by some policies implemented in recent years in the Campania Region, aimed at reducing the gap between the educational system and the world of work, thus preventing young people from slipping into the NEET condition.

## **1. FROM ELET TO NEET AND THE INTERVENTION POLICIES IN THE CAMPANIA REGION**

Lazzarini and colleagues (2020) examined the phenomenon, highlighting the link between school failure or difficulties in the educational path and the risk of becoming NEET. As noted by Brunetti and Ferri (2018), early school leaving is

often associated with conditions of vulnerability and phenomena of ‘NEETing’ (Amendola, 2022), where a temporary situation like school dropout transforms into a lasting lifestyle. Furthermore, the European Union’s initiatives to prevent early school leaving, included in the Europe 2020 Strategy, link the high dropout rate to the prevalence of the NEET condition. The difficulties faced by students can turn into a path with no viable exit options.

Seen over the longer term, the proportion of NEETs among 16-18 year olds has fluctuated between 8 and 10% from the mid-1990s. From 2008, nevertheless there has been a decline, which, again, may be partly explained by the raising of the age of compulsory education (Department for Education, 2014b). Trends in the proportion of NEETs among 19-24 year olds from the third quarter of 2009 to the third quarter of 2014. Although there are notable fluctuations, a clear curvilinear trend can be detected: the proportion of NEETs first rises to 22% in the third quarter of 2011 and then declines (with ups and downs) to 17,6% in the third quarter of 2014. Thus, the number of NEETs has gone down both among adolescents and young adults. Moreover, they have sunk below pre-crisis levels, given that the proportion of NEETS among 19-24 year olds stood at 18% in the third quarter of 2008 (Department for Education, 2013). Thus, the economic crisis appears not to have produced a lost generation as was feared by many. On the other hand, people who were 19 and older in 2009 are 25+ in 2015, meaning that they no longer fall in the 16-24 NEETs category and have thus dropped out of sight for policy makers. It could well be that the crisis has had lasting effects on this generation.

## **2. EXAMPLES OF POLICIES ADOPTED IN FAVOR OF NEETS IN THE CAMPANIA REGION**

Regarding the policies aimed at NEETs, a significant program to prevent and counteract this phenomenon, with a notable impact in the Campania Region, is “Youth Guarantee” (Garanzia Giovani). This program has provided training and job opportunities for young people, including NEETs. Potential beneficiaries could register through the MyANPAL portal or the regional ClicLavoro Campania portal and be directed by Employment Centers to training courses or internships. In May 2023, ANPAL published a national report on the program, analyzing the period from 2014 to 2022. There were 1.717,038 participants, of which 85% were managed by Employment Centers (Look4Ward, 2023). A total of 1,092,243 measures were activated, with nearly 57% related to extracurricular internships. The employment insertion rate was 66.4%, with over

half a million employed by the end of 2022. In particular, the program was most successful in the provinces of Caserta, Naples, Avellino, Benevento, and Salerno.

The Digital Republic Fund is a collaboration between the public and private social sectors (Government and the Association of Foundations and Savings Banks – Acri), which aligns with the digitalization goals set by the NRRP and the National Complementary Fund. This fund, active experimentally from 2022 to 2026, has €350 million financed by banking foundations. It operates within the National Strategy for Digital Skills, developed and updated in the context of the Digital Republic, a national strategic program coordinated by the Department for Digital Transformation. The goal is to reduce the digital divide and promote education on future technologies, supporting the country's development. The initiative is based on synergistic actions that connect experiences and skills across all sectors. A key contribution comes from the National Coalition for Digital Skills, which includes public and private entities adhering to the manifesto for the Digital Republic, proposing concrete actions to improve the digital skills of the population. In Campania, four projects have been launched that selected and supported 76 free training courses aimed at providing essential digital skills to create new job opportunities for NEETs, women, the unemployed, and workers at risk of unemployment due to automation.

The NEET Youth Hiring Bonus, established by the decree-law of May 4, 2023, no. 48, converted by the law of July 3, 2023, no. 85, offers private employers an incentive of 60% of the gross monthly salary for hired NEETs (under 30 years old) for a maximum of 12 months from the date of hiring. As of December 31, 2019, 125,866 applications had been submitted, of which over 70,000 were approved (74,056, equal to 58.8%). The companies that benefited from these contributions are mainly located in the more developed regions (75% of accepted applications), with Lombardy region (20%), followed by Campania (12,520 hires) and Veneto (9,585).

The GOL Program (Guaranteed Employability of Workers) has been extended to young NEETs (under 30 years old). Initially reserved for beneficiaries of active policies such as RdC and NASPI, it now offers extracurricular internships lasting up to twelve months. With Executive Decree no. 1 of 08/01/2024, a public notice was approved to implement the internships provided by Mission 4 of the GOL Program in the Campania Region, funded under the NRRP, extending the twelve-month extracurricular internships to fragile or vulnerable workers, including young NEETs.

## CONCLUSION

Young NEETs find themselves in a situation of particular vulnerability and discouragement, often due to insufficient family support, inadequate education, lack of work experience or negative experiences, and low trust in institutions and public policies. It cannot be expected that they will seek help through national portals or public offices; therefore, it is essential to identify and reach them, often with proposals that capture their attention. It is important not only to adopt a “push” approach, meaning “I help you out of a negative situation” (which many do not clearly perceive), but especially a “pull” approach, offering attractive opportunities that encourage them to embark on paths of improvement.

Countries with more efficient Employment Centers (CPI), known as Public Employment Services (PES), have demonstrated a greater capacity to gather information on NEETs, both directly and in collaboration with the school system, to offer specific programs. However, even in these countries, some young people remain invisible for various reasons, including family issues, psychological problems, or addiction-related issues.

In Norway, services for young people in vulnerable situations include the Norwegian Labour and Welfare Administration (NAV), follow-up services (FUS), and the Substance Abuse and Mental Health Service (SAMH). NAV offers both state-funded labor market services and municipal social services, and is responsible for providing labor market measures to NEETs, in addition to preventing work. Its mission is to contribute to creating an inclusive society and a functioning labor market, also providing income through various benefits.

As Lőrinc and colleagues (2020) emphasize, experiencing ‘NEETing’ can have long-term consequences on future job opportunities, earnings, psychosocial well-being, and health, resulting in high costs for society as well. To address the NEET phenomenon, analyzing the educational trajectories of young people can provide researchers with valuable insights, helping to understand how to prevent the deprivation of growth opportunities that many young people are beginning to experience.

The experiences of Youth Guarantee and other initiatives in Italy and Europe have shown that without targeted outreach strategies, young people who most need reactivation programs remain excluded from public policies. Early identification of certain determinants of NEET status can support policymakers’ work, suggesting measures to contain the spread of this phenomenon and reduce the number of young people at risk of social exclusion.

What seems to be lacking is the intent to create a unified and structured system, and the real challenge lies in introducing widespread listening among the various public and social actors involved, particularly students (Batini & Giusti, 2023), the Ministry of Youth Policies, and Employment Centers. In fact, according to a mandate contained in Legislative Decree 150/2015, the Ministry of Labor and Social Policies is tasked with defining the essential levels of performance and establishing a “Specialized Guidance” service, which includes skills assessment services, individualized interviews (also in small groups), counseling, and information on the system and methods of skills certification. This service aims to make individuals more aware of the context, to enhance their professional and educational history, and to identify their skills and personal resources (Nicodemo & Coppola, 2023). A person-centered approach that focuses on their potential is fundamental to promoting empowerment and a sense of self-efficacy (Nota & Soresi, 2000). Therefore, it would be incorrect to consider the NEET condition as a simple generational trait, without recognizing the public responsibility for not developing effective labor policies or training and guidance activities capable of overcoming the risk of skills misalignment.

# THE VERTICAL STRUCTURE OF EDUCATIONAL INEQUALITIES IN ITALY

Adamo Lo Cicero<sup>a</sup>

Orazio Giancola<sup>a</sup>

<sup>a</sup>Università “La Sapienza” di Roma

This paper examines the combined effects of individual characteristics (such as gender, family, and migratory background) and contextual variables (including socio-economic and cultural context, school composition, tracking, and territorial distinctions) on Italian students' academic performance. The study seeks to explore the interaction between micro- and macro-level mechanisms and their influence on educational outcomes, drawing on Coleman's theory (1990) of collective effects. Using OECD PISA data from 2018 and 2022, this research provides a novel diachronic analysis of educational inequalities within Italy, which has received limited attention. Educational disparities at the upper secondary level stem from a mix of individual and contextual influences, such as territorial differences and school-specific factors. Previous literature has highlighted the influence of school social composition on educational achievement, while also examining the impact of family background on segregation within Italian schools (Benadusi et al., 2010; Argentin et al., 2017; Giancola and Salmieri, 2020). Italian schools reflect diverse socio-economic and cultural backgrounds shaped by regional factors, institutions, and local environments. This research applies a multilevel regression analysis to interpret inequality structures across territorial, school, and individual levels, examining disparities in reading performance to assess changes over time and post-Covid impacts on student performance.

school performance; inequalities in education; territorial differences; multilevel techniques.

## INTRODUCTION

Comparative analysis of European national education systems consistently reveals disparities in the effectiveness of the Italian education system. These

differences are clear in underperformance and considerably disparities in the academic attainment of fifteen-year-old secondary school students at both national and regional levels. These competence gaps lead to inequalities after students leave school. According to the European Commission, developing competences is crucial for individuals to engage in society and the workforce, and to fully enjoy their rights as citizens (EU, 2010). Sociological studies on educational inequalities identify a range of contributing factors operating at the individual, school, and territorial levels. Many analyses have focused on the intermediate level, the school level, analysing the effects of the social composition of individual schools in different territories (Benadusi et al, 2010; Argentin et al, 2017). Other studies have showed that the social background of students in Italian schools plays a determining role in the level of segregation observed (Giancola and Salmieri, 2020). Besides these two levels, there is also the territorial level. In Italy, schools and students' families are intertwined in relation to different territorial contexts. These contexts are characterized by different socio-economic and cultural combinations, which are shaped by a range of factors, including institutions, politics, and the local environment. In our study, territories (geographical areas) represent the highest hierarchical level of aggregation for inequality factors.

## **1. AIMS OF THE STUDY**

This study examines how individual and ascriptive variables (gender, family background, migratory background), along with contextual variables (socio-economic and cultural context, school composition and tracking, territorial differentiation), influence the academic performance of Italian students. The aim is to investigate the mechanisms operating at both macro and micro levels and their interplay (Coleman, 1990), which shape individual choices and how the combination of these produces collective effects (macro-micro). Competences in Reading and Math do not refer to the mere ability to read a text or calculate results, but the former refers to the ability to understand and integrate what is written with pre-existing knowledge. The second to the skills needed to apply basic mathematical principles and processes in everyday contexts and to examine the logical coherence of one's own and others' arguments (INVALSI, 2019). Reading and math skills are crucial, and the disparity in Italian students' test scores for these subjects reveals a significant inequality issue. According to Bourdieu and Passeron (1972), inherited cultural capital within a family can be a key factor in achieving better academic outcomes. Conversely, the theoretical framework of Rational Action Theory

(RTA) focuses on the intentional actions of students and their families, who choose to participate in education based on rational decision-making (Boudon, 1974; Mare, 1980; Jackson, 2013). As the educational system continues to expand, a hierarchical differentiation emerges, placing students from lower social classes at a growing disadvantage in accessing higher levels of education. The importance of social capital has been emphasized by other Scholars, such as Coleman (1988, 1990). Coleman's theory extends Bourdieu's concept of social capital by incorporating the role of social networks, enabling a shift from focusing on interactions within groups (micro level) to understanding social action on broader scales (meso and macro levels). Social backgrounds are shaped by a multitude of factors, encompassing both familial (micro context) and broader societal, institutional, and geographic influences (macro context). Using Coleman's framework, we examine the factors and processes that influence school performance in Italy.

## **2. DATA AND METHODS**

We used the data collected by OECD in PISA 2022 (OECD-PISA, 2023). Data were collected using a stratified typological sampling method in which in each geographical area a certain number of schools were extracted and within these schools, a certain number of students were extracted. From each layer, has been extracted a random sample. The resulting sample is 465.085 weighted cases. The hierarchical structure of the data collection process is clear in the PISA dataset. Consequently, we must analyze the arrangement of variables based on individual, ascriptive, and contextual characteristics within both horizontal and vertical configurations. When examining the vertical structure, the lowest level includes variables pertaining to individual student characteristics. School-level variables are present at the intermediate level. At the highest level, the territorial variables are the grouping variables. Besides the vertical dimension, we can also consider the horizontal dimension. The horizontal dimension is clear at the intermediate level when we look at school choices (lyceum, technical, and vocational). Choices that impact school results and are linked to individual and contextual aspects. This research investigates educational inequalities by utilizing reading and mathematics achievement as dependent variables. The research methodology is structured in the following stages:

- (1) In a first part we analyse the scores of both Reading and Math to see variability (using means and S.D.).

- (2) Then we analyse the configuration of educational inequalities within and among the five macro-territorial areas considered in the PISA survey.
- (3) Lastly, Multiple linear regression models and a multilevel regression set (Bottoni, 2022) will be used to construct an interpretative model of the vertical structuring (macro-area, school, individual) of inequalities.

### 3. RESULTS

The initial focus of the study is to present data concerning the mean and variability of mathematics and reading scores across the five territorial macro-areas. As illustrated in Table 1, students living in the North-East exhibit consistently high average performance in reading and mathematics, while demonstrating relatively low levels of variability. A significant difference in performance is observed compared to the North-West region, where average performance persists at a high level but is accompanied by a greater degree of variability. Southern and Island regions show lower average performance compared to other regions, with varying performance levels across locations. The results are consistent with previous studies (Benadusi et al, 2010; Argentin et al, 2017).

Tab. 1. Mathematics and reading scores descriptives in different geographic areas. Source: Authors' elaboration of PISA 2022 dataset

Geographic Area	Score	Min.	Max.	Mean	S.D.	Variance
Center	Math	274,3	778,82	475,159	78,9371	6231,07
	Reading	212,99	706,7	488,34	80,0809	6412,95
North east	Math	187,35	752,38	501,621	76,0173	5778,63
	Reading	198,03	745,76	510,55	77,2196	5962,87
North west	Math	255,37	724,09	501,374	83,9509	7047,75
	Reading	253,75	732,68	503,983	83,329	6943,73
South	Math	237,06	678,81	438,48	79,2491	6280,41
	Reading	192,39	713,04	454,352	83,0628	6899,42
South and islands	Math	275,31	666,24	446,568	76,9435	5920,3
	Reading	241,48	699,37	462,555	83,0021	6889,35

Proceeding to the next stage, we analyse the distribution of average ESCS values across the five geographical regions for each of the three tracks (Fig. 1). When considering the northern regions (east and west), a pattern emerges wherein the average socio-economic and cultural characteristics are elevated, and the spacing between the three tracks is remarkably consistent. Conversely, in the southern regions, the three tracks have lower average ESCS values and show distinct distances between them. The structure of the three tracks depicted in Figure 1 for the southern areas, the South, and the Islands provides clear evidence for this statement.

Fig. 1. Scatter plot showing Socio-economic and cultural background variability by Track and Geographical Area. All coefficients are significant for: .000. Source: Authors' elaboration of PISA 2022 dataset.

Before turning to the regression models, we calculated intraclass coefficients (ICC) to see the variability between maths, reading and ESCS scores in the five geographical areas (Bottoni, 2022). According to the values shown in Table 2, the variability in mathematics and reading scores is higher in the North-West area than in the other areas. This shows that the educational outcomes across the different schools in the area vary significantly. The North-East exhibits the least socio-economic and cultural variability, suggesting a more uniform background among families. This contrasts with the areas in the South displaying the highest variability, suggesting a more complex situation in the Mezzogiorno.

Tab. 2. Intraclass Coefficient (ICC) for Reading, Math and ESCS results by Geographic area. All coefficients are significant for: .000. Source: Authors' elaboration of PISA 2022 dataset

Geographic Areas	ICC		
	Math	Read	ESCS
Center	0,383	0,308	0,216
North East	0,354	0,298	0,147
North West	0,478	0,399	0,207
South	0,349	0,334	0,287
South and Islands	0,357	0,364	0,235

To analyse the vertical structure of inequalities, we constructed three linear regression models using insertion modelling (Raudenbush and Bryk, 2002). The dependent variable is Math scores. In the first model, we only inserted the individual-level variables. In the second model, we added the school composition variable as a second-level variable. Finally, we included the macro area variables at the highest hierarchical level.

Analysis of the first model shows a significant track effect influencing mathematical performance, with variables, such as grade repetition and socioeconomic status (ESCS). This evidence reveals that a student's social background is a strong factor influencing their academic success in Italy (Giancola and Salmieri 2020; Pensiero et al., 2019). The second model includes information that approximates the social composition of the school. The tracking effect is observed to diminish in Table 3. At the highest level of aggregation in the third model, the track effect and significant geographical differentiation are once again observed. The impact of the school is partially absorbed by the third-level variables in this instance.

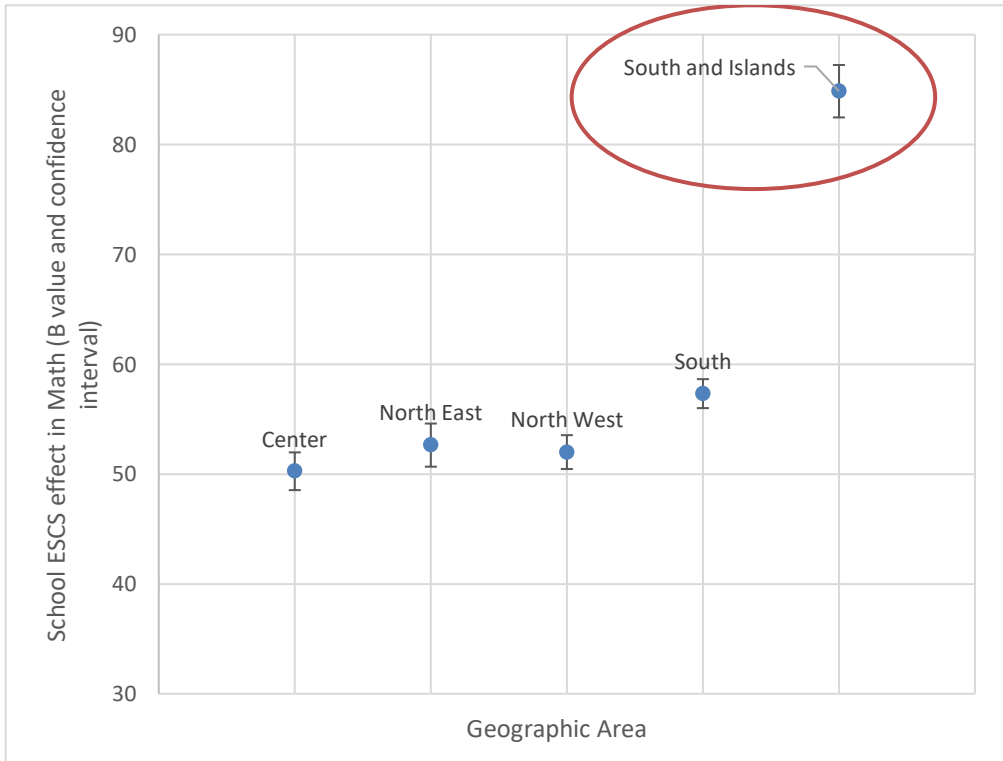

Tab. 3. Vertical Inequalities in Reading and Math. Multiple linear regression models. Dependent variable: Reading (Model 1-3); Math (Model 1-3). All coefficients are significant for: .000. Source: Authors' elaboration of PISA 2022 dataset.

	Reading			Math		
	Model1	Model2	Model3	Model1	Model2	Model3
R-square	0,218	0,27	0,311	0,235	0,32	0,37
(Constant)	432,117	468,981	451,684	441,648	488,619	467,091

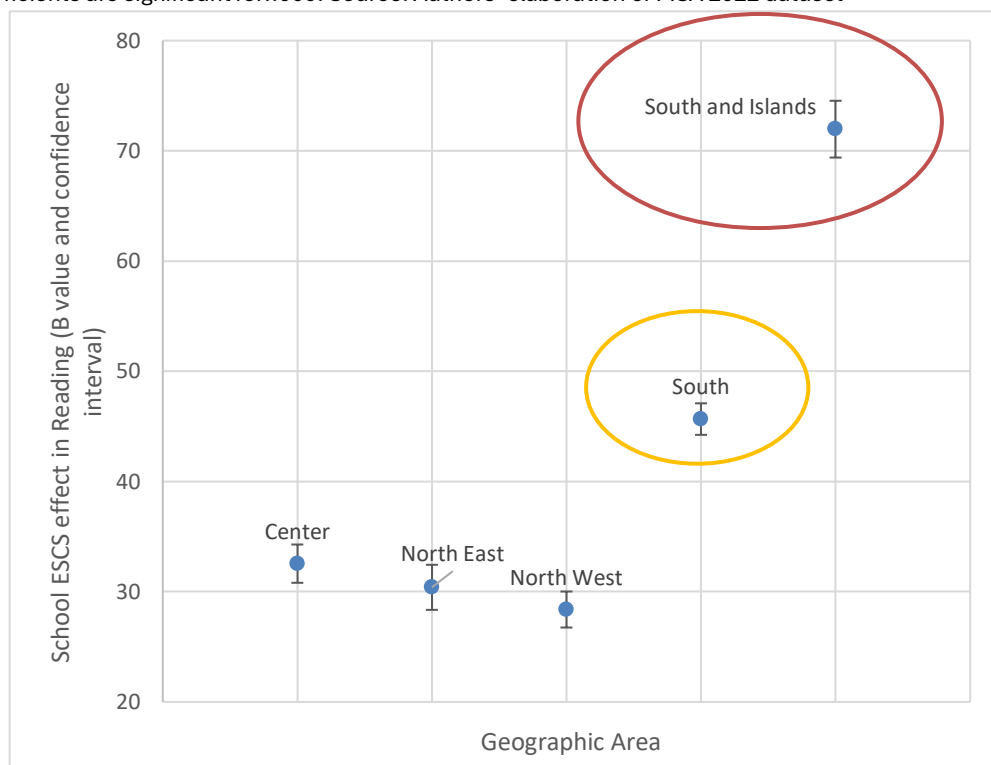

ESCS Index	20,092	10,737	9,423	23,4	11,48	10,059

ESCS_Mean		63,899	39,133		81,417	54,606
North East			23,001			25,9
North West			17,115			23,348
South			-19,329			-16,915
South and Islands			-27,831			-29,433

Fig. 2. Scatter plot focusing on the vertical regression: Effect of School ESCS on Math. All coefficients are significant for .000. Source: Authors' elaboration of PISA 2022 dataset

By applying the same analytical process to reading scores, a strong school ESCS effect can be observed in Southern Italy (both South and South and Islands). The graph (Fig. 3) clearly shows the differentiated impact of family background on the two southern areas. Reading performance in the South and Islands area is significantly influenced by ESCS level, with the impact nearly double that observed in the Center area.

## CONCLUSION AND DISCUSSION

Analyses with PISA 2022 data confirm the already known trends (Giancola and Salmieri, 2022). Geographical area, assumed as the highest-level variable, reproduces much of the North-South divide in terms of economic and employment opportunities. It shows how school actions are deeply influenced and shaped by the local context. This shows that the impact of the local area remains mostly limited to intra-school dynamics. In fact, the decomposition of social origin effects reveals a double disparity for Southern Italy. The first

disparity confirms and refers to a clear geographical division between Southern and Central-Northern regions (Ballarino and Checchi, 2006; Giancola and Salmieri, 2020). Secondly, internal differentiations between the South and the South and Islands are evident. The results for these analyses show the presence of a stratified pattern of educational inequality, which requires further investigation and more attention from educational policies. The track effect is once again confirmed as a problematic node in the Italian education system that seems to escape the radar of reforms that, instead, seems accentuating internal differentiations (Benadusi et al., 2020; Giancola and Salmieri, 2022). Finally, gender and migration background exert a constant influence, net of the variables included in the models, revealing the persistent vulnerabilities of the Italian school system (Panichella et al., 2014; Giancola and Colarusso, 2020; Romito, 2022).

# NON-PREDICTED TRAJECTORIES: EDUCATIONAL CHOICES OVER THE REPRODUCTION OF PREDICTED PATHS

Matteo Bonanni<sup>a</sup>

Orazio Giancola<sup>a</sup>

<sup>a</sup>‘La Sapienza’ University of Rome

The sociological literature on education predominantly focuses on the phenomenon of the social reproduction of educational inequalities. What is often lacking is an analysis of cases that deviate from this pattern of social reproduction. In this study, based on primary data collected in the Lazio region in 2023 from a sample of 2.860 students, the aim is to examine those cases that deviate from the educational trajectories predicted by their cultural capital and to describe them. The study will also explore the determinants of upward and downward educational mobility, as well as post-secondary educational choice expectations, with the aim of uncovering the more hidden mechanisms of the educational system.

social reproduction, non-predicted trajectories, educational choices, educational mobility,

## 1. OVER THE REPRODUCTION

Over the past decades, the Italian educational system has undergone significant internal changes. One of the most noteworthy developments has been the steady expansion of participation at the primary and lower secondary education levels, approaching near saturation. This was followed by an increase in participation in upper-secondary education characterized by both dynamics of inclusion and exclusion (Ballarino & Panichella, 2014). Upper-secondary education introduces several distinct features that significantly impact individuals. It is structured into a tripartite tracking system, where school differentiation plays a crucial role: on the one hand, track choice is heavily influenced by students’ family backgrounds, while on the other, the track attended shapes educational outcomes and future decisions (Giancola & Salmieri, 2022; Giancola et al. 2023). Following upper-secondary education,

participation in tertiary education has increased, though only marginally (Giancola & Bonanni, 2024). The likelihood of enrolling in tertiary education and completing a degree is strongly determined by social class differentials, as well as other factors such as gender, track attended, and prior academic performance (Snee & Devine, 2014; Romito, 2021a). At both the upper-secondary and tertiary levels, class-based disparities continue to reaffirm the principle of the Maximum Maintained Inequality (MMI) hypothesis (Raftery & Hout, 1993). While much of the scholar's focus has been on educational inequalities and the mechanisms of reproduction, this study aims to identify, quantify, and describe those cases that fall outside the patterns of reproduction (OECD, 2011). These are referred to as “deviant cases.” The additional objective is to explore the mechanisms underpinning such cases (Van de Werfhorst & Hofstede, 2007). Specifically, the analysis focuses on the transition from upper-secondary school to post-secondary, whether students pursue further studies, enter the workforce, or follow a combination of both options. The aim is to move beyond a reliance on theoretical frameworks that exclusively address social reproduction (Breen & Goldthorpe, 1997; Barone et al. 2021), expanding the interpretative scope to account for nonlinear trajectories, with a particular focus on cases that *deviate* from established predictions.

## **2. DATA AND METHODS**

We use primary data collected from a large-scale survey conducted in 2023 among students at the end of upper-secondary school in the Lazio region (which includes the metropolitan city of Rome, Italy's largest urban area). The survey comprised 2,860 respondents. To investigate mechanisms that extend beyond the dynamics of social reproduction, we observed groups using a typology that intersects a synthetic index of cultural capital—constructed by combining parental educational attainment—and post-secondary school choice expectations. These groups were analyzed through bivariate analysis with categorical variables and synthetic metric indices derived from principal component analysis (PCA). The analysis focuses specifically on those groups that deviate from the trajectories predicted by their cultural capital. Finally, these deviant groups were further examined using binomial logistic regression models to explore the determinants and the conditional probabilities of the factors influencing upward and downward educational mobility.

### 3. ANALYSES

The following analyses seek to introduce an innovative framework for the study of the sociology of education, with particular emphasis on the operationalization of analytical categories that are often overlooked in academic discourse. These categories have the potential to offer new insights for scholars, thereby contributing to the expansion and enrichment of sociological research on education. The innovative strength of this approach lies in its capacity to reconsider and reformulate key concepts, ultimately leading to a more comprehensive understanding of educational inequalities and processes of social mobility.

#### 3.1. Non predicted trajectories

To identify the categories for analysis, we use a typology that intersects the cultural capital index with students’ post-secondary expectations—work, pursue further studies, or combine both. This approach defines a matrix. Along the main diagonal are cases of social reproduction, while at the two extremes lie those cases that deviate from the direct relationship between the dimensions of the typology.

Tab. 1. Typology between family cultural capital and post-diploma expected choices (*chi-squared=153,9; contingency coeff. = 0.226*). Source: Authors elaboration.

		Familial cultural capital index			Total
		Low capital	Medium capital	High capital	
Enroll university or work	Work	15,1%	10,8%	5,8%	31,7%
	University and work	7,8%	7,5%	6,4%	21,7%
	University	12,5%	15,2%	18,9%	46,6%
Total		35,4%	33,5%	31,1%	100,0%

In terms of educational mobility, we classify as *ascendant* those students who come from low cultural capital backgrounds and expect to continue their studies either at university or by combining university and work. Conversely, *descendant* students are those who opt to enter the workforce despite having medium or high cultural capital backgrounds. All other cases are categorized as educational reproduction. In 63.1% of cases, we observe educational reproduction. Ascendant students represent 20.3% of the total, while

descendant students account for 16.6%. Expanding on the main diagonal, we can identify *heirs*—students from high cultural capital backgrounds who choose university after secondary school—making up 40.5% of the sample and exemplifying upward reproduction. *Stable* students, those from medium cultural capital backgrounds who choose to both work and attend university, comprise 7.5% of the total. Finally, *low trapped* students, those who come from low cultural capital backgrounds and choose to enter the workforce, represent 15.1% of the sample and reflect downward reproduction.

### 3.1.1. Characteristics of deviants by gender

Among the *low trapped*, 66.2% are male and 33.8% are female. In the *stable* category, 40.5% are male and 59.5% are female, while among the *heirs*, 57.6% are female and 42.4% are male. Along the reproduction diagonal, females tend to maintain their educational status at high and medium levels, whereas males are more likely to remain trapped. Looking at the *ascendant* category, 59.8% are female and 40.2% are male, showing a roughly 20 percentage point advantage for females. This suggests that girls are more likely to achieve upward educational mobility, moving from low to high educational levels. Conversely, males are overrepresented in the *descendant* category, comprising 69.3% compared to 30.7% of females, with a gap of approximately 40 percentage points. Analyzing further, 23.2% of males are categorized as *descendants*, and 16.4% as *ascendants*. In contrast, 24.3% of females are *ascendants*, while only 10.3% are classified as *descendants*.

### 3.1.2. Differences in the school context

By educational track (general, technical, and vocational), we observe that among the *low trapped* students, 52.2% pursue a technical track, 32.8% a vocational track, and only 15% a general track. In the *stable* category, 69% follow a general track, while 31% are divided between technical and vocational tracks. Among the *heirs*, 81% choose a general track, with 15.3% and 3.7% enrolled in technical and vocational tracks, respectively. In the *ascendant* group, 60.3% are in a general track, 30.7% in a technical track, and 9% in a vocational track. For the *descendants*, 24.4% are enrolled in a general track, while 45.9% pursue a technical track, and 29.7% a vocational track. The general track serves as a driving force for upward mobility and is a key factor in maintaining high cultural capital. In contrast, enrolling in a vocational track may lead to downward mobility. This is particularly evident when examining group distributions, where 35% of vocational track students belong to the *low trapped*

category, and 34.7% fall into the *descendant* category. Furthermore, when assessing perceived performance on a scale of 1 to 10 in Italian, mathematics, and overall, we find that *descendants* report the lowest performance among the ideal types, with mean scores of 6.76 in Italian, 5.74 in mathematics, and 6.83 overall. The *ascendants* have means like those of the *stables* and *heirs*, scoring 7.64 in Italian, 6.72 in mathematics, and 7.72 overall. These findings provide a framework for interpreting individuals' self-perceptions, which can reinforce their educational conditions.

### 3.1.3. *The role of experiences and relationships*

Two additional factors we examined relate to school experience and social relationships. We first constructed a negative school experience index and then a generic relationality index, both of which serve as indicators that could contribute to a broader measure of social or informational capital. Both indices are metric. Regarding the negative school experience index, the *low trapped* and *descendant* groups exhibit the highest means, at 0.26 and 0.36, respectively. In contrast, the other groups show negative values, with the *ascendants* averaging -0.13. This suggests that negative experiences may significantly influence perceived aspirations for mobility. On relationality index, the *low trapped* and *descendant* groups again report the lowest values, with means of -0.40 and -0.25. *Ascendants* have a mean closer to zero at 0.09, while the *stable* and *heir* categories report means of 0.12 and 0.18. Although the positive values are not substantially high, the negative values are noteworthy and relevant to our analysis.

## 3.2. What determines being a deviant?

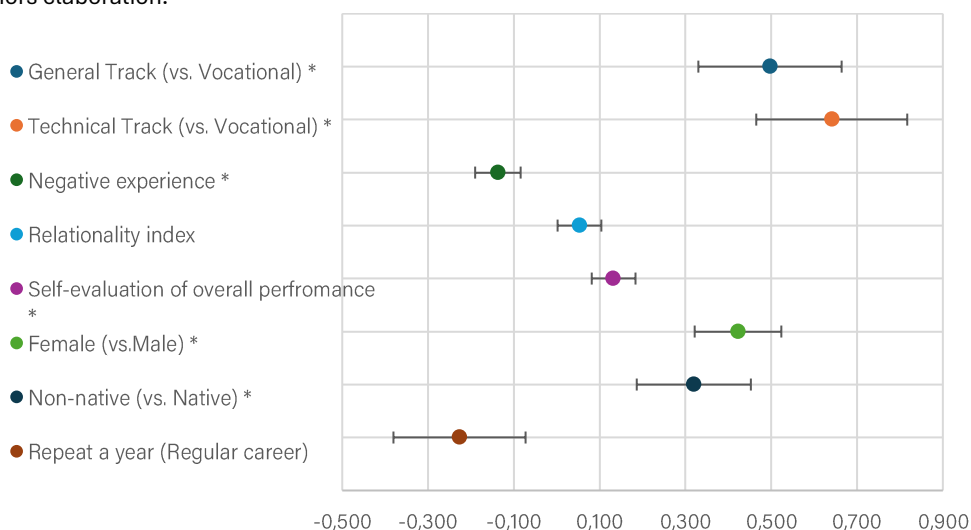

Using the variables described thus far, we developed two binomial logistic regression models to examine the probability of belonging to the descendant and ascendant groups. In this section, we present two point-error plots to display the B values, illustrating the “strength” of the effects observed.

### 3.2.1. *The determinants of being ascendant*

Focusing on the deviant cases, we examine the determinants and probabilities (calculated as  $[\text{Exp}(\beta) - 1] * 100$ ) of being classified as an *ascendant*. Initially, we consider the educational tracks, using the vocational track as the reference category. Enrollment in a general track (B = 0.49) increases the probability of being an ascendant by 64%, while enrollment in a technical track (B = 0.64) raises this probability by 89.8%, both calculated net of other variables and in relation to vocationally enrolled students. A negative school experience (B = -

0.13) reduces the probability of ascending by 12.8%. The relationality index is not significant. Self-perceived overall performance ( $B = 0.13$ ) is positively associated with ascendant status, increasing the probability by 14.1%. Being female rather than male ( $B = 0.42$ ) enhances the probability of being in this category by 52.5%. This model also includes variables related to migratory background and the experience of repeating a year in school. Being a non-native rather than a native student ( $B = 0.31$ ) increases the probability of upward educational mobility by 37.6%. In contrast, the experience of repeating a year is not significant.

Fig. 1. The determinants of being ascendant (B values and Standard Error;  $p < 0.01$ ). Source: Authors elaboration.

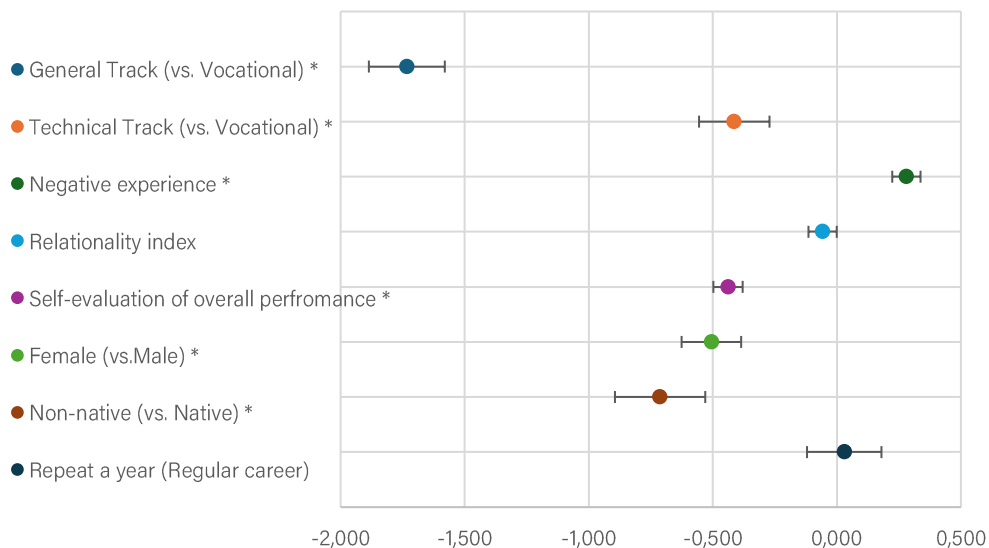

### 3.2.2. The determinants of being a descendant

Here the argumentation shifts, allowing us to discuss protective effects for negative values and downward pressure for positive ones. Enrollment in a general track, as opposed to a vocational one ( $B = -1.73$ ), protects against being a *descendant*, reducing the probability by 82%. The enrollment in a technical track ( $B = -0.41$ ), relative to a vocational track, decreases the probability of being in this category by 33.8%. Unlike the previous analysis, the effect of the general track appears to function more as a protective factor than as a push factor. A negative school experience ( $B = 0.28$ ) increases the probability of being a descendant by 32.3%. As in previous analyses, the relationality index remains non-significant. Self-reported overall performance ( $B = -0.43$ ) decreases the probability of being a descendant by 35.5%. Furthermore, being female rather

than male ( $B = -0.50$ ) reduces the probability by 39.6%. Being a non-native student, using native origins as the reference category ( $B = -0.71$ ), decreases the probability by 50.9%. As noted earlier, the experience of repeating a year is not significant. These results not only elucidate the determinants of being a descendant but also provoke further discussion on the implications of having a migration background, which appears to decrease the likelihood of being an ascendant while simultaneously offering protection against being a descendant. The motivations influencing these outcomes seem to play a substantial role (Bonanni & Moreschini, 2024).

Fig. 2. The determinants of being descendant (B values and Standard Error;  $p < 0.00$ ). Source: Authors elaboration.

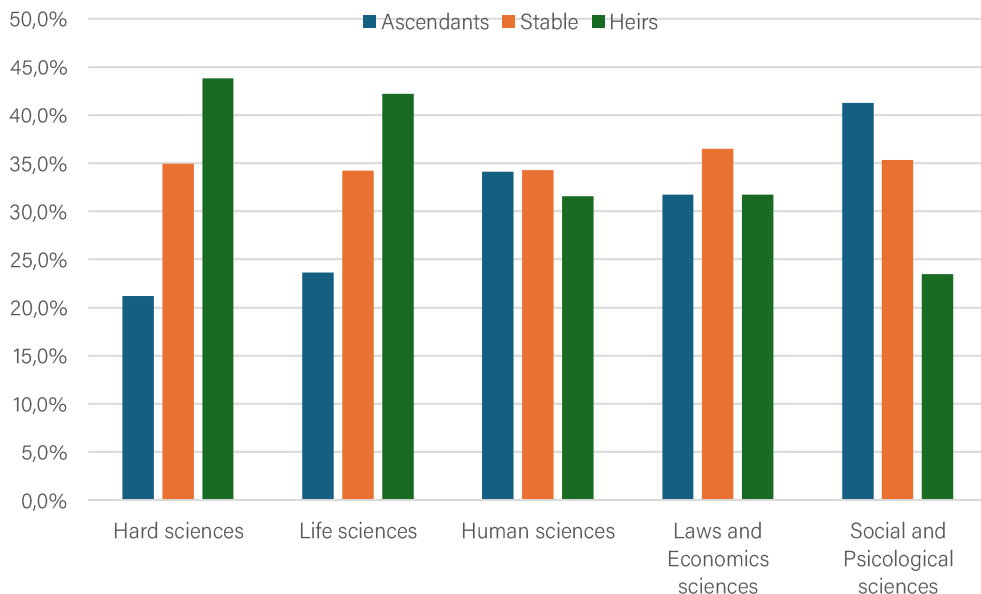

### 3.3. The choices of deviants

In conclusion, we examine the expected choices made by *ascendants*. They show a preference for psychological and social sciences, which account for 41% of their selections, followed by human sciences at 31.4%. These choices are complemented by law and economics, which comprise 31.7% of cases. Psychological sciences (35.3%) and social sciences, as well as law and economics, are particularly favored by the *stable* group. In contrast, *heirs* tend to dominate in the hard sciences (43.8%) and life sciences (42.2%). In summary, while *ascendants* exhibit intentions of upward mobility, they are

inclined to pursue fields that are already saturated, which, according to evidence from the Italian context, offer lower socio-economic returns compared to other areas.

Fig. 3. Expected academic field chosen by ideal types of students. Source: Authors elaboration.

#### 4. CONCLUSIONS

The analysis reveals that reproduction is more pronounced than mobility, at least in terms of expectation. In line with literature (Bernardi & Valdés, 2021) we indeed observe how *sticky* educational expectations are with respect to social origin. We know how real the same phenomenon is then when we turn to actual social mobility: low fluidity between classes is nothing more than the effect of low educational mobility, which in turn is the result of an expectation bias based on ascriptive factors, career and educational choices (according to the principle of the “chain effect” as in Giancola & Salmieri 2022). Treating educational propensities as factors of mobility, the possibility of leaving the path of educational reproduction affects 36.9% of students, with the primary driver being the chosen educational track—general and technical tracks for *ascendants* and vocational tracks for *descendants*. Although performance plays a role in the first model, its impact is particularly significant concerning the probability of being classified as a *descendant*. Consistent with expectations, women are more likely to be *ascendants*, while men tend to be *descendants*.

Among deviant cases, a crucial variable is the lived experience in school, especially for *ascendants*, as indicated by the determinants. When examining expected choices after school, it is noteworthy that, despite efforts, *ascendants* tend to opt for social sciences, economics, and humanities, while hard and life sciences remain marginal. Given that the latter fields typically offer better payoffs in the labor market, the inequalities observed during the upper secondary cycle are perpetuated in tertiary education, resulting in field segregation and affecting potential educational outcomes. Thus, we can conclude that educational mobility pathways are not successes of the educational system but are rather the result of individual inclinations, effects related to choices (e.g., being in the class or school with a favorable social composition) or pure randomness (having one or more encouraging or judging and guiding teachers beyond the classic biases present in this type of process). The combination of these observations is thus in line with the dual role of the school as a factor of mutation and reproduction at the same time and, taking up Atkinson's expression (2015), education – once again – can be a great equalizer or great divider.

# DO DECENTRALIZED CAMPUSES PROMOTE EQUALITY OF EDUCATIONAL OPPORTUNITY? THE CASE OF THE UNIVERSITY OF TURIN

Federica Cornali<sup>a</sup>

Valentina Goglio<sup>a</sup>

<sup>a</sup>University of Turin (IT)

Since the 1990s, through legislative measures such as Law 168/1989, Law 537/1993, and Ministerial Decree 47/2013, the University of Turin, like many major Italian universities, has established decentralized branches. These teaching sites—also referred to as “extra-metropolitan locations” or “satellite campuses”—are situated in municipalities other than that of the university’s registered headquarters. Currently, the University of Turin operates seven decentralized locations, offering a total of 24 degree programs. Existing research has shown that decentralized university sites can contribute to local economic development while addressing institutional objectives such as reducing congestion at the main campus. This study seeks to explore whether these decentralized teaching sites also serve as effective instruments for reducing inequalities in educational opportunities. Specifically, it examines their role in promoting university access for students from disadvantaged socioeconomic backgrounds and non-traditional student groups, such as working students or adult learners. The empirical analysis utilizes a unique dataset combining administrative records with survey data collected via a multipurpose questionnaire administered to first-year bachelor’s and master’s degree students at the University of Turin in the 2022-2023 academic year (N = 17,041).

decentralized campuses, educational opportunities, education policies

## INTRODUCTION

One of the most significant developments in the Italian university education system since the late 1990s has been the growing trend of “territorial decentralization” (Goglio and Parigi, 2014; Rossi and Goglio, 2018; Colombo

and Salmieri, 2022). This term refers to the establishment of decentralized branch campuses across the country, which remain administratively and financially dependent on their respective main university campuses. According to the definition in Ministerial Decree (D.M. n. 987/2016), a decentralized campus is one where “teaching or research facilities are located in a municipality different from that of the university’s legal headquarters.”

To better understand this phenomenon, it is important to note that in recent decades, the Italian tertiary education system has undergone general expansion, aligning with international trends, albeit to a lesser extent. However, unlike other European countries, this expansion has not led to a differentiation of tertiary education into university and non-university pathways (as an example, the UK has introduced University Technical Colleges, Germany has established Universities of Applied Sciences, and Sweden has created University Colleges). In contrast, Italy has largely retained a university-centric system, with limited development of post-secondary technical training options, such as the Higher Technical Institutes (ITS). Consequently, the expansion of higher education in Italy has primarily been achieved through the territorial decentralization of university teaching. This has included a broad distribution of university course offerings across the country, an increase in the number of degree programs, and the establishment of new campuses, often situated in smaller urban centers known as “decentralized campuses.”

This decentralization trend has influenced nearly all Italian state universities. By the early 2000s, around 80% of Italian state universities had implemented some form of decentralization in other municipalities. Currently, only seven universities have not established decentralized campuses, while approximately 220 municipalities in Italy host such campuses.

This paper builds on existing research highlighting the importance of decentralization in enhancing access to university education for traditionally underserved student groups (Animale and Seri, 2009; Bratti et al., 2008; Cersosimo et al., 2018; Viesti, 2018). Using the University of Turin—a large university in northern Italy hosting about 80,000 students—as a case study, this research examines the central question underlying this investigation: can university decentralization positively impact equality in educational opportunities? Specifically, does decentralization facilitate access to university education for students from lower socio-economic backgrounds or those with technical or vocational secondary school qualifications?

## 1. DECENTRALIZED CAMPUSES OF THE UNIVERSITY OF TURIN

The University of Turin operates eleven decentralized campuses. Some of these are classified as “metropolitan campuses” because, while they are located outside the municipal borders of Turin, they remain within the province. Examples include campuses in Collegno, Grugliasco, Orbassano, and Venaria. In contrast, “extra-metropolitan campuses” are situated in municipalities outside the province of Turin. These include campuses in Alba, Asti, Biella, Cuneo, Ivrea, Savigliano, and Aosta. Notably, the Aosta campus is located beyond the regional borders, within the Aosta Valley Region. To assess the impact of decentralization on educational opportunities, this study focuses exclusively on the extra-metropolitan campuses distributed across the Piedmont Region, as illustrated in Figure 1.

Fig. 1. Extra-metropolitan campuses of the University of Turin. Source: own elaboration on University of Turin administrative data (2024)

## 2. DATA AND METHOD

The analysis relies on a unique source of primary data: a compulsory online survey completed by all first-year students at the University of Turin. After data cleaning, the final sample comprises 15,570 students, including 10,144 (65.2%) enrolled in the first year of bachelor’s degree programs, 3,957 (25.4%) enrolled in the first year of master’s degree programs, and 1,469 (9.4%) enrolled in single-cycle degree programs (*lauree magistrali a ciclo unico*, lasting five or six years). To perform a meaningful comparison between students at satellite

campuses and those at the main campus, we selected only “twin courses,” defined as bachelor’s and master’s degree programs offered at both the main campus and satellite campuses with identical course structures. Table 1 provides a summary of these twin courses and the corresponding number of first-year students. The data are analysed using descriptive statistics and by means of a logistic regression model, to estimate the likelihood of enrolling in a degree program in a satellite site compared to the same course in the headquarters.

Tab. 1. Number of first-year enrolled students for twin degree programs, offered both at satellite campuses and university headquarter. Source: own elaboration on University of Turin data.

### 3. RESULTS

The survey investigated various aspects influencing the decision to enroll in university. However, for the purposes of this study—namely, estimating differences in the socio-economic composition of the student body across different sites—the authors focused on a specific set of demographic and socio-economic variables. The descriptive statistics below emphasize demographic variables such as gender and socio-economic factors related to individual students and their households, including the type of secondary school attended, parents’ education, and parents’ occupation. Additionally, the paper briefly examines the timing of students’ decisions to enroll in university.

At the individual level, variables such as gender and type of high school reveal notable differences. Female students are slightly overrepresented at satellite sites (+4.4 percentage points), while male students are underrepresented (-4.5 p.p. at satellite sites). Similarly, students from less prestigious secondary school tracks are more common at satellite sites. For instance, students from professional high schools (+10 p.p.) and technical high schools (technological track, +2.6 p.p.) are more prevalent in satellite site degree programs. Conversely, among students who attended academic tracks (*lyceum*), those from more prestigious tracks—such as the classical and scientific lyceums—are more represented at the headquarters (+6 p.p. and +11 p.p., respectively). On the other hand, students from the social sciences *lyceum* are overrepresented at satellite sites (+5.5 p.p.). These differences are not driven by variations in the fields of study, as the analysis focuses on identical degree programs offered at both the satellite sites and headquarters (see Table 1).

When examining students’ socio-economic backgrounds, as indicated by parents’ education and occupation, some notable differences emerge, particularly concerning education. Students whose parents have a higher level of education are overrepresented at the headquarters (e.g., parents with a university degree, +7 p.p., or a doctoral degree, +4 p.p.). In contrast, students whose parents have low-to-medium levels of education are more likely to be enrolled at satellite sites (e.g., parents with a lower secondary degree, +6 p.p., or an upper secondary degree, +4 p.p.).

Regarding parents’ occupation, the differences are smaller but still observable.

Students at satellite sites are slightly more likely to have parents who are self-employed (+4 p.p.) or blue-collar workers (+3.5 p.p.), whereas students at the headquarters are slightly more likely to have parents who are managers or liberal professionals (+3 p.p.).

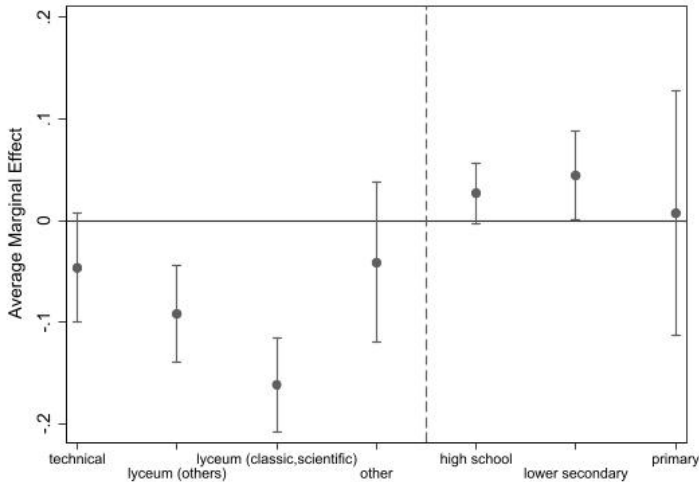

Table 2. Students' characteristics in the satellite sites and in the headquarter campuses of the University of Turin (%). Source: own elaboration on University of Turin data.

	University of Turin	
	satellite campuses	headquarter (twin courses)
Gender		
male	29,7	34,2
female	69,9	65,6
not declared	0,4	0,3
High school degree		
Science Lyceum	21,5	32,2
Social Sciences lyceum	22,4	16,9
Technical Institute – Economic Sector	10,5	12,1
Linguistic Lyceum	8,5	11,3
Classic Lyceum	3,5	9,3
Professional/Vocational Institute	16,2	6,4
Technical Institute – Technological Sector	8,7	6,1
other	5,3	3,0
Art Lyceum	2,7	2,2
Music and dance lyceum	0,7	0,4
Parental education (highest degree among parents)		
No qualification	0,7	0,3
Primary school	0,8	0,5
PhD, Medical Specialization	4,0	8,3
Lower secondary	19,2	12,8
University Degree (Bachelor/Master)	21,1	27,9
High school degree	54,3	50,2

Finally, we compared the timing of students’ decisions to enroll in university as a proxy for their motivation and commitment to academic studies. The baseline assumption is that students with stronger socio-economic backgrounds, higher motivation, and long-term academic goals are more likely to have made this decision well before their final year of upper secondary school, possibly with the support—or in some cases, the pressure—of their families. These students are expected to enroll more likely in courses at the more prestigious university headquarters; in contrast, students exiting upper secondary school without clear plans and lower academic commitment may perceive satellite campuses as a less “risky” choice (e.g. due lower costs of mobility). Indeed, students who decided to enroll in university very early—during primary or lower secondary school, or the early years of high school—are more likely to be enrolled at the headquarters (+11 p.p. and +3 p.p., respectively). Conversely, enrollment in satellite campuses is more frequent among less committed students, such as those who decided to pursue university studies only after completing their high school exit examination (+12 p.p.) or during their final year of high school (+2 p.p.).

This preliminary overview suggests that satellite campuses—even when controlling for the field of study and comparing identical degree programs—tend to attract students from less prestigious upper secondary school tracks, those who are less academically oriented (e.g., those who chose an academic path late), and those with weaker socio-economic backgrounds, as indicated by medium to low parental education levels.

Fig. 2. Average Marginal Effect (with 95% confidence interval) for the probability of enrolling in a satellite site (vs. headquarter). Source: own elaboration on University of Turin data.

To test the robustness of this preliminary descriptive analysis, we ran a logistic regression model to estimate the impact of socio-economic background (proxied by high school type, parental education, and parental occupation) on the likelihood of enrolling in a satellite campus versus the headquarters. The model also included a control variable for the student's province of residence. Figure 2 presents the average marginal effects (AMEs) for different groups, illustrating the likelihood of enrolling in a satellite campus. The left panel shows estimates based on secondary school type, while the right panel presents estimates for different levels of parental education.

The results partly confirm earlier trends, highlighting the significant influence of students' academic backgrounds compared to parental backgrounds. Students with stronger academic preparation are much less likely to enroll in satellite campuses (-16 p.p. for students from the academic track of *lyceums* and -9 p.p. for other types of *lyceums*). In contrast, the influence of parental socio-economic background, proxied by education and occupation, is less pronounced. Students whose parents have low levels of education are slightly more likely to enroll in satellite campuses (+4 p.p. compared to students with highly educated parents), but parental occupation does not show any statistically significant effect (for this reason not shown in Figure 2).

#### **4. CONCLUSIONS**

This paper offers an exploration of the socio-economic composition of the student body at different campuses of a large generalist university in northwestern Italy and its implications for reducing inequalities in access to higher education. The establishment of local satellite campuses has been a long-debated topic in Italy, and this study aims to shed light on the role of these campuses within the higher education system with new original empirical evidence.

Using a new dataset encompassing all first-year students at the University of Turin, the analysis reveals that extra-metropolitan campuses tend to attract a distinct segment of the student population. These students are generally characterized by lower socio-economic backgrounds and weaker academic orientations compared to those enrolled at the university's main campus. The ability of satellite campuses to attract first-generation students—those who are the first in their families to access tertiary education—and students with lower academic orientation (e.g. graduates of less prestigious high schools or those without a clear academic plan until the end of high school) can be viewed as

both a distinctive feature and a strength of these campuses. From this perspective, satellite campuses make a meaningful contribution to addressing gaps in Italy's higher education system. They serve as an informal response to the lack of institutional differentiation in the tertiary education sector and, in a country that ranks third-to-last in Europe with attainment levels 12.5 percentage points below the EU27 average (Eurostat 2024), satellite campuses also play a critical role in increasing tertiary education attainment among young people (aged 25–34).

# I'LL BE A DOCTOR: MEDICAL SPECIALIZATION CHOICES FROM A GENDER PERSPECTIVE

Domenico Carbone<sup>a</sup>

Joselle Dagnes<sup>b</sup>

<sup>a</sup>University of Eastern Piedmont; <sup>b</sup> University of Torino

The aim of this paper is to investigate gender differences in medical education in Italy, with a focus on medical specialization schools. On the one hand, medical education is characterized by a high rate of feminization, but on the other hand, especially in the field of specialization, significant gender differences emerge, showing a greater presence of men in some branches and of women in others. The field under study is therefore particularly interesting because it presents an apparent paradox: a professional sector characterized by high social and occupational prestige, high levels of remuneration and significant career opportunities, largely accessible to women, but at the same time a strong gender segregation within specialties. These differences are often associated with inequalities in wages, career expectations, and social prestige. In order to analyze the social processes, relational mechanisms and gender stereotypes that underlie this segregation, the paper aims to reconstruct the situation of gender imbalance in Italian medical specialties and its variation over the medium term. For this purpose, we analyze cross-sectional and longitudinal secondary data provided by the Ministry of University and Research, building an original national dataset of students in medical specialization schools.

medical specialization; gender segregation; gender stereotypes; gender inequalities

## INTRODUCTION

The medical profession, while historically male-dominated, has seen increasing female representation over time. In particular, although there are some differences in different national contexts, in most advanced countries the

number of women enrolled in medical schools and specialty schools has increased substantially in recent decades, and women now tend to be in the majority compared to men.

At the same time, if we move away from an overall view and look at individual medical specialties, significant gender imbalances remain in both training and employment. In different national contexts, some specialties continue to be male-dominated and others female-dominated, often reflecting stereotypes about alleged gendered aptitudes.

Studies attribute this divide to a combination of perceived personal attributes, cultural beliefs, societal expectations, barriers within medical training and workplace environments. These factors perpetuate the notion that men and women have distinct abilities, driving women towards “people-oriented” specialties and men toward high-stakes, technically demanding roles. These trends are influenced by both implicit and explicit biases within the medical profession (Errani et al., 2021; Pelley and Molly, 2020).

Such gender imbalances are not neutral with respect to professional outcomes: in fact, male-dominated specialties tend to be better paid and more prestigious than female-dominated ones (Errani et al., 2021). Moreover, the consequences of this gender gap are also relevant for patients, as several studies show that gender is not a neutral variable in the doctor-patient relationship (Chekijian et al., 2021).

Drawing on the literature and previous research, this paper aims to provide a detailed picture of the phenomenon in the Italian context, which can serve as a basis for exploring the systemic and individual factors that contribute to gender inequality and for proposing policy adjustments that can promote gender equality in medical education and the medical profession.

## **1. WOMEN AND MEDICAL SPECIALIZATION: AN UNBALANCED STORY**

As noted above, while there has been a significant increase in the medical field in all OECD countries (OECD, 2023), women are still far from being equally distributed across medical specialties. Studies conducted in individual national contexts show a strong under-representation of women in the surgical field – with the only partial exception of pediatric surgery – while the specialties with a strong concentration of women are, for example, gynecology and obstetrics, pediatrics, child psychiatry, general medicine, oncology, and geriatrics.

Thus, empirical evidence shows that women are overrepresented in fields associated with the female body and childhood, as well as in fields that

emphasize interpersonal skills and caregiving. These fields are perceived as “naturally suited” for women due to long-standing stereotypes about nurturing qualities (Burgess et al., 2018). In contrast, specialties with a higher concentration of men-in addition to those that involve the male body, such as urology-are, for example, orthopedic surgery and similar surgical fields, due to the perception that these fields require strength, endurance, and technical skills traditionally associated with men (Ali et al., 2015). In this regard, some authors propose a distinction between person-oriented and technique-oriented specialties, attributing the former more often to female-dominated fields and the latter to male-dominated fields (Manuel et al., 2009).

Some interpretive approaches emphasize the reproduction of gendered roles and tasks within organizations that reproduce widespread stereotypes and assign different tasks to men and women (e.g., the operating room to men, outpatient activities to women). Thus, the observed differences in specialties would not be due to innate abilities or inclinations, but rather to the guidance that women would receive, primarily within their educational backgrounds, towards more care-oriented activities and professional choices (Cavaletto, 2017; Gaiaschi, 2022). In a broader sense, gender stereotypes seem to be relevant not only in the “construction” of different roles for men and women within organizations, but also in influencing the maturation of individuals’ educational and professional choices (Šimunović and Babarović, 2020).

Other approaches emphasize processes of occupational closure in male-dominated specialties (Vicarelli, 2008), which generate implicit or explicit gender discrimination (Trinh et al., 2020). In surgery, for example, it has been pointed out that the allegedly greater precision of men, long used to motivate the strong closure of the specialty to women, was based on the exclusive availability of instruments based on the dimensional standard of the male hand (Ali et al., 2015). Barriers to women’s participation in certain specialties are thus identified in gender discrimination, but also in the possibility of being exposed to sexual harassment as early as the internship stage (Stratton et al., 2005).

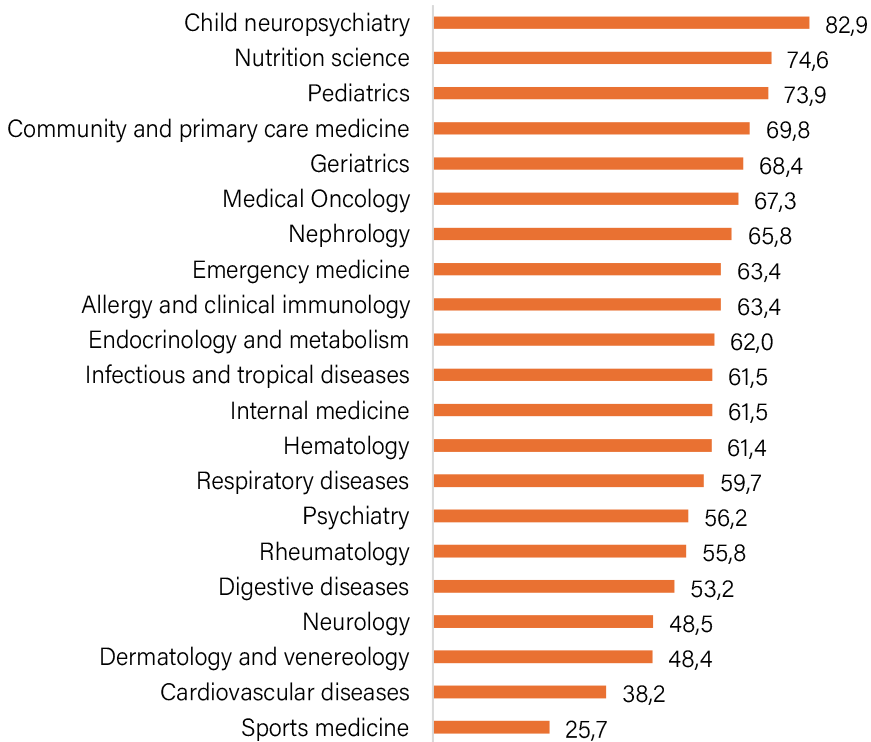

Finally, some strands of the literature attribute gender segregation to women’s preference for certain specializations that allow for an easier work-life balance (Levaillant et al., 2020), with flexible time management, less long shifts, and, in some cases, the possibility of part-time work.

## 2. ENROLMENTS IN ITALIAN SPECIALIZATION SCHOOLS: A GENDER ANALYSIS

Even in Italy, as research on individual specialties has already shown, women enrollment in medical schools has gradually increased over time, but gender-based occupational segregation remains prominent across medical specialties (Cavaletto, 2017; Giaschi, 2022).

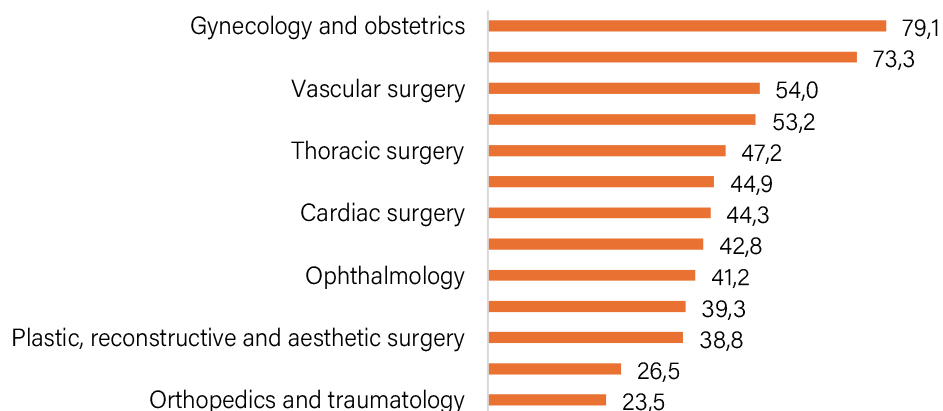

Analyses carried out on an original dataset – constructed on the basis of data provided by the Italian Ministry of Education, University and Research on enrolments in specialist medical schools between 1998 and 2020 – show a balanced starting situation in 1998 (51.5% female students) and a consequent growth of the female component until 2009, when it reaches 64.5%. Since 2010, however, there has been a partial increase in the proportion of male students, although they remain in the minority (43.4% in 2020). But this general trend is the result of a consistent process of horizontal segregation of training choices, which becomes clear when we look separately at the three areas into which graduate schools are classified: medical, surgical, and clinical services.

Fig. 1. Feminization rate in medical specialization schools – Medical Area: Italy 2020. Source: Authors' processing of data provided by the Ministry of Education, University and Research.

In the medical area, there has long been a clear predominance of female residents: from 2000 to 2020, the proportion of female residents never fell below 60 percent, and between 2007 and 2012 it even exceeded 70 percent. In 2020, as shown in Figure 1, only two of the specialties are predominantly male (sports medicine; cardiovascular diseases) and only two have a significant gender balance, with percentages between 45 and 55 percent (dermatology and venereology; digestive diseases). All other schools have more than 55 percent female enrollment, and seven have more than 65 percent female enrollment (child neuropsychiatry; pediatrics; nephrology; geriatrics; community and primary care medicine; nutritional sciences; medical oncology). Many of these reflect the *care* stereotype and offer a better work-life balance. This seems to confirm the reproduction of a cultural pattern in which women tend to gravitate toward specialties that are more *people-oriented* and more *plannable*, with a greater possibility of balancing work and family life (Davis and Allison, 2013).

Fig. 2. Feminization rate in medical specialization schools – Surgical Area: Italy 2020. Source: Authors' processing of data provided by the Ministry of Education, University and Research.

In the surgical area, the male component is still in the majority, although there has been a gradual increase in the female component over the years: in 1998, 31.1% of residents were women; in 2020, 48.1%. As Figure 2 shows, eight of the 13 schools in this area still remain predominantly male, while three are balanced (general surgery; vascular surgery; thoracic surgery). Finally, there are two specializations with a greater female presence: pediatric surgery and gynecology and obstetrics, which not coincidentally deal with the bodies of women and children.

The clinical services area shows a trend very similar to the medical area, with a female predominance: women account for more than half of the residents throughout the period 1998-2020, and more than 65% between 2006 and 2013. As Figure 3 shows, only occupational medicine shows a slight male imbalance; five specialties are gender-balanced (radiodiagnosics, hygiene and preventive medicine, forensic medicine, health statistics, and clinical pharmacology and toxicology), while all the others schools are predominantly female-dominated, with medical genetics and clinical pathology and clinical biochemistry being particularly prominent.

An analysis of the gender composition of medical schools therefore reveals a clear picture of horizontal segregation. There is a large majority of women in the medical area, which is the most feminized; a large presence of women in the clinical services area, which is also the one with the largest number of gender-balanced schools; and, finally, a male predominance in the surgical schools. Within the three areas, there remains a strong differentiation of educational choices based on social roles and gender stereotypes, which underscores the strong resistance of traditional segregation dynamics.

Fig. 3. Feminization rate in medical specialization schools – Clinical Services Area: Italy 2020. Source: Authors’ processing of data provided by the Ministry of Education, University and Research.

At the same time, the longitudinal perspective of the original dataset constructed from data provided by the Italian Ministry of Education, University and Research also allows us to appreciate relevant changes that have occurred in some specialties, rendering a dynamic and evolving picture. In the surgical

area, for example, the three currently most gender-balanced specialties – general surgery, vascular surgery, and thoracic surgery – were male-dominated in 1998 and have gradually rebalanced over time. Also in the surgical area, pediatric surgery was male-dominated in 1998 and has then become feminized over time. Other specialties that have had a similar process – from male-dominated to female-dominated, although with different intensities – are emergency medicine and respiratory diseases in the medical area; forensic medicine and radiodiagnostics in the clinical services area.

### **3. CONCLUSIONS AND FUTURE RESEARCH**

In Italy, medical school enrollment has shown a gradual increase in female participation. However, gender-based segregation continues in specific specialties. Studies show a consistent overrepresentation of women in clinical services area and an underrepresentation in surgery area.

Gender stereotypes, organizational challenges, and societal expectations continue to shape medical specialization choices, limiting the diversity of talent in critical areas of healthcare. Addressing these barriers requires multifaceted approaches, including gender-sensitive policies (i.e. increasing access to training for women in surgery and providing supportive resources for men in caregiving-oriented fields), mentorship programs, and changes in medical training structures (Carbone et al., 2024).

By fostering inclusivity and supporting diverse career paths, the healthcare system can improve patient outcomes, as varied perspectives and skills lead to more comprehensive care solutions. Creating equitable policies that encourage a balance across all specialties would not only diversify medical teams, but also enhance patient care by bringing a variety of perspectives and skills into each field.

Future research should focus on uncovering and mitigating hidden biases in medical education and exploring the potential of technology to support gender inclusivity in physically demanding specialties. Developing policies that enable balanced representation across fields would not only serve the interests of medical professionals but also benefit the healthcare system as a whole.

# EMERGING YOUTH, IDEAL AGES OF TRANSITION TO ADULTHOOD AND STUDENTS' POST-DIPLOMA SCHOOL CHOICES

Giuliana Parente<sup>a</sup>

<sup>a</sup>University of Milan

This paper aims to understand the role played by perceived social norms regarding the ideal age of having the first child in shaping the post-diploma choices of students in the fifth class of high school. In most of the literature on the topic of school choice, in fact, the role of ascribed variables and students' academic performance in determining school paths and the school-university-work transition has been analyzed. This study, on the other hand, aims to hybridize two theoretical strands: the first studying the stages of the transition to adulthood according to the imperatives imposed by tacitly internalized social norms and the second analyzing the reproduction of inequality in education. On the one hand, social norms and, in particular, age norms, institutionalize life paths by stabilizing transition times and roles to adulthood (Tosi 2017; Billari & Liefbroer 2007). On the other hand, post-diploma school choice is a privileged moment of observation to understand the processes of production and reproduction of social and educational inequalities (Pitzalis 2012; Cataldi & Pitzalis 2014; Tarabini & Ingram 2018) because it is in the transition between school levels that social selection takes place (Boudon 1973). The post-diploma choice, therefore, represents a decisive step in the school career and, more generally, in the life of students because it constitutes an essential stage towards the transition to adulthood (Arnett 2000, 2007, 2016). This stage may be conditioned by social, value, and identity expectations that are linked to one's family environment and the opportunities offered by the territorial context to which one belongs (Cefalo & Scandurra 2021; Iammarino et al. 2018). The hypothesis on which this study is based is that, in addition to the role played by the ascribed variables, the social norms perceived by students regarding the ideal age of having their first child may influence their decision to continue their studies, all else being equal, given certain contextual conditions in which young people live and experience. In addition, due to greater social pressure for women, it is hypothesized that gender may have an influence on the perception of the ideal age at which to have the first child (Bergnéhr 2009; Bernhardt & Goldscheider 2006). The study used data from the first phase of the MAYBE project – 'Moving into Adulthood in uncertain times: Youth Beliefs, future Expectations, and life choices between changing social values and local policy in

initiatives', which interviews students before school graduation and has as its main objective to investigate the role of values and choices in the transition to adulthood. Particularly relevant in the study is the attention given to the regional context of reference, Lombardy, which is very heterogeneous in terms of youth services and initiatives offered at the local level. Through the application of logistic regression, the contribution shows how the ideal age perceived by students on a stage considered to be among the main ones for the transition to adulthood, such as having their first child, can orient the decision of the post-diploma school pathway.

social norms, school choice, transition to adulthood, emerging youth, local context

## INTRODUCTION

The contribution titled “Emerging youth ideal ages of transition to adulthood and students’ post-diploma school choices,” presented at the Third International Conference of the journal “Scuola Democratica”, is based on data collected through the MAYBE project. MAYBE’s primary goal is to analyze the role of values in the transition to adulthood and is funded by the Cariplo Foundation through the 2021 Social and Humanities Research Call<sup>1</sup>. This contribution analyzes a subsection of the MAYBE questionnaire administered to secondary school students in the Lombardy region, with the specific goal of investigating the influence of social norms on post-diploma school choices, particularly in their decision to enroll in university. The contribution fits within a theoretical framework that integrates two main lines of research: the first, on youth transitions and social norms, focuses on the stabilization of social behaviors based on the perceived ideal age for certain life choices; the second, on social and educational inequalities, explores the role of social origin and gender norms in educational choices.

## 1. THEORETICAL FRAMEWORK

Ajzen's (1991, 2011) theory of planned behavior provides a useful framework for explaining how social norms influence individual intentions and behaviors. Specifically, age norms continue to regulate fertility intentions and other key life decisions (Billari & Liefbroer, 2007; Dommermuth et al., 2015; Mencarini et al., 2015). Age norms serve as a social reference for determining the most appropriate time for life decisions, such as having children or pursuing higher education (Tosi, 2017).

Simultaneously, studies on social and educational inequalities have demonstrated how social origin remains a significant factor in school decisions (Triventi & Trivellato, 2009; Argentin & Triventi, 2011; Argentin & Pavolini, 2020; Giancola & Salmieri, 2022). Students from families with high cultural capital are more likely to continue their studies at the university level, while those from less advantaged backgrounds tend to opt for shorter, vocational educational paths (Boudon, 1973; Pitzalis, 2012; Cataldi & Pitzalis, 2014). Gender inequalities are another key aspect: despite the "Gender Gap Reversal" (Rosin, 2012; Reeves, 2022), women remain underrepresented in some disciplines, such as STEM, and face difficulties in the labor market (Schwartz & Han, 2014; Huber & Paule-Paludkiewicz, 2023). Other studies (Pitzalis, 2012; Cataldi & Pitzalis, 2014; Tarabini & Ingram, 2018) have highlighted that the choices students make between educational levels are privileged moments of observation, as they allow researchers to see the social selection operated by the educational system based on pre-existing ascribed characteristics that inevitably shape students' educational paths (Boudon, 1973). Additionally, the post-diploma choice is a pivotal step in young people's transition to adulthood, as it marks the move toward autonomy and independence, often pushing them out of their family home for study or work reasons (Arnett, 2000, 2007, 2016).

## 2. RESEARCH HYPOTHESES

The analysis is based on two main hypotheses:

- H1: The perceived ideal age for having children influences students' propensity to enroll in university. Specifically, those who perceive an older ideal age are more likely to continue their studies compared to those who believe the ideal age for having children is younger.
- H2: A gender moderator effect is hypothesized: women are expected to be more influenced by social pressure related to motherhood, reducing their propensity to continue their studies compared to men.

### **3. METHOD**

The sample used in the analysis includes 2756 fifth-year high school students from Lombardy, selected through stratified sampling by province and school type. The independent variable is the ideal age to have the first child, divided into three categories: “up to 26 years,” “from 27 to 29 years,” and “over 30 years.” The dependent variable is the post-diploma school choice: enrolling in university or opting for vocational and technical training paths. The logistic regression model controlled for variables such as gender, family cultural capital, school type attended, grades in Italian and mathematics, perceived ease of finding work, and the presence of a university in the student’s home province.

### **4. RESULTS**

#### **4.1 Ideal age and post-diploma choice**

The logistic regression analysis confirms the first hypothesis (H1): students who perceive an older ideal age for having children are significantly more likely to enroll in university. Specifically, students who believe the ideal age for having children is over 30 years old are more likely to pursue higher education than those who perceive the ideal age to be under 26. This result aligns with studies by Dommermuth et al. (2015) and Mencarini et al. (2015), which highlight how social norms influence both fertility behaviors and educational choices.

The second hypothesis (H2), which hypothesized a gender moderating effect, was not confirmed. Although women generally have a higher propensity to enroll in university than men, the interaction between gender and the ideal age for having children was not statistically significant. This suggests that social pressure related to motherhood may emerge later, outside the school context, influencing life choices in subsequent stages.

Another interesting result concerns the different propensity of men to enroll in university: men who perceive a younger ideal age for having children are less likely to enroll in university, probably due to cultural norms that push them toward the role of breadwinner (the man who economically supports the family). This aligns with what Connell (2012) and Reeves (2022) reported regarding the traditional representation of gender roles.

Tab. 1. Logistic regression model regarding the relative propensity of students to enroll in university by ideal age group and gender

## 4.2 Gender and Territorial Inequalities

Although women are numerically predominant in university enrollments, as evidenced by the Gender Gap Reversal phenomenon, inequalities in access to certain disciplines and job prospects persist. Women are often

underrepresented in STEM disciplines, where men are more numerous, and they face challenges in translating academic achievements into equivalent career opportunities. This discrepancy may be explained by gender norms that regulate social expectations regarding professional and family roles (Schwartz & Han, 2014).

Territorial inequalities are another key factor. The results indicate that the presence of a university in the province of residence increases the likelihood of enrolling in university, highlighting how educational opportunities are unevenly distributed at the regional level. This phenomenon, also discussed by Cefalo and Scandurra (2021) and Iammarino et al. (2018), reflects the North-South divide in Italy, where access to higher education and the labor market is influenced by the socioeconomic context.

## 5. DISCUSSION AND CONCLUSIONS

The results of this research confirm that social norms regarding age continue to play an important role in determining young people's educational choices. The perception of an advanced ideal age for having children is associated with a greater propensity to enroll in university, while those who perceive an ideal age under 26 tend to prefer shorter educational paths geared toward the labor market. Although women are generally more likely to enroll in university than men, the effect of the perceived ideal age for having children does not vary significantly by gender.

# THE CHOICE OF FIELD OF STUDY AT THE TERTIARY LEVEL: THE ANALYTIC APPROACH OF MAPPING 2.0 AND MAIN RESULTS

Federica Rizzi<sup>a</sup>

Adamo Lo Cicero<sup>a</sup>

Orazio Giancola<sup>a</sup>

<sup>a</sup>Università “La Sapienza” di Roma

This paper presents the main results from a survey highlighting the students' decision-making process at the end of upper secondary education, showing the propensities toward those continuing their studies at the tertiary level in the various subject fields and displaying the baskets of university choices. The aim is to reconstruct the network of future propensities among the various university fields of studies using Social Network Analysis, from data collected by the Mapping technique (Giancola et al., 2023). To achieve the goals, we developed a survey conducted between March and May 2023, in the city of Rome and the Lazio region. We collected 1953 cases of students who decide to pursue their studies at the tertiary level, from a total sample of 2860 respondents. The results support the validity of the technique in representing the distinct effects of ascriptive factors (e.g., social origin, gender) and school career variables (e.g., academic track choices) on decision-making. The power of inertia of ascriptive variables seems to be reconfirmed in both the decision to pursue university studies and among the various fields of tertiary study.

educational choices; social inequalities; mapping technique; social network representation

## INTRODUCTION

The topic of educational choices and transitions between different levels of schooling has gained significant attention within academic research. Starting with Bourdieu (1972) and Boudon (1979), through the models proposed by Mare (1980) Breen and Goldthorpe (1997) and Michelle Jackson (2013), social

research has highlights how educational choices represent ‘crucial decisions’ (as defined by Cavalli & Facchini, 2001). On the one hand, they can be considered as dependent variables influenced by ascriptive factors and macro-dimensions such as motivations and perceptions (Giancola & Salmieri, 2024) and shaped by educational systems and quasi-markets between institutions (De Feo & Pitzalis, 2017). In this sense, educational choices become a field for the production or reproduction of educational and social inequalities.

Once made, academic pathways act as an independent variable affecting educational success probabilities (e.g., completing education), cognitive test performance, educational aspirations, and occupational destinies (Giancola & Salmieri, 2024). These outcomes also depend on the chosen track—linked to formal tracking or institutional differentiation—and the socioeconomic and cultural composition of schools (Giancola & Salmieri, 2022a).

Educational choices are often quantified as decisions at a specific moment, such as continuing or dropping out, or selecting a type of school. However, they result from complex processes where ascriptive, motivational, institutional, and social dimensions intersect with experiential and contextual factors, including random influences. Informational capital—shaped by the extension and quality of social networks—also plays a key role. This approach emphasizes the process behind choices, considering multiple dimensions simultaneously. The “multiple contingencies” hypothesis (Giancola & Salmieri, 2022a) highlights how individual, family, contextual, and structural factors interact in decision-making, moving beyond mono-causal models. Despite this, the oversimplification persists, as it is difficult to define educational choices operationally beyond the current standards. Qualitative studies (Cavalli & Facchini, 2001; Romito, 2016) have successfully reconstructed the decision-making process through narratives, but their typifying nature limits broader applicability. Mixed-method approaches, given the complexity of decision-making, offer valuable insights with significant theoretical implications.

Psychological studies on educational choices combine cognitive processes—addressing beliefs and informational gaps—with socio-emotional aspects (Lindsay & Norman, 1983). Quantitative decision-making methods, used in behavioural economics (Kahneman & Tversky, 2013), provide empirical insights. Gati and Asher’s three-phase model (2001) views choices as a decomposed process (pre-screening, exploration, choice), though it is unsuited to survey-based approaches. For more in-depth studies, Krumboltz et al.’s tools (1986) enable critical analysis of alternatives. These approaches commonly

view choice as a process of complexity reduction.

Another research area comes from marketing (Hauser and Koppelman, 1979; Joiner, 1998), where groups of products or services are presented to consumer panels to analyse market structure, competition, niches for new products, and advertising strategies. Though specific to marketing, these methodologies are relevant for studying educational choices, especially in the context of higher education offerings, which are presented as discrete yet potentially related alternatives.

## **1. MAPPING EDUCATIONAL CHOICES: A METHODOLOGICAL PROPOSAL AND DATA ANALYSIS STRATEGIES**

The mapping tool for educational choices draws from decision psychology, marketing, and social research methods (Giancola et al., 2022). It is not just a data analysis technique but starts with data collection, using a questionnaire. Part of a larger survey given to broad populations; it presents students with a game-like format. Eighteen academic fields are listed, and respondents select one of four positions for each:

1. “Currently, it is your top choice”;
2. “Currently, it is among your alternatives”;
3. “Currently, you are not considering it”;
4. “Currently, you have already excluded it.”

The four positions<sup>1</sup> offer an ordinal variable for each item, characterized by ranked categories with unequal distance. Options i) and ii) represent the positive side of the choice spectrum, while the negative side is reflected by options iii) and iv). All respondents are required to provide an answer for each element included in the mapping. The survey requires supervision, and randomizing item order helps avoid bias. At the end, an open-ended question asks respondents for their top choice, probing or assess alignment with the decision clusters identified through multivariate analysis. Instead of Mare’s (1981) dichotomous transition model focusing on “continue/stop,” the filter question on post-secondary plans allows for uncertainty, enabling the use of the mapping tool. This approach, adopting a configurational technique, goes beyond Mare’s model and the critique by Breen and Yaish (2006). The goal is to

---

<sup>1</sup> These response options are linked to the prompt: “Now I propose a kind of game. I will list several fields of university study. For each, you must indicate your level of interest and preference as follows...”

analyse how choices interact or exclude each other. Specifically, the aim is to identify “baskets” where elements are highly interchangeable. By identifying groups of simultaneously chosen or considered disciplines, researchers can infer whether the choice process is based on differentiation or similarity, reconstructing the cognitive process linking preferences across fields or splitting them.

Once identified and stabilized, these baskets form a choice framework. Using Bourdieu’s concept, this framework becomes a multidimensional field of attraction, repulsion, and group similarities and differences. Groups can then be characterized by various dimensions, such as ascriptive and motivational factors. To analyse blocks of homogeneous variables with ordered categories, two main strategies are used (Kim, 1975). The “ordinal” strategy uses Kendall’s or a concordance matrix for multivariate analysis, while the “parametric” strategy employs Pearson’s matrix. In the ordinal strategy, matrix cells are filled with item concordance percentages or association coefficients (sometimes Goodman and Kruskal’s Gamma coefficients). In the parametric strategy, cells contain linear association coefficients. When using concordance matrices, the cut-off level must be determined, which can be “high stake” or “low stake.” For example, with four ordered categories—“definitely,” “probably,” “unlikely,” “excluded”—the high-stake choice fills cells with the concordance percentage of fully concordant categories (“definitely”). The low-stake choice includes both fully and partially concordant categories (“definitely” and “probably”). These approaches differ in how they handle uncertainty, with the low-stake choice allowing more uncertainty.

A matrix is created from individual item intersections, with cells containing concordance percentages, association coefficients, or correlation coefficients. Depending on the content of the cells, different operations will be feasible, but the matrix will remain square with a null diagonal. Concordance or association values are typically lower in the high-stake approach compared to the low-stake one. The low-stake approach, by broadening the semantic range of choices, better reflects decision-making as a complexity-reducing process. Regardless of the chosen strategy, the matrix shows values for each variable pair (intersection row and column). In this study, both high-stake and low-stake matrices were generated using concordance percentages, Kendall’s Tau B, Gamma, Spearman’s Rank, and Pearson’s R. For analysing and graphically representing the data with progressive cut-off levels, various strategies can be integrated. Previous applications have used such matrices to create graphs via social network analysis (SNA) software (Trobia and Milia, 2011). Based on

geodesic distances, the graph concisely represents relationships and, through network analysis, identifies clusters based on reciprocal ties, as the matrix is “weighted.” This approach offers two advantages: it allows for increasing cut-off levels to dichotomize the matrix, showing tie persistence or disappearance, and provides an intuitive representation.

## 2. DATA COLLECTION AND ANALYSIS

We used original survey data collected between March and May 2023 in the Lazio region (N=2.860) through a typological sampling method (stratified by gender, type of school attended and geographical area).

In a first step, we distinguish post-school choices into ‘university choices’ and ‘work and training’ and observe the distributions by gender, social origin, macro track (type of school) and micro track (type of general track). In a second step, we focus on respondents who declared to continue their studies at university level (N=1953), whose fields of study were investigated using the “mapping” technique. Based on the university choices, we constructed a Kendall Matrix (concordances) and selected two cut-off levels: a high stake (full concordance of choices) and a low stake (full and partial concordance). Lastly, we adopted a configurational approach to explore, synthesise and represent the composition of choices, using the SNA (Social Network Representation) to increase the level of selectivity (high stake) of the analysis.

Tab. 1. Post-school choices by gender and family cultural capital

	GENDER		Total	Cultural Capital Index			Total
	Male	Female		Low Cultural Capital	Middle Cultural Capital	High Cultural Capital	
Work or professional training	43,5%	20,5%	32,0%	42,7%	32,4%	18,5%	31,7%
University or University and work	56,5%	79,5%	68,0%	57,3%	67,6%	81,5%	68,3%
Total	100,0%	100,0%	100,0%	100,0%	100,0%	100,0%	100,0%

Cross Table: Post school choice\*Gender. Valid Cases: 2838; Chi-Square: 171.350; gl 1; sign.000; Coeff.Contingency:.239. Cross Table: Post school choice\*Cultural Capital Index. Valid Cases: 2860; Chi- Square: 128.118; gl 2; sign.000; Coeff.Contingency:.4

Moving on to data analysis, starting from the setting of respondents' post-school choices included in the overall sample, we can observe (Table 1) that women pursue university studies to a greater extent than men (80% vs. 57%), and cultural capital (calculated as a linear combination of the educational qualifications and occupation levels of the students' parents) still strongly affects post-school expectations. This highlights the powerful influence of social differentiation, which not only affects academic results but also shapes students' beliefs about their prospects.

At the upper secondary level in Italy, typically at 16yo, students choose between three different schooling paths (general, technical, vocational). This choice turns out to be strongly influenced by students' social background and has a significant effect on their academic performance and future expectations. (Giancola, Salmieri, 2022a, 2022b). In fact, within the academic track, there is a further differentiation that we have referred to here as a micro-track. The data (Table 2) confirm a strong differentiating effect of the tracks, which is also clearly within the broader academic track. In this sense, the track choices once again appear to have a significant impact on students' prospects.

When analysing the subpopulation pursuing further education, the mapping technique shows a clear correlation between students' average family background and significant social variation across academic fields of study (Table 3). Likewise, as evidenced by the rate of feminization of choices, gender seems to introduce an additional level of distinction within this disparity.

To represent the mapping of university choices, we therefore used an SNA approach (employing two different clustering processes). "Architecture", "Physics-Mathematics", and "Engineering" form a distinct group (basket) in both graphs, representing the "hard sciences." Similarly, Economics, Finance, Statistics, Law, and Political Science constitute another group. The fields "Medicine," "Natural Sciences – Biology – Geology," "Healthcare Science," "Chemistry, Pharmacy," and "Agronomy – Veterinary" are recognized as a coherent cluster representing the "life sciences". In the Gamma-based graph, "Humanities and Philosophy" and "Foreign Languages/Translation" cluster apart from "Sociology/Social Work," "Education Sciences," and "Communication Sciences," unlike the other representation, all these fields of study converge into a single basket/group.

The convergence is therefore quite high, but the comparison between the two representations is more effective when using the convergence/affinity matrix based on the Gamma index. Table 4 shows the average social composition of the choice groups and their characterization in terms of gender balance (as well as the percentage of choices in each category).

Tab. 2. Post-school choices by school track

	School Track			Tot.	Micro Track					Tot.
	General track	Technical track	Vocational track		General	Scient.	Ling.	Social sc.	New school path	
Work or Professional training	11,1%	53,0%	69,7%	31,7%	6,9%	7,9%	13,1%	13,5%	18,2%	11,1%
University or University and work	88,9%	47,0%	30,3%	68,3%	93,1%	92,1%	86,9%	86,5%	81,8%	88,9%
Tot.	100,0%	100,0%	100,0%	100,0%	100,0%	100,0%	100,0%	100,0%	100,0%	100,0%

Fig. 1. Graphical representations of the combinations between choices.

# PERCENTAGE

Tab. 4. Description of the choice groups, characterized by average background and feminization ratio.

	Average Background	% Tot choices	Rate feminization
Hard Sciences (mathematics, physics, architecture and engineering)	0,213	38,1%	1,023
Life Sciences (health professions, medicine, chemistry/pharmacy, natural sciences and agronomy/veterinary science);	0,101	39,2%	1,115
Human Sciences (literature and philosophy and foreign languages)	0,066	31,3%	1,422
Economic and Law Sciences (law, economics and finance and political science).	0,137	42,0%	0,821
Psycho-Social Sciences (sociology/social work; education sciences and communication sciences);	0,008	48,5%	1,590

By transforming this data into a graphical form (Fig. 2), we can observe that the psycho-social sciences show the highest female choice rate and low background. Humanities have a high female choice rate and medium background. Economic and law sciences are male dominated with a medium background, while hard sciences are characterized by high background and male preference. As in previous research, a substantial overlap in choices across various fields of study emerges at the end of upper secondary education. The mapping effectively outlines choice groups, which can be defined by background and ascriptive variables. We can also observe a strong feminization in psycho-social sciences (48.5% of choices/propensities) and humanities (31.3% of choices/propensities). There is also an increasing trend of female participation in life sciences.

Fig. 2. Choices of fields of study by average background and feminization ratio.

### 3. FINAL REMARKS

The research presented aimed to achieve a twofold aim. First, to develop an analysis that considers the stratification of ascriptive, and pathway factors related to post-graduation inclinations. Second, to interpret, through a configurational approach, how potential educational choices--reflective of different inclinations toward fields of study--overlap or diverge within the fourth- and fifth-year high school student population.

The analysis reconfirms how the inertia of ascriptive variables still plays a key role in binary transitions (e.g., whether to interrupt or continue studies). Once the decision to continue is made, it also influences the choice of different university disciplines. The analysis reconfirms how the inertia of ascriptive variables still plays a key role in binary transitions (e.g., whether to interrupt or continue studies). Once the decision to continue is made, it also influences the choice of different university disciplines. Overall, then, even in a context of expanding participation in tertiary education is to observe a systematic pattern of inequality. The use of the mapping technique at the data collection and analysis stage provides a clear trace of the decision-making process, reflecting a progressive and non-random reduction in complexity operated by individuals (Giancola et al., 2023). Analyses based on multiple associations between various choice options (or configurational approaches) show a composition of

baskets that is anything but random. Rather, they reflect a distinct internal logic, albeit sometimes nuanced. These groups, or “baskets of choice,” appear to be consistent in their inner structure, differentiated from each other and characterized by the various ascriptive and path dimensions considered in the analysis. The highlighted results offer broad insights for analysis and reflection in terms of policies to address inequalities and guide choices, which remain, today as in the past, crucial and urgent.

# SCHOOL CHOICE AND JOB EXPECTATIONS OF ITALIAN PUPILS AFTER THE COVID19 PANDEMIC

Marialuisa Villani<sup>a</sup>

<sup>a</sup>University of Bologna

This study examines the relationship between school choice processes and Italian pupils' expectations in the post-pandemic educational landscape. The COVID-19 pandemic has intensified educational inequalities in Italy, where traditional factors like social origin, gender, immigration status, and disabilities interact with new health, economic, and digital elements. Using data from PISA 2022, released in December 2023, this research investigates how social background, school tracking, and the pandemic context influence students' educational and occupational expectations. The analysis employs regression models to examine how job expectations of Italian fifteen-year-old students are shaped by social origin, school choice, and track placement, while considering traditional determinants of educational inequalities. Building on previous research, this study aims to provide an updated picture of the Italian educational scenario following the COVID-19 pandemic, focusing on how educational pathways and social factors shape students' occupational aspirations in this transformed context.

tracking effect; educational choices; educational expectations; employment imaginaries; social inequalities.

## INTRODUCTION

The Italian educational system exhibits a late tracking mechanism (Benadusi & Giancola, 2014) whereby students make a critical educational pathway decision at age 14. This choice significantly impacts future career trajectories. The system's stratification creates substantial rigidity in inter-educational transitions (Benadusi & Giancola, 2014; Giancola & Salmieri, 2023).

Researches demonstrate a profound interconnection between social background, scholastic performance, educational tracking, and occupational expectations (Azzolini & Vergolini, 2014; Giancola & Salmieri, 2022; 2023). In

the Italian context, familial expectations and socio-economic background substantially influence early educational selection (ISTAT, 2024; Giancola & Salmieri, 2022). The secondary school selection represents a critical juncture where social and educational inequalities frequently become entrenched (Giancola & Salmieri, 2024).

The inadequacy of guidance policies, insufficiently developed to mitigate familial background influence on educational and professional choices, exacerbates inequality (Lee, 2014; Giancola & Salmieri, 2023; 2024). The most recent ISTAT report (2024) underscores the enduring impact of parental socio-economic and educational backgrounds on students' academic achievements and professional prospects, revealing persistent intergenerational inequality transfer (Pensiero et al., 2019).

Students' occupational expectations emerge through a complex, multidimensional process involving experiential and contextual factors (Neuenschwander & Hofmann, 2022). These expectations develop dynamically through interactions between educational experiences, familial expectations, peer relationships, personal interests, and individual identity trajectories (Gambetta, 1987).

Access to strategic information about educational and professional opportunities is crucial, intimately linked to the symbolic capital and social prestige associated with various occupations (Gambetta, 1987; Valdés, 2022; Jaoule-Grammare, 2024). In a socio-economic environment marked by uncertainty—particularly exacerbated by the COVID-19 pandemic—these expectation-formation processes become increasingly complex (Giancola & Piriomalli, 2020), potentially intensifying structural mechanisms of social and educational inequality reproduction (Bourdieu & Passeron, 1970).

This research critically examines the determinants influencing 15-year-old students' occupational perspectives through a comprehensive analysis of the Organisation for Economic Co-operation and Development (OECD) Programme for International Student Assessment (PISA) 2022 dataset<sup>1</sup>. The study seeks to interrogate the complex dynamics shaping youth trajectory development within a context of profound socio-economic transformation, exploring the intricate interplay between structural constraints and individual agency in educational decision-making.

---

<sup>1</sup> Despite known cultural representation limitations in non-western contexts, PISA data effectively captures the Italian educational system's characteristics, particularly the connection between social origin's effect on track choice and subsequent learning outcomes.

## 1. SCHOOL CHOICE AND JOB EXPECTATIONS

Scholars on educational decision-making reveals a nuanced interplay of sociological determinants that transcend individual choice (Azzolini & Vergolini, 2014; Giancola & Salmieri 2023, 2024). Extending Bourdieu and Passeron's (1970) seminal theorisation, contemporary scholarship critically interrogates the structural mechanisms underpinning educational selection, demonstrating how social positioning and cultural capital fundamentally mediate academic trajectories.

Boudon's (1973) rational choice theory provides critical insights into the strategic dimensions of educational decision-making, establishing school choice as a profoundly socially embedded phenomenon. Gambetta's (1987) subsequent work elaborates this understanding by illuminating the complex mediating role of familial expectations. These expectations emerge not as neutral phenomena, but as deeply contextualised constructs intricately interwoven with social class dynamics, cultural capital, and familial aspirational networks.

School choice is a pivotal mechanism in structuring individual occupational aspirations and potential employment opportunities (Gambetta, 1987; Giancola & Salmieri, 2024). This process necessitates comprehensive analysis within a broader interpretative framework that encompasses multidimensional social representations of professional domains (Jaoule-Grammare, 2024).

Professional prestige emerges as a dynamic, contextually negotiated construct rather than a static attribute. Its configuration results from complex stratification processes mediated by historical, political, and economic contingencies (Jaoule-Grammare, 2024). Media and cultural productions play a decisive role in constructing and continuously reconfiguring professional hierarchies. This prestige dynamics operates as a sophisticated mechanism of social reproduction, actively contributing to the reinforcement of occupational stereotypes and the gendered stratification of professional domains (Jaoule-Grammare, 2024).

The stratification of professional prestige functions as a sophisticated symbolic mechanism through which social representations and hierarchical structures profoundly influence students' vocational expectations and potential trajectories (Giancola & Salmieri, 2024). The interplay between structural constraints and individual agency reveals the intricate ways in which social positioning fundamentally shapes educational and occupational imaginaries.

## 2. DATA AND METHODOLOGY

In this study, I utilized the 2022 PISA (Programme for International Student Assessment) data for Italy. The PISA assessment program evaluates the literacy, numeracy, and scientific competencies of 15-year-olds across more than 90 countries every three years. In the 2022 assessment, a total of 10552 students participated in Italy, which corresponds to 496263 pupils within the national context.

The analysis is organized into three distinct phases. The first phase involved data cleaning, during which I excluded participants enrolled in lower secondary schools and regional training programs. After refining the dataset, the final number of students considered for analysis amounted to 485016. The sample analysed consists of 51% girls and 49% boys. Among the students, 55.4% are enrolled in general track, 32.2% in a technical track, and 12.5% in a vocational track. Figure 1 illustrates the geographical distribution of pupils participating in the PISA assessment across five major geographical macro areas. To perform regression analysis, I developed dummy<sup>2</sup> variables that represent key demographic factors, including gender, immigration background, and geographical residence.

Fig. 1. Pupil's Distribution PISA for Italy 2022. Source: Author's elaboration of OECD PISA 2022 data.

<sup>2</sup> In regression analysis, a dummy variable (also known as indicator variable or just dummy) is one that takes a binary value (0 or 1) to indicate the absence or presence of some categorical effect that may be expected to shift the outcome.

The second phase comprised a binary logistic regression analysis focusing on the SISCO item, which pertains to respondents' expressions of having a "Clear Idea About the Future Job." This analysis aimed to identify the factors influencing the degree to which students possess clarity regarding their future vocational aspirations. In the third phase of the research, multiple linear regression models were developed employing the Ordinary Least Squares (OLS) methodology, with the BSMJ index serving as the dependent variable. This analytical approach facilitated the examination of relationships between various independent variables and the BSMJ index, thereby illuminating the factors influencing the expected occupational status of Italian pupils participant in PISA2022. The BSMJ index was derived from responses to question ST329, wherein students specified their anticipated occupational roles at age 30. These qualitative responses underwent human coding in accordance with the ISCO-08 (International Standard Classification of Occupations) framework, resulting in the generation of the occupational classification index (OCOD3). Subsequently, the ISCO codes were mapped onto the International Socioeconomic Index of Occupational Status (ISEI), denoted as BSMJ. This index, provided by the OECD, serves as an indicator of students' expected occupational status, wherein higher scores correspond to elevated expectations of occupational standing.

### **3. DETERMINANTS OF STUDENTS' CAREER VISIONS AND OCCUPATIONAL EXPECTATIONS**

I decided to explore two key dimensions of students' job expectations. The focus is on whether students can articulate a clear vision of their future employment and what types of positions they envision for themselves in the job market.

Table 2 presents analyses regarding whether students have a clear idea of their future occupation at age 30, based on three progressive logistic regression models. The initial model examines gender, school address, and socio-economic background as key variables. This pivotal decision, influenced by the distinct curricular offerings, often leads students toward either extended academic pursuits or a more direct transition into employment post-secondary education.

In the first model, the findings underscore the significant effect that vocational school attendance has on students' employment expectations, enhancing their clarity regarding future job opportunities (Lee, 2014). The second model expands this analysis by integrating students' performance on reading

comprehension assessments. The final model further enriches the evaluation by including the geographical macro-area of residence, adding another layer of complexity to the investigation.

The outcomes from the third model reveal that geographical factors and the school track significantly influence students' perceptions of their professional futures. Specifically, residing in southern regions markedly increases the likelihood of having a clearer vision of one's career trajectory, with vocational school enrolment amplifying this clarity by a factor of 1.5. These findings illustrate the critical interplay between geographic context, educational choices, and the formation of employment expectations, highlighting the importance of these variables in shaping students' futures (Lee, 2014).

Table 3 presents analyses concerning the BJSM occupational expectation index, which indicates the professional position students envision for themselves at age 30. Model 1 presented in Table 3 indicates that the school track is the most influential variable affecting employment expectations. Notably, unlike the findings presented in Table 2, enrolment in a vocational institute is associated with a negative correlation with expected occupation (Lee, 2014). Conversely,

female students exhibit a positive correlation with higher employment expectations (Jaoule Grammare, 2024). Students from migrant backgrounds, both first and second generations, demonstrate higher employment expectations compared to their native counterparts. The ESCS socio-economic index is positively correlated with expected occupation index. As students' socio-economic status increases, there is a corresponding elevation in their career expectations (Giancola & Salmieri, 2024).

In Model 2 (Tab. 3), the inclusion of the average score in reading tests demonstrates a positive correlation with employment expectations, though it is less intense compared to the influence of school track, which remains the primary predictor of future expectations.

Furthermore, Model 3 (Tab) integrates the geographical variable, indicating that residing in the North-East of Italy correlates with higher employment expectations relative to other macro-areas in the country. Within this model, school tracking is reaffirmed as the most significant influencing factor, while enrolment in professional institutes is associated with a statistically significant negative correlation with employment expectations. Notably, both female gender and non-native status persist in showing a positive correlation with higher employment expectations.

It is important to note that these regression models draw upon student perception data. Whilst such data cannot determine outcomes definitively, it illuminates key dimensions that may facilitate support for students in their educational aspirations and life trajectories.

#### **4. DISCUSSION AND CONCLUSION**

The findings of data analysis underscore a persistent trend where students hailing from more advantaged socio-economic backgrounds demonstrate aspirations for higher socio-economic status. This observation, while seemingly intuitive, warrants a deeper examination of its implications for the perpetuation of socio-economic and educational inequalities.

One important observation about vocational school students is that, although they have a clear vision of their careers, they often envision limited paths for their social and professional advancement. In fact, it appears to create a self-limiting effect, where the clarity of their professional goals constricts their imagination regarding personal and professional growth (Lee, 2014).

Students with first and second-generation migrant backgrounds tend to have significantly higher expectations than their native peers. Although the educational context and labour market dynamics often perpetuate structural ethnic inequalities, students in upper-secondary education already reflect the results of a complex selection process that occurs during school guidance. This selection process encourages them, at least in terms of discourse, to envision opportunities for upward social mobility through future employment prospects. attitudes towards career trajectories (Nerli Ballati & Palmiero, 2024).

Girls demonstrate higher occupational expectations, which may be attributed to different forms of gender socialisation, including family and school expectations that encourage girls to perform better in both academic and professional contexts. (Connell, 2011; Giancola, Colarusso, 2020).

The insights presented in this work should guide our ongoing research into educational, youth, and employment policies that aim to address disparities related to social backgrounds, particularly in the areas of school selection and career aspirations. The findings of this paper should help combat the information barriers that impact students' career expectations and their decisions regarding educational investments. These information barriers are systematically linked to social stratification, resulting in persistent disadvantages that correlate directly with students' socioeconomic backgrounds (Valdés, 2022). Additionally, the landscape of guidance policies in

Italy poses challenges, notably the lack of adequate national and local support to help young individuals navigate their educational and career transitions effectively.

# **EPISTEMOLOGIES AND DECOLONIAL PERSPECTIVES**

# UNSCHOOLING IN ITALY: NAVIGATING IDEALISATIONS, CONSTRAINTS, AND DE-COLONISING PROMISES

Anna Chinazzi<sup>a</sup>

Emilio Ruffolo<sup>b</sup>

Angela Biscaldi<sup>c</sup>

<sup>a</sup>University of Milano-Bicocca; <sup>b</sup>CamminaMenti Cooperativa Sociale; <sup>c</sup>University of Milan

Unschooling represents a philosophy of education that challenges conventional paradigms, advocating for learner autonomy and a departure from institutionalised schooling. This paper offers reflections informed by research insights and framed within an anthropological perspective, focusing on the unschooling experience in Italy. It explores the tensions between the idealised principles of unschooling and the realities of their implementation. Drawing on mixed-methods research, the study highlights how home-educating families navigate “pedagogic compromises” as they reconcile their aspirational visions with sociocultural and institutional constraints. Key challenges identified include the deschooling of entrenched behavioural patterns, negotiating societal integration, and meeting formal assessment requirements. Rather than interpreting these compromises as shortcomings, the paper reframes them as dynamic and generative spaces for educational transformation. The findings suggest that the potential of unschooling lies not in rigid ideological adherence, but in creative adaptations that foster personalised learning, challenge dominant epistemic frameworks, and advance more equitable educational possibilities.

Unschooling, Home education, Educational transformation, Child-led learning, Deschooling

## 1. OUR POSITIONALITY: THE ANTHROPOLOGICAL GAZE ON UNSCHOOLING

Our reflections on the phenomenon of homeschooling are framed within an anthropological perspective. Adopting an anthropological gaze on the world of

schooling and unschooling means engaging in an analytical approach rooted in a well-defined intellectual stance. This approach consists primarily in denaturalising educational representations and practices, that is not taking them for granted, obvious, necessary but subjecting them to a critical reflection. Throughout its long history, anthropology has demonstrated, through field research conducted in diverse contexts, that all educational practices—without exception—are the result of specific historical dynamics, expressing contextual visions of:

- Childhood (Who is the child? Who is the adult? What is their role on the educational scene?);
- Society (What is the task that society entrusts to “education”? What place does it assign to it?);
- Knowledge (What is to be taught? How?);
- Ethics (What is right and what is not to be taught?).

By adopting this perspective, anthropology does not judge an educational system as “good” or “bad”. Instead, it applies a critical and deconstructive lens to every form of experience that societies define as “educational”. This approach facilitates critical distancing, allowing for a nuanced examination of both schooling and unschooling as historical constructs that warrant interrogation.

Starting from this distancing and reinforced by this distancing, anthropology observes that the proposals brought by unschooling into the space of public discussion are particularly interesting because they question an entire system and an entire educational ideology (the western school system) today deeply in crisis.

We therefore believe that understanding these experiences and giving them a voice, without celebratory emphasis but with a critical gaze, can be an important moment for the construction of a generative dialogue of awareness and social transformation. Such dialogue can foster collective awareness and contribute to social transformation. Anthropology can provide an interpretive framework to listen to and understand diverse educational perspectives, which may offer innovative responses to the global educational crisis (UNESCO, 2021).

For instance, overcoming the process of “othering” alternative forms of education (as suggested by Pattison, 2018) requires acknowledging the potential of unschooling to radically deconstruct the mainstream educational system. This model raises critical questions about:

- Age-appropriate norms, which often enforce uniform and standardised learning rhythms, sidelining individual developmental trajectories.
- Power dynamics inherent in teacher-student relationships, frequently structured within hierarchical and authoritarian models.
- The symbolic violence embedded in traditional school curricula, which tends to marginalise diverse voices and perspectives.
- The role of education as a tool for assimilation into neoliberal and capitalist societal models, prioritising competition and productivity.

However, we encourage a critical reflection on unschooling while avoiding its uncritical celebration.

## **2. RESEARCH-INFORMED INSIGHTS: UNSCHOOLING BETWEEN ASPIRATIONS AND COMPROMISES**

A recent mixed-methods study (Chinazzi, 2024a; Chinazzi & Fensham-Smith, 2024) conducted within a doctoral programme spanning from 2020 to 2024, has provided insights into the Italian homeschooling and unschooling landscape. The study combined ethnographic and netnographic fieldwork (Bove & Chinazzi, 2023); semi-structured interviews and surveys with home-educating parents and other key informants.

Unschooling is often viewed as a liberating approach to education, emphasising child-led learning and the importance of nurturing a child’s natural curiosity and interests (Gray & Riley, 2013, 2015; Riley, 2020). It can be defined “as learning without a curriculum, where the child directs and facilitates the learning” (English et al., 2024, p. 144).

In Italy, despite occasional references to unschooling within the broader literature on home education, no dedicated empirical investigation has yet examined this approach in depth. Existing ministerial records (see Chinazzi & Fensham-Smith, 2024) currently treat home-based learning (“istruzione parentale”) as a monolithic category, failing to differentiate between its diverse philosophical approaches and pedagogical practices. Our research insights suggest that unschooling is embraced by a small but growing number of parents who advocate for a more personalised and flexible educational experience, free from standardised curricula and assessments. However, our research also revealed a nuanced reality, where unschooling often exists more as an aspirational ideal than a pure practice. Families frequently engage in what might be termed a “pedagogic compromise”, balancing their educational ideals with

practical considerations. Many parents reported experiencing a dissonance between their envisioned ideal model of (home-)education and the realities of their day-to-day practices. Parents engaging in home-education practices navigate between structured and unstructured approaches, creating what might be termed a hybrid educational space that responds to both ideal aspirations and contextual considerations.

Through an analysis of parent narratives, we identified different sources of “pedagogic compromises” that define the gap between ideal aspirations and practical realities:

- The deschooling challenge,
- Societal integration concerns and mainstream expectations,
- Assessment-driven adaptations
- Other contextual, pragmatic, and personal reasons-

A very common challenge intrinsic to the transition to the home-education practice, especially within unschooling approaches was the need to overcome one’s own interiorised behavioural patterns and ingrained convictions about education. In open-ended survey responses, parents reported that to “homeschool” (and particularly to “unschool” children) entails “leaving what is safe and familiar”, “deschooling ourselves as educators”, “a change of mindset”.

The deschooling process is said to be essential for parents transitioning to the unschooling approach, requiring them to move beyond the traditional teaching-learning paradigm. This process involves letting go of the conventional understanding of education as a one-way transmission of knowledge from teacher to passive learner. Instead, deschooling emphasises a more flexible, child-centred approach that recognizes the importance of self-directed learning and individual autonomy. Despite identifying as “unschoolers” or not, home educators in Italy often prefer to describe themselves as “facilitators” of their children’s learning rather than traditional “teachers”. This perspective aligns with Ivan Illich’s assertion (1971) that learning should not be a top-down process where knowledge is transmitted from an authority figure to a passive learner. Instead, Illich advocates for a more decentralised and individualised approach to education, emphasising that learning is a complex process driven by personal curiosity and exploration. However, this change of mindset is not straightforward, as the following quotes illustrate:

I've noticed it in many families, also among those who recently embraced this choice: it's instinctive to replicate what you experienced in school, like textbooks and exercises. However, if you can be open and let the child express their passions, anything is possible from that passion. (I., former home-educating mother, phone interview, 22nd April 2022)

Deschooling oneself also requires overcoming the fear of nonconformity: as many participants reported, the home-education decision may be challenging due to the prejudices of relatives, friends, and society. It requires individuals to navigate the uncertainty that arises from embracing less-travelled routes:

We must be able to inhabit a space that breaks free from conventional practices. This means embracing uncertainty. (C., home-educator, video interview, 19th October 2022)

The second source of compromise stems from home-educators' awareness of broader societal expectations and the potential challenges their children might face in conventional settings. This compromise reflects a deeper tension within the unschooling movement: the challenge of maintaining educational autonomy while preparing children for potential integration into mainstream society. Parents often find themselves balancing their critique of traditional education with pragmatic considerations about their children's future social and academic inclusion. As one mother explained:

I have always integrated a bit of everything [pedagogic approaches], so that the child – if she returned to the traditional system – would feel comfortable. (...) I am open and flexible because I realised that (...), eventually, the reality they find themselves in might be different, and they could feel uncomfortable. (...) I certainly didn't want to cause them any issue. So, I can say that I actually used a traditional method. (P., former home-educating mother, phone interview, 5th October 2022)

Another recurring type of compromise revolves around the annual assessment requirements in the Italian system. Recent legislative changes have introduced annual mandatory assessments for home-educated children, raising concerns among home educators about the implications for their pedagogical autonomy and the essence of home education. The debate surrounding annual assessments for home- and unschooled students in Italy reflects a complex intersection of educational freedom, accountability, and the evolving legislative landscape. While for some home-educators, annual assessments serve as a valuable tool for accountability, for others they conflict with the fundamental

principles of educational freedom, undermining the individualised learning experiences that home education, and particularly unschooling, is designed to promote. Critics argue that such requirements could lead to a bureaucratic oversight reminiscent of traditional schooling, which many families sought to escape by choosing home education. As one mother expressed her frustration:

These exams make no sense at all, given that the choice to home-educate, at least for me personally, is to distance my children from the whirlwind of traditional school that has only caused harm. (Home-educating mother, open-ended survey response, Autumn 2022).

For most parents, however, these intrapersonal, interpersonal and other pragmatic factors appear to intertwine dynamically over time, influencing their evolving decision-making processes as home-educators.

Some home-educating parents risk romanticising unschooling as an idealised but seemingly unattainable approach, which paradoxically reinforces traditional educational binaries. This idealisation can inadvertently frame unschooling as a purely oppositional or marginalised practice, rather than recognising its transformative potential (Romero, 2021).

Rather than viewing these compromises as failures of unschooling ideals, we propose understanding them as generative tensions that reveal both the possibilities and limitations of educational transformation within existing social structures. As one participant noted about their adaptable approach:

What I see in Italy is truly a huge variability; there are very subtle nuances even within the same group...When it comes to studying together, it often happens that we may tackle some topics together, so we blend our learning methods. (A., home-educating mother, phone interview, 22nd April 2022).

This blending of approaches suggests that the decolonising potential of unschooling might lie not in pure implementation of ideals, but in the creative adaptations and resistances that emerge through practice. The “pedagogic compromise” becomes not merely a concession to conventional education but a space for negotiating new educational possibilities within existing constraints. Rather than being seen as an isolated and fixed “alternative”, unschooling can be positioned as a dynamic philosophy that engages with ongoing discussions. This perspective encourages a re-evaluation of parents’ daily practices, inviting them to consider, as anthropologists do, that the current school model is not the only viable option.

### 3. FINAL REMARKS

Unschooling emerges as a “radical” pedagogical approach and philosophy that fundamentally challenges not only the content of traditional education but also its underlying assumptions. It fundamentally challenges conventional educational epistemologies by explicitly dismantling the binary logic that equates education exclusively with institutionalised schooling. By rejecting standardised curricula and imposed learning structures, unschooling compels a profound reconsideration of entrenched social and cultural narratives regarding learning, childhood, and knowledge production—resonating with the anthropological habitus of deconstruction.

In other words, unschooling invites a reevaluation of educational paradigms by emphasising individualised learning experiences that respect children’s autonomy and promote lifelong curiosity while simultaneously calling into question the societal norms that govern traditional education, including epistemic authorities, conventional methods and content of instruction.

The Italian unschooling experience reveals some practical challenges of implementing non-conventional educational approaches: its implementation requires navigating a delicate balance between ideals and constraints stemming from sociocultural norms and regulatory frameworks. Families reported that they navigate these compromises because it is difficult to “deschool” oneself and to confront ingrained assumptions about education. This process also involves challenging societal prejudices and opinions regarding non-traditional learning, which can be particularly daunting in a culture that largely values conventional educational pathways. Additionally, parents must prepare their children for the expectations of conventional social and academic life, including annual exams, which can create tension between the unschooling philosophy and the demands of the broader educational system.

The challenge for researchers and practitioners alike is to recognise how these compromises might strengthen, rather than weaken, unschooling’s potential for educational transformation. By acknowledging and working within these tensions, families may create educational spaces that are both responsive to individual needs and cognizant of broader social realities.

Aligning with the critical unschooling praxis proposed by Romero (2021), unschooling should be repositioned from a purely “reactive” stance to a proactive, generative educational philosophy. This perspective emphasises that unschooling is not solely driven by “push” factors—such as dissatisfaction with

traditional schooling—but also incorporates “pull” factors that embrace the intrinsic motivations and interests of learners. In this perspective, unschooling can be meaningfully conceptualised as a philosophy that challenges traditional educational paradigms while promoting a holistic approach that emphasises decolonisation, student agency, community engagement, and social justice. By moving beyond civics and citizenship, unschooling may provide a lived experience of democracy for young people (English et al., 2024). As the most “radical” branch of homeschooling, unschooling serves as a catalyst for questioning conventional practices and exploring alternative, more flexible, humane, and personalised approaches to education, potentially contributing to the discourse around equitable educational opportunities (Chinazzi, 2023; 2024b).

The unschooling pathway, as the most flexible approach within home education, is not a linear, predetermined trajectory. Intrinsically open-ended in its epistemological and ontological premises, it emerges as a fluid and dynamic threshold where families continuously negotiate and reconfigure educational boundaries striving to improve their own practice—a paradoxical “gateless gate” (Lees, 2011). This ongoing negotiation highlights the potential of unschooling to serve as a generative and thought-provoking space for educational transformation. However, to fully understand unschooling’s actual implementation and its potential impact within the Italian context, further research is essential.

# CRITICAL UNSCHOOLING: PRACTICING UNSCHOOLING AND A CLOSER LOOK

Morena Franzin<sup>a</sup>

<sup>a</sup> LAIF, l'Associazione Istruzione Familiare

If we look at Italy, unschooling experiences are not very numerous, but they exist. There are some very recent publications that testify that the choice of natural learning can also be achieved in our country. On this occasion, I would like to provide some evidence of what our children have been experiencing for 9 years now. This is about taking a look at the evolution of children, now teenagers, who have been gifted this opportunity to grow through self-guided learning. Thanks to this opportunity that unschooling gave us, as parents, we were able to observe some common characteristics in both of our children. The main characteristics that emerge are: passion, perseverance, dedication and determination in achieving certain goals that everyone sets for themselves. Furthermore, learning in this way allows the notions, experiences and knowledge of certain skills to take root over time in the young person. Additionally, self-guided learning respects the physiological times of growth. We can testify that this experience of unschooler parents is a challenge to the “colonial” conception that children can only learn if they are taught, and can only grow to be fully capable adults by following the path that society has defined for them.

Critical unschooling; choice-based learning; lifelong learning; self-determination; decolonisation

## INTRODUCTION: UNSCHOOLING IN ITALY

If we consider Italy, critical unschooling experiences are not very numerous, but they exist. There are some very recent publications which open minds to this possibility of self-guided learning (Piffero, 2019; Vezzola, 2020). Writings that testify that the choice of natural learning can also be achieved in our country.

It is important to underline, as Nunzia Vezzola specified in her book *Natural learning. Homeschooling and unschooling*, as

Theoretical definitions are not sufficient in most cases to clarify how this path works and how it is implemented, at least for us adults who only know school as a way of acquiring knowledge. (p. 153)

Recently, the national association LAIF (the association for family education) carried out a study to understand the variety of learning methods that arise within a choice such as parental education. Among the various experiences there is unschooling, in all its nuances.

The study proposed a survey that took place from Tuesday 30 April to Sunday 19 May 2024. It is a “photography” of unschooling in Italy in May 2024. The results of the survey confirm the presence of unschooling experiences in our country, as well as the variety of these experiences.

The survey saw the participation of an interesting number of families and can give a good overview of the multitude of experiences in Italy. The study received 158 responses, relating to each child in parental education. Of this total, 28 children practice unschooling, equal to 17.7% of the responses (57,1% radical unschooling, 32,1% critical unschooling).

The majority of children in unschooling are in the age groups 6-10/11-13 (46.4%, 39.3% respectively). Most have never gone to school (71.4%).

Our family is part of this 17.7% and it seems important to us to give our testimony in this regard for our country.

In any case, all over the world, theories and experiences in this regard energize and encourage parents who choose to experiment with this path for the growth of their children. A path that is sometimes not easy to implement in practice in our scholastic society. But when you manage to live it, it is a fascinating experience of decolonization for parents and children because each experience is unique and inimitable as is each child, each person. Uniqueness also explained in the books of John Holt, for example *How children learn* (1982).

One of the great advantages of homeschooling or unschooling is the ability to personalize the learning experience. It allows for tailored education that meets the specific needs and interests of each individual student. Also Unschooling is the approach that emphasizes the child’s interests and passion. It allows for a more self-directed learning experience, where the child takes the lead in deciding what and how they want to learn. It promotes curiosity, exploration and independent thinking.

## **THE CHOICE OF UNSCHOOLING: A DECOLONIZING PATH FOR EDUCATION**

On this occasion, I would like to give concrete testimony of what our family, and in particular our children, have experienced and are still experiencing for the past 9 years: since we chose parental education in its unschooling form. It's not about explaining the "typical day" as families are often and trivially asked by those who are curious. It will be a close look at the evolution of children, now adolescents, who are having this opportunity for growth through critical unschooling which is leading them towards a vision of the world that is aware and freer from the influences of the colonization of education.

Like many other families in the world, our adventure did not begin with a priori prejudices against traditional school learning, but following experiences that led us to deep reflections and changes in our family life. We have 3 children who are currently: 7, 15, 17 years old. I will mainly bring here the experience lived by the eldest children which allows us to see the path with a long-term vision.

We didn't intentionally start out with unschooling. The two older children (currently 15 and 17 years old) have experienced public school (the girl for the first 3 years of primary school, the boy for 1 year). Unfortunately, they showed signs very early that they were not comfortable in that environment. Trying to better understand what was happening, we saw that their learning times and methods were not respected. As we know, everyone is different and also has different ways of learning. The emotional maturation of children itself has its own different timing from one child to another. (John Holt, "How Children Learn", 1982)

Without blaming anyone, we simply chose another way to personalize their growth path. We therefore decided to do parental education (the children were 9 and 7 years old respectively). The beginning, I'm talking about the first months, was quite influenced by the school method with a fairly classic basis, more or less following the outline of topics and disciplines by class trying to make everything more captivating and understandable for each of them. However, we soon noticed the limits of a formal modality that is still triggered from the outside, whether parent or educator. If it wasn't the right time, a topic of interest to the child, a suitable way of learning... things didn't move forward and weren't integrated or experienced with enthusiasm. We can learn about this from André Stern, who writes "Tous Enthousiastes" and shows us the enthusiasm to learn with heart.

Not even a practical workshop (creative, manual activity...) which is more playful, if it is not deeply desired by the children and is imposed, although not

purely didactic, may not be productive. Experiencing it as an imposition is not internalized as a beautiful experience. See the example of a creative workshop of decorative objects for Christmas that is offered to various children: some will be enthusiastic about it, if for others it was not of interest to them they will be bored... “Any type of teaching that has not been requested by the learner is likely to end up impeding and preventing learning.” (Holt, 1989).

By taking these first steps in parental education and being able to closely observe the dynamics that were created in the children, we noticed that there were many variables from one child to another. This pushed us to inform ourselves, to study how to best give a voice to the children themselves in order to make this journey of learning and personal growth pleasant and fruitful in such a delicate moment as childhood. We therefore decided to give more trust in our children and their innate abilities, letting their interests be the basis of their motivation and create their personal path. Daniela Lucangeli often talks in her conferences about the intrinsic motivation for learning.

As highlighted by the study carried out by LAIF, the vision that supports the choice of unschooling is mostly (60.7%) linked to the desire to offer children free, unstructured and predominantly experiential learning. 32.1% add to this the commitment to decolonizing education.

## **THE EXPERIENCE OF CRITICAL UNSCHOOLING BRINGS SEEDS OF DECOLONIZATION IN CHILDREN AND YOUNG PEOPLE**

### **Natural rhythms and self motivation**

Starting the unschooling experience, in our family we were able to notice how, even as young children and despite being free, the children soon followed their natural rhythms throughout the day. A sort of self-regulation was triggered. Even though they were very different, a boy and a girl, each of them in their own way, organized their days between times of rest, play, sport and commitments (deepening a passion, studying or helping with small household chores). What we have observed is that when things are not imposed (whether at an educational level or for daily activities), the need to carry out actions, research... that give satisfaction emerges spontaneously in children. It is evident that these innate needs for knowledge, for challenging oneself and for creating are already present in the person themselves from an early age.

Small and large rituals are part of everyday life, they contribute to the construction of this famous “comfort zone”, wrongly criticized. Because the child only sets out to discover the vast world and meets something new

when he or she has a home base. And it is his rhythms and rituals, as well as those of the adults around him, that offer him this space of tranquility and security, which gives him the freedom and enthusiasm to explore. The child is, by nature, a giant of potentials, and the more we trust him, the more he will be able to express them. Let's forget our expectations and our preconceived ideas, change our perspective and let ourselves be guided by the child, for more serene parenting. (Stern, 2021)

For example, our son has always set himself goals in the activities he is interested in such as playing or sports: his passion for basketball led him to train to reach a certain jumping height to be able to “dunk” at the basket or reach a high number of baskets; his passion for rallies and cars spurred him to be able to reach a certain level in a game (driving simulator). Consequently, these objectives also arrived naturally for the educational activities: reading a certain number of pages of the favorite book every evening (even though reading is a weak point), do 10 minutes of English language review on an app every day (including holidays and weekends).

Her older sister, now 17, has also developed great willpower and discipline which she is putting into practice in her favorite sport: the gym and in her studies. Every day he gets up at 6.00 a.m. to go to training, allowing herself a few days of rest a week because she wants to achieve some goals. She studies everything that she is passionate about on a daily basis and delves into topics related to the human body and weight training with the help of her father (personal trainer) and intends to take courses to become a personal trainer too. Not to mention his numerous experiments and research on cooking and nutrition.

Rewards (such as grades), competition (with peers) are not always necessary to create the desire to learn. What intrinsically drives learning are the objectives that a child or young person sets and wishes to achieve, and above all the interest in a given topic. These factors: interest, passion, motivation, objectives will lead to delving deeper into the topics without impositions. And what is learned in this way remains deeply anchored, not learned superficially for the purpose of a test.

Thus, it will be possible to notice, even in children who do not appreciate the traditional teaching method or are not inclined towards formal study (being more manual, kinesthetic...) that they will still try to improve on certain aspects that are more difficult for them, such as reading for ex., to set daily goals (read a number of pages of a book per day for example).

Even through play, you will observe a certain organization and commitment to

create increasingly complex objects (with cardboard, with wood) always with the aim of having fun and satisfaction in making something with your own hands. Being part of the world, in the family and in one's own locality, one will also be able to observe in daily activities the desire of the children to help parents and grandparents in taking care of the house, the garden, in the kitchen... This commitment results in great satisfaction and 360° learning for life.

About some difficulties: Some situations seen as problematic in a school environment can be resolved spontaneously by letting children experiment and find their own path: "Approaching child development from the perspectives of health and well-being rather than pathology or cultural standards of normalcy yields many surprises" (Luvmour, 2006).

For example:

- Development occurs in the matrix of relationship, not in the individual child.
- Many behaviors viewed as pathological are natural expressions of health, especially during critical transition years around eight, thirteen and seventeen.
- Teens yearn for guidance from trusted family members
- Most childhood dysfunction can be remedied with proper developmental nourishment (and without professional intervention)

## **THE BALANCED USE OF THE DIGITAL WORLD**

Even in the much feared digital world, with the necessary dialogue between parents and adolescent children and the explanation of the need for a balance in their use for their health, "you will be able to see in young people who are not looking for an escape from the world, because they are happy in their real world" (quote from André Stern) that the experience and listening to themselves will lead them to self-regulate. In the balance of their days, they will feel the innate need to set times and rules for themselves, favoring sports and outdoor activities in company as soon as the opportunity arises. It may therefore be useful to consider in certain circumstances that through games, learning sites or apps, children can create personal goals, challenges and stimuli that require their own self-management of the time and energy used in this field.

In our experience, our 15 year old son has always been attracted to the digital world such as videos or online games like other children. But his interests have always revolved around cars and sports, especially basketball. For cars, the fact that he was not yet old enough to drive led him to experiment with driving on a

simulator, accompanied in his passion by his father. From there, a manual project with wood was also born: the creation of the simulator itself and now, also of mechanical skills to be able to juggle when there are problems with the pedals, handbrake...

In basketball, playing a video game like NBA has allowed him to virtually identify with a player who has to overcome obstacles, challenge himself with game strategies at levels that currently would not be possible at his age in the team in our area. Furthermore, listening to the matches and requests in English improved the language itself.

However, despite this attraction for the virtual, at the first opportunity in which he can play basketball outside with one or more companions, or go to see a rally, the virtual definitely comes as second choice.

For our eldest daughter, the digital world encouraged her to write a book, because she was able to learn from various experiences and listen to videos of American and English writers. After learning the English language thanks to her great passion and through films, videos, music and novels in English, she dedicated herself for two years to planning the characters, writing the plot and the various chapters. A dedication and organization that went beyond all expectations at the age of 14-15.

Another of her passions has always been making videos and she has gone through various experiences: from publishing Barbie stories on YouTube (with related script and setting often created at home), to creating music videos on the theme of the novels she has read and currently, producing videos on the topic of bodybuilding and fitness on the execution of exercises, training methods...

For both, the digital world was a means to learn, explore, broaden horizons, experiment. But the aim is always to improve real life and not to replace it.

In the study carried out by LAIF it emerges that the objective of facilitating social relationships (friendships, volunteer activities...) is strongly felt by unschooler families (82.14%)

## **AUTONOMY IN MANAGING DAILY LIFE**

For our older children, this self-guided learning experience has concretely led to great autonomy in managing time and activities. Also in the study, maturation was evident around age 13. At a certain point we also saw the desire for more formal learning arise naturally to deepen their interests, but not necessarily with

someone who teaches. These interests, in the case of our children, range from pastry making to the English language, passing through the study of biology, the world of sport and nutrition and also history and geography, science, mechanics...

Autonomy manifested itself more and more as they grew up, living in the community environment of our own country, of our own area. Independence to carry out errands, walk or cycle, desire to push themselves to be independent (go to the library, take extracurricular courses with kids who go to school...).

In this regard, the LAIF survey highlights that 53.6% of children and young people have a lot of autonomy in everyday life in relation to their age and 35.7% indicated a little.

Listening and discussing with the family in everyday life are also very important for us. Taking the time to listen to what your children have to say, asking and then talking about it, each with their own vision, nourishes an autonomy of thought that is welcomed and shared.

We talk about the various experiences of daily life, work, current events... we look for information together to delve deeper into some topics that are important to us at that given moment. An exchange of ideas and experiences that enriches the whole family, even the youngest sister who is involved in this family experience.

Another example of autonomy is when teenagers express their opinions, not the same of the values of their parents: they need to inform of the need of their self-discovery. Autonomy means self-government. It doesn't mean isolation or separation. 85% of all teens (13-17 years: a massive longitudinal study by the National Institute of Mental Health report) value family relationships as extremely important. Also 85% state that they must learn to do things for themselves. So as parents, we can understand that our children need to do different experiences and not the same as we had done in order to grow and understand the life. (Luvmour, 2006)

## **CHARACTERISTICS THAT EMERGE FROM YOUNG PEOPLE**

The main characteristics that emerge from this learning experience are: passion, perseverance, dedication and determination in achieving certain objectives that everyone sets for themselves over time. Furthermore, learning in this way makes the notions, experiences and knowledge of skills rooted over time in the young person, not learned by heart just for the test (as happens in the school context).

## **RESPECT FOR PHYSIOLOGICAL LEARNING TIMES**

Unschooling is often unfortunately challenging to apply, appreciate and understand in our society today, precisely because today's adults are schooled children and struggle, or even fail to contemplate other possibilities for learning. Self-guided learning respects the physiological times of growth and learning. Nature teaches and we should remember this more often, despite the frenzy of current society. In fact, in nature times are often slower or, in any case, different from one plant or animal to another. Let us remember the seed under the ground that is sprouting away from everyone's eyes and it seems that nothing is growing! Sometimes, even in free learning, it seems that nothing is happening, but in reality this is not the case... with patience and trust you will see the fruits... Our family is seeing beautiful, healthy and strong seedlings grow, initially with beautiful original flowers and colorful and now, even some fruit. We are seeing the promise of mature, responsible and aware future adults being born.

Decolonization, for us, begins with these young minds who were not molded in a standard way, but who followed their hearts, their rhythms: "our inherent capacities (natural) to move through life to gain knowledge, comprehension, or mastery (learning) in recognizable and recurring patterns (rhythms)." (Luvmour, 2006).

## **CRITICAL UNSCHOOLING WAY OF DECOLONIZATION ALSO FOR PARENTS**

Why does unschooling teach adults a lot too? Because it teaches us to see our children's learning and the world with a different perspective. Natural and critical learning helps to decolonize parents themselves, driven by the wonder of their children's journey, going beyond everything that was imposed on us during our childhood. In fact, most adults have some schooling behind them and we need to open ourselves up and mentally stretch ourselves to flow with an unschooling experience. Here in this case, if parents choose free learning for their children, they will have to work on themselves and deschool themselves, decolonize themselves. It will be about cleaning up our beliefs (about success, competitiveness, diplomas, professions of value or not...), our habits (based on teaching by someone who knows more, the division into school classes, the very rhythms of school every day, all year round...) which have been consolidated over the years at an early age. A huge opportunity to discover the world of natural learning, its biological characteristics and timing and increase confidence in children.

Freeing ourselves (decolonizing) from what we were taught at school and aiming

more at developing children's well-being for their personal growth also nourishes us adults and helps us rediscover ourselves.

What holds parents back the most is comparison with others, expectations, the fear of gaps by not following a classic educational path.

In this regard, as also testified by adults, currently parents, who have lived a free learning experience (Stern, 2014), critical unschooling can offer benefits, challenges and above all a great mental elasticity and openness to different points of view.

On this topic of gaps and comparison with others, in a conference held in Belluno in June 2019, André Stern gave his point of view. When they asked him if he fears that his shortcomings (learning only from his interests) will create problems in his life, he suggests thinking about the shortcomings of those who went to school. In fact, if we think about it, many notions that have been taught without interest on the part of the child do not remain in memory.

He recalled that when we study what interests us, what we learn is forever, it is an experience that remains deep down, linked to emotions. Furthermore, to delve deeper into some attractive topics you often have to study topics that you like less or are more difficult.

I will give a practical example of our family: the passion for cooking and pastry-making encouraged our daughter to apply mathematics for quantities and their doubling, use of units of measurement, calculation of calories... even if mathematics was not her strong point.

In conclusion we can say that this experience of ours has brought and is still bringing great lessons to both adults and children.

# FREE PLAY AND ITS BENEFITS FOR A DEMOCRATIC SOCIETY

Marco Leali

LAIF – L'Associazione Istruzione Familiare

From the very earliest infancy, the human mind is designed to capture and process an incredibly large number of stimuli. It goes to show that a scientifically executed comparison and a process of understanding of all available information is perfectly natural for human infants, with a parallel increase of satisfaction, fruitfulness and spontaneity. Humans are, essentially, self-teaching mammals, driven by the instinct to make sense of the remarkable world they are surrounded by. No activity is as favourable to this end as free play. Research suggests that our species learns more, more efficiently and more creatively when subjects are not conscious to receive any external award for their effort. Better results are produced when subjects genuinely enjoy their activity. In other words, mental and physical skills are acquired most optimally when this activity is perceived as play. When applied as a method, free play gives infants and adults the tools to find a democratic way of exploring their own personality and of communicating with their surroundings, paving the way for non-totalitarian practices in everyday society.

Free Play; Critical Unschooling; Democracy

## INTRODUCTION

The human animal is currently experiencing a time of acute crisis, one that comprises almost all tangible aspects of life. As individual causes become more indiscernible, and the multitude of their effects more and more unpredictable, the age-old problem of efficient education rises, gloriously baptized anew. At the risk of stating the obvious, the pivotal role of education in any social organization cannot be denied. More frequently than not, this arduous task is assigned to overwhelmed institutions, administered by individuals whose social importance often lacks the reward it deserves. As we all know, the results are mildly catastrophic.

Standardized Western schooling is built on the alienating and monotonous cadence of modern day adult life. A typical school day sees youth segregated in classes by age, forced to apply standardized solutions to tedious and often unrealistic problems. Social interactions and play are mostly confined to recreation, an activity that by definition implies former destruction. The transmission of skills and knowledge happens in a top-down manner, without directly involving the pupils' own creativity, responsibility and problem-solving capabilities. Students are expected to merely perform pre-conceived tasks, as enforced by superior authority. The highest goal for teachers, families, and often pupils seems to be a high grade, which fosters strong competition for the highest results, therefore rarefying the practices of cooperation which are essential to the achievement of social justice. It is therefore impossible in a standard schooling environment to develop a system of solid autonomous research and decision-making.

Fortunately, schools rarely are the only moment of activity in a young person's life. Children and teens are generally sent to post-school activities, like art or music schools and sport clubs. And a lot of their 'free' time is usually absorbed by ubiquitous homework. The moments they are allowed to share with friends tend to be limited in time and possibility of movement, and the groups they form usually comprise roughly the same peers they meet in class, with very little opportunity for age-mixed communication. Furthermore, as age increases their relations tend to build more and more pressure for individuals to comply with social standards.

As with all parts of any social structure, trying to determine one single genesis is difficult and could be misleading. As a result, different studies point out different origins for our current educational system. Some scholars trace our vision of schooling back to the early 19th century, responding to the Prussian governments' need for obedient and subservient citizens. To implement this, all pupils, conveniently organized in age-segregated groups, were given simple and repetitive tasks, assignments that would ready them for military or working life without encouraging independent and possibly dangerous thoughts and actions. They were trained to perform in confined and unfavourable spaces, frequently subject to humiliation and punishment.

Other studies see the origins of our modern schooling in the late 18<sup>th</sup>-late 19<sup>th</sup> century industrial revolution. At that historic moment, the necessity of disciplined, docile and only basically educated labour presented itself as a priority. Workers had to be able to understand and solve basic tasks, which

could imply elementary reading and writing. In both these theories, the motive is very similar, and the results are pretty much the same. 'Better' education has always been the privilege of the powerful and wealthy. These social classes had to be trained for leadership, demanding social life and intricate conversations. Especially when considering the early 19th century, a wide knowledge base was necessary to make an all-important good impression in social events, securing good deals and convenient friendships. To achieve this, knowledge was often imparted privately, by well-paid teachers, until the children were old enough to be sent to the institution that would make the best impression later on. The expectations laid on children of these social classes were very similar to those laid on adults, and therefore youngsters were subject to strict discipline, both mental and physical. Their studying schedule was very demanding, with programs involving Greek, Latin and advanced mathematics. Aged-mixed and interclass play was often discouraged, since children of a certain age were expected to think and behave like their wealthy parents. Young children had abundant play time, but as soon as they passed a certain age their leisure time was progressively filled with after school activities, many of which are still frequented to this day.

It might be noticed that, while the preparation required for each social class diverged considerably, the underlying motivations and, ultimately, the applied methods to achieve all educational goals were highly similar, if not substantially the same. A pronounced resemblance with contemporary compulsory schooling might also be observed in both systems. Because of the intrinsic nature of its social role, public school needs to compromise its program between the very divergent needs of different individuals: in this process, the overall level of knowledge transmission is uniformed to a low or medium standard. This forces more advanced or talented students not to make use of the resources they possess, while other, slower or less involved pupils invariably feel discouraged and frustrated, knowing that their school grades will have an immediate and, possibly, remote impact on their life. More personalized and perhaps more tolerant, therefore possibly more effective instruction remains a privilege of the wealthy and powerful, thus implicitly extending social inequality and diminishing democratic potential. While this inequality is not as severe as it used to be in the past centuries, it still produces obvious drawbacks in everyday life. Apart from the obvious implications this has on career choice, a tangible inequality in individual acculturation and social engagement still persists. People who attended public schools or received a lower education generally seem to participate less in public life.

This is partially due to the utterly unnatural process that this type of education implies. Our minds and bodies are still largely designed for hunter-gatherer life, making some of the principles used for our ancestors applicable to this day. The human animal is born in a complex and evolving environment, one that requires rapid learning and adaptation to survive and thrive. A child's brain needs to be able to process and store an incredibly large amount of information in comparatively little time. At the risk of stating the obvious, we can conclude from this that children of any culture are naturally born curious. They want to explore and experience the world around them, gradually acquiring all the knowledge and skill they perceive grown-ups to possess.

In a natural environment, children would gather all information and skill they could possibly need in the contest of play. Studies have shown that many hunter-gatherer societies that still exist to this day leave children completely free and unobserved by an adult for large parts of the day. The result is that youths often group together to 'play' the events that fill their environment. This is by no means just for fun, even though everyone can vouch for the fun of play: by playing without any superimposed schemes and rules, children make sense of their surroundings, and they do it on their own. They acquire the muscular strength and the mental ability they would need if the situation they play was real. This is clearly exemplified by the evidence of Jewish children playing adults' everyday life (and, mostly, death) in Nazi concentration camps, instead of creating situations to temporarily alleviate the brutality they had to witness. It certainly was their instinct to make sense of things that drove them to it.

## **FREE PLAY**

Free play is children's main occupation when adults are not around. Free play can be defined as any self-initiated, voluntary and autonomously controlled activity where an individual is able to explore its surroundings and experience its reaction to it. It always involves creativity and the use of fantasy. Many studies have shown by now the benefits free play brings to the development of logical and critical thinking and to the building of linguistic, problem-solving and motor skills.

When they play without adult supervision or organization, children feel entrusted to make their own decisions and take their own risk, assuming the responsibilities of their actions. They autonomously find the place that best suits them in the society they grow in, while training their imaginative capabilities and problem-solving skills.

Older children develop a sense of responsibility while caring for younger ones in age-mixed play, while younger ones are given a chance to measure their talents with possibly more refined ones.

Most importantly for our discourse, free and unstructured play is the most democratic activity humans can engage in:

- No superimposed will must be executed, since the children are completely self-governed and can decide whether or not to engage in any activity and how to take part in it;
- Although games can be very competitive, in free play the stronger players need to exercise control over their abilities. The competitive spirit is found in the self-induced crisis of an individual's abilities, more than the contrast between contenders. This requires the training of self-discipline and patience. If one player quits, even the weakest link, the game would not be as fun, and could possibly even end. Free play must be satisfying for every participant, if it is to be continued as long as possible. This makes the game itself, not victory, the player's priority. Any triumph or defeat would immediately end the fun and therefore would not be satisfactory for anyone. That way less proficient players have the chance to slowly work on what they perceive as the weak points of their knowledge and skill without getting discouraged or injured. Significantly stronger players on their part need to develop control over their favourable abilities, in order to keep the activity going. It is a fundamentally inclusive process. Everybody can join, knowing that their weaknesses will not be used to harm them. This does not happen in any structured and competitive situation, where an individual weakness is to be exploited to benefit the strongest;
- The ends and the rules of the game are spontaneously established by the players, and more often than not there is no need to pronounce them. The participants have to find a compromise between the different needs of all people involved;
- Reconciliation stands as an essential part of free play. Disagreements and disputes are to be expected in any prolonged social assembly, and common experience proves the frequency of quarrels among children. Since they are unavoidable to a certain degree, players must learn to reconcile effectively when discord arises. The witnesses have to try and find a point of agreement, while the actors must manage and control their anger. Otherwise, the game is finished. This is not to say that free

play is the only medium to train the ability to solve discordance; but in other kinds of play, for instance football or card games, reconciliation often remains discretionary, while in natural free play it is essential to continue the game;

- Whenever a game is not satisfactory for any one player, or whenever someone quits, a new context must be created. Often debates are held to find a way of coping with the situation. In these considerations, participants must find a way to present their opinions in an inoffensive and convincing manner, trying to determine a point of union between all interests involved. It implies training one's aptitude to dialogue and negotiation skills, finding viable arguments to support a cause, and being open to compromise to reach a common goal.

These empirically observable mechanisms are nothing less than the procedures a democratic society is built upon. In addition to being the most natural learning method for any species, we can therefore define free play and the connected and necessary empowering trust older generations have to exercise in as the best training for democracy.

Through free play children, teens and adults put into practice the democratic methods that are claimed to be the foundation of our social system. Democracy is rarely applied otherwise in the same spontaneous vein and in such a complete manner. In most other forms of play with preset rules or other kinds of control exercised by third parties, like most sports with fixed teams, the goal of winning is regularly perceived as more important than the game itself, implicitly undermining the democratic process. In almost every situation where adults lead children's activities, the decision-making process and, therefore, the responsibility rely solely on the adult, causing obvious shortcomings both in democratic and in educational terms.

Ultimately, free play and its benefits tend to be completely excluded in an average grown-up life: the only social situations in which similar principles seem to be applied could be certain musical moments and determined theatrical occasions. The spirit of free play and exploration tends to be totally suppressed in working contexts and in almost every other aspect of everyday life. This should be perceived as a problem, since the stated personal and social benefits can also be applied as a whole to adult life.

## CONCLUSION

Free play is the most natural way for humans to satisfy their need to make sense of the world around them. Through it we are able to freely explore our intellectual and physical capabilities and create our own view of society. It trains us to think creatively and gives us the tools we need to find personal solutions to the problems we face. It exercises our minds to make tolerant decisions in democratic ways for universal benefit. It is one of the most natural activities that can be immediately put into practice, in almost any situation. And even though critical unschooling is the approach that makes the biggest use of the benefits of free play, its completely natural essence does not put its application in contrast with any other current educational method. Its systematic appliance trains humans to adapt tolerant and democratic mindsets and practices, allowing them to be transduced more naturally and effectively both in everyday life and in critical situations.

Free play and its consequences empower us to experience the world and our human community from different perspectives, giving us many tools to strengthen what we value most, aiding us to build a more organic and democratic society.

# CRITICAL UNSCHOOLING: AN EDUCATIONAL CHOICE FOR SELF-DETERMINATION AND A CHALLENGE TO THE DOMINANT CONCEPT OF SUCCESS AND WELL BEING

Valeria Melloni

## INTRODUCTION

As a practitioner of unschooling, many times I find myself thinking about my school experience, how much I still feel colonized by the school setting that I underwent in the years of my childhood and adolescence. The same concern of the judgment of others, the fear of making mistakes and making a bad impression are still with me today and it is difficult for me to be able to de-schooling myself and to decolonize my person from this judgmental vision of myself.

Looking at today's school, it does not seem to have changed much compared to when I attended it: despite the exhortations of the Ministry of Education to a school that is more respectful of the uniqueness of everyone, inclusive and not standardized, we still find it rigid, judgmental, deaf and blind to the manifestations of discomfort expressed by many children and young people who attend it.

The document "Cultura scuola persona" published in 2007 by the Ministry of Education, which introduces the National Guidelines for the Curriculum, describes today's society as being marked by continuous changes and uncertainties and recognizes school and education as instruments to bring a new humanism.

This document defines first of all the centrality of people in the educational process: the didactic action must take into account the singularity and complexity of each one in all his/her aspects: "cognitive, affective, relational, physical, aesthetic, ethical, spiritual and religious"<sup>1</sup>.

From the first years of education, it is necessary that the proposed learning

---

<sup>1</sup> "Cultura Scuola Persona. Verso le indicazioni nazionali per la scuola dell'infanzia e per il primo ciclo di istruzione", Ministero dell'Istruzione, Roma, 2007.

paths are in constant relationship with the needs and desires of children and pre-adolescents.

School should be a “welcoming place”, a place in which you feel good.

If we read the data of the survey conducted in Emilia Romagna in 2022, on a sample of 15,023 young people aged 11 to 19 we find out that (Adolescenti in Emilia Romagna, 2022):

- anxiety dominates in the majority of students with 77.4% of them who indicate it as a constant and continuous mood;
- boredom (55.9%), insecurity (48.9%) and sadness (33.3%) are the other feelings perceived by these students when they are at school.

School continues to be a place of discomfort, where the majority of the students lives a constant feeling of anxiety.

As we know from the evidence emerged from neuroscience studies, these feelings of anxiety and anguish certainly do not favour learning, which is instead effective in contexts where the individual is relaxed, feels safe and free to express himself without the fear of making mistakes or being judged negatively. Learning happens even if we don't feel comfortable or if we are afraid of making mistakes, but the emotion that will remain linked to that moment will be an emotion of fear, which suggests our brain to run away.

In recent years the scientific research has focused the attention on the connection between learning and the emotions that accompany it: it has been discovered that notions are fixed in the brain together with emotions and the latter, in turn, concretely affect cognitive processes, such as attention, memory, comprehension. If you learn with joy, you learn more and better. If you are supported and encouraged during learning, you will remember the positive emotion (Vita.it, 2020).

On the contrary, when we learn with fear, anxiety, anguish, an emotional short circuit is generated that hinders learning: the student freezes and is no longer able to learn.

Our brain sends a message of danger related to that situation that would push us not to perpetrate it. The brain will therefore tend to remove everything related to this state of mind, it will try to remove these emotions that don't cause well-being but alertness, including what has been learned.

Guilt and fear are the emotions that underpin our education system: all this keeps children on constant alert and produces an emotional short circuit that hinders the learning process.

Moreover, the state of alertness activates cortisol, the stress hormone: when it increases excessively it can lead to an increase in glycemic values: the result is a lowering of the immune defences and even alterations in the inflammatory response (ibid.).

All these aspects (anxiety and anguish at school, grades, no time for reflection) show that school, as it is organized in this way, is an authoritarian place of discomfort that widely contributes to undermine the foundations for a serene development of students, weakening their autonomy and self-determination, reducing the confidence in their own potential.

It is important now to ask ourselves some questions:

- What is individual well-being and how can we approach this condition in educational settings?
- What model of success and personal fulfilment is presented to young people today and how is it possible to facilitate the integral development of each person with full respect for his or her individuality?
- With respect to these issues, how does critical unschooling position itself?

## **1. UNSCHOOLING AND THE PURSUIT OF INDIVIDUAL WELL-BEING**

For the WHO, psychological, physical and social well-being consists of being able to use one's emotional and cognitive abilities in response to the daily demands of life, in creating and maintaining satisfactory relationships with others, in adapting to situations of internal and external difficulty. Well-being is therefore a concept that goes beyond the presence or absence of physical or mental illness, but involves numerous individual spheres. To achieve this, the individual or group must be able to identify and realize their aspirations, meet their needs, modify or adapt to their environment.

This definition of well-being places great emphasis on the need for everyone to know themselves, to be able to understand what their potential and aspirations are in order to experience a rewarding life. How can we facilitate the process of self-knowledge and one's characteristics from childhood to then be able to create one's own path of personal growth?

Unschooling surely represents a tool for self-determination, self-knowledge and self-building, it supports the development of critical thinking and it is a challenge to the dominant model of personal success and development.

Unschooling is an alternative choice of education but it is at the same time a

lifestyle choice that normally involves the entire family: from the birth of the child, the family is oriented towards an approach based on attachment, respect for the environment and the pursuit of good nutrition with the prevalence of consumption of healthy homemade foods, reorienting the lifestyle towards a more relaxed and sustainable rhythm (Kirschner, 2008).

Families who choose unschooling as an approach to learning do so mainly to leave complete freedom to children to follow their interests and focus on what they want to learn at a given time, allowing them to abandon a topic when interest is captured by another theme. At the heart of unschooling is a deep belief in everyone's innate learning abilities and a deep respect for time and individual learning.

There are no predefined programs or paths to follow, there is no precise order in which topics or theories must be learned, there is no separation among subjects. Learning takes place through experience and daily life, offering the child materials or activities that can support the curiosity he or she manifests about a certain topic or phenomenon. For this reason, unschooling certainly has a democratic connotation with respect to knowledge, parents don't select in an authoritarian manner what is more or less important to learn.

Since unschoolers are not exposed to tests or evaluations typical of the school world, they can decide to deepen a certain topic as long as they wish, not limiting themselves to learn only what is required by the teacher to pass the tests.

This has a positive impact on the quality of learning, which usually follows a spiral trend, it involves different areas of knowledge at the same time and which is more experiential rather than theoretical: from this it emerges that unschooling is the philosophy that comes closest to the natural way of learning of children (Piffero, 2019).

## **2. THE ROLE OF FREE PLAY**

The most important tool of learning for children is free play: the important role of free play in the construction of one's identity and in the development of autonomy has been highlighted by many studies conducted by Peter Gray who has analysed the link between the decline of autonomous activities in children and the corresponding increase in psychological and mental disease in them.

Research on children has shown that parents' support in encouraging autonomous activities in their children is expressed in a greater perception of autonomy, competence and connection with society, therefore greater confidence in one's own abilities (Kirschner, 2008). Unschoolers parents tend

to facilitate self-regulation, self-understanding, and intrinsic motivation in their children because they trust their ability to learn.

Play helps children (a) developing intrinsic interests and competencies; (b) learning how to make decisions, solve problems, exert self-control, and follow rules; (c) learning to regulate their emotions; (d) making friends and learn to get along with others as equals; and (e) experiencing joy. Through all of these effects, play promotes mental health (Gray & Riley, 2015).

### **3. THE BENEFITS OF UNSCHOOLING**

The research conducted by Gray and Riley in 2013, which involved 232 families who chose unschooling, reveals numerous benefits related to this choice that involve children themselves but also the family as a whole: improved learning, better attitudes about learning, and improved psychological and social wellbeing for children; increased closeness, harmony, and freedom for the whole family. 52% of surveyed parents said children were happier, less stressed, more confident, more socially extroverted than they would have been if they had gone to school or been homeschooled. Parents pointed out that their children were used to talk with people of different ages and from different backgrounds and that they had many more opportunities for intergenerational encounters than those who attend school, who spend most of their time in classes made up of the same children of the same age (ibid.).

With regard to the benefits experienced at the family level, 57% of the interviewees remarked on the greater closeness established at the level of family relationships thanks to the choice of unschooling and an improvement in the relationship between siblings (ibid.).

Peter Gray e Gina Riley interviewed 75 adults who were unschooled up to the age of 16 (all or most of the period) and asked them to give their opinion on their experience, their social relationships and the advantages/disadvantages that this experience gave them. Most said the benefits continue into adulthood in the form of Self-Direction and/or Self-Motivation (75%), 48% noted high sense of Responsibility, 44% noted Continued Learning (sometimes expressed as continued interest in learning because of not being burned out by school), and 43% noted Self-Confidence as result of their unschooling. Some of the other advantages frequently mentioned were that unschooling allowed for a smooth transition to adulthood (33%), allowed them to avoid stress associated with school (28%), and gave them more time to spend with family (24%). Many indicated that their experiences as unschoolers gave them an advantage in their

higher education and/or career.

Some of the interviewees declare that unschooling built a foundation for questioning and challenging the mainstream aspects of society. It provided the ability to be confident in not blindly “following the crowd” and being comfortable about being oneself and/or different.

In this free and relaxed environment offered by the family context, the child has time to ask himself his own questions of meaning: who am I and what do I want to become? How may I feel part of the community?

#### **4. UNSCHOOLING AS A CHALLENGE TO THE DOMINANT MODEL OF PERSONAL SUCCESS**

Children who have the opportunity to grow and mature in the family context, children who don't lose the connection with their parents, are supported in the process of individualization and construction of their identity: they are free to express themselves and to respect their identity, they don't need to fit in someone else's standards. On the contrary, children and adolescents who attend school tend to get out from their parents' orbit, they progressively orient themselves towards peers (Neufeld & Maté, 2006). Their main worry is to conform to peers and to be accepted by friends who have the power to influence them until they modify their natural maturation process. Individuality and independence must be protected by parents until the adolescent mature his own capacity to deal with social pressures and to be able not to conform if he doesn't want to, in order to preserve his own inner nature.

The same protection system takes place among animals in nature: every mum protects her babies until she knows they will survive autonomously; they keep the attachment until it is necessary. In our society we have progressively lost this common sense, people progressively lost this capacity to be guided by instinct, in the name of work and productivity: we are pushed to return to work after very few months from the birth of our children and from the very beginning of their lives we start losing the connection with them.

The practice of unschooling is based first and foremost on family time, parents decide to tune into the needs of the family while respecting the children's time to rest, play and learn, in a logic of mutual respect and non-coercion.

The slow pace and the debates that arise spontaneously in the family encourage personal reflection on the problems that affect our society and the search for concrete but also creative and original solutions. In this context, children are encouraged to make their own original contribution to the discussion because

their opinion has the same value as adult's ones. Surely this is an important aspect that helps the child to build his own identity and to have confidence in himself, in his ability to find solutions.

Each person, in his or her diversity, can offer a valuable contribution to society, which does not necessarily have to be economically quantifiable: everyone can live within society by doing what makes him/her feeling good, without following pre-established models in the awareness that he/she is simply worth who he/she is.

## **CONCLUSION**

While contemporary society assumes an increasingly individualistic and competitive connotation, in which emphasis is placed first and foremost on the achievement of economic success at any cost – ignoring the environmental and climatic crisis as well as the psychological problems that affect more and more young people who are left alone, educated by a school system that fails in its main objective of promoting the integral development of the human person -, unschooling represents a critical stance with respect to this decay, a choice that underlines the centrality of the family as a fundamental building block of society, which supports the growth of citizens aware of the problems that affect the world, capable of thinking about creative and new solutions to problems to which today's adults have not yet given answers, people accustomed to think with their own heads in a democratic environment where everyone has the same rights, without prevarication.

For all these reasons, unschooling is definitely a step towards the decolonization of our society.

# CRITICAL UNSCHOOLING: A CONSCIOUS PSYCHOSOCIAL STRATEGY AGAINST THE INFLUENCES OF INDIVIDUALISM AND NEOLIBERALISM AND FOR A MORE COMPASSIONATE SOCIETY

Elena Piffero<sup>a</sup>

<sup>a</sup>L'AIFF – L'Associazione Istruzione in Famiglia Italia

Critical unschooling aims to counteract authoritarian power dynamics in education by promoting self-directed learning, emotional support, and fulfilling relationships. This approach represents a form of psychosocial resistance, raising awareness about alternative educational choices that are often unfamiliar or legally challenged in some countries.

critical unschooling, interpersonal neurobiology, evolutionary psychology, prosocial vs antisocial behaviour, compassionate mind

## INTRODUCTION

Notwithstanding the 2030 Agenda for Sustainable Development, progress in peace, equality, and social justice worldwide remains minimal: our globalized culture, despite its advancements, perpetuates stress, inequality, environmental degradation, and social isolation, leading to preventable diseases and premature deaths. Education is a key agent of societal change, so it is crucial to examine its role. We approach this by integrating evolutionary psychology and interpersonal neurobiology. Evolutionary psychology views human behavior through the lens of survival and reproduction traits, while interpersonal neurobiology explores how our brains and minds are shaped by relationships and epigenetics.

## 1. THE EVOLUTIONARY MISMATCH

For 98% of human history, our ancestors lived as hunter-gatherers in small, mobile groups. These societies emphasized care and sharing over individualism and enforced norms that prevented the accumulation of excessive status or resources (Gilbert, 2020). As upright walking narrowed the birth canal right at the time when the baby's head was evolving to get bigger: vulnerable human infants are born highly under-developed and require long and intense parenting cares – what is often referred to as exo-gestation. As for any other living creature, three fundamental life tasks are essential for humans' survival: detecting and dealing with threats in order to avoid harm; seeking out resources necessary for survival and reproduction; finding opportunities to “rest and digest” and down-regulate threat and drive systems. For these tasks, human infants are dependent on the close proximity of a protective adult, so natural selection supported the development of care-asking and care-providing mechanisms: infants react to the lack of close proximity as a threat, and signal distress through protest/despair strategies; carers are led to respond to infant's cues by providing reassurance, food (frequent breastfeeding also ensure proximity!) and safety, and the satisfaction of these basic needs creates the conditions for resting. Weaker care-asking or care-offering mechanisms translated into a comparative disadvantage in terms of natural selection, leaving the offspring vulnerable to predators. These early experiences mold behavioural patterns, unconscious beliefs, learning styles, and relational dynamics: “emotional rather than intellectual interaction serves as the mind's primary architect” (Greenspan 2006, p. 5). In neurobiological terms, a high degree of responsiveness to children's signals of hunger, discomfort, fear or generic emotional distress shapes the brain's biochemical circuitry through a complex systems of reactions triggered by hormones such as oxytocin and vasopressin and through physiological changes to the autonomic nervous system and frontal cortex (Porges, 2007). The presence of supportive others suppresses threat and stress processing (Music, 2019 for reviews), reduces cortisol and creates the conditions for a healthy activity of the autonomic nervous system, resulting in long-lasting changes in neural pathways: this supports effective emotional regulation throughout adulthood and the ability to engage proactively with developmental tasks, such as investing in emotional, social and intellectual growth (Miller et al. 2010).

With the advent of agriculture around 10,000 years ago, societies shifted from immediate resource sharing to surplus storage, leading to increased competition to control this surplus. The “care and share” ethos got replaced

with “control and hold” behaviors, as elites sought to maintain power through coercion and repression (Gilbert, 2020). Neuroscientific research reveals that our social context shapes our brain function and behavior, with competitive and threatening environments fostering aggressive and selfish traits (McDade et al., 2019): neoliberal individualism, with its focus on competition and success, represents the epitome of these maladaptive traits (Becker et al., 2021). Evolutionary psychologists call this “evolutionary mismatch,” referring to the discrepancy between our current environment and the conditions our ancestors evolved under (Gluckman, 2006).

## **2. LEARNING IN HUNTER-GATHERERS SOCIETIES: OUR BIOLOGICAL NORM**

Reasonable inferences on the way how our ancestors dealt with cultural transmission can be made through the anthropological studies of hunter-gatherers communities. Across continents, their social structure share many of the same features, including their approach to knowledge sharing: typically, young humans acquire the culture they grow in through their self-directed play and exploration and the broadest possible access to adults’ activities. Children seem to be designed this way by natural selection: those who fail to acquire crucial aspects of the society they are living in are disadvantaged in regard to survival and reproduction. Human instincts have more to do with learning that with teaching (Boyette 2018), but the current educational system has at its core the assumption that teaching is the sole method of learning. In this, school is a particularly interesting example of evolutionary mismatch, and in the next sections we examine in detail the reason why.

### **2.1. Empowerment, schooling, and unschooling**

Schooling deprives children of any meaningful agency over their learning process, thus disempowering them: it reinforces a hierarchical teacher-student relationship (the dispenser versus the receiver of knowledge) which goes against our “fiercely egalitarian” evolutionary predisposition (Lee 1988). Children are naturally inclined to learn, but they resist compulsory learning methods that diminish their control: our well-being in fact relies on fulfilling psychological needs for autonomy, competence, and relatedness. “Salient (...) is how the thwarting of autonomy, through either excessive control, conditional regard, or lack of empathy, disrupts development, and especially in vulnerable individuals, leads to dysregulation and ill-being. Indeed, autonomy thwarting plays an important etiological role in many forms of psychopathology” (Ryan and Deci 2016, p. 386).

Critical unschooling combines the respectful and empowering dimension of self-directed learning (which refuses teacher-centred instruction, imposed curricula, assessment measures) with a call to reimagining and transforming the relationships within family and society in a more respectful, consent-based way. In this, unschooling has a conscious and intentional decolonisation focus. The most crucial precondition at the basis of parents' choice to unschool their children is trust in the latter's ability to effectively control their learning process: this means being willing to grant children enough freedom to explore, experiment, try and make mistakes, and being available when assistance and guidance are required. Thus, trust encompasses all three psychological dimensions of self-determination: it encourages autonomy ("you can do it on your own!"), it acknowledges competence ("you have the skills to do it!") and it strengthens relatedness ("I'm here for you if you need me") (Thomas & Pattison 2008; Piffero 2019).

Unschooling parents act as mentors rather than controllers: autonomy-supportive environments enhance intrinsic motivation, thus promoting not only a more enjoyable learning process but also better psychosocial outcomes (Rinner 2022; Ryan & Deci 2016).

## **2.2. "Meritocracy", schooling, and unschooling**

Recently, Italy's Ministry of Education was renamed as Ministry of Education and Merit, thus embodying the neoliberal meritocracy narrative: success is attainable through talent and effort (van Ewijk & Slegers 2010). Critics argue that merit-based achievement can be heavily influenced by initial socio-economic inequalities, yet meritocracy itself is seldom questioned. However, meritocracy in schools creates an environment where academic success reflects personal worth, failure reflects inadequacy, and competitive attitudes are reinforced. Neoliberal meritocracy values skills primarily for economic gain, unlike in hunter-gatherers' societies where skill acquisition was valued for the contribution these can make to society.

Consequently, younger generations report higher levels of socially prescribed perfectionism (Curran and Hill, 2019): this has been positively related to a range of psychological disorders and symptoms of disorders such as social phobia, body dissatisfaction, bulimia nervosa, and suicide ideation, depression and anxiety (Limburg et al., 2017; Hewitt et al. 2017). Evolutionary biology supports this, suggesting that competitive environments trigger survival mechanisms that can become dysfunctional: cooperative behaviors are inhibited and isolation and aggression fostered (Maggi et al. 2022). Ultimately, school's explicit

function of “socializing” children translates into the adoption of practices and strategies typical of the “control and hold” mentality, a social model which has been defined as “toxic” (Mate 2023). Schooling can thus be reasonably argued to have an important role in driving antisocial behaviours.

Critical unschooling removes merit as the main criterion for achievement and by redefining personal fulfillment beyond wealth and status. Self-evaluation and self-endorsement are emphasized over external judgments, while self-improvement is encouraged. This allows children to follow the lead of their curiosity and to find their passions, even when they take them along unusual paths: research on unschooled adults indicates a diverse range of careers which have been defined as “fulfilling” and in line with ones’ aspirations, from STEM jobs to professions in creative arts (Riley & Gray 2015). Preliminary evidence suggests that self-directed learners are less likely to end up in what Graeber has called “bullshit” jobs.

#### **4. SCHOOLING, UNSCHOOLING, PEERS AND UNCONDITIONAL SUPPORT**

Neurosciences and attachment theory suggest that self-directed learning in family settings differs significantly from that in school environments (democratic schools, and free schools).

Animal behavior provides interesting insights here. In order to ensure survival, natural selection has gifted the young of most animal species with an orientation instinct: they will direct their behaviour based on the behaviour of adults. Not on any adult, though: only the adults they attach to. For example, ducklings get immediately imprinted to the first creature they see once hatched. When mother duck is not around, as Conrad Lorenz proved, even a human being can do as an example until mature independence. From this innate behaviour we can draw two conclusions: the orientation instinct is so strong that any orientation void gets fill with the closest available option; and that not all forms of orienting are equally suited to coach a young into adulthood.

When children are separated from their parents for long periods, as happens in schools, their attachment bonds weaken. This leads them to rely more on peers for emotional support, resulting in “peer orientation” (Neufeld & Maté 2014). Unfortunately, acceptance within peer groups depends on conformity, with the exclusion, marginalization, and bullying of those who don’t fit in. Only the family can provide children with the unconditional love and acceptance deeply needed not only as children but as adults too, as it grants us the safety to remain vulnerable and to experience the whole range of our emotions without

threatening the relationships with those closest to us. Not all human parents are equipped to give their children this type of unconditional loving care: more awareness should be encouraged among parents about the dynamics of attachment and the impact of early relational imprint. Even taking this into account, the accusation unschooling parents get at times, i.e. to keep their children too close to them, is completely misplaced as indeed the continuation and evolution of the attachment relationship over time, from the physical dependency of infancy to the emotional and intellectual autonomy and interconnectedness of adulthood, is a necessary condition for successful cultural transmission and for growing into caring, responsible adults.

## **CONCLUSION**

Addressing issues like poverty, disconnection, oppression, inequality, and abuse requires a systemic, psychosocial approach, involving the embedment of people in caring communities. Schools, with their inherent structure and goals, often contribute to these problems rather than solving them.

The possibilities that critical unschooling offers are generally disregarded by mainstream narratives, and in some case explicitly denied (e.g., Germany and Sweden, where it is illegal). In Italy, the requirement for annual school exams can create tension between self-directed learning and school expectations, but it can also create an opportunity for dialogue and growth, encouraging families to navigate social pressures while upholding children's autonomy. Unschooling parents are forced to reflect and de-condition from their own controlling experiences: this helps them reclaim their agency and "decolonize" their selves will provide an invaluable example for their children. Through introspection, parents can develop a "praxis of love/dialogue and action/reflection," foundational for lifelong growth (Maddox 2022).

# BENEFITS OF AN UNSCHOOLING EXPERIENCE AND THE LACK OF UNSCHOOLING CHARACTERS IN THE ENTERTAINMENT MEDIA

Jacopo Silvestre

LAIF L'Associazione Istruzione Familiare

When you become part of a big system often it happens you limit yourself to follow the flow, your mind becomes lazy and you start to only do what other people ask you to do. That's why the school system should be more based on the individuality of his students and that's why my unschooling route helped me to choose my job and deal with it. We are used to think that kids (and adults too) are bored by studying and working, but I think that's totally untrue. Work is a fundamental trait of all the living beings and none of us can find happiness by doing nothing with our lives. We only have to do what we like, obviously there are always many trials and challenges, but if you are truly following your willness you'll find the way to overcome them. Unschooling allowed me to search and find my true passions and turn them into a job. A major problem with unschooling is that most people are unaware of its existence. I realised the almost total lack of unschooled characters in show business. And I want to focus on unschooler characters in history.

Unschooling; work; experience; fiction; entertainment.

The topic I am about to discuss concerns me personally, because from the fourth grade onwards, my parents took charge of my education. I can be defined for all intents and purposes as an Unschooler, since I followed studies that corresponded to my passions and interests, and not to the predetermined school program. Since reaching the age of twenty, I have reached some conclusions about my educational journey that I would now like to present to you. I will start from the beginning.

Very few people in Italy choose to take this path, so it was difficult for me and my parents, at least initially, because we definitely had few examples and methods

of comparison.

Now, having reached the “end” (if we want to call it that) of the path, I realize that I am not better than the other people, but I can say that I have, as much as possible, followed what I like to do, and that really makes me happy. I think people don’t focus enough on the concept of happiness and reason more on the level of performance. I know it could sound trite, but I think feeling happy is for all intents and purposes the most important thing in life, more important than study, career and anything else.

The shocking thing is that most people believe that if a child is not forced to study or work, she or he will never do it, but this is only because we have become accustomed to seeing reality under a tremendously distorted lens. Work and study are fundamental traits of every human being, and all children are naturally inclined to follow them if left free and equipped with the correct tools.

Unschooling is an absolutely valid educational path, and pursuing it will not lead your children to become lazy slackers.

But here we come to the second shocking thing: Actually, most Italians are completely unaware about the existence of such an educational possibility.

Many times I happened to talk about my experience, receiving multitudes of questions and bashful looks, combined with the classic phrase, “But is it legal in Italy?” Both in children and adults, in fact, complete unawareness of alternative methods of education to public schooling continues to persist.

In my opinion, this process is partly due to an almost total lack of practical examples within entertainment works.

In fact, there is a kind of vicious circle that has inevitably led to an establishment of the school as the center of teaching and education for the young characters in the stories we may read in books or see on TV.

Since school represents the educational normality for most people it is decided to continue to represent it as such within the works of entertainment and, by necessity, the status quo ends up remaining unchanged. If there are not enough examples of alternative education within movies, comics, books, or TV series, how will people accept them in their everyday lives? Certainly, characters that can almost be defined as “Unschooler Ante Litteram” have frequently appeared in stories and novels from centuries past. Without, of course, going into Renaissance, medieval or even earlier works, where the entire system of education was based on values and models so foreign to those of today that it would be pointless to set out to compare them.

Let us therefore deal with some novels, now become classics, belonging to the second half of the nineteenth century and the first half of the twentieth century. One of the earliest “Unschooler Ante Litteram” is probably Heidi, from the novel *Heidis Lehr- und Wanderjahre*, written in 1808 by the Swiss writer Johanna Spyri. Here Heidi is a perfect example of Unschooling: it is about a poor orphan who is left by her aunt Dete to the care of her paternal grandfather, who lives in a remote cabin in the Alps. Here Heidi learns the things that really interest her: how to care for goats and stay in touch with nature. However, for example, Heidi can neither read nor write, as these two activities are of no interest or use to her. This, however, runs counter to the educational conceptions of the time, so much so that Aunt Dete comes back for her, takes her to Frankfurt and forces her to follow a strict “good child” education. Heidi, however, finds herself so badly off in this condition that she is able to convince her aunt to take her back to the mountains to her grandfather.

This character certainly teaches us the importance of nature and not to reason from prejudice, as most people do toward Heidi’s grandfather. But another great lesson she brings is that: we are all different, and what may work for some individuals, may not work for others.

The truth is that Heidi is fine in the mountains. And if the mountains make her happy, there is no need for her to learn writing or counting just because other children do that. These activities will not help her stay on the mountain so, since the mountain is her goal of personal fulfillment, there is no point in pursuing them.

Another “Unschooler Ante Litteram” is Pippi Longstocking (Pippi Långstrump), based on Swedish writer Astrid Lindgren’s novel of the same name, written in 1945.

However, this character differs greatly from Heidi. Pippi is in fact a very bizarre character, belonging to a decidedly more comic and absurd novel, in stark contrast to the blunt realism of Heidi. The problem with these kinds of characters is that they offer, yes, a window into an alternative way of life, but often this way of life is closely linked to their utter strangeness. Her belonging to the category of the “out the norm ones” makes Pippi interesting to study, to admire, but only for illustrative purposes, not as an objective example of everyday life. These characters come across as the so-called: exceptions to the rule, Pippi is in fact contrasted with Tommy and Annika who, being the good children that they are, go to school.

The most paradoxical thing is that these characters are often taken as examples

of positive nonconformity by the school teachers themselves, the same ones who later disavow these behaviors in real life.

One has to wait years before overtly homeschooler or unschooler characters appear in works of fiction.

One of the earliest examples is certainly Mina, a female character who appears in the novel *Skellig*, written in nineteen ninety-eight by British writer David Almond.

Mina is the neighbor of Michael, the novel's protagonist, and is referred to as a homeschooler, despite being for all intents and purposes an unschooler. In fact, Mina doesn't go to school, her mother is in charge of her education, and she is a big fan of sculpture and birds. She does not study with a specific program or regimen, but follows her interests and passions.

David Almond liked Mina so much that the writer decided to dedicate an entire novel to her, written in the form of the girl's personal diary: *It is My Name is Mina*, published in two thousand and ten.

And Mina for me is a character of colossal importance. In fact, a reading of *Skellig* and *My Name is Mina* was one of the cathartic elements that inspired my mother to suggest that I quit school. In short; it is possible that if Mina had never been born from Almond's pen, I would never have become an unschooler. That is why it is crucial that such characters appear in works of fiction; we cannot just talk about them within essays and analyses.

One last character I would like to focus on is the even more recent and popular: Steven Universe.

Steven Universe is the protagonist of a hit animated series of the same name published in America by Cartoon Network, the first episode was released in two thousand and thirteen, and is written and directed by director Rebecca Sugar. Steven is an unschooler, born from the love of a human and an alien, he was raised in the little town of Beach City by his mother's alien companions after she died to give him life. Steven is an extremely profound character, especially considering the animated series' target audience of twelve to fifteen year-old boys. The theme of unschooling is treated gently but firmly. Steven sometimes suffers from this being different, and that is normal. When we embark on a path different from everyone else, it is normal to feel lost and scared sometimes.

But so Steven, and so all of us, has the strength to treasure his diversity and accept himself as different and unquantifiable. And that is what makes him a magnificent character within the mainstream entertainment media landscape. In short, at this time when there is a lot of talk about inclusiveness and

discrimination, let us not forget that there can be completely different life paths from one another. But let us take note of this, without feeling envy, jealousy or insecurity.

And let's make sure that there are more and more different characters for young people to take inspiration from.

# CRITICAL UNSCHOOLING FOR A DEMOCRATIC IDEA OF CHILDHOOD AND ADOLESCENCE

Nunzia Vezzola

Carlo Leali

LAIF – L'Associazione Istruzione Familiare

Anthropologically, the idea of childhood and adolescence is culturally conditioned. There are many reasons why we can speak of a hierarchical, undemocratic idea of childhood and adolescence in contemporary Western culture. In particular the mainstream idea of childhood and adolescence is based on the dominance of adults, on compartmentalisation, control, prohibition, imposition, rewards-punishment dynamics, age-based separation and discrimination, marginalisation and exclusion of “minors” from decision-making and responsibility. Compulsory education is not only part of this mainstream idea of childhood (segregation in classes, authoritarian and taxonomical setting); it’s also organised in a way to steady it and to guarantee it for the future generations. This perception of childhood and adolescence can impossibly provide social justice or democracy. But this idea of childhood and adolescence is not the only possible one. More democratic ideas are possible. For example, critical unschooling is rooted in a more inclusive, respectful and democratic perception of childhood and adolescence. It requires a parental awareness based, among other things, on human rights education. While providing informal, self-directed and community-based, not-structured education, critical unschooling can weaken adult hegemony and power towards children and adolescents. This contribution aims to show the benefits of critical unschooling for a more democratic society.

critical unschooling ; childhood; adolescence; democracy

## INTRODUCTION

According to cultural anthropology, self-depiction of human beings depends on social adaptation, that is on the solution(s) each culture and society has found for some problems, such as:

- primary needs (food, clothing and shelter)
- social organization
- environmental issues (climate, migration, war, agricultural and economical suitability, endemic diseases)

In the same way the idea we have of childhood and adolescence is strictly linked to these cultural solutions.

So in ancient farmer societies teens were expected to perform all duties grown-ups had to exercise. The concept of adolescence did not exist.

The contemporary notion of adolescence was “invented” by Granville Stanley Hall, the first president of the American Psychological Association. It is surely not a coincidence that this invention emerged in the USA between the late 19th and the beginning of the 20th century, at a time when the social changes caused by the spread of enrolments in public high schools were increasing at a much faster pace than population (Kett, 2003). In this way the responsibilities connected to the teenage years were consequently postponed. So teens began to have time to undergo their personal psychological conflicts.

Adolescence became a field of study only after the late 1950s.

Having the need to put adults at work outside the family context, industrial and post-industrial societies must provide a good childcare system. That’s one of the most impacting reasons why there are crèches, nurseries, kindergartens and compulsory schools, where babies, children and teens must learn and experience what they nowadays could learn and experience anywhere else.

So, the real reason for school is the economical need to free parents in order to let them produce and perform.

There is no evidence that kindergartens and schools are necessary to get a good education. History, Geography, Science, Maths, Music, Arts, Philosophy, Languages, etc. are indeed subjects that anyone can learn anywhere and at any time, also thanks to new technologies, libraries, museums and thanks to the opportunity to travel. The experience of friendship and relationship to other young people doesn’t need school classes to be gained: any other place can provide it.

## **1. CHILDHOOD AND ADOLESCENCE IN TODAY'S WESTERN SOCIETIES**

### **1.1. Age-based separation, segregation and discrimination**

Separation is a keystone of our social system: children are separated from their families (not rarely already during the earliest childhood), they are sent to crèche, to kindergarten or to school. At school or kindergarten siblings are also separated from each other, depending on their age. Babies, children and teens spend their days in very limited places, where they are also separated from the world and their community or village. They are expected to stay there at least as long as their parents stay at work. If not, they must provide justification. There is a sort of (moral) obligation to stay at kindergarten/school every day and all day long except for the weekends. That's why we can talk of age-based segregation.

Children and teens are expected to listen to adults, but have not the right to be listened to. They are expected to learn the way they'll live and what they'll become. But they don't have the right to choose, organise and schedule their learning activities or processes. They are expected to learn what they are taught and the way their teachers choose for them.

Depending on their age, babies, children and teens are allowed (or not) to do certain things, like for example being part of school boards and committees where decisions about their education and their school life are made. In Italy they can only partake in them from the age of 14, that is in upper secondary school.

In Italian schools they generally can't move alone from one room to another inside the school building until the age of 19: they must be with a teacher or an adult or have their permission. They can't leave the school building without their parents or teachers. Fortunately in other Western countries it's more informal.

Most West-European and South-American languages (such as Italian, French, Spanish, German, Portuguese for example) prescribe a different translation for "you" if you talk to a child or a teen than if you talk to an adult. They also prescribe a different way to say hello or good-bye depending on age (or friendship). As a language is the expression of a culture and of a Weltanschauung (world view), it would be interesting to understand if this use might be also considered the expression of an implicit cultural and psychological age-based discrimination.

### **1.2. Undemocratic and colonialist perspective: control, prohibition, imposition, punishment-rewards dynamics and authoritarianism**

In Italy children and teens before 18 can't begin to work and aren't able to build

up their independence from their original family.

In today's Western society, a child or an adolescent is a "minor" or "non-aged", not mature enough to legally engage in an activity or to exercise some sort of rights independently. In everyday life they are often seen as inferior to adults.

They must be taught, educated and shown what is right and what is wrong.

This view is the same colonists have about colonised people, when they believe the latter must be civilised.

Children and teens are seen as immature, unpredictable, capricious, unreliable and irresponsible "minors", incapable of making important decisions. Furthermore, adolescence is often seen as the age of mood disruptions, conflicts with parents and risky behaviour.

As a consequence, adult's attitude is based on a lack of trust. All this, together with separation and discrimination, necessarily leads to external control, prohibition and imposition, to punishment-reward dynamics.

### **1.3. Adult hegemony and the role of mass education**

There is a dominant age and a dominated one, where people dream of becoming dominant. That's the reason why people rarely speak to children in the same gentle way, in the same tone, with the same flattering words, the same voice and volume they do with their principal.

This idea of childhood and adolescence is functional to neoliberalism: children must be quiet and don't make any troubles until they've grown up and become consumers and perhaps also producers.

Lack of democracy combined with discrimination and segregation, with external control, prohibition, imposition and authoritarianism are the same dynamics of colonisation and apartheid.

School has always been a main tool of imperialism, colonialism, dictatorship and other kinds of authoritarian government.

Obedience, segregation, authoritarianism, control, prohibition, imposition, punishment-reward dynamics are the "values" mass education is based on. School provides formal learning while encouraging learning by heart, plagiarism and conformism. At the same time it trains for efficiency and it rewards success. Compulsory education is adult-centred because it's organised in a way to respond to adult's necessities.

While providing standardised learning and tests, school encourages homogenisation and conformism, repetition of items instead of critical thinking.

At school the child/adolescent is treated as a passive executor of predetermined activities.

Crèches, kindergartens and schools effectively “form” young minds, in order to create the habit of adult power and obedience and to train them for the future.

So school is not only the peak of the expression of adult power. It’s also a way to steady it and guarantee this status quo for future generations.

## **2. BEYOND SCHOOLING AND THE MAINSTREAM IDEA OF CHILDHOOD AND ADOLESCENCE**

The above-mentioned idea of childhood/adolescence has obvious weak points: it divides and trains to obedience, but not to human rights; it is based on suspicion more than on trust; it develops competition, but not cooperation; it teaches to accept prohibition, control and authoritarianism and doesn’t build up responsibility and decision making. In this way it can’t provide social justice or democracy neither for present, nor for future generations.

There are other ways to provide education, also in Western contemporary societies, such as democratic schools, like Sudbury Valley School, for example.

Most of these approaches must generally gain ground outside compulsory schooling, like for example unschooling, which is a part of homeschooling.

### **2.1 Unschooling**

Unschooling is a learner-centred approach to education, where children, teens and young adults are free to learn in an informal or non-formal way, in symbiosis with their learning style and in relationship to their parents and family, in their learning and living context: unschoolers are not taught, they are free to learn in an experience-based way.

This approach is a self-learning, context-related practice: no teachers are required in this kind of self-directed and autonomous learning. Each child can build his/her own learning path depending on his/her interests, characteristics and learning style; each child has the leading role in his/her learning process (learner-led practice). This helps children and teens to learn soon to do things and make decisions without the direct help of adults, albeit help is offered when requested.

Children build their own knowledge and confidence through trial and error, since that way they are trusted to find their personal way around things that work and things that don’t.

As unschooling is related to the living context, it allows to strengthen intergenerational relationships within and outside the family.

Unschooling is able to reinvent knowledge, learning, parenting and intergenerational relationships, all at the same time.

There are different modulations of unschooling, such as radical unschooling, project-based unschooling, worldschooling and critical unschooling.

## **2.2. Critical unschooling**

Critical unschooling is a type of unschooling in which the fundamental role of education for social justice is combined with a democratic idea of childhood and adolescence.

Social justice is the fair distribution of opportunities, rights and treatment. Among its pillars there are participation, human rights, diversity and equity. That's why parents who choose critical unschooling usually value dialogue, negotiation, trust, participation in decision-making, the respect of growing and learning times and individual characteristics of their children; they don't mind standardisation or conformism.

Children and teens have an active, participative role in their families/groups; they make decisions and take responsibility for themselves and their learning process. This equalitarian and democratic view implies that they are considered capable of leading their own self-learning process, too.

Parents choosing critical unschooling want to achieve democratic education. So age-based segregation and discrimination are banned: young people can spend most of their time with their family, if they wish.

These parents' approach is consent-based and democratic: all family members are equally treated, consent building and cooperation are main goals. Authoritarianism is also generally excluded: a continuous negotiation with the particular living context takes place. External regulation is extremely reduced because parents generally rely on children's responsibility and self control: the familiar dynamics are built up on trust and relaxed relationships, which is a way to empower young people.

As dialogue is a keystone of democracy, children and teens are free to speak when they wish to, about any subjects, and experience that they are listened to. They are free to take part in adults' conversations and/or activities and be involved in important decisions. The education to negotiation and compromise, to cooperation among peers, as well as to intergenerational collaboration (with parents and other adults), are main aims and a common daily practice. In this

way young people can experience participative processes and get into the habit of them. That's why for many parents the goal is not the end point of education (graduation) but the process itself.

Therefore, instead of formal, adult-centred education (typical for schooling), critical unschooling de-constructs knowledge and learning. Knowledge doesn't need to be divided in subjects (taxonomical setting), nor organised in classes or degrees (age-based segregation): it's experience-based, transversal through subjects and age-independent.

Critical unschooling is often related to attachment parenting and provides strong intergenerational relationships instead of age-based separation. It considers them capable of leading their own learning process instead of obliging them to uncritical obedience and instead of putting them into a class where they are only allowed to follow their teachers' decisions.

Critical unschooling is based on reliance, empathy, negotiation, compromise, dialogue, absence of judgement, respect of growing times and individual characteristics, instead of external control, prohibition, imposition and rewards-punishment dynamics.

In this way, critical Unschooling can concretely contribute to social justice and democracy.

### **3. CONCLUSION**

Critical unschooling is an educational opportunity for social innovation, for more democracy and social justice in everyday life. It is an opportunity for integration of young people in everyday life, as well as for reducing the reiteration of the taxonomical, prescriptive, past-oriented educational system which aims to steady the status quo.

As a challenge for the continuity of this authoritarian/undemocratic society, critical unschooling provides effective, social, and cultural learning and a democratic view of childhood and youth.

Critical unschooling is a way to make education independent from imperialism, colonisation, authoritarianism and market laws.

The parental awareness critical unschooling requires can sustain the democratisation of childhood and adolescence: human rights education happens through the experience and daily respect of them.

If unschooling is able to reinvent intergenerational relationships, critical unschooling can make them more respectful and consent-based and provide an

inner social transformation in the idea of childhood and adolescence in order to reproduce and boost cooperation, negotiation, trust and equality.

# AGAINST SCHOOL STIGMATIZATION: SUCCESSES, CONFLICTS AND MAIN CHALLENGES OF THE EDUCATIONAL COMMUNITY OF THE PISACANE SCHOOL

Adriano Cancellieri<sup>a</sup>

Fabrizia Cannella<sup>b</sup>

<sup>a</sup>Università degli Studi Milano-Bicocca; <sup>b</sup>Università Iuav di Venezia

This article examines the efforts of the Pisacane School in the Tor Pignatara neighborhood of Rome to combat school segregation through the creation of a self-organized educational community of practice. In a context marked by stigmatisation and the flight of families without migratory background, the community – including teachers, parents and NGOs – developed innovative educational practices and collaborative spaces. These initiatives transformed the school into a place of pedagogic innovation and inclusion, fostering links with the surrounding neighbourhood. Over a decade, these efforts increased the school's attractiveness, reversing declining enrolment and inspiring similar initiatives elsewhere in Italy. However, challenges remain, including tensions with local authorities, internal conflicts over the balance of power between stakeholders, and limited engagement from migrant families. In addition, the success of these inclusion efforts has led to the risk of school gentrification, potentially marginalising the very migrant community the school sought to serve. The Pisacane school provides an important case study of localised responses to segregation, highlighting the potential and limitations of community-led efforts to address systemic educational inequalities. It highlights the need for wider institutional learning and national policy support to understand and sustain these transformative practices.

school segregation; community of practice; learning spaces; educational community; school gentrification

## INTRODUCTION

It has now emerged from various studies (Cognetti, 2012; Pacchi and Ranci, 2017) that schools are becoming the mirror of extremely dangerous processes of social segregation. In neighbourhoods with a higher concentration of immigrants, for fear of a lower quality of learning and educational offerings, the phenomenon of *Italian flight* is becoming more widespread, i.e. the enrolment of the children of a growing number of Italian families, even far from their own homes, in schools with a lower percentage of pupils of immigrant origin. While this phenomenon reflects a strong sensitivity to the presence of migrants, it is the perverse result of the way in which in Italy school autonomy (and the abolition of catchment areas) has been implemented, which has led to growing competition between institutions. This education market which has been allowed to operate essentially without any regulation is producing serious selection processes on a national and social basis. The result is that, paradoxically, while the neighbourhoods of Italian cities “generally continue to have a relatively mixed social composition and there are few areas where there are real phenomena of concentration of residents of foreign origin, it is precisely the formation of schools that highlights a much more radical segregation dynamic” (Cognetti, 2012, p. 135).

In this article, we have decided to analyse the case study of the Pisacane school, which represents a very significant experience of school segregation and desegregation. In a context marked by stigmatisation and the flight of families without migratory background, the community – including teachers, parents and NGOs – developed innovative educational practices and collaborative spaces. These initiatives transformed the school into a place of pedagogic innovation and inclusion, fostering links with the surrounding neighbourhood. By analysing the networks of actors and groups involved, through qualitative interviews and by actively participating in meetings, co-design activities and public events, we set out to identify successes, conflicts and main challenges of this community of practice.

### 1. THE CASE STUDY: THE PISACANE SCHOOL IN TOR PIGNATTARA NEIGHBOURHOOD IN ROME

The Pisacane school is located in the Marranella area of Torpignattara, an eastern suburb of Rome that has struggled with a negative reputation since the 1970s, long before significant immigration began. Since the second half of the 1990s, this area has gradually become one of the most ethnically connoted

areas of the neighbourhood, characterised by a predominant Bangladeshi presence, to the extent that it is also referred to by the toponym *Banglatown* (Broccolini, 2010). At the same time, the Pisacane school has seen an increase in the proportion of pupils of foreign origin. As the percentage of pupils with a migrant background increased, the school was subjected to waves of moral panic and was labelled *the school of foreigners*. There was a massive exodus of families without a migrant background, which contributed to a much more radical increase in the presence of pupils without Italian citizenship. As a result, in the 2010-2011 academic year, a striking 97% of new enrolments at the Pisacane school were children with a migrant background. This statistic is particularly remarkable given that, at that period, only around 20% of the residents of the Tor Pignattara neighbourhood had foreign citizenship.

As a teacher interviewed in those years pointed out (Vereni, 2018, 75-76):

What should seem problematic about the Pisacane school is not the presence of foreigners, that is absolutely obvious, since they all live around here, so it is normal that they come here. What should make the news is that instead the Italians left, the Italians actually said at one point: “We’re not going to this school, we’d rather take the car every morning”.

This case of very strong residential segregation of pupils of immigrant origin has made it a focal point in the national debate, fuelled by right-wing politicians who have used the school’s demographics as an argument for implementing the 2010 Gelmini Circular, an Italian legislation which tried to set a ceiling of 30% for foreign<sup>1</sup> students in each class.

In response to this increasing marginalisation and stigmatisation of the school, a self-organised process of emancipation began in Pisacane in 2012. An ongoing path who have been as protagonists some headmasters, many active teachers, a parents’ association and several NGOs. A community of practice aimed to innovate educational practices, but also to create welcoming spaces that integrate local neighbourhoods into the school environment.

## **2. A SELF-ORGANIZED COMMUNITY OF PRACTICE**

The emancipatory path of the Pisacane School has been triggered mainly by the arrival of a new headteacher with a Montessori background (Annarita Marino).

---

<sup>1</sup> In Italy, citizenship legislation, which is largely based on the principle of *ius sanguinis* (right of blood), has significant implications for children of migrant origin. Despite being born or raised in Italy, a significant proportion of these children are considered foreigners under the law.

The starting point was to the idea to use the school premises as a lever for change and to open the school to the neighbourhood.

The headmistress says that when she arrived in Pisacane school for the first time, she found a building that was structurally closed, introverted and not very welcoming:

The first day I entered the school I can't forget: I go in, I cross the hall and I see this long corridor, all the doors closed, you couldn't see a picture of a child hanging on the wall... in short, there was no sign of a kindergarten! So I go back and I say: "Sorry you sent me to the offices, but I'm looking for the school!" and she says: "No madam, go that's the school".

The first fundamental moment in the history of Pisacane, therefore, was to open the doors of the different classrooms in order to create more opportunities for communication and connection, between students and between classes, and, in general, to immediately convey a message of openness and exchange; the second step was to open the doors of the school to local NGOs involved in social and intercultural activities, in order to extend this commitment to exchange beyond the school walls, where educational activity is traditionally confined.

When Pisacane was attacked in the media as a 'problematic school with too many foreigners', this process was still in its infancy. After this symbolic attack, these initiatives and the first alliances between teachers increased significantly, and the contribution of parents to these activities also became more and more important. A key moment was the creation of the Pisacane Parents' Association 0-11 (now 0-99), which led to the formalisation and accentuation of the active and proactive role that some parents were beginning to play. This association will soon be given a room on the ground floor of the school, which will be the headquarters of its activities in the area for years to come. This space, thanks to its permeability to the street, and therefore the possibility of being visible in the neighbourhood, became the perfect place to host the organisational meetings between parents and teachers and those of the local inhabitants' committee (Tor Pignattara Neighbourhood Committee) and a lot of afternoon activities (such as music or Arabic courses). Many of these extra-curricular activities will then be incorporated into the formal curriculum of the school. In 2016, these activities were joined by the end of year event called *Taste the word*, organised in the school premises but open to the whole neighbourhood. As defined by one of the mothers of the Pisacane Parents' Association:

The meaning of this festival is to open the school to the neighbourhood and to let them into the school, because the neighbourhood (...) has no squares, there is only Largo Pelestrello, which is not very welcoming, it has no cultural spaces and we have always thought that the school could compensate for these deficiencies by making its courtyard a meeting place and with its activities a cultural reference point.

### **3. INTERNAL DIALECTICS AND THREE CHALLENGES**

The self-organised community of practice of the Pisacane school is certainly an experience of great interest, also because over the years it has become an instrument of high-level pedagogical action and research on diversity/mobility/migration and has fostered the creation of important local and national networks, such as the Roman network of open and participatory schools. However, we must avoid idealising this path: the Pisacane community of practice is in fact a situated and contextual field with many internal dialectics and challenges to face.

The first point to analyse is their great difficulty to dialogue and collaborate with local authorities (e.g. City Hall, Municipality). This is mainly due to a lack of territorial vision on the part of the municipality, which rarely seems interested in supporting the processes taking place at the Pisacane school. One of the main dialectics within the Pisacane School's community of practice is just related to the nature of the relationship with local institutions: some take a more oppositional stance and promote self-organisation and avoid having particular relationships with local municipality; while others call for more public intervention, e.g. to maintain certain areas of the school. This dialectic has always been present in the school and has entailed a continuous and tiring oscillation. More recently, a participatory process has been launched to create a 'Community Education Pact' between schools, NGOs and the Municipality of Rome to strengthen the network between schools and with some municipal services. A new path, not without its issues.

A second relevant challenge is related to the so-called educational monopoly of the school. In fact, the community of practice includes activist teachers who are used to sharing power and educational responsibility with NGOs and parents, as well as teachers who believe in the educational monopoly of the school and are afraid of external interference. This second group of teachers considers confrontation with parents and NGO's useful, but who insist on the absolute predominance of the educational role of the school and, in particular, of the teacher component. This position is well summed up, for example, by the words of this Pisacane teacher:

The parents' association was stimulating until it became too intrusive (...) the association can help me with many things, but it cannot get involved in didactics, it cannot get involved in the real dynamics of the school.

A third challenge is the involvement of families of migrant origin. Attempts in this direction have always been considerable. For example, in order to involve foreign parents more closely, the community of practice decided from the outset to open an Italian school for women within the school. In time, this initiative led to the creation of the Intercultural Centre for Women *Miguelim*, which still exists today and is coordinated by one of the most active NGOs in the school (Asinitas onlus). Some parents of Bangladeshi origin became first class representatives, then mediators involved in many projects. In general, however, the contribution of foreign families to this community of practice is still extremely underrepresented, so that it can be said that the transition of migrants from the role of beneficiaries to that of promoters is slow. This is also due to the fact that the need for pedagogical innovation is not a priority for many families who face daily economic, social and cultural challenges, as many families of migrant origin do.

#### **4. FROM SCHOOL SEGREGATION TO THE RISK OF SCHOOL GENTRIFICATION?**

In ten years, the number of pupils enrolled in the school has increased considerably and it has become attractive again for many Italian families, so much so that a secondary school has been opened. Thus, despite the many internal dialectics analysed above, we can say that it has been a very successful course. At the same time, however, a new and not easy challenge is looming on the horizon. Indeed, the aura of a more open and inclusive school has been created around the school and this has attracted the interest of Italian young and creative families (e.g. designers, architects, artists) who are now increasingly settling in the neighbourhood; on the contrary, the migrant component is decreasing sharply. So we are beginning to talk about the risk of a passage from school segregation to school gentrification (Pearman and Swain, 2017). This new challenge makes the story of the Pisacane School both more problematic and more interesting.

This experience mirrors that of many other similar emancipatory paths in marginalised Italian contexts. Fragmented and too isolated stories that finally need to be properly understood and supported as great opportunities for institutional learning.

# THE DISCIPLINARY NOTES AND THE SHAPING OF STUDENT SUBJECTIVITIES

Caterina Donattini<sup>a</sup>

<sup>a</sup>La Sapienza University

The disciplinary note fits within the school routine of the professional technical institutes as a recurrent practice. Apparently functional to the regulation of behaviors that place themselves in implicit or explicit conflict with the educational institution, the note assumes within the circular teacher-student-institution relationship a different, transversal and a more profound meaning. Disciplinary notes in fact document the practices by which schoolwork is distorted, sabotaged, and made fundamentally ineffective (Caroselli 2022); the exercise of pedagogical authority as power (Goffman 1967); the definition of subjectivities according to precise behavioral codes that define normativity. Based on the analysis of a data set of approximately 5,000 disciplinary notes issued within a professional technical institute of Bologna from 2021 to 2023, the study aims to investigate and classify this material with the purpose of identifying and illustrating the processes of defining subjectivities within the school environment on the one hand, and the nature of conflicts and their recursiveness on the other.

school discipline, disciplinary note.

## INTRODUCTION

This study explores the intimacy of the school administration with two aims: to identify the processes through which subjectivities and roles are defined and to analyze the nature of relationships and conflicts within the school environment. The research is carried out by combining the structuralist and constructivist Bourdieusian tradition, which focuses on mechanisms of social and cultural reproduction, with an interpretive approach (Mehan, 1996). The disciplinary notes considered in this study were collected within a professional technical institute located in the metropolitan area of Bologna over the course of a two-year period (21/22 and 22/23). The institute has a student population of about

1400 students, the 20% of them are enrolled in the vocational. The school is marked by a high incidence of students with migrant backgrounds (over 32%), students who failed previous grades (33%), and students with special educational needs (19%). The presence of students with these vulnerabilities is markedly more evident in vocational classes where pupils with migrant backgrounds make up 55-58 %, students who failed in one or more grades are the 62 %, and students with special educational needs are more than 31%. These data remain stable during the two school years that are taken into consideration.

### **1. THE DISCIPLINARY NOTE AS A RECURRENT PRACTICE<sup>1</sup>**

884 out of 1471 students received at least one disciplinary note in s.y. 21/22, accounting for 60% of the student population. At vocational, the incidence of notes is significantly higher, with 75 percent of students receiving at least one note and 56 percent at technical. The following year 780 students received at least one disciplinary note, accounting for the 55% of the institute's student population. At vocational, the incidence of disciplinary notes remains significantly higher (the 76% of students gets at least one note while at the technical the 50%). In the year 21/22 the school issued 3647 disciplinary notes, in 22/23 2369. The School Principal has changed from year to year, the disciplinary policies and the institute rules accordingly. Equally the critical phase of pandemic management has ended in 2022, that had an impact on the decrease of the notes issued<sup>2</sup>. This research therefore takes its cue from the suggestions provided by more than 5,000 short texts. This total includes three types of notes: individual, collective and class notes. Individual notes are those issued to a single student, collective notes pertain to a group of students within the same class, and class notes were assigned to all the students who result present in class when an infraction occurred. 173 out of 197 faculty members, thus 87% of the faculty, administered at least one note in s.y. 21/22, 154 out of

---

<sup>1</sup> Bourdieu & Passeron (1972) use the acronym AP to refer to pedagogical action, defining it as: "symbolic violence insofar as it is the imposition, by an arbitrary power, of an arbitrary cultural order," which logically implies that "every power of symbolic violence—i.e., any power that succeeds in imposing meanings as legitimate while concealing the power relations on which its strength is based—adds its own force, that is, a specifically symbolic force, to these power relations." Symbolic violence involves a process of "incarnation of norms and cultural models and the formation of a habitus coherent with the institutional framework" (Pitzalis, 2012).

<sup>2</sup> During the Pandemic special disciplinary regulations were passed in each school, according to National Guidelines, to counteract the spread of the virus. New rules involved limitation to freedom of movement, to corporal expression, to natural behaviors like eating or drinking. These measures had a strong impact on students' life and on disciplinary records accordingly.

200, thus 77% of the faculty, administered at least one note in the following s.y.. The phenomenon of the disciplinary note thus constitutes a recurrent practice therefore a foundational experience of the school condition in this school.

## 2. WHAT A NOTE IS ABOUT

### 2.1. Public and formal acts

Notes are public acts since, while remaining “private,” they are addressed to multiple recipients; they are formal acts because in their linguistic modes of expression, construction and purpose they are inspired by codes proper to institutional and bureaucratic communication, aimed at certifying rather than describing, recording rather than expressing.

### 2.2. Explicit and implicit purposes

The primary purpose of the note is to sanction the student<sup>3</sup>; the secondary function is to produce an official version of reality<sup>4</sup>, thus certifying an action<sup>5</sup> or its denial, a behavior, attitude, intention or situation by fixing it in time.

However, notes also have implicit purposes: the teacher resorts to the note to restore his or her pedagogical authority (Thin, 2002); or he/she entrusts the note, like a diary page, with the description of a difficulty, the revelation of a judgment or hope. This element comes into contradiction with the nature of the public act, which is supposed to constitute itself as formal, certifying an objectivity, without indulging in anything subjective.

## 3. TEACHER LANGUAGE

The notes are constructed from linguistic codes borrowed from the bureaucratic language of the formal act, connoted by what Calvino defined as *antilanguage* which “emerges whenever a speaker uses his means of expression “in an impersonal and mechanical manner” (Calvino, 1965) thus using a language that De Mauro defines as *scholastic language*<sup>6</sup>: “the exaggeratedly precious and courtly expressive choices that have their humus in the school world”. The

---

<sup>3</sup> For the purpose of “rehabilitation,” the change in the nature of the self (Goffman, 1968). The educational function of disciplinary sanctions is emphasized by school regulations. This purpose justifies the sanction not as a punitive act, but in its rehabilitative function, from a behaviorist perspective. It would be necessary to empirically demonstrate whether this assumption is valid; however, current literature systematically shows the opposite.

<sup>4</sup> One of the tasks of “those who have institutional authority with a position that allows them to give an imprimatur to specific versions of reality” (Goffman, 1998).

<sup>5</sup> “One thing is to consider the problem a crisis, and another is to consider it a diagnosis, because the diagnosis is an object, while the crisis is a subjectivity” (Basaglia, 1968).

<sup>6</sup> “Scolastichese” in Italian.

student is *learner*, the lighter *device*, the flip-flops *footwear*, the teacher is a *scribe*, or *teaching figure*, speaking is *eloquence*, vulgarities are *profanity*, note is a *measure*, fight is *scuffle*, responsibilities are *charges*, to continue is to *persist/reiterate/persever*, corridors are *transit areas*, the school is the *plexus*, and so on.

It is about the “professorial use of a professorial language” which, according to Bourdieu, (1972) constitutes “the last protection of the teacher (...) the distance created by words” apt to reinforce the fundamental distinction between oppressed and oppressors (Tsfau, 2020).

#### **4. TEACHER GAZE**

While professorial language coldly reifies and certifies the subject and his or her actions from afar, with the distance of words, the teacher’s gaze occasionally breaks into the text and lands on the subject with personal comments and judgments, drawing him or her close and covering him or her with the veil of his or her own descriptions and externalizations thereby betraying the implicit purposes of the note, which are essentially ego-referential (it is about reestablishing one’s authority and/or sublimating thoughts and frustrations in writing). These comments in the sidelines of the objective descriptions of the behaviors that gave rise to the note:

- Betray or declare the vulnerability, the thoughts, the judgments, of teachers;
- Freeze in the delivery of a categorical and definitive glance, thus in a diagnosis, labelling, the students’ subjectivities: notes like Polaroids that snapshot them in fragments of “inappropriate” actions, gestures, attitudes within the school context.

The note, marked by the finality of written words, replaces the dialogue: a process marked by the mutability of the subjects involved, who mutually influence each other in their responses, in an attempt to understand each other, mediating with the other.

#### **5. STUDENT BEHAVIORS**

Inappropriate is the adjective most frequently associated with reported behaviors. However other definitions also recur, some examples:

Unhygienic. Bad, uncivilized and unsuitable. Totally uncivilized and unacceptable for any human and social environment. Beastly. Totally unsuitable.

Improper. Inconsistent. Undisciplined. Very polemical and defiant. Hostile. Increasingly improper and unfit. Rude. Completely disrespectful. Recidivist. Rude.

Many actions fall within the orbit of what, in the school context, thus in the teachers' gaze, turns out to be inadequate. In fact, many habitual actions (such as eating, drinking, going to the bathroom, chatting, putting a jacket in a schoolbag, sleeping, being distracted, or reading a comic book) cannot be considered inadequate in themselves, but within the institution they become so. In both s.y. the majority of notes recur for infractions that concern not dangerous or universally incorrect actions for the purposes of a peaceful coexistence, but inadequate behavior. Looking at the data from s.y. 22/23 for example, it is observed that in 53% of the notes, recur infractions such as:

- going to the bathroom/asking to go to the bathroom;
- using a cell phone;
- sleeping;
- talking, laughing, joking;
- distracting oneself;
- eating or drinking;
- unauthorized movement in the classroom;
- leaving the classroom without permission.

When counting tardiness and absences as well, the 62% of the disciplinary notes involves this kind of infractions. These data confirm other similar quantitative studies<sup>7</sup> and tell us that infractions related to actions that endanger the safety of people recur in a minority of the notes. In particular, possession of weapons, drugs or alcohol recurs in 0.2 percent of them. Acts of violence recur in 1.4 percent of the notes. Infractions related to acts of aggression, anger, threats (indirect violence) recur in 2.4% of the notes.

Inadequacy returns thus as a recurring and dominant data signifying students' actions recorded in disciplinary measures. This is to be understood as the condition of a subject who is not yet sufficiently schooled: thus unable to remain motionless, dumb and concentrated for long periods of time, unable to submit to pedagogical authority in the hope of gaining benefit from it, unable to delegate to the latter the control of his autonomies for a defined number of hours each day.

---

<sup>7</sup> See in the references: Apa Report, 2008; Morrison & Skiba, 2001; Chin et al. 2012; Caton, 2012; Heitzeg, 2014.

He chatters profusely. He loudly exclaims his own state of mind. He opens a discussion with his desk neighbors about his dog, which seems to come from Caserta. He communicates from a distance. He secretly eats a snack. Exits the classroom saying he is cold. He reads something else. Keeps laughing wandering. Spinning. Packs paper balls. He shows total disinterest. He twirls his hat in the air as if juggling.

Given the premises of the school condition, these actions are to be interpreted as recurrent practices through which “schoolwork is distorted, sabotaged, rendered fundamentally ineffective” (Caroselli, 2022); “geographies of freedom” (Vienne, 2008) insinuated into the interstices of the day.

## 6. INADEQUATE SUBJECTS

In the first pages of *Discipline and Punish: the birth of the prison*, Michel Foucault explains that the “political investment of the body” is about the dynamics through which power relations “in a subtly calculated, organized, technically directed way” (Foucault, 1975) exercise a “political technology of the body” (Ibidem), which in a capillary way exercise a specific subjection of the body, aimed at making it productive. The disciplinary notes are the effect and the instrument of the orthopedics of an adolescent soul that still escapes the subjugation of bodies. The wide range of resistance techniques that through the bodies, the subjectivities of students act to oppose the microphysics of school power. The revelation of bodies emerges in the notes as a disturbing invasion of an animal collective body, wildness that disrupts, escapes and destroys control, irrationality that is both negation and antithesis of schoolwork. A collective class body, a black body, a migrant body, looming and disruptive sexuality, smell, wetness, movement, noise, unmanageable dirt/color emancipating itself. The student:

Produced shouting animal noises several times. Spits. Emits air noisily and continuously from the stomach. Makes a loud, prolonged noise of air pouring out of the mouth. He burps noisily. Emits high-pitched sounds, emits immoderate and extremely harassing screams. Blews raspberries. Poses as if to “evacuate”.

The texts of the disciplinary notes thus document the structuring of colonial-like spaces and imaginaries where adolescents are depicted as *inadequate* by the fearful and disdainful gaze of those who mark the distance between culture and nature and in so doing define an inferior humanity, closer to the state of nature and therefore dangerous, unmanageable. On the other hand, however, as in “a

(class) self-fulfilling prophecy (...) the boys personify and accentuate ways of being that are antithetical to the docility demanded by the institution. Certainly, through an unconscious mechanism, they ‘decide’ to incorporate the nightmare” (Caroselli, 2022). They thus realize, as effectively written by Valerio Marchi (1994a, 2004) an “unconscious hymn to their own state of inferiority and inadequacy” whereby boys end up aligning themselves with those same stereotypes that always want them to be “too uncivilized, too rough, to become ruling class”.

# BEYOND DEFICIT THINKING: FROM EPISTEMIC SUBJUGATION TO THE DECOLONISATION OF THOUGHT AND KNOWLEDGE IN THE CLASSROOM

Paola Dusi<sup>a</sup>

Università degli studi di Verona<sup>a</sup>

Students whose strengths differ from those valued by the curriculum and societal norms are often assessed based on perceived deficiencies according to the education system's standards, rendering their knowledge invisible. This dynamic is shaped by deficit thinking, which dominates Western school systems. This paper examines the hypothesis that the "coloniality of knowledge" (Quijano, 1992) has fostered conditions that support the persistence of deficit thinking in education. It asks: To what extent is deficit thinking linked to the coloniality of knowledge as a power structure? Through a literature review, the study argues that rationalist scientific absolutism remains the epistemological foundation of education and teacher training in Western countries. The knowledge promoted reflects a privileged (white) perspective, marginalizing 'othered' subjects and their epistemological traditions, relegating them to peripheral positions in educational spaces.

Western school systems; coloniality of power; deficit thinking theory; epistemic decolonization.

## INTRODUCTION

According to coloniality theory in the European project of world domination, a central role was given to the domination of subjectivities, culture, and knowledge. Expanding on the theories of decolonial thinkers (Quijano, 1992; Dussel, 2000; Mignolo & Walsh, 2018), "epistemologies of the South" (Santos, 2014), and perspectivism (Viveiros de Castro, 2017), this contribution offers a theoretical explanation for the academic challenges faced by non-dominant students (i.e., people of color, with migrant backgrounds), in Western school system.

Students whose strengths differ from those valued by the curriculum and society are often assessed in terms of their perceived deficiencies relative to the education system's established standards (Levinson, 2011). This perspective is further shaped by a dominant discourse that portrays these students – particularly those with migrant backgrounds from the “Global South” – as lacking the ability to learn, attributing this to supposed deficiencies in motivation and language skills (Beach et al., 2019; Santagati & Bertozzi, 2023). In fact, the difficulties they encounter within the school system are often attributed to them and their families (Olivos, 2006; Bishop, 2008; Yosso, 2005), as theorized by deficit thinking (Shields et al., 2005; Valdés, 1996).

I hypothesize that the “coloniality of knowledge” (Quijano, 1992) provided fertile ground for the development and spread of deficit thinking theory in the education system (Dusi, 2023). So, a question arose: *is there a connection between the deficit thinking approach to education and the ‘coloniality of knowledge’ structure of power?* To address this question, I adopted a theoretical approach grounded in a traditional literature review<sup>1</sup> (Pope, Mays & Popay, 2007). While this type of review has its limitations, it offers the potential to generate new insights and conceptual frameworks. Within this context, it facilitated the development of an explanatory theory aimed at understanding the persistence of deficit thinking in Western school systems, where “other” students and, more importantly, their knowledge are often neither acknowledged nor valued.

## 1. DEFICIT THINKING MINDSET

Deficit thinking (DF) has been discussed using various labels, including deficit assumptions, deficit discourse, deficit framing/framework, as well as deficit ideology, deficit model, deficit paradigm, and deficit theory. Some authors have used these terms interchangeably to describe an approach that views “different” students as less intelligent or less competent (Pica-Smith & Veloria, 2012), while others reference deficit theory without clearly defining its meaning

---

<sup>1</sup> In addition to reading the works of some of the main authors in decolonial theory, such as Mignolo, Walsh, Maldonado-Torres, de Sousa Santos, Kilomba, and Chicana feminist critical thought by Anzaldúa, as well as the perspectivist theory of anthropologist Viveiros de Castro, the fundamental works of Fanon and Césaire were examined, with some incursions into authors from critical race theory, such as Ladson Billings, D. Solórzano, and T. Yosso. The books of some Afro-descendant Italian writers, such as Scego, Hakuzwimana, Efionayi, Ben Mohamed, Djarah Kan, and Osei, were analyzed to determine whether their texts contained passages and reflections that traced the presence of deficit thinking in their school experiences.

(Sharma, 2018). DF focuses on unfavorable conditions, environmental challenges, and racial disparities that define oppressed populations as “deficient”, reflecting broader systemic oppression disguised by ideologies like meritocracy and color-blindness (Patton Davis & Museus, 2019). It is an implicit, pervasive mindset within social systems, policies, educational institutions, culture, and language, shaping cognitive structures and worldviews. DF ignores the role of domination structures that create what Gloria Ladson-Billings (2006) calls the educational debt, focusing instead on individual and cultural “deficiencies.” It perpetuates power dynamics that marginalize the “other,” fostering lower expectations for students from minority groups and undermining their confidence, leading to disengagement.

## **2. EPISTEMIC SUBJUGATION**

According to the hypothesis presented here, DF is closely linked to the abyssal thinking produced by the coloniality of knowledge, which constitutes the epistemic foundation of school curricula and teacher education. The domination of culture, subjective experience, and knowledge was a key part of the European project of global domination. The “non-white” other, along with their subjectivity and knowledge, was studied, categorized, and presented to the white world through “scholarly” research – an instrument of colonization practices (Denzin & Lincoln, 2008) – and deemed less civilized. This theory shines a light on the absolutism of Western rationalism, which casts positivist science as the sole, valid knowledge form for distinguishing “true” from “false”. Rationalist scientific absolutism remains the epistemological foundation of schooling, education, and teacher training. As a result, the knowledge offered in schools reflects a privileged and dismissive perspective towards “other” subjects and their epistemologies, relegating them to a marginal position within educational spaces. The Other, within dominant socio-cultural assumptions about intelligence, language, abilities, and knowledge, is “invented” (following Toni Morrison) as inferior, uncivilized, and lacking. This often happens unconsciously, reinforcing the divide between “us” and the Other. The analysis of the texts reveals how authors identify the perception of the Other as inferior as central to the continued subjugation of minorities. Western anthropology has been preoccupied with finding a criterion to distinguish between “us” and everything that is not us. White anthropologists, fascinated by the concept of the “savage” mind, claimed that Indigenous people possessed “primitive” intellects and were, therefore, “deficient” (Viveiros de Castro, 2017). As Anzaldúa notes, this extended to the belief that “we cannot think in the higher

mode of consciousness-rationality” (2012, p. 59). Western domination has colonized the imagination of the Other and the ways of producing knowledge, establishing a hierarchical relationship with other epistemic universes and their inhabitants, who are not recognized as rational subjects. Even today, Gloria Ladson-Billings identifies “the constant questioning of our intellect” (AERA, 2024) as one of the challenges to confront. According to this scholar of *Critical Race Theory* (CRT), students in Western school systems are oppressed by the Euro-American regime of truth (2000). Referring to the Foucauldian concept, she highlights the central role of epistemology, understood both as an expression of a specific worldview and as a system of knowledge. The domination of ways of knowing, producing knowledge, and assigning meaning was central to the colonization of the world, achieved through the subjugation of subjectivities, knowledge, and cultures. This process dismisses the epistemic capacity of certain groups (Maldonado-Torres, 2004).

Colonization, as a total social fact, tends to destroy the cultural life of the colonized people through a process of cultural obliteration and uprooting. “The loss of the past,” as Simone Weil emphasizes, coincides with “the fall into colonial servitude” (2021, p. 53), which serves to appropriate the imagination of the subjugated people through the imposition of a super-ideology. The *coloniality of power and knowledge* takes the form of *the coloniality of being* (the Self): the violation of the meaning of otherness to the point where the alter-ego becomes a sub-alter. The epistemic difference becomes one with the ontological difference.

### **3. THE DECOLONISATION OF THOUGHT AND KNOWLEDGE IN THE CLASSROOM.**

The school system was originally designed to promote education. However, schools are not merely educational spaces; they are cultural and socio-political arenas. They often replicate the ideas and practices of the dominant social group (Apple, 1993), imposing norms that reinforce existing hierarchies. As a result, students frequently report discovering their differences – and the subtractive, deficit-based value attributed to them – only upon entering scholastic environments (Dusi, 2017). “Among the Whites at school”<sup>2</sup> (Hakuzwimana, 2024), these students (and their knowledge) become invisible

---

<sup>2</sup> *Among the Whites at School* (2024) is the title of a volume dedicated to the Italian school system by the writer E. Hakuzwimana, in which the invisibility of generations of students, their roots, their rights, and their future prospects is emphasized. The title plays on the similarity between the Italian words *banchi* (the desks where students sit) and *bianchi*, used to refer to the white population.

(Ellison, 2014; Anzaldúa, 2012).

The school system has always struggled to recognize us. It doesn't do it on purpose; it's simply accustomed to leaving the most disadvantaged behind. (Hakuzwimana, 2024, p. 70)

The Decolonisation of Thought and Knowledge in the Classroom starts with recognizing the dignity and value of the Other. Alongside this ethical recognition, it also addresses the cognitive-theoretical dimension, understood as a set of knowledges. Western episteme exists within a discourse that has excluded the Other, as Anzaldúa wrote, affirming that what is considered theory is often off-limits to non-Western thought. She insisted on the need to claim the space for theorizing and not allow only whites to occupy it. With her, we can say: "If we have been gagged and disempowered by theories, we can also be loosened and empowered by theories" (1990, p. xxvi). So, by introducing alternative approaches and methodologies, we can transform *the* "theorizing space" of our school. The challenge is greater: we must distance ourselves from our own epistemic approach, which shapes our thinking. We need to move beyond it and embrace other paradigms and perspectives through which we can think, reflect, feel, and live (Walsh, 2017), without denying our own way of thinking.

This process requires a theoretical praxis that goes beyond merely changing content (as Mignolo suggests with de-occidentalization), involving a shift in the entire framework. It's about 'inventing' new rules for conversation, including the principles and assumptions behind the creation, transformation, and dissemination of knowledge. Decoloniality, as an umbrella term, is one option in the struggle to free ourselves from the negative aspects of modernity, but it is not a discipline to be taught or added to the curriculum. Instead, it is a perspective that demands a shift in viewpoint. To break free from the epistemological (and ontological) confines imposed by the coloniality of knowledge, the suggested path is one of epistemic disobedience and epistemological reconstruction. The decolonial vision presents a project of delinking (Mignolo 2007; 2018), which involves conceptual and epistemic decolonization, grounded in boundary thinking. For those of us shaped by colonial thought, an epistemic shift is necessary (Bateson 1984), one that enables us to recognize the multiplicity of epistemic orders that have been overlooked until now. This means creating a school that allows space for other perspectives, which have been oppressed or overlooked, beginning with the linguistic dimension. In doing so, we open the possibility of initiating a true dialogue with diverse epistemological traditions, fostering exchange between

different ways of thinking and naming reality. To become capable of seeing all our students and all the worlds they already inhabit.

# BECOMING A “SPACE DEFECTOR” OR WHEN INEQUALITIES MEET SOCIAL JUSTICE IN ARCHITECTURAL EDUCATION. THE CASE OF THE NANTES SCHOOL OF ARCHITECTURE

Bettina Horsch<sup>a</sup>

Pauline Ouvrard<sup>b</sup>

<sup>ab</sup>Nantes Université, ENSA Nantes, École Centrale Nantes, CNRS, AAU-CRENAU, UMR 1563

This survey of architecture graduates of Nantes School of Architecture (ENSA Nantes) from 2015 to 2018 offers an analysis of their career paths, from access to studies to professional integration, in the light of their social origins. In fact, the recruitment process for architecture schools favors the admission of students from middle and upper socio-professional categories, who seem to benefit from a combination of cultural, economic and social capital, compared to the minority of underprivileged students admitted. Once these students have successfully entered the school, what strategies do they implement to succeed? To help us understand what happens before, during and after studies in terms of reproduction and distinction, we looked at the figure of the “defector”, as a way of exploring what individuals and institutions “can” do to counter determinism. The analysis of their educational trajectories shows that these defectors are able to compensate for their socio-cultural gaps by multiplying their professional experience during their studies and by being coopted by teachers. Lastly, although the defectors succeed in finding employment in the short term, they nevertheless find themselves in a position of reproducing the canonical practice of architecture in the form of salaried employment, taking on few responsibilities.

## INTRODUCTION

This study follows on from a doctoral thesis on the professional socialisation of architecture students and graduates at ENSA Nantes (Horsch, 2021). While that

study focused on graduates from 2011 to 2014, this new survey, conducted among graduates from 2015 to 2018, analyses their professional integration in the light of their social origins. The way schools of architecture are recruiting students favours the admission from mainly middle and upper socio-professional categories<sup>1</sup> (SPC). Their overall capital (cultural, economic and social) seems to give them an advantage over the minority of working-class students admitted, as well as for admission to the schools as for professional integration. Thus, the quantitative analysis shows that the social inequalities taking place at admission seem to be replayed at professional integration. The system favours young architects from the so-called ‘privileged’ classes even though the school seemed to have ‘compensated’ for these inequalities in terms of academic performance of the various social categories surveyed<sup>2</sup>.

What can schools of architecture do to prevent the reproduction of these inequalities, which seem to be at stake both at admission and graduation? Is social determinism so powerful that everything is played in advance? Can schools compensate for inequalities or do they even contribute to reproduce them? What levers can be used by the institution, by those who teach and those who study to counter determinism?

To understand what happens ‘outside’ and ‘inside’ school in terms of reproduction and distinction, we looked at the figure of the ‘defector’, in order to explore what individuals and institutions ‘can’ do to counter determinism. The trajectories of the defectors are to a large extent made possible by the school as an instrument of training in knowledge and know-how specific to architects (compensation for cultural capital) and more particularly by the fact that the school offers spaces for socialisation in the worlds of architecture (compensation for social capital). This contributes to the distinction of these defectors in relation to their social group of origin. In this way, the trajectories of the defectors provide us with information about the way in which specific forms of socialisation help to counter determinism, such as the network built on the school benches or interactions with teachers or architects during internships in architectural firms.

In addition, the trajectories of graduates from so-called ‘advantaged’ categories

---

<sup>1</sup> Indeed, the rate of students whose fathers belong to the higher socio-professional categories enrolled at ENSA Nantes in 2016 (50%) is thirty points higher than the national average (20%) (Horsch, 2021, p. 148).

<sup>2</sup> In this respect, see parallel research on the acquisition of a specific spatial capital enabling an understanding of space and its translation into architectural and urban planning projects, a capital greatly valued by the institution (Horsch and Ouvrard, 2023).

who perceive their professional integration as difficult document the way in which the institution may have displaced them. It has led them to adopt various more or less innovative and committed practices that may explain the perceived difficulty of professional integration. We temporarily refer to them as ‘downgraded’ graduates. We have identified four figures: the ‘semi career changers’, the ‘career changers’, the ‘pioneers’ and the ‘dispassionate pragmatists’. Those figures will help us to understand how these profiles of young graduates may contribute to shifting the boundaries and to renewing the practice of architecture. However, the figures presented here should not be taken to imply that they represent a majority of graduates, since most of them work as salaried architects in architectural firms.

Our methodology is based on the analysis of 122 semi-structured interviews with graduates from the classes of 2015 to 2018, conducted in March 2021 as part of the ‘Worlds of Architecture’ course<sup>3</sup>. Those interviewed had graduated three to six years earlier. A questionnaire on geographical, educational and social origins, and their way to employment completes the survey<sup>4</sup>.

The analysis of the questionnaires, by crossing the social origins of the graduates and their perception of their professional integration, shows that social inequalities are replayed during professional integration. It may be an evidence of a ‘glass ceiling’ encountered by students from working-class backgrounds (section 1). We will then briefly present the four ‘downgraded’ profiles: graduates whose two parents belong to the favoured social classes and who perceive their integration as ‘difficult’ or ‘fairly difficult’. We shall see that the apparent difficulty of professional integration may, for some, conceal realities that enable them to establish more favourable working conditions in the longer term (section 2). At last, we will analyse the trajectories *outside* the quantitative results mentioned above: the graduates whose two parents come from disadvantaged backgrounds and who perceive their integration as ‘easy’ or ‘fairly easy’. We shall see how these defectors manage to compensate for their socio-cultural gaps (section 3). The different trajectories will be represented graphically: a time scale and the various key moments on the x-axis; their social background, the perception of their professional integration and their

---

<sup>3</sup> This course, co-coordinated by the authors, offers the opportunity to gain an insight into the positions and practices of architects through a collective survey of architects’ careers taken out by 3rd year bachelor’s degree students.

<sup>4</sup> Unlike the questionnaire used for the survey of previous years, mentioned above, a supplementary question has been added on a scale of perception of professional integration (easy, fairly easy, neither easy nor difficult, fairly difficult to difficult).

architectural practice, whether innovative or by reproduction, on the y-axis.

## 1. WHEN INEQUALITIES ARE REPLAYED DURING PROFESSIONAL INTEGRATION

Few qualitative and quantitative surveys have been carried out to gain a better understanding of the career paths of architecture graduates and the conditions of their professional integration. In a qualitative survey carried out by Olivier Chadoin (1996), the author identified ‘ideal career paths’: the ‘traditional’ path of the male heir, with a good knowledge of the field and moving into independent practice as a *maître d’œuvre*; the ‘heterodox path of necessary diversification’, reserved for women and men with little social capital and little knowledge of the field, obliging them to diversify through additional training.

The quantitative surveys carried out each year by the Department of Culture’s Observatory of Education and Professional Integration provide information on the proportion of graduates working in the field of architecture, urban planning and built heritage<sup>5</sup>. Although the SPC of the head of the family is included in the information collected by the questionnaire sent to young graduates, it is not included in the summaries published by the Department. However, based on raw data compiled by the Department, it is possible to conclude that graduates from parents of higher social categories are more likely to succeed in completing their studies than those from working-class families<sup>6</sup>.

Previous work based on the graduates from 2011 to 2014 (Horsch, 2021, p. 469) had shown that graduates from upper classes are more geographically mobile than other social groups. They find their first job both through the labour market, of which they have mastered the codes of access, and through the relationships they have been able to forge with professionals they met during their graduate studies. They seek to reinforce their legitimacy on the labour market through specialised training and accreditation<sup>7</sup>. The vast majority of graduates from working class families are quickly integrated into the field. They focus on accreditation, but relatively few go on to specialisation courses, often offered in Parisian schools or universities, where they settle less than graduates from the

---

<sup>5</sup> L’insertion professionnelle des jeunes diplômés en architecture – Enquête sur les diplômés de l’enseignement supérieur Culture (DESC). These surveys are published on the Intranet of the Department of Culture.

<sup>6</sup> We compared the distribution of the SPC of the heads of household of first year students from 2006 to 2012 with those of graduates from 2012 to 2018 (Horsch, 2021, table 210, appendix 7).

<sup>7</sup> The French architects’ accreditation, *Habilitation à la Maîtrise d’œuvre en son Nom Propre* (HMONP), is a 6th year course which can be done as an apprenticeship or based on validation of prior experience. It enables graduates to bear the title of architect and to work as an independent professional, subject to registration with the French Architects’ Association.

favoured categories. On the basis of these quantitative data, we concluded that the transition to working life was egalitarian, although many biases could blur these outcomes and research should be continued by adopting a qualitative approach.

The present survey shows clearly that inequalities are replayed when it comes to the perception of the ease or difficulty of entering the labour market, introduced to the questionnaire submitted to the classes of 2015 to 2018. In fact, while 30% of the surveyed graduates perceive their professional integration as difficult or fairly difficult, 38% of them have a working class background and 25% a favoured background (difference of 13 points). Conversely, half (51%) of the surveyed felt that they had found it easy or fairly easy to enter the labour market, although upper class graduates (63%) are much more concerned than working class graduates (40%, difference of 23 points).

Tab. 1. Difficulty/ease of professional integration perceived by graduates surveyed, according to the father's socio-professional category (%)

Socio-professional category of the father	Upper (B)	Middle	Lower (A)	Total	Difference (A-B)
Difficult, fairly difficult	25	30	38	30	+13
Neither difficult, nor easy	13	35	23	19	+10
Easy, fairly easy	63	36	40	51	-23
Total	100	100	100	100	
Number	64	17	40	121	

The differences are fairly similar for perceptions based on the mother's SPC. Working class graduates are 8 points less likely to perceive their integration as difficult or fairly difficult, and 20 points less likely to perceive it as easy or fairly easy. Graduates whose mothers belong to the middle class are the least likely to perceive their integration as difficult or fairly difficult and the most likely to perceive it as easy or fairly easy compared with other socio-professional classes. Indeed, we have shown that a great part of graduates have a father and/or mother who are secondary school teachers with a high level of cultural capital (Horsch, 2021, p. 211).

Tab. 2. Difficulty/ease of professional integration perceived by graduates surveyed, according to the mother's socio-professional category (%)

Socio-professional category of the mother	Upper (B)	Middle	Lower (A)	At home	Total	Difference (A-B)
Difficult, fairly difficult	32	19	40	33	30	+8
Neither difficult, nor easy	13	24	25	0	19	+12
Easy, fairly easy	55	56	35	67	51	-20
Total	100	100	100	100	100	
Number	38	41	32	9	120	

We should also emphasise the role of mothers in the specific cultural socialisation of children (Octobre, 2011). It requires to consider the instruction and socio-professional categories of the mothers in the same way as those of the fathers.

We should keep in mind that the assessing of the difficulty or ease of professional integration is a *perception*. It is based on the comparison of the graduates with their peers or with the social expectations that obtaining a degree in architecture implies. It would need to be objectivised by more protruding elements (salary and contractual conditions, opportunities for advancement, satisfaction with the position held, responsibilities, etc.). The trend is clear, however, and questions the role and resources available to the institution to counter these determinisms and support all students more equitably in their professional integration.

## 2. GRADUATES FROM PRIVILEGED BACKGROUNDS: DOWNGRADED OR PIONEERS?

As mentioned above, we propose to summarise the key characteristics of the different figures of graduates from the privileged classes, before taking a closer look at the 'defector' in the final chapter.

Among graduates from privileged backgrounds who perceive their integration as difficult or fairly difficult, the 'semi career changers' are the most numerous. Those graduates have turned away from the canonical practice of architecture and are moving towards salaried positions in other segments of the architectural worlds. They soon develop an interest in fields other than architectural project management, particularly urban

planning. This interest is aroused or reinforced by social sciences courses during their architectural studies. The semi career changers describe them as triggering an awareness of other possible career paths. The post-study period is marked by vacillation and a professional quest. The respondents became temporarily involved in associations, travelled or pursued other activities. Some try their hand in architectural firms or as freelance, but don't see themselves working there in the long term. Semi career changers end up enrolling in further training in a field that they appreciated at school and in which they feel they have a greater future. They see this as a 'necessary step'. They therefore apply for an additional diploma in various specialisations or advanced courses, often in the Paris region, at different stages in their career: either directly after initial training, or one or two years later. These courses are often organised on an apprenticeship basis or conclude with an internship, which of most lead to a first job, also in Paris or the Paris region.

The majority of 'career changers' come from working or intermediate classes. Here, we are considering the minority of career changers from the favoured categories who perceived their professional integration as 'difficult' or 'fairly difficult'. These are quite special cases, rather unclassifiable, and would merit analysis using a larger number of individuals. On completion of their architectural studies, some go straight on to training in a completely different sector without having attempted to work in an architectural firm. These may be graduates who wish to pursue a long-standing or nascent passion, or a vocation that has been thwarted by family pressure or self-censorship (Negroni, 2007). Other graduates retrain after a few years of professional experience. The abandonment of architectural practice is triggered by one or more bad experiences, difficult working conditions or a loss of meaning in daily practice. It is following the example of graduates of the *Grandes écoles* of management, studied by Le Gros (2020). Many retrained graduates carry the knowledge acquired during their architectural studies with them into their subsequent professional lives. What they learn in architecture school is seen as an education, not just for their future professional life, but as a solid foundation for life itself, a new relationship with the world. In hindsight, the training would ultimately be seen as an apprenticeship in overcoming difficulties. Its core activity, planning, can be applied more broadly to all life projects.

The 'dispassionate-pragmatists' build their career path without any real strategy, out of opportunity or even avoidance. They are not passionate about their studies. Their commitment to courses and internships is partial: their

student involvement is minimal and they have little experience prior to professional integration. The compulsory internship gives them the impression that there is a significant gap between what is taught at school and what they describe as the 'reality of the job' in the architectural firm. They are apprehensive about joining the workforce, and even deliberately delay it. The job search is proving difficult because these graduates have not built up a professional network. However, they do end up finding a job in an architectural firm and may accumulate a number of precarious working contracts. They feel inadequately prepared, may enjoy the work, but they are not passionate about it. In the end, it's 'just another job' that they don't necessarily plan to do for the rest of their lives. They don't follow up on current architectural events and clearly want to keep their professional and personal lives separate. Since they see themselves more as employees, they don't feel it's necessary to obtain the accreditation.

The 'pioneers' have built their careers by experimenting, both inside and outside the school. They claim a social approach of architecture in which the well-being of humans is a major concern. They turn their backs on salaried practice in architectural firms and wish to extend and apply the practices they identified during their studies as being more congruent with their convictions. They have started out working on renovation and furniture projects, as well as on small-scale community work for disadvantaged groups that do not require them to be registered with the professional association. Those practices can lead to a form of precariousness, since this commitment is often voluntary and makes them perceive professional integration as 'difficult'. This entry into the profession gives young practitioners a long-term symbolic capital: they are noticed by the professional authorities, published in specialist journals, invited to give lectures, and even to join the teaching profession. However, they are quickly confronted with the regulatory framework that governs the profession. Practising under their own name and gaining access to certain commissions requires them to abide by the rules imposed by the profession. They eventually obtain their accreditation and establish a form of multi-positionality (Chadoin, 2007; Ouvrard, 2023), evolving between several positions: self-employed or associate, community work, and teaching.

### **3. THE DEFACTORS: WHEN INEQUALITIES ARE NOT REPLAYED**

We will analyse now the trajectories that stand *outside* of the quantitative results presented above: those of graduates whose two parents come from

disadvantaged backgrounds and who perceive their integration as 'easy' or 'fairly easy'. As proof, no time elapsed between graduation and their first paid job for the majority of them.

A large majority have taken up the challenge of professional integration well before graduation. Some of them have adopted strategies, early during their studies, to increase the number of internships. Some express the need to discover 'the reality of the profession'. Others are afraid of not finding work at the end of their studies, either because of the repercussions of the economic crisis of the 2010s, or because of a lack of confidence in their abilities to be an architect. As they are obliged to earn money to finance their studies, they soon replace a 'student job' with a work placement in an architectural firm. For students from modest backgrounds, meeting professionals is a way of compensating for their socio-cultural differences and lack of network, as described by this graduate from an immigrant background:

Well, the first thing I said to myself was that I don't come from a family with architects, so I didn't know any architects, well I only knew one and that was is, and I knew that I wasn't necessarily in the best position to get a first job, and I was really aware of that, because I could see that other friends had many contacts and that things were going really well for them. And I realised this especially for my first year internship, because I really struggled to find the internship, really really struggled, until finally I had a contact and that's how I got my placement.

In the Master's programme, while some students opt for a semester-long internship, others choose to work on an apprenticeship basis, spending one or two days a week in a firm and three or four days at school. These work experiences are often described as 'a trigger', where practical experience in a firm supplements studies at school to give students a glimpse of their future profession:

Well, I was aware of it (...) that's what I said to myself, I had to... I had to get a move on before I finished my studies. Basically, my objective was to have some experience in my bag when I finish school so that I can find a job more easily and also because I was under more pressure to find a job straight after school, I just couldn't afford not to work after graduation because I didn't have any money, I was living with my parents and I didn't want to end up living with them [laughs], so that was motivating.

Those graduates have in common that they found their first job through their internships and work placements, some in the firms they worked for as

students, others through co-optation by a school teacher who also a manager of an architectural firm. 'It's all a question of networking', says one of the graduates interviewed. However, this way of finding employment is not unique to graduates from modest backgrounds. As we have shown, 23% of graduates from 2011 to 2014, across all socio-professional categories, were able to find their first job through internships and 14% through co-optation (Horsch, 2021, p. 423):

I did another part-time internship with (name of the firm), so we became quite close (...), so in that last year [of studying] architecture I spent a few months with them, I got my diploma and they took me on straight away, so I stayed with them for a few months.

At the time of the interview, the vast majority of the defectors were on permanent contracts with architectural firms – most of them in Nantes – and were carrying out the 'classic' tasks of project management: architectural design, technical drawing, construction supervision. Thus, they reproduce as employees the canonical activities of architects that some of their (project) teachers have set up as a model. It is striking that these graduates all work in firms with a certain regional or even national reputation, who have won various architectural prizes and are regularly published in specialist journals. But the responsibilities borne by young professionals in these renowned firms seem rather limited. One graduate admits to 'going round in circles', while another says she has very little design autonomy.

Our bosses, really, they're the ones who reserve themselves the design and... the architectural vision of the firm, it's them. And we're not going to copy their drawings either, but we're going to follow them, we're going to work very closely with them. And they're the ones who'll give us the guidelines, well... the main concepts, the main lines, we'll, it's almost never me or more experienced colleagues. Designing on our own... it's very, very rare.

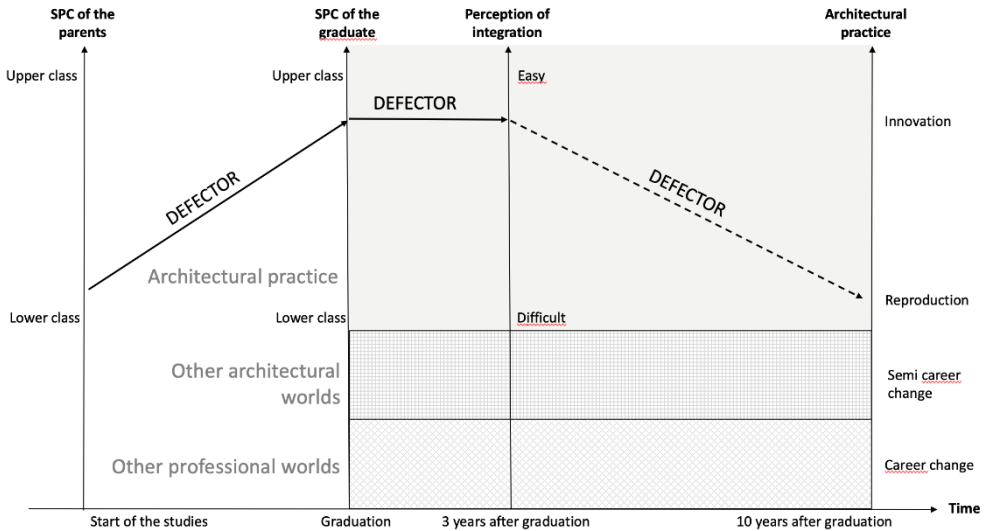

At this stage, none of the graduates had taken any specialised training – unlike graduates from higher social categories. Some have obtained their accreditation, which they see as the end point of their architectural training. But they do not have any concrete plans to set up their own firm: 'I wanted it to be over, I wanted school to be over'; others wanted to 'get rid of it'. At the time of the interview, none of the defectors were registered

architects<sup>8</sup>. Their professional projection seems rather ambiguous, even contradictory, as if they were torn between a relatively comfortable salaried employment and the ideal of a self-employed architect or partner, like many of their project teachers at school.

Virtually all of them have a positive relationship with their studies:

With hindsight, (...) studying is really about opening your mind and learning about architecture, and in fact all the stuff that's a bit boring, much more down-to-earth professional stuff, well, you learn it later in the firm and it works out really well.

Fig. 1. Trajectory scheme of the defectors.

<sup>8</sup> One of the graduates registered with the professional association at the beginning of 2022 (i.e. seven years after obtaining her diploma and three years after her accreditation) and is practising under her own name. However, she works in a relatively unglamorous segment: interior design and individual homes.

Fig. 2. Trajectory schemes of all figures.

## DISCUSSION

The notion of ‘downgrading’ that we introduced to describe the careers of graduates from advantaged socio-professional backgrounds who perceived their integration as ‘difficult’ needs to be weighed, as it conceals several realities. For the semi career changers, it reflects a search for professional interest in which the traditional practice of architecture is not seen as fulfilling. However, they build their career on the foundations of their initial training, while capitalising on additional specialist training that ultimately leads to a smooth transition into working life. Pioneers aspire to defend the social values and public utility of architecture by questioning the neoliberal aspects of canonical practice. Their perceived difficulties stem from their refusal to submit to the professional rules established by the profession and their choice to experiment with other ways of doing architecture. Not just anyone can be a career changer or a pioneer. The capital acquired before and during their initial training enables the former to capitalise on complementary training and the latter to act as pioneers of new practices and defenders of social, political and/or ecological values. Despite their difficulties, they have accumulated educational and symbolic capital that will stand them in good stead in the long term.

The dispassionate pragmatists reproduce or even undergo – as salaried

employees and with limited responsibility – the canonical practice of architects. Their partial commitment to their studies and to their work runs the risk of downgrading them, even though their social origins and secondary socialisation in a prestigious higher education establishment predestined them to succeed and flourish. Ultimately, school has not been a framework conducive to a stimulating and fulfilling practice for them. The teaching methods have failed to meet their expectations and they have not found their place.

Even if the defectors succeed in entering the profession in the short term, they find themselves reproducing the canonical practice of architecture as employees, taking on few responsibilities. At this stage, their way of working does not contribute to a renewal of architectural practice. Being at the start of their careers, it is interesting to question whether the initial socio-cultural gaps are likely to re-emerge in the longer term. In this respect, women are particularly affected, as once they become mothers they have to make choices between their personal and professional lives. A survey of these graduates some ten years after graduation could provide interesting insights.

This work opens up a number of paths for further investigation, one of which is a survey of women's occupational integration. A quantitative analysis of the difficulty/ease of professional integration perceived by women compared with men – which we have chosen not to address here – confirms once again what we have already noted in our previous work (Horsch, 2021): women perceive a more difficult integration than men. What are the perceived and real reasons for this? One of our hypotheses is the supposed lack of legitimacy that leads to strategies to build on educational and professional achievements.

A second path concerns 'drop-outs'. This study analysed the trajectories of graduates. But what about those who abandon their studies at a more or less advanced stage? In this respect, an investigation of the link between social origins and dropping out could enlighten the role that school and teachers play in supporting students as they move towards professional life.

It should also be noted that the work presented here has the bias of a narrative built retrospectively by the graduates. It would be interesting to adapt the survey methodology to collect what the respondents think they are doing in the course of their trajectory *in itinere* and not *a posteriori*. This could be done through a series of *recurring* semi-structured interviews, i.e. once a year during their studies and the first years of their professional integration. That will make it possible to understand how representations are shaped as individuals become socialised into their future profession and how the institution can support them,

‘displace’ or even compensate for the socio-cultural gaps that exist beforehand.

# THE OVERQUALIFICATION OF EASTERN EU MIGRANTS: A GENDERED AND SECTORAL APPROACH

Montanari Maria Giulia<sup>a</sup>

<sup>a</sup>University of Milan-Bicocca

This study explores the overqualification risks among Eastern European migrants in Western Europe, emphasizing gender disparities and labor market segregation. Utilizing data from the 2018–2019 EU Labour Force Survey, it compares tertiary-educated migrants to the stayer peers in their origin countries. The findings reveal that Eastern EU migrants are more likely to be overqualified than stayers, particularly in sectors with high migrant segregation, such as manufacturing for men or private care for women, as well as transports, accommodation and food for both genders. While female migrants generally face a greater overqualification risks, the gender gap diminishes in sectors where migrants face higher segregation. Contrary to traditional tied-mover theories, Eastern European migrant women tend to act as breadwinners and first-mover, thus their risk of overqualification is similar to migrant men. The research highlights that migration rarely serves as a straightforward pathway to socio-economic mobility for Eastern European graduates, as they are frequently confined to low- and medium-qualified jobs abroad, regardless their occupational and educational credentials. This study underscores the need for nuanced approaches to migrants' integration and labor market policies, addressing structural inequalities to foster opportunities for fair occupational-matching and upward mobility for male and female Eastern Europeans.

Eastern EU migrants; overqualification; gender.

## INTRODUCTION

Migration has long been a subject of intense scholarly inquiry, with significant attention devoted to understanding how migrants compare to the populations in their destination countries. However, comparisons between migrants and their peers who remain in their origin countries (hereafter, stayers) offer a

compelling counterfactual perspective (Lucas, 2013). This approach helps to isolate the impact of migration by examining differences that arise solely from the migration process itself. This paper contributes to this discourse by focusing on Eastern European migrants and stayers, with a particular emphasis on gender differences. The books by Grabowska (2016) and Recchi (2016b) denounced that often the migrants coming from the new EU member states<sup>1</sup> (hereafter, EU13) do not find enough qualified occupations in their main destination countries, corresponding to ‘old’, Western Europe (hereafter, EU15). The present analysis explores how employment sector segregation influences the risk of overqualification for EU13 migrant male and female graduates in Western Europe (EU15).

## **1. COMPARING MIGRANTS TO STAYERS AND OVER GENDER**

Migrants are usually compared to the population of their destination country, which is considered the migrants’ natural benchmark (Kogan 2006; Reyneri and Fullin 2011; Recchi 2016). Among the reasons leading to this choice, not only is there methodological nationalism but also availability of data on migrants, given that these are usually collected by receiving rather than sending countries. Nevertheless, a proper counterfactual argument (Lucas 2013) suggests that the population of peers in the origin country (stayers) is the closest group of comparison to migrants, since they differ in the migration process only. With regards to the comparison among Eastern EU migrants and their stayer peers in EU13 countries, few and recent examples can be found (Grabowska 2016; Kahanec and Zimmermann 2016; Barbulescu et al. 2019; Montanari and Meraviglia 2024; Montanari 2024b).

Regarding gender differences, scholars found that in Western Europe migrant women are more likely to be overqualified as compared to migrant men, experiencing a ‘double penalty’ for being both female and migrant (Birgier and Cantalini 2023; Maiorino and Terzera 2024; Palencia-Esteban and del Río 2024). A complex interplay of structural factors contributes to explain gender differences across destination countries, but also the prevailing composition of migrant population matters, according to their demographic and socio-economic characteristics (Montanari 2024a), their country of origin (and

---

<sup>1</sup> The so called ‘New Europe’ or EU13 comprises both EU10 countries (Cyprus, Czech Republic, Estonia, Hungary, Latvia, Lithuania, Malta, Poland, Slovak Republic, and Slovenia) accessed in 2004, and EU3 countries (Bulgaria, Romania, and Croatia) accessed in 2007 or 2013. Instead, the ‘Old Europe’ or EU15 includes Austria, Belgium, Denmark, Finland, France, Germany, Greece, Ireland, Italy, Luxembourg, the Netherlands, Portugal, Spain, Sweden, and the United Kingdom.

respective norms), admission class (labour migration, family reunification or asylum) and length of stay (Schultz-Nielsen 2024). As compared to male migrants, migrant women are expected to be more likely tied-movers (Ballarino and Panichella 2018), prioritizing the partner's over their own occupational career when migrating. Furthermore, they risk remaining 'trapped' in the low qualified jobs found at first entry or first search in the destination country, given the huge segregation of migrant women in certain employment sectors, such as private domestic care (Barbiano di Belgiojoso and Ortensi 2015).

## **2. DATA AND METHODOLOGY**

The dataset chosen for the analysis is the EU Labour Force Survey (EU-LFS) with its waves 2018 and 2019 pooled together. The period 2018-2019 is after more than a decade since the EU Enlargements to Eastern countries came into force, and it precedes two major events which deeply altered the labour market and migrants' socio-economic conditions in Europe: the exit of the UK (a major destination country) from the European Union, and the Covid-19 disease, which suspended most of the economic activities as well as migration flows. All the 28 countries which were member states of the European Union at the time are included in the sample, where stayers in sending countries (EU13) are confronted to migrants in receiving (EU15) countries. Both migrants and stayers are identified as Eastern EU nationals born in Eastern Europe who reside either in EU13 countries (stayers) or EU15 countries (migrants).

Within the scope of this study, overqualification is operationalized by following the normative approach proposed by the OECD (2007: 156), and subsequently adopted by Eurostat (2021) with reference to graduates only. In particular, Eurostat (2021) defines overqualified individuals as those performing a medium-low qualified job while being tertiary educated. A medium-low level of qualification corresponds to values 400-900 of ISCO-08 1-digit codes (ranging from 'Clerical support workers' to 'Elementary occupations'), while a high educational level corresponds to having attained at least a tertiary degree (values 5-8 of ISCED-11 scale). Therefore, the share of overqualification is computed among a sub-group of the total population, that are the tertiary educated who are employed (as dependent employees or self-employed) at the time of the interview.

## **3. OVERQUALIFICATION RISK AND EMPLOYMENT SECTOR**

Table 1 below presents the relevant demographic and socio-economic

characteristics of the four groups of working-age (15-64) Eastern Europeans at comparison: male migrants, female migrants, male stayers and female stayers. Age is grouped into three values (aged 15-34, 35-49 and 50-64), as well as education (Up to lower secondary, Upper secondary and Tertiary) and the employment status (Employed, Unemployed and Inactive). Moreover, the share of low to medium qualified jobs (as defined above) is shown both among the total working-age employed population and the sub-population of employed graduates belonging to each comparator group. Similarly, the last two rows of Table 1 show the size of the total sample and the size of the graduates' sub-sample by gender and migrant status.

Tab. 1. Descriptive statistics. Source: EU-LFS (2018-2019).

Comparator groups	Migrants		Stayers		Total
	Male	Female	Male	Female	
Age					
15-34	42,2%	41,8%	36,8%	35,2%	36,5%
35-49	43,0%	42,2%	34,3%	33,6%	34,7%
50-64	14,8%	16,0%	28,9%	31,2%	28,8%
Educational level					
Up to low secondary	30,1%	26,8%	17,4%	17,5%	18,4%
Upper secondary	50,8%	45,9%	62,8%	54,6%	57,8%
Tertiary	19,2%	27,3%	19,8%	27,9%	23,8%
Employment status					
Employed	81,5%	63,9%	74,0%	59,9%	67,4%
Unemployed	8,6%	10,2%	4,9%	4,0%	4,9%
Inactive	9,9%	25,8%	21,1%	36,1%	27,7%
Low-med qualified jobs					
Tot employed pop	84,3%	77,6%	68,9%	57,4%	65,4%
(Graduates only)	(56,0%)	(52,9%)	(18,5%)	(18,3%)	(21,2%)
Sample size	26.558	35.170	657.231	688.465	1.407.424
Graduates sub-sample	(4.543)	(6.751)	(105.474)	(144.606)	(261.374)

Migrants emerge to be on average younger and lower educated than stayers. Moreover, considering that men are generally more active than women, a comparison within genders reveals that migrants tend to be more active (either employed or unemployed) than stayers, for both men and women. Migrants are also more likely to be employed in low- to medium-qualified jobs than stayers. For all the four comparator groups, the share of low- to medium- qualified jobs diminishes among graduates, and especially among stayers. Conversely, over a half of Eastern EU graduates who migrate to Western Europe (56% for men and 53% for women) perform a low- to medium- qualified job abroad.

Fig. 1. Share of workers by employment sector. Source: EU-LFS (2018-2019).

Figure 1 presents the share of workers by employment sector among each of the four comparator groups. ‘Manufacturing and constructions’ for men, ‘Private care (in households)’ for women and ‘Transport, accommodation and food’ for both genders clearly emerge as the sectors where migrants are most concentrated. On the basis of the results of Figure 1, a dummy variable is identify the ‘Sectors with higher migrant segregation’, which are diversified according to gender. This dummy informs on the type of sector and is used in the next step of the analysis.

Figure 2 shows the plot build on the margins of a logistic regression run on the selected sub-sample of employed graduates only, aiming to assess the

probability of Eastern Europeans to be overqualified. Age is included as a control variable, then each comparator group is interacted with the above mentioned dummy on the type of sector, to check whether the overqualification risk varies in sectors with higher migrant segregation. The model equation is:

$$\begin{aligned} \text{Prob. } \hat{y} (\text{Overqualification}) = & \\ & \beta_1 \text{ Comparators (male migrants; female migrants; male stayers; female} \\ & \text{stayers)} \\ & + \beta_2 \text{ Age} + \beta_3 \text{ Type of sector (dummy)} \\ & + \beta_1 * \beta_3 \text{ Interaction between Comparators and Type of sector} + \varepsilon \end{aligned}$$

Fig. 2. Probability of graduates to be overqualified per type of employment sector. Source: EU-LFS (2018-2019).

In the sample of Eastern EU graduates, the probability to be overqualified emerges to be significantly higher among migrants, especially for women. Even though such result holds in all types of employment sectors, the migrants-stayers' gap is much wider among the sectors with higher migrant segregation, where the gender differences also lose statistical significance. Interestingly, among both genders, the migrants' overqualification risk in other sectors is similar (overlapping confident intervals) to that of stayers in sector at high

migrant segregation (in the origin countries). This means that migrating for Eastern Europeans always brings a penalty in terms of overqualification, even though the entity of such penalty is much more relevant when the graduate is segregated into employment sectors with higher presence of migrants (not all necessarily graduated) abroad.

## **CONCLUSION**

This analysis provides an overview of the phenomenon of overqualification among Eastern Europeans (EU13), highlighting the significant disparities between migrants and their peers who stay in their countries of origin. Underscoring the complex interplay between migration, gender, and labor market dynamics, this research reveals that the risks of overqualification faced by migrants significantly differs according to the type of employment sector. Among sectors with higher migrant segregation, male and female Eastern EU migrants share the same probability to be overqualified. Such result is in line with the author's previous findings (Montanari 2024b) suggesting that, among Eastern EU migrants, women do not present a higher overqualification risk as compared to men, contrary to the expectations of both tied-movers and gender segregation theories (Barbiano di Belgiojoso and Ortensi 2015; Ballarino and Panichella 2018). Indeed, migrant women from Eastern Europe often act as 'breadwinner' and first (single) mover of their household. Nevertheless, among sectors where migrants are not highly segregated, the gender gap is visible and confirms the expected 'double penalty' for migrant women.

This study contributed to enlighten the complex relationship between migration, gender, labour market institutions and social mobility, which often result in migrant segregation into low qualified jobs and gendered access to employment opportunities (Birgier and Cantalini 2024; del Rey Poveda et al. 2024). A certain degree of overqualification attached to migration process is straightforward when, for instance, the qualifications required in some jobs are country-specific or the migration is mainly driven by reasons other than occupational achievement. Overqualification may also be a temporary, stepping-stone mechanism before migrants can access more qualified occupations in the destination country. Nevertheless, whenever migrants are systematically segregated into low qualified occupations abroad, their chances of being overqualified goes beyond the risks attached to the individual migration process. To conclude, at least in the case of Eastern Europeans towards Western Europe, migrating does not emerge to be an easy way to boost one's

own socio-economic status. Indeed, Eastern EU graduates who move abroad, especially women, have far more chances to be employed (and remain segregated) into low- to medium- qualified jobs. By drawing comparisons with stayers, this study also emphasizes the importance of understanding migration in its full context, offering a foundation for future research on the long-term implications of migration for both individuals and societies (Kyriazi and Visconti 2023).

# NEUROMYTH AND GENDER STEREOTYPES

Valeria Minaldi<sup>a</sup>

<sup>a</sup>Independent researcher

The aim of the intervention is to examine the influence of gender-related stereotypes on studies of gender brain differences. After introducing three concepts considered to underlie current gender stereotypes, such as androcentrism (Perkins, 1911), gender polarisation (Bem, 1993) and biological essentialism, the phenomenon of ‘neurosexism’ (Fine, 2013), i.e. the tendency to legitimise preconceived ideas about inherent gender differences through neuroscientific research, will be presented. The reciprocal conditioning between research bias due to cultural stereotypes and the impact of scientific research in their further confirmation is thus found. Through the critical review of the literature in the field by researchers Cordelia Fine and Gina Rippon, some features will be highlighted in the structuring of the research question and the analysis of the results that could be the result of such conditioning and thus of research bias (Fine 2010; Rippon, Fine 2014; Rippon 2019). In the review, the following will emerge: the tendency to rely on gender stereotypes in formulating research hypotheses and drawing inferences; pervasive confusion related to the concept of gender, mostly treated as a natural phenomenon rather than a social construct; the frequent and fallacious overlap between biological sex and gender; the persistence of the essentialist view in research hypotheses that biological sex incisively determines the individual’s brain development; the influence of evolutionary theories on gender roles, often considered natural rather than cultural; the common classification of the sample into groups divided according to biological sex (group of XY individuals, group of XX individuals), with the aim of investigating distinct ‘female’ and ‘male’ profiles that can be considered as opposite extremes of a continuum; conclusions related to behavioural differences on numerically small samples. In opposition, it is supported a revision based on the notion that gender is multifactorial, rather than two-dimensional, and that structural and functional brain differences cannot be clearly differentiated according to the sex of the individual. Specifically, it is referred to four possible guiding principles suggested in the research for gender-related brain differences: the principle of overlap, contingency, mosaicism, and entanglement (Rippon, Fine 2014).

neurosexism, neurosciences, neuromyths, gender, stereotype

## **INTRODUCTION**

In order to understand the weight that male-centric stereotypes and models have on practices, knowledge and disciplines, it is appropriate to introduce the three concepts of androcentrism (Perkins 1911), gender polarisation (Bem 1993) and biological essentialism (Witt 1995).

The former indicates the construction of opinions, evaluations and theories on nature and society by taking into consideration only the point of view of the male subject, institutionally recognised in society as hegemonic. This entails the marginalisation and ancillary nature of everything that lies outside this perspective frame, which thus acquires specific normative and disciplinary value. 'Androcentrism' is therefore the term used to describe social practices that sacrifice the female point of view, relegating the female subject to a secondary and accessory role, or even one that deviates from the norm (Perkins 1911).

'Gender polarisation', on the other hand, refers to a sociological concept introduced in the 1980s by psychologist Sandra Bem to describe a construct that understands gender as characterised by two opposing and distinct poles (Bem 1993). Starting from the supposed differences linked to biological sex, this categorisation fixes the dualism of male/female prototypes by attributing specific characteristics to them, such as behaviour, attitudes, personality, up to attitudes, potential and desires, so as to make it atypical for individuals to stray to one side or the other: hence the concepts of femininity and masculinity, which fulfil the mistaken expectations of adherence between sex and gender. Polarisation has also contributed to the construction of so-called gender roles that, throughout human history, have entailed strict social and legal constraints for individuals.

Finally, 'biological essentialism (or determinism)' is the assumption that the biological features are predictive of behaviour (Witt 1995). The concept of biological essentialism applies to any biological characteristic, but is here framed in the context of sex-linked anatomical and functional differences only.

## **1. NEUROSEXISM AND THE REINTERPRETATION OF THE SCIENTIFIC LITERATURE ON BRAIN DIFFERENCES RELATED TO BIOLOGICAL SEX**

Scientific research on gender differences has historical roots dating back several centuries, but has acquired a more solid scientific basis and rigorous methodologies in recent decades. The introduction of advanced techniques, such as magnetic resonance imaging (MRI), positron emission tomography

(PET), allowed scientists to observe the brain in vivo. This has made it possible to investigate anatomical, functional and connective differences between brains in a more comprehensive manner. However, neuroscientific research, despite the efficiency of the instruments, is subject, like all human practices, to bias, which may depend on the knowledge, beliefs and interpretations of the researcher.

The essentialist thought, which envisages innate behaviours predisposed by a precise biological matrix (e.g. linked to sex or ethnicity), has influenced the phenomenon of 'neurosexism' (Fine 2010), i.e. the tendency to legitimise preconceived ideas about intrinsic differences between the sexes through neuroscientific research. Thus, there is a reciprocal conditioning between research bias due to cultural stereotypes and the impact of scientific research in its further confirmation at societal level.

A critical re-reading of the literature in the field has led researchers Cordelia Fine and Gina Rippon to highlight certain features in the structuring of the research question that could be the result of such conditioning and thus research bias (Fine 2010; Rippon, Fine 2014; Rippon 2019), as follows:

1. the tendency to use gender stereotypes in formulating research hypotheses and deriving inferences assuming that gender behaviour is innate;
2. the persistence of the essentialist belief in the research hypothesis that biological sex determines an individual's cerebral development. Many of the experiments analysed appear to have been designed by considering sexual dimorphism as the basis of behaviour and, at a later stage, the basis of gender behaviour, ruling out a priori the hypothesis that they may have a cultural basis;
3. the influence of evolutionary theories on gender roles, often regarded as natural rather than cultural (woman-caregiver/man-hunter), which have fuelled the narrative about the supposedly insuperable difference between the two profiles – male and female -, although there are findings that have been reinterpreted or refuted;
4. the hormone testosterone, usually produced in greater quantities by XY individuals, is investigated on the assumption that it determines characteristics historically associated with maleness and masculinity: aggressiveness, competitiveness and promiscuity. A review of the studies on this subject that highlights field errors or underestimates of the samples instead leads to the observation that these characteristics

are not uniquely male prerogative, and indeed vary considerably not only among humans, but among animals in general;

5. many of the experiments analysed turned out to be snapshot comparisons by taking a single moment in the much longer and more articulated brain history of each individual and basing conclusions on it. This seems to be due to a naïve conception of human behaviour as predetermined, unchangeable and independent of its adaptation to the environment;
6. the frequent categorisation of the sample into groups divided according to biological sex (group of XY individuals, group of XX individuals), with the aim of investigating distinct 'female' and 'male' profiles as opposite ends of a continuum. This kind of approach tends to consider and identify anatomical differences as the basis of male and female behaviour, not taking sufficient account of similarities (which are rarely the subject of research), and instead focusing exclusively on differences;
7. conclusions concerning behavioural differences on numerically small samples. In comparison, on the other hand, large samples show that both cognitive abilities and social behaviour do not diverge so clearly between male and female individuals.

In other words, in many experiments there is considerable confusion about the concept of gender, which is also mostly treated as a natural phenomenon rather than a social construct. Hence, the frequent and fallacious overlap between biological sex and gender, which highlights the increasingly pressing need for specific training for those investigating human behaviour. A more in-depth and contemporary knowledge of gender studies would in fact imply less susceptibility to stereotypes and dichotomic simplifications, as well as provide additional keys to interpretation that go beyond essentialist thinking applied to gender.

In opposition, it is argued a reinterpretation based on the belief that gender is a multifactorial phenomenon, rather than a two-dimensional one, and that structural and functional differences in the brain cannot be clearly divided according to the sex of the individual.

## **2. FOUR PRINCIPLES TO GUIDE SCIENTIFIC RESEARCH ON BRAIN DIFFERENCES RELATED TO BIOLOGICAL SEX**

Specifically, there is reference to possible guiding principles suggested in the

investigation of sex-linked brain differences (Rippon, Fine 2014):

The first principle, known as ‘overlap’, demands avoiding the assumption that the anatomical configuration of the brain is necessarily predictive of a particular behaviour. Given that different neural patterns may support the same ability and predispose to similar behaviour, relying merely on anatomical observation of the brain would run the risk of overlooking its functional realities. In short, behavioural similarities can be found even in the presence of brain differences.

The second principle, called ‘mosaicism’, involves discarding the idea that there are such things as exclusively ‘male’ or ‘female’ brains. Rather, the structural and functional reality of the brain is a complex mosaic of characteristics, commonly simplistically associated with the concepts of male and female, that vary from individual to individual. Although hormones can influence behaviour, they do not rigidly determine behavioural differences between the sexes.

The third principle, known as ‘contingency’, emphasises how human behaviour emerges from a complex interaction between multiple factors at different levels that influence each other. In addition to biological factors, which in themselves vary considerably between individuals, contextual factors such as dominant cultural norms, the social system, inequalities, stereotypes experienced (Aronson, Steele 1995), social status, chosen or imposed gender roles, as well as individual factors such as well-being, education received, emotional development, interpersonal relationships, personal experiences, learned and practised skills, and the development of gender identity also play a significant role.

Finally, the principle of ‘entanglement’ states that brain predispositions can be modified, neutralised or even reversed by interaction with the environment. The influence of experience, training and context culture in brain development is mentioned (Rippon 2019). In other words, the environment can significantly influence the development of specific abilities. These assumptions undermine the belief that dimorphism is the theoretical basis required to effectively study gender behaviour.

When considering structural or functional differences in the brain determined by hormones, it is emphasised that it is important to consider that neural characteristics are not entirely characterised by biological sex and that average differences are not easily identifiable. It is therefore desirable to favour the adoption of multifactorial models that consider not only genetic factors, but also the socio-cultural context and individual experiences, in order to definitively discard the essentialist approach. Research is expanding

exponentially with a greater understanding of neuroplasticity, showing that the brain is not rigidly 'male' or 'female', but displays a continuum of characteristics influenced by genetics, hormones, experience and culture, challenging binary ideas about gender differences.

It is therefore considered likely that taking these new scientific assumptions into account will influence our practices and knowledge. It is therefore important to consider these alternative guiding principles to guide new contributions to the subject, coupled with specific training that can provide the basis for formulating hypotheses and designing experiments.

# SCHOOL DROPOUT AND ACTIVE CITIZENSHIP. A SOCIAL AND SUSTAINABLE EXPERIENCE IN LOMBARDY.

Lisa Sacerdote<sup>a</sup>

Annaletizia La Fortuna<sup>b</sup>

Nicola Morea<sup>b</sup>

Luisa Zecca<sup>a</sup>

<sup>a</sup>University of Milano-Bicocca (Italy); <sup>b</sup>State Institute of Higher Education IIS “Paolo Frisi”, Milano (Italy)

The dropout rate in Italy is very high due to endogenous and exogenous causes (ISTAT 2021). As part of a project promoted by the Regional School Office of Lombardy, which involves schools, prison institutions and universities on the topic of Education to Legality, this research looks at how, by getting different institutions involved, a school approach based on active and innovative methodologies, the formation of peer groups and the development of joint studies, it is possible to reactivate and revive the sense and pleasure of learning. The pilot project shows how Education to Legality as education to active citizenship can contribute as a possible antidote and fight against school dropout. A multidisciplinary team composed of teachers working outside and inside the prison, prison staff and researchers from the university, following the participatory mode of Research Action, worked together on a pilot project involving two classes of adult foreign students most of whom were returning to education. One class was made up of students who were detained. We'll be looking at the strengths and challenges that emerged from this educational-didactic research project.

sustainable education; school dropout; prison; action research; education to citizenship

## INTRODUCTION

We present here a pilot workshop in two high school classes, in and outside prison, as part of a project on Education to Legality (“Education to legality between schools and the services of criminal and precautionary enforcement

limiting of freedom”, 2022-2023) carried on in Lombardy (IT) as an institutional agreement including the Regional School Office, penitentiary institutions, and universities, which aims to outline guidelines and implement an action plan dedicated to education to legality between schools and penal services, that can be implemented in middle and high school.

The institutions involved in the framework agreement were USR (Regional School Office) of Lombardy, PRAP (Penitentiary Administration Department – Regional Superintendency) for Lombardy, CGM (Juvenile Justice Center) for Lombardy, UIPE (Interdistrict Office for External Penal Enforcement), UNIMIB (University of Milano-Bicocca), UNIMI (University of Milan) and UNICATT (University Cattolica del Sacro Cuore).

The general project included: 1) an in-service training course and workshop activities for school principals, teachers, prison educators; 2) a workshop on Education to Legality carried out by an Action Research group composed of schoolteachers outside and inside the prison, criminal justice professionals, and university researchers, building a co-designed path of education to legality. This project was aimed at both external students and students in prison. The project’s principal objectives were threefold: firstly, to establish novel guidelines for the Education to Legality policies of School Regional Administration; secondly, to enhance multi-professional in-service training between teachers, prison educators, school managers and penitentiary administrators on Education to Legality; and thirdly, to conduct a pilot workshop in two high school classes, in and outside prison (described in this manuscript).

## **1. REASON OF RELEVANCE: WHY AN EDUCATION TO LEGALITY FOR/AS ACTIVE CITIZENSHIP?**

As Dalla Chiesa observed

Legality has to do with a feeling that binds us to others, to values, to participation, to responsibility. It is a path and a process of change. Rules are neither prescribed nor taught; rather, they are the culmination of a deeper and broader formative process (Dalla Chiesa, Lecture, 28/02/2023).

Education to legality was not treated as a pedagogy of rules and norms. One of the strengths of our Action Research group was the broadening of the theme of legality towards active citizenship, democracy, participation.

We show how a project on Education to Legality can contribute as a possible antidote and fight against school dropout. In this pilot project of Education to

Legality (for active citizenship), good educational and teaching practices are applied tout-court. Indeed, we believe that a good way of teaching is already de facto education for citizenship and vice versa (Dewey, 1916, 1929; Meirieu, 2007; Mortari et al., 2021).

Moreover, the indications for the training/education of adult students of national and international policy and research on ways of doing school (e.g. participation, listening) are significant, precisely in relation to school dropout, with an added value for students in detention (UNESCO, Institute for Lifelong Learning, 2021).

## **2. STATE OF THE ART**

In Europe, according to the Eurydice 2017 report on Citizenship Education at School: “In democratic societies citizenship education supports students in becoming active, informed and responsible citizens” (Eurydice, 2017). However, training on citizenship education is absent in nearly half of European education systems. According to the EU funded STEP project – Pedagogy of Citizenship and Teacher Training: an Alliance between School and Territory (2015-2018): “New models of training and strengthening the professionalism of the teacher, whose citizenship skills still seem weak, need to be implemented and supported” (Zecca and Nigris, 2022). More specifically in Italy, despite a history spanning more than 40 years, Education to Legality – today topic of Civic Education – remains a discipline without a clear scientific statute and without defined methodological parameters. The fragility of the system can be attributed to several factors, including a lack of training and specific skills among teachers, a lack of clarity regarding the curriculum, and a lack of consistent engagement with the university as a central hub for reflection, research, experimentation, and teacher education (Dalla Chiesa, 2021, 2023).

## **3. METHODOLOGY**

The design and methodological hypothesis of the project are based on the principles of Action Research, which is one of the methods of a participatory research strategy. As outlined by Mortari (2016), action research is a process that is conducted in the field, structured on the basis of close collaboration between researchers and professionals, and aims to facilitate positive change within the context in which it is implemented. Furthermore, all participants are co-researchers: participants with different skills and backgrounds all have equal voice in the research.

The institutions involved co-planned and negotiated the content and the development of an Education to Legality path (Elden, Levin, 1991). Each group was multidisciplinary and equal. Both the strategies and the objects of the research were co-constructed by each group, as well as the themes and the subjects to be involved.

#### **4. THE PILOT PROJECT AND THE RESEARCH QUESTIONS**

Specifically, we report the activity carried out by the Action Research group established and coordinated by UNIMIB, Department of Human Science for Education, from March to June 2023. This group included: two researchers from UNIMIB; two teachers from the high school IIS “Paolo Frisi” (Prison Section) in the Bollate Prison, Milan; two teachers from the IIS “Paolo Frisi” (Adult Education Department), Milan; two legal-pedagogical penitentiary officials; a manager and responsible for the observation and treatment of the Lombardy PRAP (the regional superintendency of the penitentiary administration); two classes of adults from the IIS “Paolo Frisi” secondary school (Adult Education Department), one of 6 students from Bollate prison (first year of high school, average age 35) and one of 14 external students (third year of high school, aged between 20 and 40).

The research questions were twofold. The first was a general question: what is to be done? This question pertains to the development of novel educational methodologies for the teaching of legality and citizenship between educational and justice institutions.

The second question was more specific in nature and concerned the process evaluation. This question sought to identify the strengths and weaknesses of the pilot workshop on Education to Legality, both within and outside the prison system.

#### **5. THE PILOT WORKSHOP**

Our Action Research group was set up and led by UNIMIB. Two meetings were organized with all the group’ actors. The purpose of these meetings was to collaboratively develop the educational-didactic framework for the activities, to negotiate the methodologies, and to determine which students should be involved. It was agreed that the focus would be on autobiographical themes, specifically on the theme of identity, the life stories of each in the us/world relationship, to question legality, not merely as a matter of observing rules and norms, but as a form of active citizenship.

The group chose a literary text on otherness (Ghebreigziabiher, 2016): a broad theme that allowed the students to explore the legality transversally, working on common themes despite different contexts and life stories. The underlying common paradigm is that school is a dispositive where it is possible not only to learn the norms, but where students can develop critical thinking skills; confidence in justice; sense and value of belonging to a community; conscious adherence to shared values (Meirieu, 2007).

Starting from the text “L’Altro”, the didactic method was built around reading, discussion and reflective interpretation. Active methodology was developed as implementation of exercise of skills, right to speak, dialogue, participation, comparison, mutual listening, conflict education, observance of rules. It was decided to have first a meeting in Bollate prison in which the two classes would get to know each other and read the text together. Then to undertake two parallel paths, in the school inside and outside the prison. To end with a final meeting in Bollate to exchange and share reflection between the two classes. Both classes actively participated in the project, showing interest in and adherence to the theme, in which they felt deeply involved.

Tab. 1. The Pilot phases (March/June 2023).

Two meetings of the Action-Research group without students (March 2023): Path’s co-planning (9/3/23 +23/3/23)		
Joint meeting (external and internal)	First meeting of the Action-Research group with the two classes, in Bollate prison (18 April 2023)	
Separate workshop (external and internal)	External meeting Frisi (classroom work)	Bollate (classroom work)
	27/4/2023, 1 <sup>st</sup>	10/5/2023, 1 <sup>st</sup>
	11/5/2023, 2 <sup>nd</sup>	16/5/2023, 2 <sup>nd</sup>
	16/5/23, 3 <sup>rd</sup>	
Joint meeting (external and internal)	Second meeting of the Action-Research group with the two classes, in Bollate prison (23 May 2023)	
Separate meetings (external and internal)	6/6/2023, 4 <sup>th</sup>	
Focus Group	20/6/2023, 5 <sup>th</sup> (small group self-assessment)	30/5/2023, 3 <sup>rd</sup> (self-assessment)

The instruments for data collection were 12 participatory observations, 3 interviews, 2 focus groups and 12 field notes (see Tab. 1 for details). Thematic analysis was the method used for analyzing data (Lochmiller, 2021).

## **6. RESULTS**

The qualitative research yielded a number of noteworthy findings.

### **6.1 Student Voices from the Focus Groups**

- a) The issue of legality influences perceptions of transformative learning through the medium of experiential learning and indirect teaching, as exemplified by the use of autobiography and literary text. The students' words highlighted the transformative power of learning (Mezirow, 1991), as well as the strong involvement of students through participatory methodologies and through themes related to autobiography and identity (Dewey, 1916, 1929; Mortari, 2016). One student (#1) commented, "Many of us have become the other in this journey. They were other and have changed".
- b) The formation of peer groups and the development of joint study leads to students' self-perception of the value of teamwork (Wenger, 1998, 2000; Mead, 1934). Working with/in the school with two classes of students outside and inside the prison gave the possibility to create a community of peers reflecting together: the classroom as a research community (Dewey, 1916; Nussbaum, 2016). As one student (#2) articulated, "I told you in the second meeting, I felt it just like maybe we are one thing, one person, one body."
- c) The shared experience between high school students and inmates changes self-representation and the view of the other. Furthermore, both classes expressed the desire for more durable paths. As one student (#3) observed, "The look from outside changed my gaze. Those from outside see things here that we do not see, and they changed our gaze, they make us see precious things here."

### **6.2 Thematic Analysis**

The data analyzed through thematic analysis yielded the following outcomes:

- a) The potential and significance of co-design between diverse institutions. The involvement of universities was pivotal, both in terms of their researchers, who served as facilitators, and in guaranteeing the

expertise and comprehensive training on the subject of Education to Legality (Mortari, 2016; Leone, Prezza, 2021).

- b) The need for specific training of teachers, particularly in regard to the forms of active involvement of students, also to mutually restore the sense of the process that took place in the two classes. The expertise of those who led the experience in the two class groups was a very significant variable: the urgency of specific training of in-service teachers, clearly emerged.
- c) The main learning outcomes were related to critical thinking and argumentation on legality topic based on identity-alterity perspective connected to “living together” (Scriven & Paul, 1987).

## 7. FURTHER QUESTIONS, PERSPECTIVES

If legality is not just the observations of norms but skills that need to be cultivated and supported, it will have to be empowered with systematic and continuous educational actions, involving school, institutions, politics. We conclude with two open questions:

How to balance, in schools and beyond for education to legality, knowledge of democratic forms and competences on active citizenship?

The “imposed rules” paradox: school in prison promotes these same habits of coexistence in prisoners while they are living inside a coercive environment. Is it possible to develop a sense of citizenship in this context?

### **Acknowledgements**

We’d like to thank the teaching staff and students, both inside and outside the prison, for their invaluable contribution.

# INCLUSION BEYOND THE CONFLICT: PERSPECTIVES ON INCLUSIVE EDUCATION IN THE EAST-JERUSALEM CONTEXT

Arianna Taddei<sup>a</sup>  
Tommaso Santilli<sup>a</sup>  
Samah Halwany<sup>a</sup>  
<sup>a</sup>University of Macerata

This contribution aims at illustrating and discussing a co-design experience concerning the development of inclusive educational frameworks within the Palestinian context. The promotion of inclusive education paradigms in contexts affected by protracted conflict is a challenging but resourceful trajectory to foster democratic processes, since education practices can promote equality and civic participation (Taddei, 2021; INEE, 2018; Taddei, 2010). As the Israeli-Palestinian conflict poses critical barriers to the achievement of inclusion in educational scenarios within the areas of East Jerusalem and West Bank (Taddei & Pacetti, 2018), the search for innovative and meaningful pedagogical strategies is an essential effort to foster democracy and limit the disruptive effects of turmoil and upheaval. In this direction, University of Macerata worked with Al-Quds University (Palestine) to co-design educational pathways that can foster the formation of teachers and students according to inclusive education paradigms in a shared pedagogical action. As a result, the promotion of democratic and inclusive processes can offer new frameworks for Palestinian schools, in the co-creation of a sustainable, contextualized and valuable perspective for education. In this sense, the concept of an inclusive school can go beyond physical, conceptual, and intercultural borders, promoting a democratic society for future generations.

inclusive education; equality; conflict-affected areas; Palestine; democracy

## INTRODUCTION

When questioning the meaning of borders, one might consider how a border has the potential to produce alterity from equity, otherness from belonging, difference from similarity (Zanini, 1997). Canevaro's logic of boundaries and

pathways (2006) puts forward the value of balancing the maintenance and the crossing of visible and invisible boundaries for inclusion and equity. The author envisions an alliance between boundaries and pathways, promoting a symbolic passage from an individual to another informed by the sensitivity of respecting human diversity. This perspective highlights how every context presents tangible and intangible elements that either obstacle or support inclusion, active participation, equity, and Quality of Life (Giaconi et al., 2022; Giaconi et al., 2020; Giaconi et al., 2019). In this sense, the establishment of boundaries and pathways influences our opportunities for wellbeing, personal development, self-determination and active participation. Therefore, the paradigm of inclusion implies a counterbalance and interplay between complementary forces, ensuring individualisation (i.e., the right to equity) and personalisation (i.e., the right to diversity), as well as supporting people in their growth towards adulthood through active participation and social inclusion opportunities (Giaconi et al., 2024; Caldin & Giaconi, 2021; Giaconi & Capellini, 2021). With reference to the Israeli-Palestinian conflict, physical and cultural borders act as an architecture of restricting confinements that increase social injustice and alter the Palestinian community's everyday life, posing critical barriers to the achievement of inclusion in educational contexts within the areas of East Jerusalem and West Bank (Taddei & Pacetti, 2018). The dynamics of occupying powers and the limitations of freedoms draw significant concerns towards the possible creation of a democratic school. Consequently, the presented co-design experience hereby tries to address an urgent issue: the protection and promotion of inclusion and democracy in conflict-affected areas.

## **1. CHALLENGES FOR INCLUSION IN PALESTINE**

The ongoing Israeli-Palestinian crisis constitutes a dramatic scenario of hostility, disruption and violence across the Gaza Strip, Israel and the West Bank, as documented by the United Nations Office for the Coordination of Humanitarian Affairs (OCHA)<sup>1</sup>. Such a disruption of countless lives and flow of distressing images demands a profound reflection on human rights and solidarity. Although discussing themes like education or inclusion amidst such devastation and tragedy might seem out of focus, it is important to note how inclusive education can foster cultural resilience, conciliation and societal change (Taddei, 2021). In this direction, international cooperation has

---

<sup>1</sup> <https://www.unocha.org/>.

recognised education as a vital element for emergency response, safeguarding children's wellbeing and preventing disruptions of their right to education. As situations of emergency threaten to limit children's opportunities to process and share their fears and distress (AICS & RIDS, 2015; EU, 2018), education has the potential to establish a safe space that provides continuity and stability, preserving the vision of a future through the turmoil (Taddei, 2021). Offering opportunities for the communication of ideals, hopes, and standards, education can maintain social life, constituting a means through which democratic and inclusive values can be communicated, shared and spread (Dewey, 1916). Additionally, it can also empower people to activate transformative processes, representing a means of liberation from oppression and social injustice (Freire, 1970). If the mandate of inclusive education is a complex goal based on both dismantling barriers that limit student participation and embracing diversity through accessibility, tailored approaches and empowerment (Adams, 2008), such a perspective is even more challenging in conflict zones. Indeed, the constant disruption of education often exacerbates exclusion and discrimination (Shah et al., 2020; Taddei, 2010). Still, education can represent a pathway for hope, equality, participation and democracy (Canevaro, 2006). In fragmented contexts, education remains a crucial avenue to address disparities and foster equity.

In Palestinian territories, education faces immense challenges connected to geographical division, segregation, and occupation, which undermine human rights and communities' wellbeing (Amaney, 2009). Issues connected to politicisation, distrust and discrimination, security checkpoints, underdeveloped infrastructure and complex cultural dynamics hinder educational process on different levels. Consequently, cultural and structural barriers place significant burdens on students, teachers, and educational communities. When considering refugee camps, overcrowding, damaged infrastructure and scarce resources further undermine education processes (UNRWA, 2024). Inclusion of students with disabilities in Palestine suffers a lack of service and support systems for families, as well as inaccessible learning environments (Al-Masri et al., 2023). As highlighted by Hasweh (2002), although the educational system suffers an undemocratic context, educators still have a considerable amount of freedom to implement inclusive practices.

In this challenging scenario, education practices can promote equality and civic participation (Taddei, 2021; INEE, 2018; Taddei, 2010), representing a precious resource to contrast discrimination and spread democratic principles. Given the current situation in Jerusalem, where advancing standards, best practices,

and inclusive principles are urgently required to protect the rights of children with and without disabilities (UN, 2006), our intervention seeks to address these issues through the cultivation of teachers' knowledge and competences.

## **2. THE CO-DESIGN EXPERIENCE**

This section illustrates the objectives, methods and preliminary outcomes of the co-design experience. Specifically, University of Macerata worked in collaboration with Al-Quds University (Palestine) to promote inclusion in fragmented communities of East Jerusalem, spreading inclusive education principles and practices to be embraced and applied by primary school teachers.

### **2.1. Background and objectives**

The overall objective of the co-design experience is to foster inclusion and democratic processes within primary school educational environments in East Jerusalem. To this end the research team worked on the ideation, design and development of a training programme on inclusive education for primary school teachers and educators.

### **2.2. Methods & Tools**

The co-design experience represents a case study (Thomas & Myers, 2015) involving University of Macerata and Al-Quds University. Specifically, a participatory approach (Cornwall & Jewkes, 1995) was adopted to design and develop a training programme on inclusive education for primary school teachers of East Jerusalem. The choice of adopting a participatory approach lies in the attempt to design and develop a contextualised educational path, co-creating knowledge that integrates deeper insights and fostering empowerment processes among the actors involved. In this sense, the involvement of Al-Quds University represents a viable trajectory to increase the social, intercultural and educational value of the training programme, guaranteeing meaningfulness, authenticity and efficacy in the Palestinian context. Specifically, researchers from University of Macerata defined the key concepts and contents to be included in the training programme. After designing and developing a first draft of the programme, consisting in 5 thematic modules, a focus group was held (Liamputtong, 2011) with Al-Quds University researchers in order to review the training material and discuss integrations and optimisations. Such an effort would ensure the programme's contextualisation and efficacy for the Palestinian context. A second focus group session was held to verify the

integrations and finalise the modules

### 2.3. Preliminary results

As a result of the co-design experience, a training programme on inclusive education composed of five training modules in English language was successfully designed and developed. The training programme was co-designed through a modular approach, ensuring that Al-Quds instructors could freely choose the order with which to work with the resources. Additionally, the modules highlight thematic interconnections, in order to promote a comprehensive view and understanding of the programme’s topics. Each training module consists of four different resources: a PowerPoint presentation combining textual information on key concepts with graphical elements or images; a voice recording illustrating its topics in deeper detail; hyperlinks to further explore the module’s topics with specific web resources; a proposal of practical activity for learners to put into practice the module’s theoretical knowledge.

Table 1 presents an example of the co-design process with reference to the module dedicated to the topic of accessibility. The column on the left presents the outline of the module draft. The central column includes the suggestions emerging from the focus group conducted with Al-Quds researchers. The column on the right shows the solutions that were implemented to integrate the given feedback.

Tab. 1. Example of co-design process.

First Draft Topics	Al-Quds Researchers’ Feedbacks	Co-designed solutions
Accessibility and usability definitions.	Need to present the multiple dimensions of accessibility.	Integration of practical examples of accessibility in everyday life.
International Classification of Functioning, Disability and Health (WHO, 2001), concepts of barriers and facilitators.	Need to contextualise accessibility in the Palestinian scenario.	Integration of a “Palestinian Context” section.
Universal Design & Universal Design for Learning.	Need to present the elements that can hinder or enable accessibility to improve understanding.	Provision of resources on emergency measures to accommodate accessibility needs in Palestine through hyperlinks.

## CONCLUSIONS

The co-design experience represented by this case study offered unique insights on the solutions and strategies that can orient inclusive and democratic processes beyond context-specific differences. The results highlight how the promotion of empowerment and equity in conflict-affected areas needs to start from a shared vocabulary and understanding of core principles and values related to inclusion and democracy. Indeed, the cultural exchange at the basis of this experience suggests how reaching shared meanings and definitions is an essential step for international cooperation and promotion of communities' wellbeing, providing richer perspectives and renewing societies' commitment to cooperation for peace, equity and the protection of human rights, also through academic research. In this direction, teacher education can represent a valuable tool for societal transformation. Indeed, education, when provided equally and inclusively, can contribute to the creation of fairer societies (Taddei, 2021; INEE, 2018; Taddei, 2010). To this end, frameworks belonging to special and inclusive pedagogy can initiate virtuous processes for the achievement of democracy and equity in conflict-affected areas. Given how the developed training programme can be considered as a preliminary result of the co-design experience, further participatory research should expand qualitative analyses to develop interculturally valid frameworks of action within conflict-affected areas for quality and equitable education, beyond borders of any nature.

# **NEOLIBERALISM IN/AND EDUCATION**

# HEALTH PROMOTION AND CO-PLANNING OF AN AFFECTIVITY AND SEXUALITY EDUCATION LABORATORY WITH ADULTS WITH INTELLECTUAL DISABILITIES, PARENTS AND SOCIAL

Gabriele Buono<sup>a,b</sup>

Carmen Ferraro<sup>a</sup>

<sup>a</sup>Spes Auser APS; <sup>b</sup>University of Genoa

This contribution aims to propose a project for the design of an education course on affectivity and sexuality for adults with intellectual disabilities. If, on the one hand, there are international guidelines that recognize sexuality as an inalienable right common to all people; on the other hand, in Italy there are few pedagogical practices inherent to the topic in question and contextual. The need emerges to build and consolidate a network of transdisciplinary professionals and educational services who experiment and disseminate good practices regarding affectivity and sexuality education projects in the field of disability. However, as often happens, targets of the projects are not included among the actors, creating top-down projects. Instead, in the socio-health district of Ventimiglia, we want to use the participatory logic of health promotion, based on agency and empowerment. Therefore, it is essential to understand the point of view of adults with intellectual disabilities, who co-participate in the construction of an affectivity and sexuality education project based on their needs. For this reason, it is necessary to actively involve other social actors: family members of adults with intellectual disabilities and social and health workers such as educators, psychologists, social workers, pedagogists and managers of educational services.

## INTRODUCTION

In this article, we aim to describe the beginning of an experiment of a workshop inherent in affectivity and sexuality education with adults with intellectual disabilities in a residential facility. This educational project was carried out

during a training internship of the master's program in "Health promotion, community development and operational networks. Planning, management, evaluation of integrated health promotion and salutogenesis actions" at the University of Cagliari; the project will last until June 2026.

Some general objectives are:

- 1) Promoting sexual health through co-design with people with disabilities with a bottom-up approach.
- 2) Promoting knowledge and skills to actors involved in Spes educational settings (Educators, Oss, people with disabilities, parents, volunteers).
- 3) Promoting a cultural change in the territory of Social and Health District 1 concerning the topic of the affective and sexual dimension of people with intellectual disabilities.
- 4) Creation of a widespread educating community: involvement of Third Sector entities and local government administrations in Social and Health District 1 and neighbouring districts.

This section aims to describe the process that is being pursued for the implementation of project work, programming and design of interventions.

The Precede-Proceed model is divided into the following phases.

### **Phase 1. Social Assessment**

- Provides for the collection of statistics and numbers on intakes at the health level of Asl 1 SSR Liguria and the Health District; Social District and Spes Auser APS.
- Identification of social actors involved: the multiprofessional team, groups of people who will cohabit in the new residential centres being renovated through NRP funds, and family caregivers.
- Validation of the Rickter Scale "DAS" (Disability Affectivity and Sexuality): this activity was shared together with a trainer from the Social Cooperative "Anziani e non solo", who is training the trainers in the use of the Rickter Scale. This tool was designed by "Rickter Scale World Limited and Rickter Scale associate companies" based in London. Therefore, every step that defined the overlay was supervised and approved by its owner. After a year of work, the Rickter Scale "DAS" was officially validated, thanks to our teamwork. The Rickter Scale is a portable whiteboard that engages and motivates individuals to take ownership of their health by exploring possibilities through structured

dialogue. The process is a combination of motivational assessment, evaluation and action planning. This captures an individual's path toward positive, user-defined outcomes. "Overlays" have been developed to allow the Rickter Scale to be used for different groups of people and health topics; for example: addictions, adult learning, education, employability, youth, disability, and mental health.

- Getting to know people with semi-structured interview and group sharing moments: both informal and formal getting to know people is intended. Informal because it is important for the operator to establish a relationship with the guests with a good level of trust: this would increase adherence to the project. Formal acquaintance through semi-structured interviews serves to assess in greater detail the homogeneity of the group with respect to the degree of disability and educational needs on the topic at hand.
- Initial involvement of residential centre guests, families, and social and health workers: The intent is to conduct educational pathways in parallel for both adults with intellectual disabilities and caregivers and social and health workers. This is motivated by the fact that it is essential, to support and reinforce the educational pathway of the former, to find space for listening and discussion with both caregivers and social-sanitary district workers. It is also essential to analyse the needs of family members of the professionals involved, to enable them to recognize in the future and accompany adults with intellectual disabilities to the discovery and awareness about their corporeity, affectivity and sexuality.

## **Phase 2. Epidemiological assessment**

The assessment will be organized through individual interviews with DAS overlay administration to have quantitative and qualitative data: the questionnaire investigates specific areas of sexuality: knowledge of sexually transmitted diseases and the reproductive system, emotions, and relationships (self-perception, perception of others about self and vice versa). This tool would make it possible to identify some topic areas that could be present in the next workshop, considering the indications found in the scientific literature. In fact, for the identification of group needs on the topic of affectivity and sexuality, the topics of interest whose values are lower could indicate a training need. Recall that people with intellectual disabilities have a higher likelihood of sexual abuse and violence than a neurotypical person; therefore, limited to the skills of

understanding and awareness, an attempt will be made to transfer necessary information useful in recognizing situations of discomfort and/or danger to them.

### **Phase 3. Ecological and educational assessment**

It includes the analysis of direct and indirect factors that influence people's environment and behavior in their affective and sexual spheres: These are called PAR (Predisposing, Reinforcing and Enabling) factors. This is possible through preliminary interventions with adults with intellectual disabilities, where some of the most important PAR factors are identified, which will help define the specific objectives of the workshop pathway.

Another methodology would be the Focus Group for caregivers and social and health workers: on the one hand, to understand what caregivers' concerns and resistances are in recognizing the sexual dimension of their children; on the other hand, to support the multidisciplinary team in accompanying facility residents to effectively express their affective and sexual needs and, where possible, accompany them to meet them, limited to the physical, cognitive and educational capacities.

### **Phase 4. Political and Health Promotion Assessment**

This phase concerns the beginning of affective and sexual education workshop with active and participatory methodologies by identifying:

Each meeting will last one and a half hours on a weekly basis. The whole course will be divided into thematic Modules. The mode will be mainly composed of playful, multimedia and participatory activities to build training/information materials (photos, videos, posters, various materials and stationery to build objects useful for conducting the workshop and explaining the topics). In addition, an initial mapping of other services (associations or social cooperative) that are conducting educational projects on the topic of sexuality and disability in the Italian regions is being initiated. The goal is to create a network of specific services on the topic to mutually exchange experiences, skills and professional practices while to co-construct scientifically valid and shared National Guidelines as a cultural basis for designing interventions for affectivity and sexuality education with adults with intellectual disabilities.

### **Phase 5. Implementation**

It is intended to share the workshop pathway with other actors/entities addressing the topic of sexuality and disability. From the perspective of health

promotion and scientific evidence, it is essential to share good practices and scientifically valid experiences to homogenize practices, which otherwise risk being self-referential, ineffective and even iatrogenic. One is aware that each context has peculiarities that influence the design of an affectivity and sexuality education pathway but sharing guidelines and recommendations as common ground from which to design could be an essential contribution for all practitioners who, in addition to passion, would act with competence.

### **Phase 6. Short Term Assessment**

At this stage, the change in PAR factors from the previous diagnosis (educational and ecological) is evaluated: short-term assessment of knowledge by means of an ex-post questionnaire being validated; also, qualitative participatory group evaluation is also important, to have subjective feedback and returns with respect to the workshop pathway carried out. It turns out to be necessary to initiate meetings with parents. Involving families allow to increase the effectiveness of interventions with adults with intellectual disabilities, if caregivers positively accept the project initiative and are willing to cooperate with the professional team. It would also open potential cultural change and vision, moving from a condition of sexuality denied or not recognized in its integrity to a vision of sexuality as a multidimensional and central aspect of every human being.

### **Phase 7. Mid-term assessment**

In this phase we are involved in assessing behavioural changes and environment:

The DAS – Disability Affectivity and Sexuality Rickter Scale will be used as instruments to assess individual attitudes toward affectivity and sexuality 3 months after the end of the workshops.

### **Phase 8. Long-term assessment**

The last phase assesses health and Quality of Life: maintenance of behavioural and environmental changes six months after the conclusion of the project. Reports from social and health workers written daily, in which incidents about critical incidents related to sexual problem behaviors are reported, will be used as tools.

## CONCLUSIONS

In conclusion, we would like to highlight the following project progressions:

- By mid-December, a mixed group (males and females) of six people will permanently enter the newly renovated residential facility; the occasion is useful for experimenting with the co-construction of the affectivity and sexuality education workshop with a group of young people assisted by social and health workers from Spes Auser APS.
- The programming includes a period of informal acquaintance of the people in cohousing to create a climate of acclimatization and relational trust, to share the topic at hand and plan individual and group interviews and semi-structured interviews. Subsequently, a weekly schedule of one and a half hours per meeting over the year 2025 is planned for the workshop programming.
- It has just been validated by the British body, owner of the Rickter Scale, the DAS overlay to assess the affective and sexual needs of adults with intellectual disabilities from an “inclusive” perspective.
- A mapping of social and health services working in the field of intellectual disability is being carried out to validate a questionnaire (Gil-Lario, 2021) aimed at adults with mild to moderate intellectual disability and to build a network of services to share good practices that can be replicated in other Italian contexts.
- The intention is that once the project is over, the network of actors involved can continue the activities and interventions on affectivity and sexuality education with people with intellectual disabilities and with families and institutions. Therefore, specific training is planned for practitioners to acquire the necessary skills and knowledge to assess and design specific group and individual educational interventions.

### **Acknowledgements**

We would like to thank Marianna Caruso and Francesco Rovatti.

# DEMOCRATIC EDUCATION? LEARNER VOICE AND ADULT EDUCATION IN IRELAND

Thomas Murray<sup>a</sup>

Aisling Meyler<sup>a</sup>

<sup>a</sup>AONTAS – Ireland’s National Adult Learning Organisation

The following article examines the democratic potential of Learner Voice through the lens of a solitary case study: the National Further Education and Training Learner Forum (NFLF) of Ireland. AONTAS (2024a), Ireland’s National Adult Learning Organisation, is responsible for the NFLF. Forum events bring together adult learners from across Ireland to ask their views on their experience of Further Education and Training (FET). The Forum aims to ensure that FET meets the needs of adult learners today and in future. The article reflects on the social justice and democracy dimensions of the NFLF. It explores the potential for Learner Voice to inform the appraisal of FET policy and practice in Ireland and highlights the practical challenges associated with nonparticipation, tokenism, and meaningful participation. The gradual emergence of Learner Councils in FET provision is a recent, hopeful development, one which underlines the latent possibility of enhanced forms of student participation in decision-making about their education and society.

learner voice; participation; democracy; further education and training; Ireland

## INTRODUCTION

In the context of rapid economic, social, and demographic change, fostering democracy and social justice in adult education is a prerequisite for adaptability, social cohesion, and human development. The following paper examines the possibility of fostering democracy and social justice in adult education through the theory and practice of Learner Voice. We examine the democratic potential of Learner Voice through the lens of a solitary case study: the National Further Education and Training Learner Forum (NFLF) of Ireland.

Emergent from the democratic and egalitarian norms of adult and community education, we argue that Learner Voice foregrounds and supports vital forms of student dialogue and recognition (See Fleming, 2021). In doing so, the paper speaks to diverse, interdisciplinary scholarship in the fields of transformative student voice (Fielding, 2010), citizen participation (Arnstein, 1969), and participatory social policy (Beresford, 2016).

The work falls into three parts. Part one outlines the origins of the NFLF and the specific roles of AONTAS, Ireland's National Adult Learning Organisation, service providers, the Education and Training Boards, and associated state agencies, notably SOLAS. Part two reflects on the social justice and democracy dimensions of the NFLF, exploring the potential for Learner Voice to inform the appraisal of Further Education and Training (FET) policy and practice in Ireland. Part three highlights the practical challenges associated with nonparticipation, tokenism, and meaningful participation. By way of conclusion, we highlight the emergence of Learner Councils in FET provision as a recent, hopeful development, one which underlines a latent possibility of enhanced forms of student participation in decision-making about their education and society.

## **1. AONTAS AND THE NATIONAL FET LEARNER FORUM**

The National Further Education and Training Learner Forum (NFLF) is a Learner Voice project designed to bring together adult learners from across Ireland to ask their views on their FET experience. The purpose of the Forum is to ensure that FET meets the needs of adult learners today and continues to do so in future. AONTAS, Ireland's National Adult Learning Organisation, is responsible for the NFLF (Dowdall, Sheerin, and O'Reilly, 2019). AONTAS works in partnership with 16 Education and Training Boards to host regional forum events and to document Learner Voice in both regional and national reports. Forum events bring together adult learners from across Ireland to ask their views on their FET experience.

The National FET Learner Forum was founded in 2016. The project answered the call of the 2014-2019 FET Strategy for the creation of a forum to 'systematically benchmark learner's views and satisfaction with their FET programme on an on-going basis' (AONTAS, 2024a, 16). The Forum has since grown into a series of regional and national events, regularly engaging over 1700 learner contributions in recent years. The project is one of the largest of its kind in Europe. In the 2023-2024 academic year, AONTAS partnered with the 9 Education and Training Boards to host the National FET Learner Forum (See Table 1).

Tab. 1. FET Learner Participation rates in National FET Learner Forum focus groups and surveys for different Education and Training Boards: Ireland 2023-2024. Source: AONTAS (2024)

Regional ETB	Focus Group Participants	Survey Respondents	TOTAL Contributions
City of Dublin	72	55	127
Donegal	94	219	313
Mayo, Sligo and Leitrim	80	113	193
Waterford Wexford	88	87	175
Cork	79	186	265
Louth Meath	98	147	245
Kerry	71	139	210
Cavan Monaghan	53	38	91
Tipperary	60	45	105
TOTAL	695	1029	1724

A total of 686 learners participated in 86 focus groups during the 2023-24 academic term, while 1030 learners completed an accompanying survey, supporting wider participation and offering additional insights. Learners represented a broad range of levels and courses offered by each of the participating Education and Training Boards. At each Forum, trained AONTAS facilitators supported focus group participants to reflect on their experiences in Further Education and Training. Learners discussed three primary questions: (i) “What has been working well in your course?,” (ii) “What has not been working well?,” and (iii) “How could your course experience be improved?.”

Learner Forum participants expressed differing levels of overall or net satisfaction with diverse aspects of their experience of Further Education and Training. In 2023-24, for example, Learner Forum participants expressed highest satisfaction with areas such as opportunities to participate in class as well as the guidance and advice available when first entering Further Education and Training. Learners expressed lowest satisfaction with the lack of availability of mental health supports, childcare, and public transport. AONTAS analyse the resulting data and compile a regional report for the participating regional Education and Training Board. At the conclusion of National FET Learner Forum events for the academic year, the Research Team collates all regional report findings and publishes an overarching report, ‘Learner Voices Across Ireland’ (AONTAS, 2024a).

## **2. LEARNER VOICE AND WHY IT MATTERS**

The National FET Learner Forum centres the concept and practice of “Learner Voice.” ‘Learner Voice’ seeks to empower learners by providing appropriate ways of listening to their concerns, interests and needs to develop educational experiences better suited to those individuals (Fielding, 2010). Simply stated, Learner Voice positions learners as partners in the educational process rather than the objects of policy and pedagogy (Dowdall, Sheerin, and O’Reilly, 2019). Partnership in the educational process is demanding. On the one hand, Learner Voice requires learners to play a more active role in their education. On the other, it requires established institutional and policy stakeholders to become ‘more attentive, in sustained or routine ways, to what students want to say about their experience of learning’ (David Hargreaves quoted in Walker and Logan, 2008, 2). Partnership further enjoins educational policy to support mechanisms that engage a diverse range of learners and enable a sustainable response to learner voices.

Learner Voice emerges from long-standing values of democracy, equality and empowerment in adult education and further seeks to extend those values beyond the classroom into institutional and policy-making domains (Fielding, 2010). In doing so, Learner Voice mirrors models of “bottom-up” participation in other areas of civic life, including citizen assemblies, participatory budgeting, and participatory social policy (Arnstein, 1969; Beresford, 2016). Learner Voice does not position learners as service users or customers but as vital participants in co-creating lifelong learning, alongside educators, support staff, managers, and policymakers. Education is understood as a social good, not a product, and a collaborative, transformative process, not a transaction (Lynch, 2023).

The benefits of Learner Voice are many, consistent, and well-documented. For the individual, Learner Voice is not a simple or singular act but engages deeper questions of identity, agency, aspiration, and meaning making. A forum offers participants a shared space to self-actualise, to develop authentic reflection and to access new insight (McLeod, 2011). National FET Learner Forum participants consistently highlight the personal development and self-esteem associated with speaking openly about their programmes and sharing their views with others in a facilitated group discussion. Participants further highlight the benefit of the Forum as a space where they learn more about local FET provision, including previously unknown courses, supports, and progression pathways.

Most important is learners’ recognition that their ETB is listening and wants to

listen to them (Dowdall, Sheerin, and O'Reilly, 2019). While ETBs' invitation to dialogue and listening matters to all adult learners, it may be particularly important for those whose negative views on education have been constructed through long-term experience of marginalisation, silence, or indifference in mainstream provision. 'Promoting, recognising and acting on learner voice, particularly the voices of disadvantaged and marginalised students, can help to provoke the kind of social, economic and political reform that can result in a more democratic society in which social justice and equality can prevail' (Angus et al., 2013). Arguably, the Forum's greatest strength comes from its unique ability to engage the voices of learners who are not traditionally heard in alternative formal structures or representational models (Dowdall, Sheerin, and O'Reilly, 2019).

Finally, by offering adult learners an opportunity to make their recognitions and misrecognitions known, Learner Voice is a site where the personal intersects with the political (Fleming, 2021). Learners' lived experience engages questions of power and decision-making over pedagogy, policy, and resources. By sharing their experience, National FET Learner Forum participants learn about disparities in FET provision across a region as well as areas where provision may not meet learners' satisfaction. During Forum discussions, participants may come to reframe their "private troubles" as "public issues" (Mills, 1959). Equally, Forum participants learn about how to make changes to the educational process and develop capacities for communication, collaboration, and advocacy. The National FET Learner Forum invites learners to take up Learner Voice positions in their Education and Training Boards and encourages further capacity building along these lines.

### **3. PRACTICAL CHALLENGES AND POTENTIAL SOLUTIONS**

Among the practical challenges faced by advocates of Learner Voice, one of the most important is the limited time available at Forum events for participating learners to gain a thorough understanding of Learner Voice and its democratic potential. The nature of the recruitment process ensure that some FET learners may arrive at their focus group with a hazy understanding of the Forum or their role within it. Equally, following the Forum, the commitment of various stakeholders to act on Learner Voice findings may be described as inconsistent. Indeed, there is no formal onus on ETBs or state agencies to action Learner Voice findings or proposals. Nor is there a clear structure for ETBs or SOLAS 'to close the feedback loop' and share ways in which Learner Voice influences

changes in policy or material improvements in practice.

Learner Forum participants consistently express a need to know what will happen to their views after the Forum. They further request stakeholders to offer ‘examples of how these sessions have contributed to changes historically’ (AONTAS, 2024a, 96). The nature of the power imbalance (Arnstein, 1969) between learner and policymaker gives rise to justifiable concerns of ‘tokenism’. The danger here is that the Forum replicates a customer satisfaction survey and reproduces an understanding of education as service provision, one which emphasises outputs over meaningful engagement and democracy (See Fitzsimons, 2017). This presents a risk to the Forum’s longevity as far as failure to act on Learner Voice is likely to lead to non-participation in future.

By way of a potential solution, the NFLF invites learners to take up Learner Voice positions in their Education and Training Boards. AONTAS advocate and support further capacity building along these lines. AONTAS support the development of Learner Voice groups as an appropriate mechanism for FET learners to help clarify, refine, and support the implementation of Learner Forum findings. In this manner, the NFLF’s regional and national reports constitute a rich resource for Learner Voice groups and class representatives, communicating the views and proposals of their peers in FET. Several ETBs with an established Learner Voice group already demonstrate a good practice approach by working in collaboration with learners to respond to learner feedback and proposals. Collaborating with Learner Voice groups to explore solutions to the issues raised in the Forum reports supports learner participation and helps close the feedback loop on the process.

The role of Learner Voice groups in both the recruitment and communication processes for Forum events could be enhanced. By actively involving Learner Voice groups in the selection of participants, the process would not only ensure that learners are better informed about the Forum’s democratic purpose and their role within it but also empower learners to take on a more central, leadership-oriented function in the learner engagement process. By ensuring that Learner Voice group representatives speak at Forum events and discuss progress on past Forum report findings, the process would further close the feedback loop and ensure greater accountability to learner participants. This shift would redistribute some power from the Education and Training Board to the Learner Voice group, fostering a more participatory, learner-driven approach. The more learners understand and feel ownership of the process and its democratic goals, the greater the likelihood of attendance, engagement, and

positive impact.

In conclusion, to borrow Arnstein's language, we view Learner Councils as a means for adult learners to climb the ladder of democratic participation. Ireland's experience of the National FET Learner Forum illustrates the potential for transformative change that arises when we listen deeply to adult learners. Across nearly a decade of forum events and surveys, AONTAS have consistently documented the views and satisfaction of FET learners, as well as their suggestions for future development. The Forum reports' findings and recommendations have the potential to inform and inspire national policy and to secure improvements for all FET learners. What happens next clearly interests and involves a diverse range of actors, including AONTAS, SOLAS, Education and Training Boards and other state agencies. Stakeholders may now choose to continue a developmental conversation with FET learners, to clarify context on learner feedback provided, and to implement solutions. AONTAS support the development of local Learner Voice groups as a vital, democratic space in which to do so.

# ABILITATING DIGITAL LEARNING TO INNOVATE VET AND ADULT EDUCATION: FIELD PRACTICES SUPPORTING POLICY IMPLEMENTATION

Elena Pacetti<sup>a</sup>

Serena Foracchia<sup>b</sup>

Alessandro Soriani<sup>a</sup>

Laura Zambrini<sup>b</sup>

<sup>a</sup>University of Bologna – Department of Education Studies; <sup>b</sup>Demetra Formazione S.r.l.

The pandemic exposed gaps in integrating digital technologies into training systems, but recent years have seen policies emerge to address this challenge. The Marrakesh Framework for Action prioritizes equal access to digital learning for all, including adults. Technology is reshaping how adults learn and the skills required, with educators playing a key role in designing effective digital experiences. The *Digital Education Action Plan 2021-2027* highlights the need for innovation in vocational education and training (VET) providers. Similarly, the European Agenda for Adult Learning emphasizes the professionalization of educators and the adoption of innovative approaches like blended, online, and hybrid learning. While tools like DigCompEdu (2017) support digital literacy and teaching, they are insufficient for adult education and VET contexts. The Erasmus+ Agile-2-VET project builds on DigCompEdu, offering additional resources to integrate technology into training design, delivery, and evaluation. Agile-2-VET fosters collaboration among training institutions, technology providers, and education experts to create models for professional digital training. Its common Training Model equips educators, tutors, and VET staff with skills for innovative digital methodologies. Findings from the project, based on cross-country analyses in Italy, Spain, Germany, and Ireland, aim to advance digital learning in adult education and workforce development.

VET; Adult Education; Digital Learning; competences; training model.

## **1. INTRODUCTION. THE ROLE OF DIGITAL TRANSFORMATION IN ADULT EDUCATION AND VOCATIONAL TRAINING**

In the modern era, the era of the “infosphere” and of the “onlife” (Floridi, 2017) digital transformation has emerged as a pivotal driver of educational reform, particularly in fostering inclusivity, lifelong learning, and skills development. In the context of inclusivity, technology holds the potential to broaden opportunities, especially for adults who might otherwise be excluded from training initiatives. Ensuring equal access to digital learning environments for all learners, including older adults, is a cornerstone of the Marrakech Framework (UNESCO, 2022) and a critical challenge for training centres to address. For adults who are not digital natives, navigating digital learning environments presents a unique set of challenges. These extend beyond logistical concerns, such as access to broadband or IT devices, and basic digital literacy. While these foundational elements are essential to ensuring equal access, it is equally critical that online training programs for adults are designed to align with their cognitive processes, which may be influenced by the pervasive adoption of technology. AGILE2VET Erasmus+ project partners joint together following the COVID pandemic, to make sure that better alignment exists in the use of online tools and in distance education ensuring that distance training meets the specific participants’ needs and fosters meaningful skill acquisition. Digital technologies offer transformative opportunities in the vocational education and training (VET) sector, such as reaching remote populations, reducing costs, facilitating knowledge sharing, and breaking down complex training needs into accessible modules and tutorials. However, to fully harness these benefits, training initiatives must be thoughtfully planned and implemented. The rapid evolution of technological capabilities, often outpacing the professional development of trainers, necessitates careful adaptation to the abilities, digital habits, and dependencies of adult learners. Effective training design should prioritize the learners’ profiles over the subject matter alone. Trainers must possess a nuanced understanding of adult cognitive processes to select the most appropriate combination of training methods and online tools. However, given the rapid proliferation of technological tools, trainers themselves often lack the time or resources to explore all available options thoroughly and little dialogue exists with IT designers and experts. Moreover, trainers themselves are adults who require targeted support to develop their technological proficiency, integrate traditional and modern teaching methodologies, and navigate an ever-evolving educational landscape.

## 2. DIGITAL COMPETENCE

In 2018, the European Parliament and the Council of the European Union adopted an update to the *recommendation on key competences for lifelong learning* originally published in 2006. The document identifies eight fundamental competences considered essential for personal development, employability, social inclusion, and active citizenship. Among these competences – Literacy; Multilingualism; Numerical, scientific and engineering skills; Digital and technology-based competences; Interpersonal skills, and the ability to adopt new competences; Active citizenship; Entrepreneurship; Cultural awareness and expression – one in particular stands out in our highly interconnected and technologically driven society: Digital Competence. This competence not only complements but amplifies the other seven, as it influences learning methodologies, professional environments, and personal interactions in a digital-enriched world (Council Recommendation on Key Competences for Lifelong Learning, 22 May 2018, ST 9009 2018 INIT).

Digital Competence (Vourkari et al, 2022) reflects a broader understanding that goes beyond mere technical skill; it includes an awareness of digital rights, the ability to think critically about online content, and the ability to collaborate effectively in digital spaces. The relevance of digital competence in today's labour market cannot be overstated. With the expansion of remote work and digital communication as staples of modern business, employers increasingly seek individuals who are not only technically proficient but also capable of adapting to new technologies and platforms. These skills encompass everything from basic digital literacy to advanced capabilities. Furthermore, digital competence also includes the ability to work collaboratively in virtual environments.

Beyond professional needs, digital competence has become a vital element of personal and civic life. The pervasive nature of social media platforms, digital news outlets, and online communities, transformed how individuals interact, obtain information, and form their own opinions. In this context, digital competence implies the ability to assess information critically, recognizing biases, identifying credible sources, avoiding misinformation and protect one's own privacy.

The EU's emphasis on Digital Competence reflects its recognition of the critical role this skill set plays in fostering an informed, adaptable, and ethically aware citizenry. Digital literacy enables citizens to engage fully in societal, political, and economic spheres, thereby promoting lifelong learning, self-improvement,

and active participation in digital society. By prioritizing digital competence within its educational and professional frameworks, the EU aims to prepare its citizens for the demands of a technologically advanced world, ensuring that they not only understand digital tools but also navigate them with responsibility and discernment.

### **3. THE PROJECT AGILE2VET**

AGILE-2VET was designed to respond to a specific need of innovating the way in which training was delivered in a very critical moment for VET system: the disruptive COVID-19 pandemic. In the training sector organisations working in this field started to question themselves on how to reach learners with their proposals in an effective manner and with high-quality approaches, changing and shifting away from the “traditional” onsite/classroom training proposals. The need to reshape training offers had to start from the conception of training offers, in their delivery and evaluation, to this extent all VET staff had to be engaged in this innovation process, involving on one side multimedia, ICT and technology experts to support this cultural change within training organisations; while on the other experts in eLearning pedagogies and methodologies to configure a new model to design and deliver training to adults. A further element considered in the drafting of the project was the need to make VET attractive again for learners, in a digital era that risks leaving behind the most vulnerable and that makes the use of training contents that are sometimes of poor quality and professional opportunities. A project centred on the proper adoption of technologies such as AGILE-2-VET can boost the VET sector by strengthening the capacity of VET providers to deliver inclusive and high-quality digital training. The main project focus has been the ability to implement online, blended and distance training and learning occasions, in collaborations with digital technology providers and experts in educational technologies and pedagogical practices. The project’s goals included: enriching the skills of VET providers, specifically trainers and tutors, with respect to remote training, through the creation of a common curriculum addressing specific skills: technical (ability to use technologies and tools, instructional design, etc.); facilitation skills (pedagogical, methodological, communicative ones); managerial (definition of times and methods, feedback and monitor learners’ path through available digital technologies).

#### **3.1 Phase 1: the analysis the model and the identification of skills**

In the initial part of the project a research action developed by the consortium

investigated the most used models and methodologies in the field of digital training, analysing them from the point of view of VET. Focus groups were then created with the target groups and stakeholders in the sector to deepen the skills needed to adopt a new approach to this type of training. The FG has been conducted in 5 countries with interesting cultural differences arising. Result 1 is a comprehensive report focused on identifying and analysing the essential tools and skills needed to develop successful holistic digital training programs in the VET sector. The study employs a triangulated methodology combining a review of existing learning models with data collected from focus groups and surveys conducted in four countries: Italy, Spain, Ireland, and Sweden. These activities yielded 76 responses, providing valuable insights into course development, learning processes, course structures, learner support, and evaluation mechanisms.

This study developed the “Agile-2-VET Holistic Digital Training Model”, a framework defining key skills required for high-quality online training. By analyzing diverse national experiences during the pandemic, the report captures best practices, innovative approaches, and lessons learned that enhance the resilience and digitization of the VET landscape. The study’s findings emphasize the importance of stakeholder contributions, and the usability of the data collected. The models and insights presented can be applied to other VET organizations, researchers, and universities aiming to advance digital transformation and develop innovative training methodologies. This report serves as both a repository of knowledge and a practical guide for fostering digital readiness and innovation in the VET sector.

### **3.2 Phase 2: Training Model Development**

Phase 2 of the Agile2VET project focused on enhancing digital competency development in response to the transformative digital environment. This phase revolved around the development of a training proposal/scheme for trainers. Starting from the results of the research, a skills framework (matrix of skills) has been structured for the different phases of the training process. This framework served as the foundation for developing a self-assessment tool aimed at evaluating current digital skills and guiding users toward deeper knowledge. It was deemed to be important that the whole training process be anticipated by a self-assessment scheme which has proven to be the most effective step for trainers: gaining consciousness of the capacities of adapting to technology and using it in different contexts and environments. The self-assessment tool features questions aligned with the training model, enabling users to identify

strengths and weaknesses across various competency areas. Upon completion, the tool generates a wheel graph, visually representing skill gaps and providing tailored resource suggestions. This user-centric approach empowers learners to make informed decisions about their learning paths while fostering continuous improvement in the digital learning environment.

Based on this matrix, an eLearning platform was built with the active contribution of all partners in the structuring and insertion of supporting teaching resources. To support skill development, the project introduced the Microlearning Toolkit, a collection of digital resources, including links to open educational resources (OERs). These resources align with the Agile2VET training model and cater to users' specific needs, addressing also different cultural contexts as microlearning tools may differ according to language. The toolkit, available in five languages—English, Italian, German, Spanish, and Swedish—enhances accessibility and usability for diverse audiences. An innovative aspect of this output is its ability to support trainers and learners across VET, higher education, and adult education. By using the Agile2VET platform and manual, trainers gain new methods for designing and delivering engaging digital training programs, while learners benefit from more attractive and effective learning experiences.

### **3.3 Phase 3: Experimentation & Manual definition**

In the last phase of the project key findings from the AGILE-2-VET emerged highlighting essential strategies for optimizing its implementation in VET and related educational contexts. These findings include: the need to address challenges in implementation, improve online participation, manage resistance, and enhance trainees' self-management skills with targeted resource guidance. The inclusion of socio-emotional and technological skills was identified as crucial for enriching the training model, alongside continuously improving platform resources based on feedback and aligning content with sector-specific labour market competencies. Flexibility and adaptability remain central, with ongoing feedback ensuring the model evolves to meet emerging needs while maintaining inclusivity and accessibility for diverse audiences. Furthermore, a process for assessing the long-term impact of courses on participants' practices has been established, fostering continuous improvement. Exploring innovative technologies to align with educational trends also emerged as a key priority for sustaining relevance.

As a concluding initiative, the project produced a comprehensive manual designed to support VET organizations in leveraging the AGILE-2-VET e-learning

platform. The manual explains the methodology and approach, presents project results, and provides practical guidance on platform use. It aims to engage VET organizations in contributing to the tool's ongoing development and offers real case scenarios to demonstrate practical applications of the AGILE-2-VET framework. Each scenario includes details on the case context, target group, competencies addressed, solutions adopted, and links to online tools for support.

#### **4. CONCLUSIONS**

At the end of the project (July 2024) it is important to emphasise that there are still many challenges to be met in the VET field, especially with regard to the continuing education of economically and socially disadvantaged adults. In recent years, also due to the covid-19 pandemic, VET professionals have certainly improved their digital skills because adult education is increasingly linked to digital for plan, design, delivery and assessment, maintaining a Universal Design for Learning approach.

The action-research of the Agile2Vet project enabled the participants and stakeholders involved to reflect on and experiment with a new holistic approach for training processes that enables trainers to become aware of the digital competences needed to design courses, produce their own content and evaluate it. It is therefore important to continue this philosophy even now that the project has come to an end so that the project partner organisations can:

- fully adopt the existing platform and implement it in the different partner countries;
- allow the training and self-assessment scheme to be used by trainers and facilitator as a process to assess quality;
- foster project dissemination and development of the initial tools;
- continue the dialogue and experimentation with technology providers and designers;
- continue researching around the cognitive process in the era of digital transition.
- Agile2Vet's journey has just begun!

# SKILLS DEVELOPMENT FOR SOCIAL JUSTICE?: A CRITICAL READING OF ADULT EDUCATION POLICIES IN THE EUROPEAN AND THE GREEK CONTEXT

Eleni Prokou<sup>a</sup>

Georgios Koulaouzides<sup>b</sup>

<sup>a</sup> Panteion University of Social and Political Sciences, Athens; <sup>b</sup> Hellenic Open University

This paper argues that the European Union (EU) accreditation policies in ‘lifelong learning’, with the emphasis in skills’ development through tools such as the European Qualifications Framework (EQF), the Individual Learning Accounts (ILAs) and the micro-credentials, stress the economic function of ‘lifelong learning’ (LLL). Through these policy tools, there is a shift in responsibility from institutions (as service providers) to the individuals, while privatisation trends put equity aims in LLL at risk. With the dominance of the aim of employability, social aims are underestimated, while adult (popular) education is marginalised. This is the situation also in Greece, where LLL in the form of ‘continuing vocational training’ has prevailed and an emphasis has been attached to the aforementioned policy tools, albeit not fully implemented.

Adult education and training policies, skills, individualisation, Europe, Greece

## INTRODUCTION

The shift in adult education policies in the EU towards serving the needs of the labour market is an established reality. With the support of research bodies (e.g. CEDEFOP), policy tools have been developed, highlighting vocational skills as the most important contribution of adult education to social well-being. This paper aims to analyse the EU accreditation policies in LLL, by approaching tools such as the EQF, the ILAs and the micro-credentials, which are strongly associated with the aim of employability. Then, the paper will discuss the transfer of these policy tools in the case of Greece.

## **ON LLL AND THE DEVELOPMENT OF SKILLS FOR 'EMPLOYABILITY'**

The strategy of promoting vocational training for employability has been pursued for years with great methodical steps. The first step was the introduction of the term LLL into the terminology of adult education policy. This vague term, despite the individual clarifications given in analyses of the definition by organisations (e.g. UNESCO, OECD, the European Commission), was the first indication of the focus of adult education policies on individual responsibility (Field, 2010).

Over the last three decades, the economic function of LLL is dominant at international, EU and national levels. The emphasis is on employability and the responsibility has shifted from the state to the private sector. Individuals are encouraged to develop their skills on their own responsibility and often at their own expense, minimising both organisational and financial public costs (Prokou, 2020). The role of the state in ensuring equity has been reduced to a form of supervision towards the unspecified goal of achieving a 'learning society'. However, it has been overlooked that it is in social welfare schemes that more opportunities are given for participation in adult education and training, while structural inequalities may persist in the labour market despite people having highly developed skills (Prokou, 2018).

Indeed, the emphasis on vocational accreditation of learning means that the responsibility for learning and the integration into employment rests with the individual. In addition, the focus on certification policies for employability has led to a decline in interest in the objectives of social inclusion, active citizenship, critical thinking, and personal development (Koulaouzides, 2017). The development of competences linked to the function of democratic societies, social solidarity, tolerance, and cultural tolerance have been marginalised and with them the traditions and institutions of popular education in many countries in Europe (Koulaouzides & Romano, 2022).

The strategy of promotion of LLL for employability and individual responsibility has acquired very concrete tools for implementation.

## **EQF, ILAS AND MICRO-CREDENTIALS: THE CONTEMPORARY TOOLS FOR IMPLEMENTING NEOLIBERAL CONCEPTS OF ADULT EDUCATION**

The EQF was put in practice across Europe in 2008. Each country would reference its national qualifications (in terms of diplomas, certificates or awards) to the eight EQF levels. The descriptors covered the full range of learning outcomes, irrespective of the learning or institutional context. They

covered work and study situations, academic and vocational settings, initial and continuing education or training, i.e. all forms of learning, formal, non-formal and informal (European Commission, 2008, p. 4). Each level of the EQF was defined by a set of descriptors (for knowledge, skills, competencies), which indicated the learning outcomes relevant to qualifications (Official Journal of the European Union, 2008, pp. 5-6). A revision of the EQF in 2017 kept the core objectives of creating transparency and mutual trust in the landscape of qualifications in Europe, while member states committed themselves to further develop the EQF (Official Journal of the European Union, 2017). Overall, the EQF created a normative framework for classifying and managing the phenomenon of human learning by emphasising those skills and qualifications clearly relevant to the labour market. What was missing to complete this effort were the implementation tools.

This gap is now being filled by the European Commission's flagship initiatives to promote and implement ILAs and the recognition of micro-credentials in the member states. These two tools emerged and were presented as a panacea to address critical social issues such as unemployment and underemployment especially during the period of the COVID-19 pandemic (Council of the European Union, 2022a & 2022b). The focus is in harmony with the pursuit of adaptability, employability and flexibility in the labour market, promoting a model of education that focuses on individual responsibility, vocational training, skills' upgrading and re-skilling.

In particular, an "individual learning account' is a delivery mode for individual training entitlements. It is a personal account that allows individuals to accumulate and preserve their entitlements over time, for whichever eligible training, guidance, or validation opportunity they deem most useful and whenever they want to, in line with national rules. It grants the individual full ownership of the entitlements, irrespective of the funding source" (Council of the European Union, 2022a, p. 30).

According to the Council Directive, the state, employers or even the workers themselves will be able to deposit funds in these accounts, which can be used for the acquisition of training services, counselling and certification programmes. This system drastically reduces the involvement and the responsibility of the State in the provision of free public adult education services. While it seems that such a system of individual responsibility is capable of enhancing individual adaptability and competitiveness in an increasingly fragmented labour market, in reality its implementation may lead

to the formation of new inequalities in terms of access to learning opportunities. Interestingly, OECD notes that “Individual learning schemes present attractive features.... But individual learning accounts are unlikely to be a panacea to the challenges set by the new world of work. Rather, like any other training measure, they become a Pandora’s box once one starts looking at the details” (2019, p. 7).

Especially if the system is based mainly on the financial participation of workers or employers, those who are in more economically advantaged positions or those who work in firms where employers invest in training will have more opportunities for training and skills upgrading than those who work in less advantaged or even precarious jobs and are less-skilled. Recently a comparative study of similar initiatives that examined the application of ILAs in several countries presented evidence that in countries like France, the least skilled “have not utilised this program to the same extent as those with higher skill levels” (Cummins, et al, 2022, p. 152). Also, the close link between ILAs and the exclusive service to the needs of the labour market deprives adults of their individual right to personal development (Thursfield et al, 2002, p. 44).

The micro-credentials, in which workers and the unemployed will most probably invest the resources of their ILAs, concern the learning outcomes of short, specialised training programmes focusing on specific skills or knowledge. According to Brown et al, “... there is increasing interest from industry, policymakers and educational stakeholders in the value of micro-credentials to enable learners to attain more personalised micro versions of formal/credentialed learning, which better recognise and signpost their achievements across the lifespan” (2021, p. 237). Unlike traditional degrees or vocational training certificates, micro-credentials seem to be more flexible and often digital, allowing participants to acquire them quickly and adapt them to the needs of the labour market. It is also believed that these new methods for skills development could support the recovery process from whatever happened in the labour market during the COVID-19 pandemic (CEDEFOP, 2022). Micro-credentials embody a neoliberal conception of the purpose and value of education. According to the relevant recommendation (Council of the European Union, 2022b), micro-credentials are considered to be important because workers can upgrade their skills in line with market trends. There is also evidence that the labour market recognises to some extent the value and validity of micro-credentials (Tamoliune et al., 2023).

Nevertheless, there are studies showing that many HR professionals challenge

their practical transferability (Alasmari, 2024). Micro-credentials are also seen, by researchers, as a way of manipulating curricula and teaching practices in an attempt to harmonise the work of educational institutions and especially universities with putative labour market requirements (Wheelahan & Moodie, 2021).

The European Trade Union Confederation and the European Trade Union Committee for Education emphasised the dangers of integrating micro-credentials into vocational training and skills initiatives in a joint communication. They argued that the acquisition of skills in this way affects the holistic approach to education, and the quality and recognition of workers' training, as there is a risk that micro-credentials will be issued and arbitrarily placed at the same level in the EQF as full qualifications and skills acquired after participation in organised and long-term vocational and university education programmes (ETUC-ETUCE, 2020).

### **LLL AND ACCREDITATION POLICY TOOLS IN GREECE**

In Greece, within Law 3879/2010 “Development of Lifelong Learning and Other Provisions”, the indication of the focus of adult education policies on individual responsibility could be seen, through the introduction of the EQF (Prokou, 2014). The process of referencing of the Hellenic Qualifications Framework (HQF) to the EQF started after the enactment of this Law. The aim of the HQF was announced by EOPPEP (the *National Organisation for the Certification of Qualifications and Vocational Guidance*) in 2013 and was planned to be done gradually. In the first phase, the objective set was the classification of qualifications within the formal educational system. At a later stage a classification system was to be developed for qualifications acquired through non-formal education and informal learning. The eight Levels of the HQF covered the entire range of qualifications, from compulsory education to higher education. By Law 4283/2014 “Establishment and organisation of the National Education Policy Council...”, a classification of the following qualifications was introduced: Vocational Training School (SEK)–Specialty Certificate – Level 3, General Upper Secondary School Certificate – Level 4, Vocational Upper Secondary School Certificate – Level 4, Vocational Upper Secondary School ‘degree’ (EPAL) – Level 4, Vocational Upper Secondary School ‘degree’ and apprenticeship class – Level 5, Vocational Training Institute (IEK) – Specialty Diploma – Level 5. The remaining three levels of the HQF corresponded to the degrees offered by higher education. In 2015, EOPPEP developed and designed

Learning Outcomes and in 2016, it established the Greek Qualifications Register. Regarding *Initial Vocational Training*, EOPPEP is responsible for the certification exam of students having completed training at Initial Vocational Training Institutions (IEK-Level 5). Upon successful exam results, IEK graduates are awarded the Vocational Training Diploma recognised both in Greece and in EU member states. Regarding *Continuing Vocational Training*, EOPPEP is responsible for the certification exam of students having completed training at Lifelong Learning Centres (KDBM). After graduating from the three-year vocational education at the Vocational Upper Secondary School (EPAL), EOPPEP is responsible for the certification exam of students who have successfully completed the fourth year named *Apprenticeship Class* (EOPPEP, 2016).

The Greek government introduced the ILAs with law 4921/2022 (Government Gazette, A, 75, 18/04/2022) titled “Jobs Again”. Individual Skills Accounts were introduced for the purpose of crediting training entitlements. During the few days of consultation on this law, initially the Small Business Institute of the Hellenic Confederation of Professionals, Craftsmen, and Merchants (GSEVEE) strongly criticised this regulation. Two years have passed since the law has been passed (as a result of the EU directive), but these accounts have not been activated and the relevant skills.gov.gr platform remains inactive.

The Labour Institute of the General Confederation of Greek Workers (INE GSEE, 2022) argued that the ILA is likely to be a means of individualising the unemployment problem and fits into a broader neoliberal logic that unemployment and lack of skills are the result of inadequate preparation of the individual to enter the labour market.

The micro-credentials have not developed so far in Greece. However, there is an official public discourse, coming mainly from the Hellenic Authority for Higher Education, which promotes their introduction in the Lifelong Learning Centres (KDVM) of the Greek universities (Hellenic Authority for Higher Education, 2022).

## **CONCLUSIONS**

The implementation of the EQF, the ILAs and the micro-credentials reflects the neoliberal philosophy about the individualisation of responsibility. These tools promote the idea that education is an individual investment rather than a social obligation and that the only education of value is that which serves the labour market. This can lead to increasing inequalities, as people with fewer resources,

skills and opportunities have reduced opportunities to access quality education and training. Moreover, the emphasis on adapting to labour market needs may limit critical thinking, creativity and a broader understanding of social and cultural issues. In Greece, nowadays, the vocationalisation of adult education has almost completely prevailed, also through an emphasis attached to the promotion of these policy tools (albeit not fully implemented), pulverising a long-standing tradition of popular education that operated with wide social acceptance and recognition.

# RADICALIZATION AND POST-CRITICAL PERSPECTIVE

Claudio Melacarne<sup>a</sup>

<sup>a</sup>University of Siena

This paper explores how the Post-Critical Pedagogy manifesto can enhance our understanding of radicalization phenomena. We examine how post-critical pedagogy might inform research approaches and methodologies that guide the prevention of violent radicalization. A key focus is how the concept of 'radicalization' is often positioned as external to educational frameworks. This framing overlooks fundamental questions about the principles underlying 'radical thought', whether education about and toward 'radical thought' exists, and most importantly, how to interpret and evaluate 'radical thought' using meaningful criteria. The post-critical perspective offers a promising avenue for re-engaging with radical thought and examining both the constructive and destructive principles that drive it. This approach views these phenomena as expressions of a world that demands more than simple 'correction', 'punishment', or exposure (as in critical pedagogy). Instead, it suggests a more nuanced understanding of radicalization within educational contexts.

Post critical pedagogy; Radicalization; Educational prevention

## INTRODUCTION

This proposal aims to discuss what contribution the Post-Critical Pedagogy manifesto can offer to the interpretation of radicalization phenomena. In particular, we will reflect on how a post-critical pedagogy can suggest the use of research languages and postures capable of orienting prevention practices of radicalization phenomena (Schmid, 2013) that lead to violence. In the manifesto of post-critical pedagogy (Hodgson, Vlieghe, Zamojski, 2020) the positions of the scholars interested in launching the post-critical challenge appear clear: transition from procedural normativeness to principled normativeness (there are principles to defend!); the affirmation of pedagogical hermeneutics (the construction of a relational space is a possibility to be built,

neither an ‘a priori’ nor a principle far from the here and now); affirmation of a pedagogy ‘beyond criticism’. In particular, the idea espoused in this proposal is to see how the construct of ‘radicalization’ (Fabbri, Melacarne, 2023; Sabic El Rayess, Marsick, 2021) is often defined as external and outside a educational framework, in this sense losing along the way a fundamental question about the principles which orient ‘radical thought’, whether there is an education to and about ‘radical thought’ but above all how to read ‘radical thought’ and with what criteria of discrimination. What seems promising to us in a post-critical perspective is the challenge of getting back in touch with radical thought, with the positivity or negativity of the principles that fuel it, considering these phenomena as expressions of a world that must not only be ‘corrected’ or ‘punished’, or which must be revealed (critical pedagogy) (Latour, 2004). According to this approach, radicalization must not be deconstructed and broken down to be evaluated and understood within standards (Caramellino, Melacarne, Ducol, 2020). The most relevant question posed by the post-critical perspective, however, is the following. Education that deals with ‘de-radicalization’ or ‘prevention’ is based on the idea that there is nothing to save in the processes that generate these phenomena. It is an education in opposition to something that must be corrected, external, to be criticized in order to ‘fight’. The post-critical perspective, paradoxically, would still invite us to take into consideration a perspective that is more open to considering what is positive about the radical process, even if only in some of its forms. A non-secondary solicitation concerns the question that post-critical pedagogy raises regarding the value of principles. It is a classic and interesting short circuit if thought about in the context of the debate on radicalization and social justice. Trust and hope in the present and in emerging phenomena push us to also open up to the study of radicalization phenomena which, although not manifesting themselves as aligned with an idea of normative or socially shared social justice, may incorporate hope of positive change. In our opinion, the post-critical perspective can help us to re-read the theories and methodologies for preventing radicalization processes within a more authentic and self-directed educational perspective.

## **1. RADICALIZATION THROUGH POST-CRITICAL LENS**

Recent developments in educational theory have introduced post-critical pedagogy as a novel approach to addressing radicalization. Moving beyond traditional dichotomies between security-focused and educational approaches, post-critical pedagogy offers new perspectives on understanding

and preventing radicalization.

In 2016, Hodgson, Vlieghe, and Zamojski revolutionized this field by introducing the fundamental principles of post-critical pedagogy. These include principle-based normativity, emphasizing fundamental principles rather than procedural standards; pedagogical hermeneutics, creating spaces for mutual understanding rather than merely interpreting others; post-critical orientation, assuming equality and transformation potential while protecting educational experiences; present-focused hope, embracing current possibilities rather than distant ideals; and love for the world, valuing education's intrinsic worth over instrumental goals.

This framework represents a significant shift from traditional critical pedagogy. It emphasizes an affirmative perspective that acknowledges the world's value while recognizing the need for change. Unlike conventional approaches that treat relationships as given, post-critical pedagogy views them as achievements requiring active construction and maintenance.

The implications for addressing radicalization are profound. Instead of attempting to deconstruct or eliminate radical thinking, post-critical pedagogy suggests holding together conflicting elements, seeking healing and potential rather than correction. This approach raises fundamental questions about respect and dialogue, particularly how conventional notions of respect might paradoxically hinder authentic communication.

The three major innovations of post-critical pedagogy offer crucial insights into the complex processes of radicalization. By recognizing radical thinking's educational potential, this approach acknowledges that radicalization often begins with legitimate questions about social justice, identity, and meaning. People may turn to radical ideologies not out of inherent destructiveness, but from a genuine desire to understand and improve their world. This perspective helps us recognize that radical thought can emerge from positive impulses like the search for truth, justice, or community, even if these impulses later become distorted.

Understanding radical thinking's educational potential reveals how the development of radical perspectives often intertwines with learning processes. Individuals might adopt radical positions through intense engagement with social issues, historical study, or philosophical questioning. Their journey toward radicalization frequently involves sophisticated meaning-making processes, critical analysis of social structures, and deep engagement with complex ideas. By acknowledging this educational dimension, we can better

understand how intelligent, thoughtful people might develop extreme positions through their pursuit of knowledge and understanding.

The promotion of dialogue without predetermined outcomes represents another crucial insight into radicalization processes. Traditional approaches often fail because they begin with fixed assumptions about what constitutes “correct” thinking. This predetermination can alienate individuals who feel their perspectives are dismissed before being truly heard. The post-critical approach suggests that authentic dialogue, where outcomes remain open and multiple viewpoints can coexist, better addresses the psychological and social dynamics that contribute to radicalization.

This emphasis on open dialogue helps us understand how the lack of spaces for authentic exchange might drive radicalization. When individuals feel their concerns or perspectives cannot be expressed within mainstream discourse, they may seek more extreme venues for expression. The post-critical approach suggests that creating spaces where different viewpoints can be explored without immediate judgment might prevent the isolation and polarization that often fuel radicalization.

The shift toward disengagement rather than complete ideological transformation offers practical insights into how radicalization operates and how it might be addressed. This approach recognizes that beliefs and behaviors, while connected, are not inseparable. Someone might hold radical views yet choose non-violent ways of expressing them. By focusing on behavioral change rather than thought reform, this perspective helps us understand how individuals might maintain strong convictions while finding more constructive ways to act on them.

This focus on disengagement also illuminates how radicalization often intensifies when individuals feel their fundamental beliefs are under attack. Attempts to forcibly change someone’s core beliefs frequently backfire, strengthening their commitment to radical positions. Understanding this dynamic helps explain why conventional deradicalization programs, which often aim at complete ideological transformation, may prove counterproductive.

Moreover, the post-critical perspective helps us understand radicalization as a complex interaction between individual agency and social context. Rather than viewing it as either purely individual choice or social determination, this approach reveals how personal experiences, social conditions, and educational opportunities intersect in the development of radical perspectives. It suggests

that addressing radicalization requires attention to both individual meaning-making processes and broader social contexts.

This framework also helps explain why some individuals become radicalized while others in similar circumstances do not. By recognizing the role of individual agency and meaning-making in radicalization processes, we can better understand how personal factors interact with social conditions to influence outcomes. This understanding suggests that prevention efforts should focus on supporting individual meaning-making processes while creating social conditions that encourage constructive rather than destructive expressions of radical thinking.

The post-critical approach thus offers a more nuanced and effective framework for understanding and addressing radicalization. It suggests that preventing violent radicalization requires not just countering extreme ideologies, but creating spaces where individuals can explore complex ideas, express strong convictions, and engage in meaningful dialogue while finding non-violent ways to pursue social change.

The practical implications of this shift are significant. Traditional approaches to deradicalization often aim at comprehensive ideological transformation, viewing radical thinking as fundamentally flawed. In contrast, post-critical pedagogy suggests examining what might be valuable in radical perspectives while working to prevent harmful manifestations.

This approach is particularly relevant in multicultural educational contexts, where fear of offense can create barriers to genuine dialogue. By redefining respect as active engagement rather than passive reverence, educators can create more authentic spaces for exchange and understanding.

The post-critical perspective suggests that preventing violent radicalization doesn't necessarily require eliminating radical thought entirely. Instead, it proposes creating educational spaces where diverse perspectives can be explored safely, and where transformation occurs through engagement rather than confrontation.

This represents a fundamental departure from traditional prevention strategies. Rather than focusing solely on security or behavioral modification, it emphasizes understanding, dialogue, and the potential for positive change within radical thinking itself. This nuanced approach may offer more effective ways of addressing radicalization while respecting individual autonomy and fostering genuine educational relationships.

The methodology's success lies in its ability to maintain the tension between

acknowledging legitimate concerns within radical thought while preventing violent expressions. By focusing on disengagement rather than deradicalization, it offers practical ways to reduce harm while respecting intellectual freedom and promoting deeper understanding.

This innovative approach opens new possibilities for addressing radicalization in educational contexts, suggesting that effective prevention might come through engagement and understanding rather than confrontation and correction. It offers a promising path forward in the complex challenge of addressing radicalization while maintaining educational integrity and respect for human dignity.

# EXPLORING THE NORMATIVE ASSUMPTIONS OF THE “INCLUSION PARADIGM” THROUGH THE LENS OF THREE SOCIAL JUSTICE THEORIES

Marie Verhoeven <sup>a</sup>

Amandine Bernal Gonzalez <sup>b</sup>

<sup>a,b</sup> UCLouvain, Interdisciplinary Research Group in Socialisation, Education and Training (GIRSEF), IACCHOS Institute.

This article explores the normative assumptions of Inclusive Education, which has shaped global educational policies over the past two decades. Moving beyond its neoliberal interpretation, it situates Inclusive Education within the plural evaluative frameworks of late modernity. Drawing on the theories of Rawls (redistribution), Honneth (recognition), and Sen and Nussbaum (capabilities), the study highlights their strengths and limitations in addressing educational justice. Advocating for a plural critique, it integrates these perspectives to tackle the multidimensional challenges of inclusion, offering theoretical insights and critical tools for analyzing educational policies.

Inclusive Education, Political and Social Philosophy, Post-Critical Approach

## INTRODUCTION

Over the two past decades, the semantics of inclusion have progressively colored most international declarations on education (Husson & Pérez, 2016; Norwich, 2014). Spreading quickly under the impetus of organizations such as OECD or UNESCO, and translated in many national legislations, this “Inclusive Education” paradigm represents a major normative shift in policy narrative at global scale. This shift reconfigures the frames of meaning in which educational justice issues are expressed, or the language in which actors express desirable perspectives (Boltanski & Chiapello, 1999).

The aim of this paper is to contribute to uncover the normative assumptions that underpin the IE paradigm, stepping away from an interpretation of it as simply

reflecting a neoliberal agenda (Laval et al., 2011). We have sustained elsewhere (Verhoeven & Bernal Gonzalez, 2023) that this new configuration echoes the social grammar of late/reflexive modernity (Beck & al., 1994), as well as its “new anthropology of vulnerability and capacity” (Genard, 2015). In the following lines, in line with a “postcritical turn” (Hodgson, Vlieghe & Zamojski, 2017) redefining critique beyond hermeneutics of suspicion and assuming that late modernity is defined by a plurality of evaluative frameworks, we scrutinize the IE paradigm through the lenses of three theories of social justice: redistribution, recognition and capabilities. Each approach highlights specific dimensions of educational justice, encouraging a “plural critique” of IE by combining these perspectives.

### **INCLUSIVE EDUCATION (IE), A HOLISTIC APPROACH TO ADDRESSING INEQUALITIES**

The IE framework originates in a two-folded critique of previous educational responses to “special needs students”: the critique of social segregation and learning inequalities related to the existence of separate schools, which prompted a shift toward integrating them into mainstream schools (Thomazet, 2009); and the will to break with the prevailing ‘deficit’ model for thinking “disability”, associated with the recognition of each learner’s unique strengths and potential. Over time, the initial focus on disability has broadened to encompass a wide range of learners and needs. Inclusion has gradually moved towards a universalist perspective (Ebersold, 2017), as its goal is now to ensure that education systems enable each student to develop its own potential without being defined by its difficulties. The IE model also reflects a shift in the way of addressing inequalities, emphasizing the responsibility of educational organizations to respond to the diversity of learners, defined by medical, psychological, cognitive, or sociocultural differences.

Significant variations can be observed in the ways in which the main international organizations envision this global narrative. While UNESCO (2015) links inclusion to universal rights and cultural recognition, the OECD (2018) sees it as a lever for human capital development, and the European Union (2020) points to the fight against marginalization and exclusion.

A decade after its widespread adoption, many countries have adapted this global IE discourse to their own realities, leading to a high range of reforms and institutional arrangements. But, beyond disparities, there is a common IE “narrative”, asserting the need to guarantee that every individual, considering

their physical, cognitive, emotional, or social vulnerabilities and potentialities, has the right to benefit from the best institutional, organizational, and pedagogical conditions to maximize their potential and their personal development throughout life. IE is also about protecting students from vulnerability and exclusion, ensuring their well-being and active participation in social and economic life.

## **INCLUSIVE EDUCATION THROUGH THREE MAJOR THEORIES OF SOCIAL JUSTICE**

The “inclusive turn” in educational policies calls for new conceptual tools to capture its complex and plural normative foundations. To contribute to this task, we will draw on three major theories of social justice: John Rawls’s redistributive approach, Axel Honneth’s recognition theory, and the capability approach by Amartya Sen and Martha Nussbaum. Each offers a unique lens to understand justice claims underlying inclusive education.

### **The Redistributive Approach: Equity through Resource Distribution**

John Rawls’s theory, developed in *A Theory of Justice* (1971), seeks to define the principles required to establish a just society, with a focus on fair social cooperation. Rawls argues that justice in society is achieved when individuals have access to resources that are essential for functioning effectively in society, such as rights, freedoms, power, opportunities, income, health, and self-respect. His approach is distributive, centering on the fair allocation of these “primary goods” to ensure equality of opportunity and fair access to socioeconomic positions based on merit and talent (Arnsperger & Van Parijs, 2003; Rawls, 1971). The cornerstone of Rawls’s theory is the “difference principle” which stipulates that inequalities are acceptable only if they result in compensatory benefits for the least advantaged members of society (which challenges purely egalitarian distribution).

While Rawls did not develop an explicit theory of educational justice, his foundational principles have significantly influenced educational policies, particularly those aiming to establish *de jure* equality and equality of opportunities in education. This approach underpinned most educational reforms of the second half of the 20th century and was translated into a set of policy measures targeting equal access, equal treatment, and compensatory initiatives (Michiels, 2017; Pourtois, 2008).

Such a redistributive conception of educational justice has weakened, but not disappeared from the IE paradigm. However, it has taken on new meanings,

promoting a more differentiated and personalized understanding of educational equity (UNESCO, 2015). The Rawlsian perspective is echoed in the affirmation of a principle of *accessibility*, meaning that, beyond equal access, schools are expected to provide adjusted educational resources considering individual differences; the concept of equal treatment is also reframed into one of *equitable support tailored to individual needs*, moving beyond standardized treatment (Ebersold, 2017).

### **The Recognition Approach: Flourishing through Recognition**

Axel Honneth's theory of recognition emphasizes the social and relational dimensions of social justice, beyond the mere distribution of resources or goods. According to Honneth, recognition is central to justice, as it enables individuals to build self-respect, integrity, and a sense of personal and social value. Conversely, the lack of recognition can result in marginalization, humiliation, and exclusion, and hamper individuals' capacity to participate in social life (Honneth, 2002). Honneth identifies three essential dimensions or sources of recognition. The first one is linked to primary experiences of love and affective security in interpersonal relationships (essentially in the private sphere), as a precondition for self-confidence. The second one has to do with law, and with the respect which is conquered when someone is treated as an equal subject of rights in the public sphere; the third dimension relates to social utility in the socio-professional sphere. Altogether, these three dimensions provide a stimulating grid for interpretation of the normative principles at play within the educational sphere (Michiels, 2017).

The grammar of interpersonal recognition is increasingly evident in education, as greater attention is given to the relational conditions essential for students' self-confidence and personal growth. The IE framework promotes a new *ethical framework of interpersonal relations* within schools, highlighting emotional bonds and mutual respect. Recognizing each student's uniqueness and fostering supportive relationships are viewed as vital for developing a positive self-image, while their absence can lead to low self-esteem and hinder students' growth. Issues such as bullying, humiliation, and contempt further underscore the importance of this relational grammar. The second source of recognition, tied to equal rights, has also gained importance in education. While schools were once governed by their own rules, democratic norms and equal rights are now seen as legitimate norms and objectives. The IE framework aims to prepare students for active, responsible citizenship (OECD, 2018), encouraging them to express opinions, participate in deliberative processes,

and act autonomously. This emphasis on “school democracy” reflects the growing recognition of rights, with any denial or discrimination criticized as a failure of equality. Finally, the recognition of social utility is visible in how IE values each student’s potential contribution to society. This is evident in affirming the inherent worth of every student, fostering a sense of belonging and social value. The IE framework also promotes the equal worth of diverse educational pathways (vocational, technical, or general), emphasizing their valuable contributions to societal development.

Thus, the tridimensional grammar of recognition is clearly visible in IE semantics, through claims of relational respect, equal rights and democratic norms, and social utility.

### **The Capability Approach: Real Freedom and Empowerment**

Amartya Sen and Martha Nussbaum’s capability approach (CA) offers yet another perspective on justice, centering on “real freedom”—the actual capacity of individuals to pursue lives they find meaningful. Beyond a formal notion of equality, the CA measures individuals’ real opportunities to accomplish their aspirations, recognizing that people have unique needs, backgrounds, and social contexts.

Sen’s concept of capabilities refers to individuals’ “real freedom” to achieve desirable life outcomes, focusing on what people are genuinely able to do and be. It refers not only to individual abilities but also to social, environmental or institutional “conversion factors” that either enable or restrict individuals’ ability to transform resources into meaningful achievements (Bonvin & Farvaque, 2007; Robeyns, 2006).

Several elements of the CA find an echo in the IE paradigm. The grammar of capabilities is clearly visible when it is suggested that inclusive schools should create environments that respect human diversity and provide students with adapted tools and resources to develop their potential. The CA also pays attention to the social and institutional conditions of capabilities deployment. This claim is clearly identifiable in the IE recommendations, that require school organisations to transform themselves into supportive educational environments, likely to strengthen the ability of pupils from different backgrounds to convert educational resources into effective learning and meaningful life projects. IE is also in line with the multidimensional evaluative basis proposed by the CA, which does not stick to instrumental goals (academic performance or employability) but also considers the intrinsic values of education as well as its role in personal and social development (Robeyns,

2006). Finally, the CA underscores the long-term temporal aspect of education, advocating for policies and practices that enhance students' future freedoms (in line with IE attention to future social ability to learn and participate).

### **DISCUSSION: ASSUMING THE PLURAL NORMATIVE FOUNDATIONS OF EDUCATIONAL JUSTICE TO BUILD (POST-)CRITICAL VIEWS ON IE**

Together, the redistributive, recognition, and capability approaches offer a plural vision of justice that captures the normative complexity—and possible ambivalence—of Inclusive Education. These three theories complement one another, providing a complex framework for inclusive education that transcends a one-size-fits-all model. Redistribution ensures a foundational equality of resources, promoting equitable access to learning opportunities for all. Recognition fosters an educational climate that values each student as an individual, a subject of rights, and a contributor to society. Capabilities promote real freedom, focusing on contextual factors that empower each student to pursue personally meaningful goals.

Each approach sharpens our understanding of specific dimensions of educational justice while presenting its own blind spots and risks. The capability approach broadens educational goals beyond immediate outcomes and provides a critique of the dominant human capital model. However, its focus on personal goals and freedoms may overlook shared societal objectives and undermine the importance of equal resources and conditions. The recognition approach, by emphasizing relational and social conditions, critiques neoliberal views of individual freedom but risks sidelining standardized equality in favor of individualized treatment. The redistributive approach challenges instrumental educational models by emphasizing equity and universal access, while reminding us to consider the objective resources needed to make these rights a reality.

Ultimately, these three approaches can act as cross-critical tools, correcting each other's blind spots. For example, redistributive approaches can critique excessively subjective definitions of domination, while recognition highlights relational dimensions of justice often overlooked in redistributive models. Similarly, the capability approach's potential neglect of equal resources can be balanced by redistributive principles.

For researchers, this three-fold theoretical foundation offers a renewed critical lens for examining IE policies in their complexity. Rather than ranking these approaches or constructing a definitive evaluation framework, in line with a

“post-critical” approach, it is essential to raise practitioners’ awareness of the diversity, complementarities, and limitations of these conceptions of justice. Collaborative and reflexive spaces between researchers and practitioners could foster the elaboration of context-specific solutions to the challenges of inclusive education.

# AN INCLUSIVE GLANCE ON LOCAL HERITAGE: FOSTERING ENGAGEMENT AMONG HIGH SCHOOL STUDENTS

Marianna Di Rosa<sup>a</sup>

Sara Ovidi<sup>b</sup>

Nicoletta Zucca<sup>b</sup>

<sup>a</sup>University of Florence; <sup>b</sup>Convitto Nazionale Vittorio Emanuele II Cagliari

More than ever, schools today are called upon to fulfill their essential roles in contemporary society, equipping every child and adolescent to become an active citizen. This requires a shift in educational paradigms to address the complexities of a dynamically changing society and its relationship with knowledge. To support this transformation, innovative educational tools and strategies are necessary to renew the educational landscape (Morin, 2001).

Educational pathways, whether in formal settings or informal contexts, like cultural heritage sites, play a vital role in fostering students' inquiry skills. These empower students to engage with cultural heritage and nurture active citizenship (Alvarez Ibis et al., 2023). Heritage education serves as a "privileged tool of education, enabling people to learn about their roots and identity while respecting those of others" (Branchesi, 2006). It not only frames cultural heritage as an object of study but also as a means to explore identity and establish diverse connections. The Faro Convention reinforces this perspective (Di Capua, 2021), highlighting cultural heritage as a dynamic source that promotes the exchange of knowledge and skills across different fields, applicable at all educational levels (Art. 13). Heritage education adds a cultural and historical dimension to citizenship, creating a reciprocal process that interrogates identity and links citizens through cultural heritage (Coopland, 2009).

Furthermore, Italian law connects the education regarding its territories' cultural legacy to the enrichment of cultural heritage, defined as "the exercise of functions and regulation of activities aimed at promoting knowledge of cultural heritage and ensuring optimal conditions for its public use and enjoyment, including by people with disabilities, to promote cultural development" (D.Lgs. n.42/2004).

Heritage education supports transformative processes, positioning schools as active interpreters of society. This approach engages students not only as learners but as citizens linked to their communities and local heritage. To achieve this framework, educational strategies must be inclusive and accessible to all; students themselves should understand the importance of inclusivity in all learning environments, fostering the application of inclusive practices within and beyond school.

This paper presents an experimental case study that allowed students to experience and live local heritage through an inclusive lens, engaging them in active participation and encouraging the exchange of knowledge and skills as they explored their own cultural heritage.

This perspective aligns with the research theme rooted in the democratization processes of the second half of the 20th century in Italy, where the school institution's openness to its surrounding territory emerged as a crucial element. Central to this approach is the relationship between the school, local heritage, and community, leveraging its resources "to benefit the school in the direction of an expanded educational system" (De Bartolomeis, 1983, p. 28).

Building on these premises, this case study investigates how PCTO (Pathways for Transversal Skills and Orientation) projects can offer a practical framework for fostering connections between schools and their surrounding territories. Introduced in 2019 as an evolution of School-Work Alternation, PCTO projects foster interdisciplinary collaboration and key competences for lifelong learning (European Council Recommendation, 2018).

In this context, we examine a PCTO project implemented during the 2020/21 (class 3<sup>^</sup>I) and 2021/22 (class 4<sup>^</sup>I) school years at the Liceo Scientifico Internazionale with a Chinese Language option at the Convitto Nazionale "Vittorio Emanuele II" in Cagliari. Conducted in collaboration with the "Confucius Classroom" at the University of Cagliari, the project sought to connect students with their local heritage through innovative and inclusive educational practices. Initially called Kaliyali 2.0 ("Cagliari 2.0"), its first year focused on enhancing students' linguistic, cultural, and digital skills. This was achieved through the creation of a website and social media profiles designed to promote a hypothetical holiday package to Cagliari for Chinese tourists.

In its second year, the initiative was renamed Sadingdao 2.0 ("Sardinia 2.0"), reflecting its expanded scope to promote the entire island of Sardinia as a tourist destination. This iteration broadened the range of skills to be developed and involved additional partners, including the Italian Association of Museum

Educators (AIEM). The program's output, in the context of skill development and interdisciplinarity, was the collaborative creation of customized cultural itineraries in Sardinia for specific target groups of Chinese tourists.

This educational experience, which was already integrating various areas such as local tourism, professional skills, proficiency in the Chinese language, and an understanding of the Chinese tourism market, aimed to broaden its scope and offer students a fresh perspective on the accessibility to their region through inclusion. To achieve this, both visible and hidden needs that potential tourists from China might encounter when exploring the Sardinia region were identified. Thanks to the project, students actively co-designed inclusive tourist itineraries, addressing the diverse needs of their target audience, including accessibility for individuals with disabilities. These itineraries were promoted in Chinese, deepening the students' linguistic skills and their understanding of cultural diversity. This process involved expanding their vocabulary and applying it in practical contexts while exploring how cultural and geographic differences shape audience needs.

Over 36 hours of workshops, delivered both in-person and online, students worked with professionals and teachers to overcome the rigid disciplinary boundaries typical of Italian schools that have long characterized this school system (Calvani, 1986). This interdisciplinary collaboration broadened their competencies and opened pathways to future careers (Madera et al., 2023).

A workshop on inclusion introduced accessibility concepts and fostered empathy and collaboration. Although the idea stemmed from the presence of a student with a motor disability, its purpose extended to broader notions of inclusion. Drawing on heritage education's multisensory approach, this idea was emphasized by making cultural heritage accessible in both physical and digital contexts, stimulating reflection, and fostering the development of a new and deeper sensitivity.

This framework allowed students to develop practical skills, such as teamwork, organization, and management, while designing inclusive itineraries that promoted local heritage. It also strengthened their sense of regional identity, enriched by engagement with a culture as distant and different as the Chinese one, fostering the discovery of both new differences and unexpected affinities.

Participatory evaluation, using an assessment grid, assessed the linguistic accuracy, accessibility, and creativity of the itineraries. The students' presentations in Chinese, supported by photos and resources, generated significant interest among peers and colleagues, inspiring plans for similar

projects.

The experience enhanced students' maturity, group cohesion, and sensitivity to the needs of others. They recognized how simple, creative solutions can address invisible barriers and developed a broader perspective on inclusion, particularly in relation to their local heritage. This shift extended beyond the classroom, influencing their reflections on daily life and society. The project also inspired several students to pursue studies in Foreign Languages, International Studies, or Economics and Management for Art, Culture, and Communication.

In conclusion, students learned that individuals' needs—whether tourists or peers—are often not explicit but are essential. In today's fluid and diverse society (Bauman, 2000), education must address this complexity, equipping learners with the tools to foster a more inclusive and accessible world.

# PEDAGOGIES OF SOCIAL ENQUIRY FOR DEMOCRACIES OF THE COMMONS

Jean-François Dupeyron  
University of Bordeaux (SPH)

In different contexts, many educational theories and practices of social emancipation, such as critical and decolonial pedagogies, eco-pedagogies, feminist and anti-racist pedagogies and, even earlier, materialist, workers' and socialist pedagogies in Europe, affirm the existence of a substantial link between the production and dissemination of knowledge, and the construction of a social, political and economic organisation in line with the project of a social and (henceforth) ecological democracy. This is why, in addition to the necessary political reflection, the project of an education and a school of the commons must not neglect the pedagogical question. This text therefore proposes: firstly, to recall the scope of the commons model; secondly, to discuss the broad outlines of an education of the commons for a democratic school revolution, in order to present in a third step some proposals for a plural set of pedagogies of the commons. The last element is a special focus about the pedagogy of social enquiry (John Dewey). In other words, the project is to finally give democracy the educational and pedagogical form that corresponds to it, as a way of life without domination or discrimination.

commons, pedagogy, social enquiry, Dewey, school

## INTRODUCTION

Pedagogy is not a set of technical resources and practices that should have the strange ability to be deployed without political implications. This is what models such as the very classic transmissive pedagogy and the new evidence-based education, among others, show: they give concrete form to powers that make knowledge a key to the consolidation of dominations based on class, gender, race and colonial history.

This has been understood, in different contexts, by many educational *praxis* of social emancipation, such as critical and decolonial pedagogies (Mohanty,

1990; Tuhiwai Smith, 1999), eco-pedagogies (Gadotti, 2000; Shiva, 2022), feminist and anti-racist pedagogies (Bell Hooks, 1994; Berth, 2019) and, even earlier, materialist, workers' and socialist pedagogies in Europe (Dupeyron, 2020).

They all affirm the existence of a strong link between, on the one hand, the production and dissemination of knowledge and, on the other hand, the construction of a social, political and economic organisation in line with the project of a social and ecological democracy. It is in this sense that the Zapatista schools in Mexico (Baronnet, 2019) and the popular schools within the *Landless Workers Movement* in Brazil are unfolding, with their ups and downs.

This is why the *praxis* of the commons must not leave out the pedagogical question and must develop the project to finally provide democracy with the educational form that corresponds to it, as a way of life free from domination and discrimination.

## **1. DEMOCRATIC, ECOLOGICAL, SOCIAL, FEMINIST AND DECOLONIAL COMMONS**

We propose, firstly, to recall and to specify quickly the scope of the proposition of the commons (Dardot & Laval, 2014; De Angelis, 2022), using a three-axis model.

The first axis assumes the existence of a common set of resources [the *commonwealth*] used, or even held in common, because they are essential for solving the problems of the populations and for the exercise of collective and individual rights. The school of the commons would therefore be the social form enabling access to a common education understood as a shared resource for knowledge and individual and collective fulfilment.

The second axis consists of the concrete existence of a community of *commoners*, without social segregation and discrimination, self-managing common resources through a set of democratically shared rights and obligations.

The third axis lies in the use of a *praxis* of popular self-government (*commoning*) that guides the commons through the principles of co-activity, self-managing co-operation and shared uses.

So, “all non-hierarchical forms of human cooperation are different forms of commons.” (De Angelis, 2022, 197). By the way, the *commons* are another word for democracy as a form of life and as an instituting power.

## **2. EDUCATION FOR THE DEMOCRATIC, ECOLOGICAL AND SOCIAL COMMONS**

In this way, the educations for the common have three interlocking aims:

- building and maintaining together a shared life fighting against discrimination and domination;
- developing a free and enlightened *praxis* of the population;
- using collective intelligence;
- promoting an integral individuation, which is not the capitalistic individualism.

This gives us four important educational axis.

### **2.1. A common service education**

Popular educational action is an action by the population on itself, in the production of its common life, in the resolution of its collective problems, and in the pursuit of a form of life without discrimination or social injustice. This action is one of the tasks that the population must carry out itself, within the framework of a common education service organized on a self-management basis.

This is particularly the case for people who suffer discrimination and social inequality, people who, it should always be remembered, are in the majority in most societies, if only because of the prevalence of male domination, of relations of coloniality and of capitalist production relations. For these populations, the motto is: *don't liberate us, we'll take care of it!*

### **2.2. Education in minor mode**

Education must not produce completions but, on the contrary, enable beginnings. This is the opposition between the major mode of education, which chooses the future for people, and the minor mode, which prepares people to choose themselves (Ingold, 2018). Thus, the main project of the minor mode is not to predetermine the experience of the future; on the contrary, it aims above all to preserve the future of popular and individual experience.

This means that education aims to develop a plastic understanding of relationships, rather than a fixed knowledge of objects. Its heart is relationship and coexistence, not possession or domination. It is not on a Promethean mode. This is particularly important for improving relations between humans and between humans and non-humans – in the eco-pedagogies.

So, education is a mediation. The essential task of education, then, is not to

prepare the child to possess and master reality, but to bring the child into contact with it.

### **2.3. Education in line with buen-vivir**

Education is, at root, a benevolent ‘maintenance’ of the youth population, a care for its well-being – the *buen vivir* that many South American decolonial struggles claim as an alternative to the madness of capitalist extractivism and productivism, which on the contrary imply an oppressive management of bodies and of beings.

Whereas capitalist anthropology defines human beings in terms of competition and the desire to dominate, the concrete utopia of the commons values the desire to live well together. Life in common, and not universal competition, is what education must prepare for.

### **2.4. A polycritical education**

Faced with the worrying state of the world, the philosophy of education can no longer be satisfied with repeating the slogan of ‘conserving the world’, and teaching can no longer be satisfied with a concept whereby knowledge is used to insert young people ‘into the world as it is’. Similarly, to define educators as ‘representatives of a world’ is to confine them to practising – and disseminating – climatic, social and political inaction.

In this sense, as Paulo Freire writes, ‘for the true humanist or revolutionary educator, the object of action is reality, not human beings’ (Freire, 2021, 101).

In this vein, it is in the reality of the life, the concrete experience, the everyday, the close, the private, even the intimate, that the fight for equality must be developed, so that the dominated populations can take their lives back into their own hands (*‘Riprendiamoci la vita’* was the slogan of Italian feminists in the 1970s).

For these educative aims, what kind of pedagogies?

## **3. PEDAGOGIES OF THE COMMONS**

### **3.1. Critical pedagogies**

The first element of a critical pedagogy is the desire not to reduce knowledge to a knowledge of objects, but to make it part of the fundamental *project* of improving reality. In this sense, pedagogy is not a technique but a *praxis*, an activity of transforming social reality that links thinking and action (Pereira, 2018).

### 3.2. Pedagogies of resonance

The concept of resonance thus expresses the aim of a more ecological pedagogy, in the sense that it seeks neither a unilateral appropriation of things, nor an omnipotent control over them, but rather an interrelation and reciprocal tuning. One of the challenges of pedagogy, then, is to establish the capacity and sensitivity for resonance. For Hartmut Rosa (2022), ‘successful forms of presence in the world are not those that are cut off or mono-maniacally concentrated, but rather those that are connected’.

The school must form this space of resonance where pedagogy can help the emergence of a true commonality experienced in mutual resonance.

### 3.3. Pedagogies of cooperative research work

Pedagogies of cooperative research work are built on three important concepts:

- *work*: learning is a work of experience, i.e. an active investigative approach involving the most direct possible interaction with reality.
- *research*: study is a ‘biting’ activity, in the words of Bachelard’s epistemology (1971), an activity that ‘attacks’ problems. So ‘discovery is the only active way of knowing’. As a corollary, ‘making people discover is the only way to teach’. The pedagogy of the commons cannot confuse the dissemination of answers with the study of questions.
- *Cooperation*: separating students from the research community, in order to better assess them individually, is a decision that is highly inconsistent with two major principles of the commons: mutual aid as an anthropological rule and full democracy as a political choice. We have to trust in our collective intelligence, not in the artificial intelligence, to lead our societies.

### 3.4. Pedagogies of encounter

‘We have one thing in common: diversity’, says the south-african writer Mungi Ngomane, by presenting the general spirit of the *Ubuntu* philosophy (2019). In other words, I am not different from you, I am different *like you*. So the pedagogies of encounter are working against the racisms and ethno-nationalisms all around the world. Here the benchmark is not inclusion in ‘our’ world, but life in a shared world because we are humanity in its diversity, we are not only patriotic citizens or faithful believers.

### 3.5. Polycultural pedagogies

We have to anchor educational proposals in an ecology of culture, in order to

preserve the links between human cultures, their changing environment and the historical experiences that gives rise to them. This means rejecting the primacy of monocultural models (Shiva, 2022).

in the words of Édouard Glissant (2005), “la mondialité” is the opposite of the monocultural uniformity brought about by economic globalisation; rather, it crystallises as a dynamic of recognition and preservation of cultural diversity, within an ethic of polycultural encounter.

#### **4. THE PEDAGOGY OF SOCIAL ENQUIRY**

We can focus in particular on the pedagogy that John Dewey considered to be most in keeping with the democratic spirit (1995; 2011): the pedagogy of *social enquiry* (1993).

According to him, this is the only way to enable people to become a true public, capable of governing itself because it is simultaneously capable of informing and educating itself.

For example, broad climate issues can be studied on the basis of ordinary experience, following the stages of epistemic enquiry. First, be surprised and observe an unusual fact (the rarity of pollinating insects in the pedagogic vegetable garden, for example). Then question, set a problem, study, experiment, try, discuss, conclude, act, communicate, and so on.

In the sixteenth century, Montaigne already gave this wise advice: “ si j’eusse eu à dresser des enfans, je leur eusse tant mis en la bouche cette façon de respondre, enquesteuse, non resolute: qu’est-ce à dire ? “ (1992, III, 11)

#### **CONCLUSION**

In short, the anti-globalisation slogan of the 1990s (*another world is possible*) is now coming up against the urgent climatic and political issues of our time. It is no longer a question of asking whether another world is possible, but of understanding that *another world is radically necessary*. The creation of schools for the ecological and democratic commons is therefore a project that we believe to be essential. The work is ongoing, both in the field and in research into the philosophy and sociology of education (Laval & Vergne, 2021; Dupeyron, 2024).

We have done no more than provide a modest overview here.

# INCLUSION AND EXCLUSION THROUGH TIME? A COMMONS PERSPECTIVE ON TIME

Sylvia Jäde<sup>a</sup>

Judith von der Heyde<sup>b</sup>

<sup>a</sup>University Osnabrück, Germany; <sup>b</sup>Fliedner University of Applied Science Düsseldorf, Germany

Time is an important organizing factor in everyday life. Hence time determines e.g. in which periods of time things can or must be done, and in which stages of life or at what age one has access to certain actions or institutions. Time is therefore a powerful actor in inclusion and exclusion processes. Our article focusses on these processes in the field of social work. With reference to the theory of educational commons, we discuss time as a central organizing category for children's leisure practices and the social work practice of zoning. Using empirical material, we can show how powerful time becomes in social work practice and that it needs to be taken into account as an important actor with regard to reducing educational inequalities.

childhood and youth research; doing time; Grounded Theory Methodology; participant observation; policy of zoning

## INTRODUCTION

In this article we focus on time as an important actor in educational commons. We discuss the crucial role of time in inclusion and exclusion processes and for the concept of educational commons. In addition to theoretical considerations, we will draw on data from our completed study 'Occupying Public Urban Space with Stunt Scooters', which was situated in the non-formal educational setting of child and youth work in Germany. The article focuses on the following question: What role does time play as an active agent for inclusion and exclusion processes and for the concept of the (educational) commons?

In social work, it is primarily adults or institutions of the adult world that use time to determine when certain opportunities are (un-)available. They determine who

has access to certain areas and educational settings. Time can therefore be seen as an instrument for creating generational order (Punch, 2020). However, time is not only a powerful tool in organizing time slots. It also determines, through «duration» of membership, who can occupy a powerful position within a group. Thus, time is the result of interrelated practices (Hillebrandt, 2023). While time can generally be theorized from both an objectivist and subjectivist perspective, our practice-theoretical perspective lies in between. We conceptualize time as a result and component of practice (Orlikowski and Yates, 2002; Reckwitz, 2016). It has a temporalizing effect and produces its own temporal structures (Koch et al., 2016; Reckwitz, 2016). Koch et al. (2016) emphasize three levels of temporality of the social. (1) The temporality of social practice, because practice is always temporally structured as a sequence of events that have a past and a future, which are differentiated in the present. (2) The temporality of individual social practice, which is about the specific temporality that individual practices produce and (3) so-called “temporal practices” (Reckwitz, 2016, 123; translated by authors). Below we will discuss the specificity of time as a concrete actor in the social work practice of zoning.

## **1. SKATE PARKS – ZONING AND GOVERNANCE OF PUBLIC SPACE**

In view of limited public socio-spatial resources, skate parks are places for specific youth and children’s cultural practices. They are meeting places and offer a very specific space for certain practices. Practices such as skateboarding are characterized in their origins by the reinterpretation and appropriation of urban space. Skate parks represent a form of binding an initially spatially unbounded practice to a place. Something that Dirks et al. (2016) called zoning (29). Skate parks are therefore politically defined places (Eber et al., 2024). Children and young people use this place of enclosed youth cultural practice to conduct their own practice in a way that is characteristic for the practices such as skateboarding or stunt scooter riding. From the perspective of childhood studies, the conflicts between skaters and scooter riders that emerged on the skate park we conducted our research at can be interpreted as a side effect of the domestication of childhood (Zinnecker, 1990), which has led to the increasing displacement of children from public life. From the perspective of youth research, this can be interpreted in the context of increasingly functionalized and commercialized public spaces to which young people have less and less access (Boyd, 2014).

## **2. THE CONCEPT OF (EDUCATIONAL) COMMONS**

Based on the three-part structure of the concept of the commons, namely commons, commoning practices and commoners (Ostrom, 1990), in educational commons, education becomes a commons that is produced in a process and together with all those involved. Education is thus understood as something dynamic that takes place as a process in everyday practice. More open, egalitarian and diverse educational processes would therefore require, e.g. the involvement of a wide variety of stakeholders from different groups, such as children, parents and professionals (Bollier and Helfrich, 2019; Pechtelidis and Kioupkiolis, 2020). This applies not only to everyday practice, e.g. in schools, but also to jointly developed educational content or curricula. From this perspective it's possible to ask what role time plays as an active agent for inclusion and exclusion processes and for the concept of the educational commons.

## **3. THE STUDY**

In our study, we focused on the question of how children and young people appropriate public urban spaces through the practice of stunt scooter riding and on the triggered learning processes. Stunt scooters resemble city scooters. They are designed for performing tricks and stunts on ramps. Due to their handlebars, they are easier to use than skateboards and are therefore often ridden by younger children. Stunt scooter riding is a new trend sport that has become increasingly popular in recent years. This is also true for the German city where we conducted our research. There the city skate park has become a popular spot for spending time and practicing one's own sport. The lack of space and different movement sequences resulted in an increase in conflicts at the skate park. The emerging accidents and disputes led to tensions between the "established" users (e.g. skaters) and the new group of scooter riders (Elias and Scotson, 1965/2002). Due to overcrowding, the municipal administration reacted in 2021 by excluding the scooter riders from the park. After (partially public) debates between the scenes and with city officials the following rule was imposed by the city: scooter riders were allowed to use the park two afternoons a week. However, the conflicts remained, and the separation of the scenes was thus addressed by building a new area for scooter riders. While our pre study, which took place over the summer of 2021, focused on getting to know the research field and its actors, we accompanied the planning and construction of the new scooter area in four case studies from summer 2022 to the beginning of 2023. In addition to observation protocols, the data corpus includes photos,

videos, in-field conversations, newspaper articles and documents (Jäde et al., 2024). The data was analyzed based on the method(olog)ical principles of the Grounded Theory Methodology (Corbin and Strauss, 1990).

#### 4. ZONING BY TIME

In the following, we will illustrate how time can be understood as an actor in policies of zoning. Zoning as part of social work practice not only refers to a place, but also to the connection and interrelation of different policies to deal with childhood, youth and practices identified as belonging to these. With our data, we can analyze *how* zoning works on a skate park and in the situation described above. *Firstly*, zoning is a relational and political process that is initiated by policy makers and social workers. *Secondly*, the process takes place as a practice immanent in the field. Hence, a policy of zoning is part of the practice of the skate park. Thus, policies of zoning can be understood as a central phenomenon of this field, which is produced by the interplay of a wide variety of categories. Categories such as: generational order, age as a relational category and field competence in the sense of a capable human body are significant for zoning processes (Eber et al., 2023). And all these categories are aspects of temporality and time itself, which become relevant for the policies of zoning and help to produce it. The following excerpt from the material originates from a situation where four scooter riders talked to researchers, city officials and a representative of the planning company involved about the situation at the park. The scooter riders are expelled from the site by skaters or encounter other exclusionary practices that are intended to make it clear to them that they have “no business” (Ilja; 17-year-old scooter rider)<sup>1</sup> there.

That’s why I thought the signs were a bit stupid that they put them up, because that made it extremely bad with the scooters, (...) because especially for the first three months (...) we didn’t like it at all that it was the way it is now, (...) which would have been a solution if (...) they said, yes, two scooter days, (...) but skaters can go too. and we’re not allowed to go on one skater day if they’d said yes, well, only scooters and no skaters, then okay, then I would have understood but that only skaters are allowed to go every day, that was a bit discriminatory in my opinion for the sport of scooter (Ilja)

Ilja refers to signs that regulate the times when scooter riders can use the park, which the scooter riders perceive as a strong restriction or discriminatory. Aspects of time are interwoven with leisure practices and the scooter riders

---

<sup>1</sup> All names have been pseudonymized.

must deal with them. They must actively deal with the fact that they are now breaking rules or evading time-structuring zoning attempts and that they are now marginalized, at least in terms of time. Because there are no explicit scooter days the park always remains a place for skaters. Time for cultural practice thus becomes a special commodity. And what's more: according to Ilja, time is distributed unfairly, which gives it the power to marginalize. For skaters, this in turn provides a legitimization for exclusionary practices, in that they refer to the signs while expelling the scooter riders or actively prevent them from riding. When the researcher asks how the conflicts could be dealt with differently, Ilja replies:

The simplest thing you can do is to make them realize that somehow we've managed (...) to make the scene bigger, firstly, abolish the signs altogether because they don't make sense any more anyway because I go there every day (...) if I can't (...) on Wednesday, then I go on Thursday (...) if I can't on Thursday, then I go on (...) Saturday Sunday, for example, we're actually there the whole time. (.) just take down the signs.

He offers two possible solutions: *Firstly*, that the scene has gotten bigger, so that it must be granted a certain amount of space solely in terms of numbers. *Secondly*, he points out that the signs are nonsensical because they don't follow them anyway. After all, scooter riders don't just ride two days a week but in their free time in general. Although the signs are explicitly named as disruptive, what is problematized about them is the zoning or even containment of the leisure practice in terms of time. Ilja explicitly states that scooter practice takes place or must take place in his free time, while pointing out that the politically scheduled times for scooter riding do not coincide with his times.

Hence time is significant in various ways: it is used by the scooter riders to prove their own affiliation to the scene, and it serves to control and organize the practices at the park. The signs become powerful, due to their practice of organizing according to time structures. They regulate access and at the same time create massive exclusions. Not only does the sign itself become an actor that shapes the situation, but it also affects temporal practices that have an organizing character. Time is therefore not just an artefact of legitimization, but a relevant relatum of the situation.

## 5. CONCLUSION

Signs and time(s) become actors in the phenomenon of zoning. It's not only scooter practice and political decisions that allocate spaces to children and

young people, but also the signs and the times they call up. Hence, time is not only a measurable quantity, and not only a certain experience, but it structures itself, specifies, organizes and is the product of practice at the park (Orlikowski and Yates, 2002; Koch et al., 2016). Simultaneously, signs and time(s) give the actors at the park new possibilities for action and reference. Skaters have another reason to exclude scooter riders, which is very powerful not least because the scooter riders know that signs are there to organize what is happening. Regarding the concept of educational commons, it is essential to examine and analyze all aspects that structure and order practices that are explored – time being one of them. After all, the core of the educational commons is about confronting powerful structures and inequalities and render the latter ineffective (Cappello et al., 2024; Pechtelidis and Kioupkiolis, 2020). Thus, it makes sense to focus on time as a crucial actor of inequality and power relations (Flack et al., in press). Different time-related logics of the participants take effect, which can lead to exclusion and inclusion from the park. This is why we advocate for recognizing that time practices produce inclusions and exclusions. Temporal structures regulate access to certain public places, thereby enclosing children and young people there. Simultaneously, the commons perspective offers a possibility of understanding time as a common good, that needs to be governed by adults *and* children and young people so that in the conception of educational spaces and educational commons, time does not become a factor of inequality. Instead, the emphasis should be on making time equally usable and available, and on reflecting on when time is powerfully <allocated> and becomes an instrument of authority.

# CONDITIONS AND POTENTIALS FOR EDUCATIONAL COMMONS TO PROMOTE MORE EQUAL AND INCLUSIVE EDUCATION: A SWEDISH CASE STUDY

Liselott Mariett Olsson<sup>a</sup>

Robert Lecusay<sup>a,b</sup>

<sup>a</sup>Malmö University; <sup>b</sup>Stockholm University

This paper presents results from a Swedish case study conducted as part of a HORIZON 2020 project (2021-2024), investigating the potential of educational commons to foster more equal and inclusive education. The study identifies three key factors for achieving this potential: (1) the image of children and teachers, (2) the educational task, and (3) the methods and theories used in educational practice. Through a critical analysis of policy documents and neoliberal governance in education, the paper examines how these factors were activated within a Playworld/Interactive Performance involving children, teachers, artists, and researchers exploring a shared question of human beings' place in nature and culture. The analysis and performance are framed by the theories of Carol Bacchi, Michel Foucault, Henri Bergson, and Cultural-Historical Activity Theory (CHAT). This collaborative, socio-dramatic approach positions children and teachers as contributing commoners engaged in meaning-making processes. The findings challenge current educational policies, which emphasize a deficit-oriented, compensatory logic. In contrast, the Playworld approach demonstrated that the potential for educational commons to promote inclusion lies in practices that foster imagination, play, and narrative co-construction, supported by aesthetic and sensory experiences. These methods allow both children and teachers to actively contribute to the creation of new commons.words.

early childhood commons; inclusive education; commoning research-practice; Aesthetic theories and methods; playworld/Interactive performance

For decades, proponents of the commodification of early childhood education claimed that competition, calculation, and choice would lead to forms of education of enhanced quality, equality, and inclusion. However, scholars now show that commodification has instead done the opposite, leading to increased inequality and an expansion of exclusionary practices in education (Robert-Holmes & Moss, 2021; Vandenbroeck, Lehrer, Mitchell 2023). Commodification is, in fact, experiencing its own “inflation” motivating the need to propose necessary alternatives. In this paper we present such alternatives, presenting observations from a case study of a preschool activity that hybridized imaginary play and aesthetics to explore how the values of the commons – equality, sharing, participation, togetherness, caring, and freedom – are actualized in such early childhood settings. The case study formed part of a HORIZON 2020 project – *Smooth Educational Common Spaces: Passing through enclosures and reversing inequalities* (SMOOTH).<sup>1</sup> The project, involving nine European countries, brought together a consortium of 12 partner universities and cultural institutions, together with third parties coming from preschools, schools, afterschool programs, NGO’s, museums and youth organizations, to conduct various studies to research the question if and how educational commons may function as a catalyst for more equal and inclusive education.

### **CRITICAL ANALYSIS OF EARLY CHILDHOOD EDUCATION POLICIES IN SWEDEN**

Our work conducting one of the early studies in the SMOOTH project – an analysis of national, regional, and local education policies in the countries participating in the project – threw into stronger relief the persistence of educational inequalities rooted in the commodification of education. Our team studied Swedish early childhood education and care documents on equality and inclusion, guided by the question: “What is the problem represented to be?” (Bacchi 1999). Using an interpretive framework based on the ideas of Michel Foucault and the policy-analyses of Carol Bacchi, we described the scientific, ontological and epistemological underpinnings of these policies, and identified the subject-positions these documents made available for the child. Our analysis revealed an ontologically informed image of children as lacking (not contributing to culture, knowledge and values), a reproductive epistemology (children should only imitate and reproduce already existing culture, knowledge and values), and a formulation of the problem as being centrally about early acquisition of the Swedish language (children can be included only when they

---

<sup>1</sup> Visit the project site for more information: <https://smooth-ecs.eu>

have adapted to national, linguistically-coded definitions of culture, knowledge and values; Lecusay, Olsson, & Nilsson, under review).

The results of this policy analysis provided us with a framework that guided how we engaged with our third-party partners – a network of three preschools – in the implementation of the case study component of the SMOOTH project. In this component, the various research partners collaborated with their third-party partners to develop, implement and study activities in their respective educational settings to examine if and what role a commons perspective could play in making these settings more equal and inclusive. The results of our policy analyses contrasted sharply with the culture of the commons already in place within and between the partner preschools in the network. These preschools were firmly rooted in the scholastic gesture of the older generation creating time and place for the new generation to study and transform cultures, knowledge and values currently held as commons in society. They were skilled in methods characteristic of educational commons, methods originating from the history of pedagogy and from early childhood centres in Reggio Emilia, Italy: careful listening to children in exploratory projects where children’s perspectives are documented, analysed and valued as contributions to the commons. In essence, even before the case study and project, these preschools already viewed children as commoners, actively participating in commoning processes to create new common goods (Pechtelidis & Kioupkiolis, 2020).

## **METHODOLOGICAL CONSIDERATIONS**

Given our research task of conducting a case study to explore the commons principles in ECEC, several questions emerged: How can we enter an ECEC practice that already embodies these principles? How can we introduce complexity to the reductionist ontology, epistemology, and monolingualism revealed in policies?

How can we enhance the existing commons to foster more equal and inclusive education?

To these ends we drew on the collaborative, participatory research methodology of Cultural Historical Activity Theory (CHAT; Cole 1996; Engeström, 1987/2017). A core methodological strategy adopted by CHAT scholars is that of co-creating with others the activities that produce the phenomena of interest (Cole & Engeström, 2006). It is a process of negotiation with all participants, children and adults alike, that is illustrative of the ethos of mutual appropriation that underpins CHAT research both as a research logic and ethic: A researcher

arranges to become an integral part of the activity so that she can experience what it is like to become a functional aspect of the system through the active and reflexive co-construction of the activity of interest with others. In other words, it is a process not of participant observation, but rather of observant participation (Rosero et al., 2011), where children and teachers seen as co-contributors to the research. This presented an alternative to the reductionist image of children at stake in current policies.

We also found support in the theories and methodology of Playworlds – an approach that, in contrast to the reductive epistemology of the ECEC, seeks to create contexts for children’s meaning making through joint, adult-child socio-dramatic play. Originally developed in Sweden by Gunilla Lindqvist (1995), this approach involves adults and children collaboratively creating a shared imaginary world, brought to life by the adults and children through characters, props, and plots. The narrative is selected based on topics important to the children, ranging from emotions and abstract concepts to local, practical concerns. It is the aesthetic and dramatic qualities of the Playworld activities that are understood as driving the emotional pull that draws and sustains children and adults’ joint play (Nilsson, 2009). These qualities became an important counterpoint to the monolingual logic we identified in the national ECEC policies. Furthermore, these qualities were enhanced in our case study both through our interests in Henri Bergson’s aesthetic reasoning on the relation between matter and memory (Bergson, 1896/1991), as well as through cooperation with an art/performance collaborative known for their use of extra-verbal, aesthetic performance materials and processes to promote more equal and inclusive practices. Equipped with this conceptual and methodological toolkit, we staged activities that gave children opportunities to explore the values of educational commons both through sensory-perceptive experiences and through individual and collective memories (Olsson, 2023).

### **THE CASE STUDY: CHILDREN’S IDEAS ABOUT LIFE AT THE INTERSECTION OF NATURE AND TECHNOLOGY**

Our case study began with a two-year period in which we followed exploratory projects (Olsson, 2009), pursued by the teachers and children, that focused on the themes of Plants and Robots. We drew on a theory of meaning (Deleuze, 1998; Vygotsky, 1978) as the foundation for analysing these projects, reasoning that this approach not only allowed us to authentically listen to the children but also provided a scientifically robust framework for understanding their existing

commons. Our analysis threw into relief the children's holistic and non-dualistic thinking in relation to both nature and technology. The children theorized how different elements in the life of plants collaborate to obtain food, oxygen and water as well as how, in the case of robots, cables, batteries and cogs collaborate to bring the machines to life. The children showed a sensitivity to relationships between nature and technology, comparing, for instance, human veins with the veins of the leaves of plants and to the cables inside the robot. At the same time, they expressed love and concern for both plants and robots, and seemed fascinated with the heart, both as a symbol of love and friendship and as an important biological and life-sustaining organ. Building on our analysis, we turned to the perspectives of philosopher Henri Bergson (1907/2007) and plant-neurobiologist Stefano Mancuso (2018), who emphasize a non-dualistic relationship between human intellect, other life forms, and more-than-human matter. These perspectives helped us recognize the depth of the children's contributions. Had we, as a society, adopted such a close connection with nature, we might not face the climate crisis we do today. Likewise, had we applied this critical awareness to our technological innovations, we might have addressed crucial questions about artificial intelligence much sooner.

These analyses led us to develop a shared research question for children and adults to explore in the next phase of the case study: What is human beings' place in nature and culture? Working closely with the art/performance collaborative, we carefully designed and staged a Playworld in which the children could engage with two characters inspired by their interests, HeartRob and HeartRoot. We seeded this environment with a narrative: Both characters had lost their energy and the children were recruited to assist them in restoring "the nerve center" that would help bring energy and love back to them. In line with our aesthetic methods and theories, we invited children to explore the shared research question through their sensory-perceptive experiences and individual and collective memories, developed as they played and interacted in the Playworld. Before, during, and after the Playworld events, we maintained a letter correspondence with the children, regularly sharing documentation of these experiences with them.

This approach also connected to another aspect of our study: examining children's views on key values that support educational commons—sharing, caring, and cooperating—and identifying possible influences on such prosocial behaviors. For this, we combined qualitative observations with quantitative measures of prosocial behavior and educational determinants. Correlation analysis and triangulation of data indicated a positive link between the

Playworld intervention and children's prosocial behavior, showing the many creative strategies children used for sharing, caring, and cooperation. For example, children shared their hypotheses and questions with each other, tried different ways to give the characters energy and love, asked each other for help, and invited their peers to join in the exploration. We observed no signs of exclusion; instead, the children encouraged each other, saying things like, "We need you here for more energy," "Don't be scared; try this!" and "Hold my hand and join us!"

Our findings illustrate how children actively engaged with prosocial values—sharing, caring, and cooperation—through their involvement in the Playworld. The collaborative missions allowed children to enact these values in real-time, building connections and encouraging inclusivity. As they supported each other with statements like "We need you here for more energy" and "Hold my hand and join us," they demonstrated an sense of common purpose and collective exploration. What we observed in the case study suggests that educational commons hold the potential to catalyze a more equal and inclusive form of education, provided certain key conditions are met. First, the image of children and teachers must be framed within an intergenerational search for meaning, where both groups are viewed as active contributors to the commons. Second, education should adopt an open and expansive approach to knowledge, allowing commoning processes to flourish through imagination, play, and shared narrative creation. Lastly, methods and theoretical tools in education should embrace aesthetic diversity, enabling sensory-rich experiences and enhancing individual and collective memories while fostering a shared purpose in creating new common goods.

### **Acknowledgements**

We wish to thank our colleagues in the SMOOTH project, as well as the artists, preschool children, teachers, and principals with whom we have been collaborating. # CHILDREN AS CULTURAL ACTORS: PARTICIPATION AND ACTIVE CITIZENSHIP THROUGH HERITAGE EDUCATION

Ludovica Sebastiano<sup>a</sup>

Francesca Berti<sup>a</sup>

Simone Seitz<sup>a</sup>

<sup>a</sup>Free University of Bozen-Bolzano

The present paper proposes heritage education as a field of research and practice suitable for promoting children's participation and their awareness as cultural agents. In a critical approach to heritage (Harrison, 2013) and starting from the "paradigm of the intangible heritage" (Lapicciarella Zingari, 2015), this contribution presents findings of a research project aimed at gaining a deeper understanding of children's perception of heritage in relation to their neighbourhood. In line with childhood studies (Melton et al., 2014), which consider children as social actors, the project offered heritage mapping workshops based on exploring, identifying and producing knowledge about everyday urban spaces. While reflecting on children relation with heritage (Smith, 2013), the aim is to foster experiential and participatory processes of heritage education (De Nicola et al., 2022),

heritage education; childhood studies; participation; active citizenship; mapping

## INTRODUCTION

Heritage has been approached from different perspectives and aims by various disciplines, from archaeology to history of art, from architecture to geography, (Harrison, 2013). In the last 30 years, anthropology (Lapicciarella Zingari, 2015) and, more recently, education have particularly promoted attention to the intangible dimension of heritage.

At the level of the international recommendations, the need for multiple and interdisciplinary heritage education strategies to encourage the participation of the younger generation in safeguarding of heritage is emphasised by both the 2003 UNESCO Convention and the 2005 Council of Europe (known as Faro

Convention). However, there is a lack of theoretical frameworks that provide a clear overview of reflections and strategies for practice, due to the relatively recent growth of heritage education as a research field (Fontal et al., 2023). The pedagogical perspective often draws attention to the subjective dimension of heritage, stressing the centrality of the subjects and the active role of society in the interpretation of heritage (Borghi, 2023; Muscarà et al., 2024). In other words, the emphasis is on revealing the multiple meanings and values, that both children and adult attribute to natural, tangible and intangible heritage. Consequently, as Casonato & Branduini (2024) underline, heritage could be considered as a changeable values system which, in turn, would well support the purposes of participation and citizenship education (Berti & Seitz, 2024). The paper presents a reflection on children's voices and their participation in heritage safeguarding, in order to reinforce the centrality of a subject-based approach. Considering how experiences in non-formal education settings prove to be a privileged vehicle for the practice of heritage education (Borghi, 2023), the aim of the research is to comprehensively understand how children perceive, understand and represent heritage in their everyday urban environments, through neighbourhood walks and mapping,

## 1. A CRITICAL APPROACH TO HERITAGE

In a critical understanding of heritage, Smith emphasises that heritage “is not (...) what it is” (2006, p. 3), but is constructed by the values, meanings and social practices that are attributed to it and recognised as such. Yet, from a Foucauldian perspective, the author suggests that heritage can also be conceptualised as a *discourse*, with recognised specific criteria to define it. Such discourse conveys the idea of a single, fixed definition of heritage (reflecting the context), that excludes alternative interpretations of the concept (Smith, 2006, p. 4). In line with Smith, Harrison (2013) refers to an *official heritage*, recognised by various form of legislation and in accordance with established criteria, and an *unofficial heritage*, unrecognised and generally associated to an everyday dimension of “culture” (p. 18). Even so, there is a mutual influence between the *official* and *unofficial heritage*, and in what people may begin to recognise and claim as their heritage (Harrison, 2013, p. 20). This interdependence became clear with the introduction of the 2003 UNESCO Convention, and it has impacted upon the recognition and safeguarding of elements of intangible culture by local, regional and national institutions. Accordingly, heritage can be described as a “cultural and social process” (Smith, 2006): it encompasses collective, transformative and dynamic

dimensions, and is therefore “multi-vocal” (Smith, 2006, p. 12).

The present contribution adopts the perspective of intangible heritage and focuses on the *everyday heritage* (Mosler, 2019), that is, the one that belongs to an ordinary and an everyday dimension, with specific reference to the urban context. The aim is to explore meanings, values and uses attributed by different subjects to the same heritage element, and to find out how such diversity coexists as an expression of the multivocality of heritage. This means investigating the potential of heritage, and consequently heritage education, as a vehicle for democratising processes, involving a wide range of actors (Robertson, 2012, pp. 8–9).

## **2. A CRITICAL APPROACH TO HERITAGE EDUCATION**

To start from the perspective of children, in a democratic and participatory approach, means to foster an intergenerational co-construction of knowledge about heritage (Zuccoli & De Nicola, 2016). The practice of heritage education should, therefore, stimulate the production of a plurality of narratives and interpretations through collective experiences and reflections (Del Gobbo et al., 2018). Such experiences should be closely linked to children’s everyday lives and therefore to the interaction between subject and object: experiences that are anchored in something relevant in the present, in continuity and with meaning for the future (Dewey, 2014). Based on these assumptions, and referring to praxeology (Reckwitz, 2003), heritage becomes interactively produced, meaning that children’s knowledge of their social constructions of heritage is documented in social practices and can be researched by analysing them.

In this regard, the need to rethink the relationship between children and heritage, given that children are under-represented in heritage discourse (Ginzarly & Srour, 2021; Smith, 2013), finds a valuable vehicle in the perspective of Childhood Studies (Melton et al., 2014). The latter recognise children not as “merely voiceless adults in the making”, but as social actors: the way a child is, acts, moves and gives meaning to his or her own life context. New childhood studies also emphasise the relational understanding of children as social actors, i.e. the generational and power order between children and adults (Eber et al., 2016).

In the context of heritage education, children should be involved first and foremost in participation and safeguarding actions, as they are the main link between the past, present and future of heritage. Yet, in order to value children’s

voices, the living context and the specific socio-cultural relationship between children and adults needs to be addressed. Similarly, in research context, children's voices are influenced by the researcher relationship (Spyrou, 2018). Preserving the richness and complexity of children's thinking is therefore a real challenge.

### **3. EXPLORING EVERYDAY SPACES WITH CHILDREN**

With the aim of ensuring children's accessibility and participation, the research translated the concept of heritage in terms of *place* (Schofield, 2015). Looking at the relationship between children, spaces and their use (Malatesta, 2015), children are considered as social and cultural actors capable of producing and modifying their everyday places, attributing meanings and participating in social practices. Moreover, their knowledge in terms of social constructions of heritage is understood and reconstructed in relation to a social practice (Reckwitz, 2003). The exploration of everyday spaces accompanies them in a process of research, identification and meaning making of heritage present in the explored area. The research project is, therefore, based on an ethnographic and reconstructive approach (Bohnsack et al., 2010) to reconstruct children's practical knowledge of heritage through the analysis of related social practices. The research included creative mapping workshops based on tools developed in the field of New Childhood Studies (Balagopalan et al., 2023), and Children's Geography (Malatesta, 2015).

The structure of the mapping workshops is developed in three main phases, starting from an embodied and experiential dimension and leading to a moment of collective reflection, summarised below:

1. Introducing the theme through images (historical and contemporary), stories and testimonies, followed by neighbourhood walk.
2. Drawing a personal map, inserting those elements that children consider most important.
3. Creation of a collective map, followed by a group discussion.

The production of graphic representations of the area, both individually and collectively, seen as the product of children's lived experience (Malatesta, 2015, p. 64), facilitated the elaboration of the experiences lived and enabled the development of a collective reflection on heritage.

Finally, in line with the documentary method (Bohnsack et al., 2010), participant observation combined with field notes, children's drawings and group

discussion formed the data basis for triangulation and interpretive reconstructions.

#### **4. "I AM AN EXPERT OF THIS PARK"**

The empirical study is conducted in a northern Italian urban area characterised by significant internal and external migration. It is located between two neighbourhoods connected by a canal and a large park.

Understanding the children's perception of the area was the aim of the first workshop. Here a short sequence about the park:

Andrea: I live nearby

Stefano: I also live nearby

Interviewer: you too? great, so we have super-experts

Clara: I don't...

Interviewer: well, you can ask them to help you

Andrea: Sure, I am an expert on that park, because I live near and I always hang out there.

The researcher first uses the term *experts* and, while Clara takes a step back, Andrea recognises himself in this role: he emphasises that he lives nearby and he goes there regularly. The feeling of being an expert seems to be closely linked to the degree of familiarity with the space, how often it is inhabited and appropriated, becoming *places*.

From a methodological point of view, in this sequence children communicatively produce a positive horizon (to be an expert) and a negative counter-horizon. This seems to suggest that expertise can be acquired through social practices in a space and through the shaping of that space with agency.

Re-reading the short sequence from the perspective of Childhood Studies, the social practice of recognition comes into focus, as the children are addressed by the interviewer as experts. It can therefore be asked to what extent this impulse from the (adult) researcher has prompted (the child) Andrea to accept this role attribution and fill it with meaning by explaining why he feels like an expert about the place. On the other hand, this indicates that being addressed as an expert is an unexpected impulse that breaks through typical role expectations between children and adults. From this perspective, Andrea's argumentative search for an explanation can be understood as a validating such role.

## CONCLUSION

In this paper, *spaces* are understood as *cultural places* and stages for heritage enactment (Smith, 2006). Exploring everyday places with children brings them closer to identifying both official and unofficial heritage. Drawing from everyday life, from close and concrete experiences, helps us to accompany children in understanding heritage, to encourage their participation, to raise their awareness of being actors and thus to stimulate the possibility of engaging in active citizenship.

In this respect, the Childhood Studies perspective, as well as Children's Geography, by considering children as social agents, invite researchers to develop strategies that not only support children in expressing their views, but also help them to create these themselves in group interview situations. This requires a high degree of sensitivity to role attributions and related behavioural expectations, e.g. not to judge or/and not to feel judged (Lundy & McEvoy, 2012, p. 131).

Finally, the active involvement of children in heritage education requires a constant questioning of heritage representations. In this regard, the adoption of an understanding of heritage as a cultural and social process emphasises its dynamic character – rather than a static one, i.e. heritage as a stasis of cultural values and meanings – and as a tool to promote cultural change (Smith, 2006, p. 4). The active participation of children in safeguarding heritage could therefore be enhanced by the further development of an interdisciplinary line of research that fruitfully integrates Childhood Studies, Heritage Education and Educational research.

# **SOCIAL INVESTMENT STRATEGIES IN EDUCATION. AN INVESTIGATION OF ITALIAN CASE STUDIES**

Arianna Montemurro  
University of Verona

## **INTRODUCTION**

In recent years, the implementation of the new paradigm of social investments has redefined the relationship between the economic and social spheres and designed new ways of addressing collective problems. In this context, tasks that traditionally fell under the competences and responsibilities of the State are now shared with private organizations.

Contemporary privatization is part of a broad redesign of the public sector, involving private companies, non-profit organizations, voluntary organizations, non-governmental organizations (NGOs) and social enterprises. In this scenario, reflections on the transformation of the welfare state intersect with a narrative of governance that identifies a change favored by growing neoliberal pressures. Furthermore, the social fabric, transformed as the old solidarities of class, community, family and nation have deteriorated, has produced new risks and collective needs (Giddens, 1991) imposing the neoliberal imperative to “govern through freedom” and to self-manage in different areas of daily life (Ong, 2007), such as education. The analysis of social investment strategies in the Italian education system implemented by new philanthropic organizations reveals a chaotic scenario, whose dynamics are the result of the clash between old and new political discourses that have become part of the educational debate (Grimaldi and Serpieri, 2010).

As in other European countries, in Italy the welfare state is subjected to intense pressures, connected to rapid changes in social needs, defined as “new risks”: job insecurity, obsolescence of human capital, social exclusion, difficulty in reconciling work and family responsibilities, etc. (Ferrera & Maino, 2011). With the economic recession, European welfare systems are facing an almost unprecedented reorganization effort. However, in Italy, the measures to combat poverty, before the pandemic with the Citizenship Income and then in the midst

of the health crisis with the Emergency Income, have made it possible to reduce the consequences of otherwise devastating social impacts (Ciarini & Mariano, 2020).

In recent years, Italy has also been characterized by the structuring of a significant synergy between new private actors and innovative forms of collaboration and coordination (Agostini, 2017) in the implementation of social policies. Much of the networking activity of Italian new philanthropy organizations occurs through personal relationships, in which social, corporate and political networks are intertwined. These entities address public policy problems in innovative ways, providing not only financial means, but also skills, characterizing philanthropic and civic commitments as a form of moral capital. New philanthropy organizations therefore represent “cultural heroes” (Ball & Junemann, 2012, p. 91), becoming bearers of values, methods, discourses and social commitment.

The research on which the paper is based analyzed some philanthropic organizations and their connections within Italian educational networks thanks to the information provided by their members in semi-structured interviews. The popularity of the concept of “network” is an appropriate methodological response to the change in governance and in the forms of the State. That is, the network as a tool for both research and policy representation allows for modeling research methods in relation to the shift from government to governance models (Rhodes, 1995; Ball & Youdell, 2008; Cone & Brøgger, 2020), or what is sometimes called “network governance.” This shift involves a shift away from administrative, bureaucratic, and hierarchical forms of state organization and the emergence of new self-regulatory and horizontal governance spaces called “heterarchies.”

The analysis of philanthropic networks also responds to the need for “new methods and concepts and new research sensibilities” (Ball, 2012a, p. 4) to understand “new actors, organizations, forms of participation, and relationships” engaged in shaping Italian educational policies and, more generally, in the “global expansion of neoliberal ideas” (p. 2). The “network analysis” adopted in this research is therefore appropriate both as a method for exploring educational governance and as a representation of the actual social relations and sites of activity within which government work is carried out (Ball & Thawer, 2019).

## **NEW PHILANTHROPY IN ITALY AND NEOLIBERAL REFORMS OF EDUCATION**

In Italy, the consolidation of public budgets in recent years has significantly reduced the space for investments in social services, resulting in an ever-growing gap between the provision of infrastructure and collective needs. In the context of the economic crisis, Italian foundations are increasingly promoting experimental interventions to combat poverty: in most cases, these measures are not limited to income support or the provision of material goods, but are oriented towards promoting autonomy and activating the beneficiaries of the disbursements (Agostini & Cibinel, 2017).

In particular, banking foundations have the skills, organizational structures and financial resources needed to integrate the welfare measures guaranteed by a public sector that is increasingly inadequate in responding coherently to new risks and emerging needs of society. These entities are, therefore, able to guarantee disbursements for the development of territories, offering support to non-profit organizations and public institutions in the promotion of initiatives of public utility (Bandera, 2013).

In this scenario, partnerships involving banking foundations, public, private and non-profit entities have given rise to innovative experiences to address emerging challenges at local and, in some cases, national level. Banking foundations, with the aim of connecting organizations that would not collaborate independently, see their ability to network as the lever to support social innovation, understood as actions capable of tracing new paths to address social problems (Agostini & Cibinel, 2017).

### **New philanthropic organizations**

In Italy, the new philanthropic sector is made up of a heterogeneous panorama of actors with specific characteristics, history and methods of intervention. The main actors within this panorama are the grant-making foundations, which contribute to collective well-being through the allocation of contributions (grants, scholarships, subsidies, etc.). The territorial distribution of these organizations sees a greater presence in central and northern Italy. This localization, however, does not reflect the distribution of social needs, which are distributed across the national territory in a more heterogeneous way (Italia non profit, 2021).

As stated in the Italia non profit report (2021) entitled “The state of philanthropy in Italy”, the total amount of donations in 2021 was equal to 8 billion euros. The report also highlights how the logic of collaboration between new philanthropic

organizations and beneficiaries of the donation has changed, translating the flow of donations into a concrete exchange. The new philanthropic exchange is therefore configured as a model in which organizations express network and philanthropic relationships. In this context, the dichotomy between supply and demand is overcome by a network logic, where all actors are connected to each other by co-design dynamics, shared understanding of needs and definition of actions based on common values. Non-profit organizations become partners of the public administration in the management of public resources, making the public space occupied not only by individuals but by a composite community of actors.

The development of an alternative economy with social impact is acquiring an increasingly central role in the Italian political agenda. In this redesign of the financing infrastructure for philanthropic organizations, it is necessary to consider specific tools (Chiodo & Gerli, 2017). Impact investing represents, in fact, a new approach to investment activity, which involves investments in economically sustainable companies, entities and financial instruments, capable of responding to social challenges and at the same time remunerating the invested capital. This is a new approach to investment, which can be achieved with different instruments, such as equity and investments in real assets (Fondazione Cariplo, 2022).

### **The neoliberal reforms of the Italian school**

From the point of view of social investment in education, the Italian welfare system has been characterized in recent years by cuts in public spending due to multiple causes linked to governance designs and choices, not always consistent, followed by the various governments (Ciarini & Giancola, 2016).

In the Italian education system, the State still exercises a pervasive influence on local authorities and schools through the control of human and financial resources and the use of its regulatory powers through the definition of standards and the provision of incentives. A weak school autonomy coexists with the permanence of centralized control, exercised through the introduction in the public sector of contractual logics and “performance management systems” (Hall et al., 2015).

Since the Second World War, the Italian education system has been based on the choice of bureaucracy as the main vehicle for rationalization. In this context, the State has been the main provider of mass public education, although some residual spaces have been left to private schools, in particular to Catholic schools (Grimaldi and Serpieri, 2013). Only at the end of the 1990s did political

stability, the growing crisis of welfare structures and the pressures exerted by the European political agenda on education create the conditions for a reform of the Italian school system. The reform process has gradually evolved following some characteristics such as localism and emphasis on partnerships and the role of local authorities in the governance of education (Grimaldi and Serpieri, 2010).

Since the end of the 1990s, the Italian education system has undergone a restructuring process. The milestones of this process were the introduction of school autonomy and decentralization in 1997 and the controversial establishment of a national evaluation system covering schools, staff and students. In this context, the dominance of the central bureaucracy has been accompanied by increasing forms of control and governance of education, such as “managerialism” and “social partnership”. However, “all these trajectories are today still ambiguous in their outcomes and characterized by tensions and paradoxes, originating from the clashes of neoliberal and neo-managerialist discourses and their technologies with welfarist legacies.” (Barzanò & Grimaldi, 2014, p. 26).

The strengthening of the regulatory framework has, therefore, placed the Italian school in a complex governance terrain: between the “evaluating State” (which directs policies, moves resources and governs recruitment and evaluation), the pressures of the “quasi-market” (with the entry into the decision-making arena of subjects with new roles such as users, families and other schools), and the horizontal push produced by competing schools, local associations and the local institutional system (Ciarini & Giancola, 2016).

Starting from Law No. 59 of 1997, the center-left government has shaped the educational system in three years of intense legislative activity. This has opened up new spaces of autonomy for schools. First of all, schools have acquired the right to outline the annual training offer plan, within which to plan school projects, define local curricular priorities and outline at least in part their internal organization. Secondly, schools have been strongly encouraged to build partnerships with other public and private actors, in order to pursue their educational mission. In this scenario, partnerships have been explicitly identified as a potential channel through which to obtain extra public or private resources and enrich the educational offer (Grimaldi & Serpieri, 2010).

### **The role of new philanthropic organizations in the Italian education system**

“Private sector participation in public education delivery is growing internationally” (Ball & Youdell, 2008, p. 25), reflecting the ongoing formation of

heterarchies involving philanthropists, corporations, charities, banks, politicians, civil servants, national and international institutional agencies, experts, consultants, universities, academics and professional unions. In Italy, since 2008, these new “political entrepreneurs” have acquired an increasing centrality in the educational decision-making process (Barzanò and Grimaldi, 2013).

Therefore, the public space has expanded to include new philanthropic organizations, which have assumed a central role in educational decision-making. Today, in the Italian governance of education, philanthropic actors play the role of new political entrepreneurs, embodying a new set of knowledge, strategic skills and interests, acting as “networkers”, negotiators, disseminators and bearers of discourses drawn from the regimes of practices of the private sector. Private actors also employ apparently equitable discourses, such as quality, improvement, meritocracy and effectiveness, to legitimise their involvement in educational policy (Grimaldi & Serpieri, 2013).

## CASE STUDIES

In order to analyze the composition of social investment strategies in the Italian education system, the research developed a methodological design that would allow us to follow the different actors that populate these strategies. Several employees of new philanthropy organizations were involved in the research: board members, presidents of organizations, heads of departments and staff. The interviews were scheduled after having identified an organization as “central” in terms of nodal density (visual interconnection of actors) within new philanthropy networks focused on education, starting from online searches and the construction of network graphs that accompanied the different phases of the study. Referring to the information available on websites, the following types of new philanthropic organizations were distinguished: foundations, associations, social enterprises, NGOs, social cooperatives, volunteer organizations, networks, and think tanks. A total of 21 people were interviewed, coming from different types of organizations, as listed in the following table.

Table 1. Interviews: list of organization types

Interviews	Typologies of organizations
1	University
5	Association

6	Foundation
1	Network
2	NGO
2	Social cooperative
1	Social enterprise
2	Think tank
1	Voluntary organization

The data analysis process produced several maps of social investment networks, each with its own characteristics, analyzed according to three topological dimensions, introduced in the table below.

Table 2. Topological dimensions of visual analysis

Dimensions	Characteristics	Visual representation
Centers	<ul style="list-style-type: none"> <li>• Authorities of the networks having most of the connections and consequently being highly visible</li> <li>• Hub-actors around specific projects</li> <li>• Actors guaranteeing the interconnection of the network</li> </ul>	<ul style="list-style-type: none"> <li>• Highly connecting actors occupying the centers of the network</li> <li>• Organizations surrounded by more or less interconnected actors</li> </ul>
Boundaries	<ul style="list-style-type: none"> <li>• Nodes connecting different networks</li> <li>• Organizations which are not the most prevalent in the network</li> <li>• Actors gathering different types of activities</li> </ul>	<ul style="list-style-type: none"> <li>• Nodes gathering actors together</li> <li>• Actors associating different “minor” clusters</li> </ul>
Margins	<ul style="list-style-type: none"> <li>• Actors coming to stand more on their own</li> <li>• Nodes not linking actors together</li> <li>• Organizations defined by a geographic or thematic diversity</li> </ul>	<ul style="list-style-type: none"> <li>• Organizations positioned at the margins of the graphs</li> <li>• Actors located in small isolated clusters</li> </ul>

### **Central nodes**

The educational policy networks identified in the study can be theorized as networks of organizations composed of central nodes and boundary actors. These networks are built on partnerships between organizations and are able to generate relationships between philanthropists, public authorities and businesses through funding calls, consultations, hearings, participation in working groups, etc.

Central nodes need to be seen in their socio-political context, as they are able to help “smaller” organizations overcome obstacles in obtaining funding for their initiatives, for example by supporting grant applications to the European Commission. Within the educational policy networks analyzed, central nodes were often found to generate the greatest amount of social investments through seeking partnerships, participating in virtuous initiatives, supporting projects and implementing fundraising activities.

### **Boundary Actors**

Some new philanthropic organizations within the educational policy networks examined are central to social investment processes, as they are actors that pursue their business based on specific philanthropic relationships and goals. They operate by creating bridges between different philanthropic organizations and peripheral areas of the networks, providing financial resources. The empirical analysis suggests that most new philanthropic organizations operate as boundary actors and that boundary actors are needed at different groups and levels of a network, due to their power to connect organizations and to allow smaller nodes to access funding and the policy context.

From the data collected, a variety of boundary actors emerge with different roles such as accumulators of social capital, “changemakers”, participants in an interconnected corporate elite. Therefore, these actors are found at different levels of educational social investment networks and come from different social spheres.

## **TOPOLOGICAL VISUALIZATION OF NEW PHILANTHROPIC NETWORKS**

Network ethnography, used as an analysis methodology in this study, is based on “comprehensive” interviews with members of new philanthropy organizations. This approach is based on the belief that interviewees are active producers of the social. Therefore, in the interviews the grid of questions constituted a flexible representation and a guide for the interviewer, which was

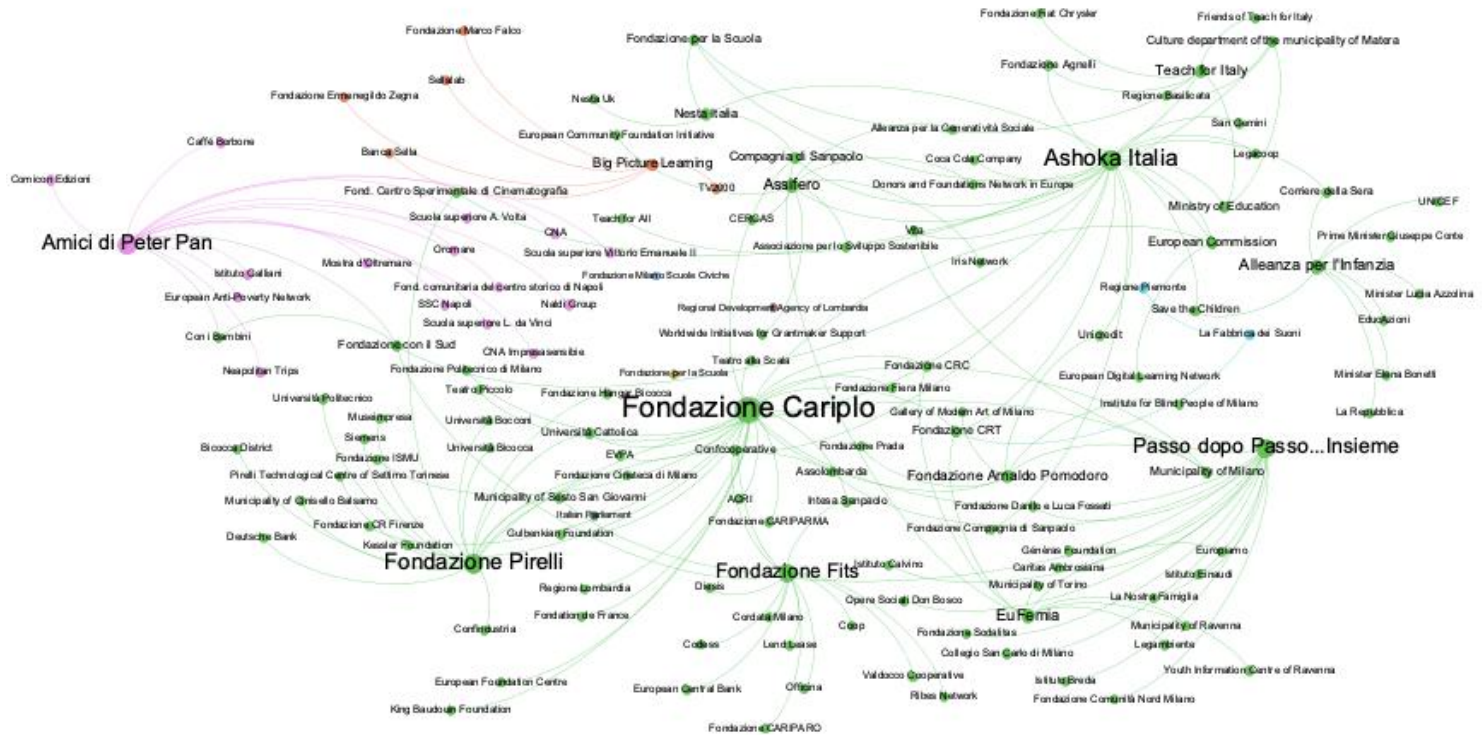

used to get people talking about an issue and obtain a richer conversational dynamic than simply answering questions. The grid of questions was also structured in such a way as to produce a positive feeling in the interviewee (de Singly, 1992), who can be more or less “involved” in the interview depending on the level of trust towards the interviewer.

The interviews were developed in order to arrive at network visualizations. The visualization phase began with the analysis of each interview transcript to identify the different relationships between the actors of new philanthropy focused on education. Then, the resulting networks were visualized through the graph manipulation software Gephi. Each graph displayed in the study is composed of nodes that connect the actors and lines that visualize the interactions between these actors. The shape of the different graphs was obtained with a “force”-based algorithm, called Force Atlas, capable of building a network based on the attraction between connected nodes and the repulsion of non-connected nodes. Furthermore, as argued by Severo and Venturini (2015), once the algorithm is launched, it modifies the arrangement of the nodes until it reaches the best balance of forces. This balance ensures that if two nodes are close in the specific graph, they are directly or indirectly connected to the same set of nodes.

The research focuses on the visual aspects of the graphs, manipulating two parameters: the size of the nodes, calculated as the number of links with other nodes, was used to classify the various actors based on their visibility in the network (the size of each node is proportional to the number of connections with other nodes); the color of the nodes was used to represent their category.

The analysis identified a network of 140 nodes and a total of 154 connections. In the network, organizations that are connected to each other are represented with the same color. The network shows a density (the number of connections of each organization with the others) of 2,216: the central cluster is composed of foundations (Fondazione Cariplo, Fondazione Pirelli, Fondazione Fits) and is surrounded by isolated actors, such as Alleanza per l’infanzia (think tank) and Big Picture Learning (social cooperative). It is also possible to identify some more or less interconnected groups, for example those involving the NGOs Ashoka Italia and Teach for Italy, connected through the Fondazione Agnelli (corporate foundation) at the top right of the graph, the association Amici di Peter Pan and the social enterprise Con i Bambini on the left in the image, and Eufemia (association), Fondazione Cariplo, Nesta Italia (foundation) and Ashoka Italia connected through the Compagnia di Sanpaolo (foundation of the Intesa Sanpaolo bank) at the top center.

Figure 1. Italian network of social investments in education

Furthermore, the relationship between the connected actors is generally mediated by banking foundations, such as Fondazione Cassa di Risparmio di Torino, Fondazione Cassa di Risparmio di Cuneo, UniCredit Foundation and Compagnia di Sanpaolo. These foundations are able to connect different philanthropic organizations: Fondazione Cariplo, Fondazione Pirelli, Fondazione Fits, Fondazione Arnaldo Pomodoro, Nesta Italia, Eufemia, La Fabbrica dei Suoni (social cooperative), Passo dopo Passo...Insieme (voluntary organization), Amici di Peter Pan (association), Ashoka Italia and Teach for Italy.

## **THE ROLE OF NEW PHILANTHROPY IN SOCIAL INVESTMENT STRATEGIES IN EDUCATION**

One way to delve into the complexity of social investment networks may be to focus on the role of nodal actors, consisting of organizations that appear in a variety of roles, moving across different sectors through their engagement in multiple positions, spanning the private, public and voluntary sectors.

Much of the networking activity of boundary actors is “invisible,” in the sense that it materializes through personal relationships, in which social, corporate and political networks intertwine. Boundary actors innovatively address public policy problems, providing not only financial means but also expertise, legitimacy and authority, making philanthropic and civic engagement a form of moral capital.

One among the interviewees could serve as example of this engagement. As mentioned by the employee of the social enterprise Con i Bambini:

We are fully owned by Fondazione con il Sud. But we are the implementing body of the Fund for the contrast of educational poverty of minors. This fund was established by ACRI, which groups together all foundations and savings banks in Italy, and by the government. We have no partners. We are a private entity that manages a fund that is made up half of public money and half of private funds. (Interview, Con i Bambini, 2021).

The social enterprise Con i Bambini crosses different bridge interests, blurring between various fields and converging in their practices. It also accumulates a significant volume of *social capital*, as explained by the respondent:

We mainly address third sector entities, but these entities cannot present themselves on their own. They must create a broad, heterogeneous, complementary, meaningful partnership, also made up of schools, institutions, local authorities, municipalities, parishes, profit organizations, trade

associations. We try to support projects that are carried out by very significant networks.

Hence, much of the networking activity of boundary spanners is “invisible”, meaning that it occurs through personal relationships, where social, business and political networks intertwine. Boundary actors will to address in innovative ways public policy problems, by providing not just financial means but also skills, legitimacy and authority, that make philanthropic and civic engagements a form of moral capital. They become contemporary “heroes”, carrying with them values, methods, discourses and commitment (Ball & Junemann, 2012, p. 91). Among the interviewees, the employee of Nesta Italia serves as an example:

Nesta Italia, as Nesta UK, deals with the expertise in the support of social innovation. And the areas we work on in Italy are basically health, ageing of the population, education, inclusion, emerging technologies, art and culture. In each one of these fields, we use the methods that are the most appropriate to solve the problems that we identify in the different contexts. (Interview, Nesta Italia, 2019).

In addition, as stated by the respondent of Ashoka Italia, this NGO aims to *change the systems* and the mindset that are behind the emergence of social problems:

These are programs, together with others that we promote, that (...) are useful to change the systems, from one side, and most of all the paradigm and mindset which are behind the emergence of social problems. This is why, a movement that says “Everyone is a changemaker” allows us to redefine the idea of success, the growth experience, a series of things like those ones. (Interview, Ashoka Italia, 2020).

The civic engagement of philanthropy towards social problems is also confirmed by the interviewee of Teach for Italy. Specifically, in the field of education, this NGO aims to ensure that:

there is an increase in the quality and level of teaching, of the profiles that choose teaching at an international level. (Interview, Teach for Italy, 2021).

New philanthropic organizations also move and operate between different but highly interrelated social fields of business, politics, philanthropy. This is confirmed by the respondent of the Nesta Italia foundation, who claims that the banking foundation Compagnia di Sanpaolo:

(...) supports the organization (...) So, we have a very good relationship with Compagnia di Sanpaolo. They facilitated Nesta's arrival in Turin and they definitely have a very important role in the foundation's activities. (...) In terms of activities, there is a lot of freedom and support. So, it's a good relationship. (Interview, Nesta Italia, 2019).

Furthermore, regarding the interconnected roles of the senior management members, the interviewee of the Fits Foundation claims:

The secretary general, in particular, has always been a social entrepreneur in life. Here, there are some collaborators who have more tools to understand whether the project actually brings something innovative or not. (Interview, Fits Foundation, 2021).

New philanthropists play multiple roles in different fields and accumulate different and significant relationships within each of them. As mentioned by the respondent of the NGO Teach for Italy:

I run the association. In essence, I created it, I founded it, I manage it. And therefore, I do medium- and long-term planning, I manage the staff who work in the organization. I deal in particular with partnerships, fundraising and institutional relations. (Interview, Teach for Italy, 2021).

Finally, the excerpts of the interviews with new philanthropic actors focused on education governance highlight the multiplicity of roles that organizations are able to play in the various social spheres of the private, corporate and public sectors.

## **FOUNDATIONAL ECONOMY: A KEY TO UNDERSTANDING SOCIAL INVESTMENT**

Over the past 30-40 years, the welfare state has been increasingly challenged by the reduction of public provision and the privatization of key services. At the same time, many services previously run by the state have been taken over by multinationals. As a result, in high-income countries, a network infrastructure delivers services that are called "fundamental" because they are daily necessities, consumed by the entire population and necessary for the well-being of the privileged and disadvantaged.

However, these key services need to be reoriented to deliver positive outcomes for users and to provide alternatives to state provision, especially where the state has withdrawn support or where ongoing austerity has limited the capacity of the state to act.

In this context, the “fundamental economy is about goods and services, which are necessary for as many people as possible to enjoy a decent life. Within the fundamental economy, fundamental services are universally needed and include education (Eadson et al., 2021).

Hence, the idea of having educational infrastructure to democratize education, enunciated by interviewees, fits with a broader sense of democracy that emerges through the empowerment of people. Such educational infrastructure will often need some form of external financial support to operate successfully where viable markets do not exist or to effectively shape existing markets. Supporting these structures should be a priority for funders because philanthropic activities can complement public sectors in providing accountable services, while also playing an important role in focusing on vulnerable and marginalized groups.

## **CONCLUSIONS**

Although this paper explored how Italian philanthropic organizations promote social investments in education by mobilizing their resources, the most important findings concerned the democratization of education through social investments. Indeed, according to the interviews, new philanthropic organizations have engaged in education in new ways, including improving access to services, supporting students’ actions, and promoting their greater involvement in decision-making.

In addition, during the writing of the paper, it became increasingly clear that the exploration conducted refers to the fundamental questions of student participation in society and access to services. The discussion enables a new way of perceiving social investment strategies by providing a topological analysis and conceiving differently how to approach such strategies.

# BETWEEN SPATIAL AND SOCIAL JUSTICE – THE CASE OF LIFELONG LEARNING POLI- CYMAKING

Jozef Zelinka<sup>a</sup>

Marcelo Parreira do Amaral<sup>b</sup>

<sup>a</sup>University of Münster; <sup>b</sup>University of Münster

In the paper<sup>1</sup>, we focus on the spatial dichotomies of lifelong learning (LLL) policy programmes. Departing from the observation that space is both constituted and constitutive of social relations, we problematize the dynamic relation between space and education and its impact on socially inclusive and cohesive policymaking. In this regard, we understand LLL policy programmes as significant instruments for combating social inequalities and contributing to more just and democratic societies. The main research question is to understand the relationship between space and education and its impact on LLL policymaking at various governance levels. The paper is structured as follows: *First*, we frame our understanding of spaces and spatiality and embed the concept of spatial justice in education. *Second*, we present the results of a short analytical exercise on the relation between education and spaces developed in form of so-called spatial dichotomies. *Third*, we contextualise our results within various levels of LLL policymaking and offer concluding remarks on how LLL can be further theorized. Our paper explores the dynamics between various levels of policymaking and their implications for European and global education governance.

space; spatial justice; education; spatial dichotomies; lifelong learning policymaking

---

<sup>1</sup> This is a shortened and adjusted version of a chapter titled *The Dynamics of Education and Space: Examining the spatial dichotomies of Lifelong Learning Policies* and submitted for the *Handbook on Geographies of Education* (forthcoming), edited by Yi'En Cheng, Peter Kraftl, Sarah Holloway & Silvie Rita Kučerová. Edward Elgar.

## INTRODUCTION

The relation between space and education has long been neglected in research. Both education research and geography have enriched each other's discipline, yet only very recently, especially since the so-called *spatial turn* (Lefebvre, 1974) in the social sciences and humanities, has education research started integrating knowledge on spaces, places, and landscapes and their impact on and interaction with learning (Freytag et al., 2022; McLeod et al., 2023). It perceives the surrounding world no longer as a mere scenery behind which social processes take place (a container of social life), but rather as a co-producer of the social life itself. In breaking down the linkage between education and geography, our focus is turned to spaces and their role in shaping the educational opportunity structures and learning pathways of young people.

From the life course perspective, the impact of space on educational pathways tends to be stronger when the duration of individual's exposure is longer (Levy, 2022). We argue that the concept of space offers a vital starting ground for a more context-sensitive and holistic approach to education, in particular in understanding lifelong learning (LLL) environments. In the context of European policymaking, LLL has emerged as a policy option to secure social cohesion and support young people in their life courses, especially after the devastating impacts of economic or social crises, like the 2008 financial crisis (Parreira do Amaral et al., 2019). Although there are indications of discrepancies between the design and the impact of LLL policies related to the effects of spaces on education (cf. Parreira do Amaral et al., 2019), these interactions remain largely unexplored, which is why we have turned our focus to the dynamic nature of relations between space and education. Against this background, we seek to examine the relation between space and education and its impact on LLL policymaking at various governance levels.

The paper is structured as follows: *First*, we frame our understanding of spaces and spatiality and embed the concept of spatial justice in education. *Second*, we explore the broader relation between space and education and develop so-called *spatial dichotomies*. *Third*, we illustrate and discuss chosen aspects of spatial dichotomies using the example of LLL policymaking. *Fourth*, we round the paper with a short conclusion.

### 1. CONCEPTUALIZING THE KEY TERMS

In this section, we briefly conceptualise our core terms – space, spatiality, Spatial Justice – before exploring the relation between space and education in

the next section.

The concept of space has been elaborated in various disciplines, most prominently in critical geography and urban studies. We borrow our understanding of space from the British geographer Doreen Massey (2005 and define space as interactive, heterogeneous, and open-ended construct of social and physical worlds, which can be modified, re-defined, contested and re-arranged in multiple, even, yet unknown ways. According to Massey's propositions, space cannot be reduced to its physical manifestation, which underlies only the laws of physics. Spaces are not mere containers of the social life, but actively influence social agents and shape their choices, possibilities, and actions.

Furthermore, spaces exercise power and are effects of power relations (Soja, 2010). This *spatiality* of places, including educational sites, demands a closer look at how spaces interact with the actions of social agents. At the *individual level*, spaces are attributed with various meanings and convey a sense of belonging, e.g., home, fatherland, the foreign. At the *social and policy level*, spaces are shaped and co-created by a vast variety of factors that decide upon the distribution of rights, resources, and opportunities, but also burdens and limitations. The role of policymaking is to assure that all citizens within a given territory or region are given the same opportunities, irrespectively of their spatial or other origin. And it is the spatially unjust distribution of rights and opportunities that has spurred the debates over spatial justice.

The concept of *Spatial Justice* is a relatively new, yet very promising theoretical perspective in the study of social change. The concept enables scrutinizing the spatial dimension of social inequalities and problematize the (un-)fair distribution of opportunities, rights and public goods. It articulates how structural forms and modes of inequality, segregation, marginalisation, and spatially based discrimination operate, create, and sustain social divisions. While focusing primarily on cities and urban/rural cleavages, the range of the concept is wider and includes diverse sites and constellations (core-periphery, lagging-thriving regions, remote-central locations) that affect life courses and educational pathways of young people.

After providing a short conceptual framing of our core terms, in the next section, we focus on the underlying relation of space and education and present a set of spatial dichotomies helpful in analysing the design and impact of LLL policies.

## 2. EXPLORING THE RELATION BETWEEN SPACE AND EDUCATION

In this section, we explore, in a broader sense, a set of dichotomies characterising the interplay between education and space.<sup>2</sup> We depart from the assumption that the nature of space is ambivalent. Spaces do not have positive or negative characteristics or impact on individual or collective actions. Instead, we consider them as constructs and construals at the same time, as determining the quality of social relations, but also as dependent on the actions of social agents. Given this dualism and the ambivalence of space, we have derived several dichotomies using selected parameters that shift our attention from one subject to another.

From the viewpoint of *power*, spaces can play an important role in empowering individual and collective subjects. Regional learning environments can foster creativity, self-realization, and ownership, but they can also work as constrains of individual or collective actions, restrict or block the access to educational offers and curtail the academic achievement. Similarly, the quality of *local/regional structures* affects the possibilities in access to education and transition from education to the labour market. Learning experiences are further part and parcel of individual and collective *meaning-making processes*, which are affected by spatially inscribed narratives and discourses and in which the actors decide about the meaning of learning and education. With regard to the *sense of security*, the spatiality of places may evoke or foster vulnerabilities. We need to be conscious about the difference between *vulnerability* as an experience of being threatened or injured and *vulnerantility* as the precondition for the possibility to get injured (Burghardt et al., 2017, p. 12). Given the latter aspect, educational sites can create vulnerant conditions for learning, such as noisy and dirty environment, the presence of heavy traffic or polluting industries, criminality, and violence, all of which produce/enhance the risk of threats. The *sense of belonging* tells us how spaces are related to the self-understanding and future imagination of individuals and collectives. Another key aspect is the perception and *sense of time*. With this category, we encompass the subject's perception of their past, present, and future. Learners, in particular, often encounter and experience various temporal structures during their educational pathways, which coincide with institutionalised time frames of social and cultural expectations of policymakers. Finally, one last parameter that we chose for the exploration of space-education interplay is *development*. By this parameter we simply mean the ability and plasticity of space to change and

---

<sup>2</sup> The full list of spatial dichotomies is part of the original version of this paper.

adapt to ongoing circumstances, which enable different kinds of innovation and progress, allow successfully attracting investments, and have diverse opportunities to transfer their knowledge.

In this section, we have provided a brief analytical exercise to show how the dynamics of space and education can be conceptualized and assessed. In the next section, we illustrate the spatiality of educational landscapes by applying the analysis of spatial dichotomies to the LLL policymaking.

### **3. SPATIALITY OF LLL LANDSCAPES**

In contrast to more traditional approaches to policy analysis in the field of LLL, which are biased towards researching employability, academic credentials, and measurable outcomes of learning, we aim to highlight the significance of the dynamic, ambivalent and processual nature of LLL, as well as the multiplicity of and interplay between physical, structural, and socio-cultural dimensions of spaces (from international to regional/local levels) and diverse power actors involved in the policymaking process. Such multidimensional view enables us to approach LLL policymaking more holistically and with stronger context-sensitive focus and avoid reducing LLL to its instrumental understanding.

One example is the *sense of security*. The geographical feature of a space has a great impact on the mobility of individual subjects, its time-consumption, and financial costs. The reflection of spatial factors in LLL policy design can help avoid unnecessary labelling and stigmatisation of certain groups of population, which are more prone to vulnerable experiences (members of ethnic or religious minorities, women, disabled persons etc.), yet which might be seen as unwilling to cooperate due to their presumed *immobility*.

With respect to *local/regional structures* and their opening and closing possibilities, urban agglomerations serve as a great example. Cities are portrayed as main spaces of productivity, innovation and growth, where employability is honoured and valued as the main currency. Subsequently, many LLL policies (most notably the Youth Guarantee), profile its recipients on the basis of the operationalisation of their physical *distance* to the labour market. In urban and sub-urban sites, the flexibility to reach out to the centre and the main working and learning districts is the key to success. Since LLL policies are mainly targeted to young adults in diverse conditions of vulnerability, most of them move from deprived outskirts, where they have often amassed negative experiences of relation with the local representatives of institutions and can usually rely on limited amounts of economic, cultural, and

social capital.

In addition, young people, especially those in disadvantaged and vulnerable positions, are further confronted with *making sense* of their educational pathways, often marked with multiple breaks, dropouts, detours, and setbacks, also affected by spatially distributed educational and labour market opportunities. According to variable intersections of disadvantages affecting the youth, the journey into the LLL pathways might further discriminate those who are sufficiently equipped to support and make sense of their movement toward the centre, finding in the LLL policies opportunities for integration, from those who struggle to recognise their own goal, risk *getting lost* in a loop of movement with no clear (and often neither aspired) direction.

Embedded in structural *power* relations, the inequalities faced by young people involved in LLL programmes are not only a matter of low individual resources, as they also deal with a more general trend toward the (also physical: housing, community centres) *peripheralization* (Naumann & Fischer-Tahir, 2013) of youths in Europe and elsewhere. The research on the processes of policymaking has highlighted that the engagement of youths' organisations and voices is very weak, and often totally absent, even when the policies are explicitly designed to target them risking turning social problems into individual ones (Parreira do Amaral & Zelinka, 2019).

#### **4. CONCLUSION**

In our paper, we have argued that LLL policymaking needs a more profound understanding of how spaces affect and contribute to the dispersion of educational opportunities and challenges and how they co-create spatial and, thus, social injustice. We have further stressed the need to accept the complexity of relations between space and education. What the analyses and their application has demonstrated is the fact that the ambivalent, processual, and constructive nature of spaces is seldom reflected in LLL policymaking and research. The dichotomies elaborated from the dynamics of space and education offer a different perspective on how LLL—as an educational pathway and as a policy tool—can be designed, understood, and implemented on various governance levels. If we assume that LLL pathways are socially and spatially constructed landscapes, their exploration must also consider how different actors experience their crossings and trajectories and how the relations build while passing through these experiences.

Furthermore, there is no universal definition for when spatial injustice has been

done since every case is a dynamic and open-ended process. Some spaces can temporarily worsen the social situation and access to quality education, yet they are not to be blamed as the sole causes of inequality and injustice. Instead, it is necessary to acknowledge the power imbalances resulting from the uneven distribution of resources, rights, and opportunities, which are to be balanced by context and spatially sensitive policymaking.

Finally, the aim to strengthen the subjective capacity and agency of young people needs to overcome their mainstream monolithic representation as passive recipients, if they are to be empowered to build their life courses in the existing environments. This understanding is in some cases, albeit unnoticeably, reinforced by the spatial representation of young people (villagers, hinterlanders, street-children, etc.), which affects not only their self-perception and educational aspirations, but flattens them out as ‘*difficult*’, ‘*risk*’, or ‘*wicked*’ youth, thus leading to stigmatisation and ill-informed policymaking.

### **Acknowledgements**

Financial support for this study was provided by the European Commission under Grant Agreements No. 693167 (YOUNG\_ADULLLT) and No. 101061155 (CLEAR). We further like to thank Xavier Rambla, Marcella Milana and Tore Bernt Sorensen, the convenors of the panel “*Global governance and education: implications for policy and practice*” at the Third International Conference of the journal “*Scuola Democratica*” at the University of Cagliari, Italy (June 3-6, 2024).

# GENERATIONS, EDUCATION AND COMMON VALUES: A STUDY ON FIVE ITALIAN COHORT-GENERATIONS, FROM THE RECONSTRUCTION TO GEN Z

Matteo Bonanni<sup>a</sup>

<sup>a</sup>'La Sapienza' University of Rome

This study investigates the changing values across generations and the emerging configurations of values among them, with a focus on the role of education. The literature reveals a gap in the debate regarding value changes between generations (Lyons et al., 2005; 2007). To address this gap, S. H. Schwartz's theory of Basic Human Values was employed, along with data from the European Social Survey (2016-2020), extracting the Italian sample. The objective is to assess whether values serve as a useful criterion for distinguishing generations, especially those closer in time, and to contribute to filling the existing gaps. This could prove valuable for studying the behaviour, beliefs, and relationships between older and newer generations, as well as for understanding the specificities of these generations within a comparative framework.

Generations, Basic Human Values, Education

## GENERATIONS AND VALUES

In social interactions, it is crucial to examine the relationships that emerge between social groups of different ages. When these groups are united by a shared bond and perceive common experiences (i.e., a shared historical-social context), they can be identified as generations (Mannheim, 1952). Understanding generations, their cohesion, and their worldview offers a valuable framework for interpreting social reality. However, given the accelerated pace of social change, it has become increasingly difficult to distinguish between generations, making it more challenging to identify clear differentiating elements (Chisholm, 2023). One potential criterion for distinguishing between generations, particularly those in close succession, lies

in fundamental human values, as posited by S.H. Schwartz's theory (1992; 2012; et al. 2012), now into the European Social Survey (ESS) database. The idea for this work arises from a review of the literature and the recognition of an existing gap regarding the issue of changing values across generations (Lyons et al. 2005; 2007). This gap is even more pronounced when considering the numerous historical events of the past 20 years, including the 2008 financial crisis, the pandemic, and various national events (Sortheix et al., 2019). This study aims to achieve three aims: establish a criterion for distinguishing generations based on values; contribute to filling the gap in the literature on generational value change; examine the role of education in shaping value transformation across generations. Education can be considered a key factor in influencing generational change (Giancola & Bonanni, 2024). The hypothesis proposed here is that values may serve as a clear criterion for distinguishing generations, and that these values are, in turn, influenced by education in different ways across generations.

## **2. METHODOLOGY, DATA AND AIMS**

Data for the Italian sample (15'639 cases) from the 2016 (wave 8) to 2020 (wave 10) editions of the European Social Survey (ESS) were used. The tool of cohort-generation was employed as a proxy for generations. The cohort for the statistical necessities, while the concept of generation for interpreting the results. The cohort-generations are the Z, born between 1996 and 2008, the Y (Millennials), born between 1980 and 1995, the X, born between 1969 and 1979, the Baby Boom, born between 1949 and 1968 and the Reconstruction, born between 1927 and 1948. The analyses consist of bi- and trivariate comparisons of means, with a mention of linear regressions. It is important to note that for Generation Z and the Reconstruction generation the results may be skewed due to the limited number of cases in the categories and for the former, due to the presence of who is already student.

## **3. BASIC HUMAN VALUES**

Here, values represent a key element that articulates conscious goals, theoretically and empirically, guiding fundamental aspects of human and social nature. A value can be understood as a belief associated with desirable outcomes or modes of conduct that transcends specific situations. It functions as a guide for the selection and evaluation of behaviors, individuals, and events, and is prioritized relative to other values, thereby forming a system of value

priorities (Schwartz, 1994). These values are operationalized into 21 variables from the ESS questionnaire that comprise 10 core values. These are further synthesized into 4 “higher-order” values: Openness to change (comprising the values of Stimulation and Self-direction), conservatorism (including the values of Tradition, Conformity, and Security—referring not to political Conservatorism but rather to a spirit or instinct of conservation), Self-enhancement (encompassing the values of Power, Achievement, and Hedonism), and Self-transcendence (composed of the values of Universalism and Benevolence). These values are in a circular continuity model and are presented as opposing pairs. However, they can yield different configurations and represent distinct elements at various levels of interpretation of human nature (Schwartz et al. 2012). To derive the four higher-order values, two sets of principal component analyses were conducted. The first addressed the 21 variables from ESS (grouped according to the theoretical framework) and the second on the 10 components extracted.

### **3.1 Values and education**

To further clarify the framework connecting education and values, it is worth noting that K. Mannheim examined the relationship between education and values in the context of the transmission of democratic ideals (Casavecchia, 2017). Additionally, in educational discourse, these elements have been analyzed concerning their ideological transmission (Giancola & Salmieri, 2024). In Basic Human Values theory, a statistical association exists between universalism and participation in higher education (Schwartz, 2007; 2012). Research in Italy shows a positive correlation between educational attainment and the values of stimulation and self-direction, as well as a negative correlation with tradition and security (Schwartz et al. 2012; Capanna et al. 2005).

## **4. ANALYSIS**

### **4.1 Distinguishing generations by values**

Initially, the means of the cohort-generations on the four higher-order values were analyzed. The results indicate a significant gap between older generations (lower levels) and younger generations (higher levels) in openness to change (1.15 mean points) and self-enhancement (0.95 mean points). In self-enhancement, there is also a considerable positive difference between Generation X and Generation Y, the two cohorts that are the most challenging to distinguish (0.27 points).

A more nuanced distinction emerges in the domain of conservatorism, where

the highest values are found among older generations, with reconstruction generation scoring 0.09 and Baby Boomers scoring 0.07 points. There is a reversal of polarity between Generation X (0.04) and Generation Y (-0.06), with all differences being statistically significant, although small ( $p < 0.00$ ).

Further insights can be drawn from examining the means of the sub-values of conservatorism (Tradition, Conformity, and Security) and self-enhancement (Power, Achievement, and Hedonism). In the case of conservatorism, the value of security is highest for Generation X (0.04), compared to preceding and subsequent generations, which score -0.04 for Generation Z, 0 for Generation Y and Reconstruction generation, and -0.01 for Baby Boomers. All other values decrease over generations ( $p < 0.05$ ).

For the values of self-enhancement, the slopes of the transitions between the Economic Boom Generation and Generation X are relatively small, with mean differences of 0.12 points on Power, 0.21 points on Achievement, and 0.24 points on Hedonism. However, the slope increases significantly between Generation X and Generation Y, with mean differences of 0.17 points on Power, 0.25 points on Achievement, and 0.25 points on Hedonism. This highlights a further distinction between these close generations ( $p < 0.00$ ).

#### **4.2 Generations and education**

Introducing the level of education into the analysis, it becomes evident that all values begin with low averages and increase with higher educational attainment, except for conservatorism. Openness to change and self-enhancement exhibit more rapid growth across educational levels, showing significantly higher averages. Self-transcendence also rises, but at a slower pace ( $p < 0.00$ ).

A detailed examination of the relationship between educational attainment, generation and values reveals how these differ across generations and education levels. As educational attainment increases, the level of self-transcendence generally rises across generations, with the notable exception of the Reconstruction generation. In Figure 1, younger generations display higher levels of self-transcendence. Generation X and Generation Z start with the lowest levels, while Baby Boomers begin with higher levels but exhibit the lowest average at the tertiary education level. Despite their initial positions, Generations X and Y show a similar trend and values for tertiary education, along with Generation Z, which demonstrates the highest values starting from lower secondary education ( $p < 0.00$ ).

Fig. 1. Mean on self-transcendence by educational level and cohort-generations. Source: Author elaboration.

For self-enhancement (see Figure 2), the trends are more straightforward: the means increase across generations as educational attainment rises, with the trends remaining roughly parallel and displaying only minor deviations between educational levels ( $p < 0.00$ ).

Fig. 2. Mean on self-enhancement by educational level and cohort-generations. Source: Author elaboration.

The average value of openness to change rises with higher educational attainment (see Figure 3). The Reconstruction Generation exhibits the lowest value, while the Baby Boomers, Generation X, and Generation Y begin at similar levels but diverge as they attain tertiary education. In contrast, Generation Z starts with the highest overall values; however, these values decrease between upper secondary and tertiary education, potentially due to the number of cases ( $p < 0.00$ ).

Fig. 3 Mean on Openness to change by educational level and cohort-generations. Source: Author elaboration.

Conservatorism exhibits the most pronounced differences between generations (see Figure 4). Baby Boomers and the Reconstruction Generation show very high values at the lower secondary education level; however, they display the lowest average values at the tertiary education level and beyond.

For Generations X and Y, a notable trend emerges. They start with very low averages at the lowest educational level. Generation X's mean increases with each level of education, ultimately reaching the highest values among all generations at the tertiary level and beyond. Generation Y experiences a slight decrease at the lower secondary level, but then the average rises, making it the generation with the second-highest values, following Generation X. Generation Z also sees an increase in conservatism with higher educational attainment, although it starts from the lowest values. Despite this growth, Generation Z maintains one of the lowest overall averages (considering the sampling issues previously mentioned). The rise in conservatism among Generations X and Y

is likely linked to the living conditions shaped by the aftermath of the economic boom and the 2008 financial crisis, as these generations have experienced worse conditions than their parents or were born during a period of crisis and increasing welfare cuts ( $p < 0.00$ ).

Fig. 4 Mean on Openness to change by educational level and cohort-generations. Source: Author elaboration

This result may partially explain the resurgence of conservative political discourses. However, when considered alongside other values, the interpretation becomes more nuanced: the increase in openness to change over time and across educational levels may account for younger generations' growing sensitivity toward social rights, particularly when combined with self-transcendence. Additionally, the rise in self-enhancement reflects the logic of prevailing economic paradigm and the adaptation of new generations to it. The combined effect of these values suggests that there is likely no straightforward shift from materialist to post-materialist values (Inglehart, 2018) and a resurgence of the first (Norris, Inglehart, 2018) but maybe we are encountering new configurations or reconfigurations of values.

To estimate the impact of educational qualifications on values, four linear regression models were tested — one for each value, divided by generation, resulting in 20 linear submodels. Gender was included as a control variable. However, neither gender nor educational level consistently demonstrated significance across generations or values. Beyond this, the only clear

conclusion is that education does not play a fundamental role for every value; for example, it influences openness to change but not conservatism, with variable effects across generations. In summary, the roles of these two variables are not generalizable across generations or values. These relationships warrant further investigation, accounting for both age and cohort effects.

## 5. CONCLUSIONS

We observed that generations at different ages exhibit distinct averages and configurations of values. This differentiation is particularly effective for distinguishing between generations that are closer in time, especially when considered alongside educational attainment. The element of values serves as an effective means of differentiating between generations, highlighting key differences and fulfilling one of the study's objectives.

Differences within and between generations based on educational attainment reveal additional significant distinctions in values, particularly concerning the trend of conservatism. The analyses presented primarily operate at a descriptive level. Although they remain at the trivariate level and the linear models did not yield particularly successful results, they partly confirm the hypotheses and provide an interpretation of reality that seeks to transcend a dichotomous understanding of values.

This study contributes to addressing the literature gap on generations and values by incorporating the element of education, which, through its role and expansion over time, has proven to be a valuable variable for interpreting social reality. However, the evidence presented remains relatively weak and calls for further theoretical and empirical exploration, moving beyond a purely descriptive approach. The analyses hold not only theoretical value; when read in the context of recent periods of crisis, they can provide a tool for understanding the changing values and contextualized generations. More importantly, they can contribute to social actors in guiding potential targeted interventions for populations, with attention to their generation of belonging.

# EDUCATION AND SOCIAL COHESION IN EUROPE: TESTING THE POST-MODERNIZATION THESIS

Loris Vergolini<sup>a</sup>

<sup>a</sup>University of Bologna

In this paper, I test predictions coming from the modernization thesis by examining the relationships between social cohesion and educational attainment in Europe. Social cohesion is measured using indices of institutional trust, solidarity, and political and socio-cultural participation. I explore how education influences social cohesion and interacts with country-level characteristics, based on the assumption that the transition to modernized societies diminishes the role of economic resources in shaping lifestyles and opportunities. As a result, education is expected to play a crucial role in influencing social cohesion in these societies. Two hypotheses are tested: (1) education has a stronger impact on social cohesion in more modernized countries, and (2) education is more influential than social class in shaping social cohesion, particularly in these countries. Using multilevel models and structural equation modelling, I analyse data from the European Value Study. The results demonstrate that a higher level of education is associated mainly with greater social and political participation, and that this effect is significantly stronger in more modernized countries, partially supporting the proposed hypotheses.

social cohesion; modernization; social inequalities

## INTRODUCTION

The topic of social cohesion has been widely studied over the past two decades. A vast body of literature has addressed its definition (Aruqaj, 2023), measurement (Delhey et al., 2023; Tok et al., 2024), and its main determinants (Walle, 2022). I consider social cohesion as a multidimensional concept that can be measured using individual-level data, stating that the overall level of social cohesion emerges from attitudes and behaviours at the micro level. Regarding the determinants of social cohesion, empirical research showed that

it is negatively affected by social inequalities (Vergolini, 2011a), educational inequality (Green et al., 2006), income inequality (Wilkinson and Pickett, 2009; Aruqaj, 2023), poverty and economic vulnerability (Whelan and Maître, 2005; Vergolini, 2011b; Andrews et al., 2014; Goubin, 2018), and ethnic concentration (Putnam, 2007).

This paper contributes to the literature by clarifying the role of education from a comparative perspective, focusing on the interaction between macro and micro factors. Specifically, I examine how a country's level of modernization (macro) affects the relationship between education and social cohesion (micro). The paper is organized as follows: the next section reviews the main definitions and measures of social cohesion, followed by an outline of the theoretical model and research questions, which guide the choice of data, methods, and empirical analysis. The final section provides concluding remarks.

## **1. SOCIAL COHESION: DEFINITION AND MEASUREMENT**

In the literature concerning social cohesion, a great emphasis has been placed on its definition and measurement. As pointed out by Vergolini (2011a) there is a distinction between two main families of definitions that have characterised the field of social cohesion since its beginning. The first considers social cohesion as a process directed toward the attainment of a particular goal: it concerns the goal of promoting equal opportunities and reducing disparities (Berger-Schmitt, 2002). In this way, there is the risk to create some confusion between the constitutive elements of social cohesion with the factor that could affect it. The second one looks at social cohesion in a static way, defining it as a state of affairs concerning the interactions among members of a society, interactions that take place in various domains of human associate life (Chan et al. 2006; Vergolini 2011a; Dickes and Valentova, 2012; Bottoni, 2018). The latter is the approach I follow since it is the more promising one to analyse social cohesion. For the measurement aspect we rely on individual data following the approach suggested by Dickes and Valentova (2012). They identify a set of indicators of social cohesion suitable for cross-countries comparisons identifying four main dimensions, measured by additive indexes that are made up by several indicators as detailed below:

- Institutional trust: confidence in national distributive system, national organisation, authority institutions and satisfaction of democracy and government.
- Solidarity: proximal and distal solidarity.

- Political participation: participation in legal and illegal political activities and political concern.
- Socio-cultural participation: participation in social, political, cultural associations as well as in youth and leisure associations.

## **2. THEORETICAL BACKGROUND**

In this paper, I analyse a number of predictions derived from the modernization thesis, focusing on the cultural basis of social stratification. The key argument is that, in modern societies, the relevance of economic resources in defining lifestyles and life opportunities has declined (Kalmijn and Kraaykamp, 2007). In contrast, knowledge and cognitive ability have become more central in the stratification system (Bell, 1973). The research questions explore the relationship between educational attainment and social cohesion, as well as how this interacts with country-level characteristics. Previous section has highlighted that the economic sphere, measured through social class and economic conditions, shapes social cohesion. People in higher social positions are more likely to exhibit greater levels of social cohesion, as active participation in social life requires resources. This suggests that activities that foster social integration remains a costly activity, requiring time and/or money. This suggests that material resources, measured through social class, continue to shape social cohesion, with social class acting as a proxy for permanent income (Goldthorpe and McKnight, 2006).

However, this paper challenges that perspective by focusing on the cultural basis of stratification—education—rather than purely economic factors. According to modernization theory, the transition to modern societies decreases the importance of economic resources in shaping life opportunities, with education assuming a more significant role. Higher levels of education are associated with greater cognitive resources, such as knowledge and skills, which increase civic engagement and participation in social life (Almond and Verba, 1963; Green et al., 2006). Thus, education promotes social cohesion through various channels, including socialization to values and to the access of remunerative occupations.

Country characteristics play a pivotal role in this framework. Modernization, marked by rising education levels, economic growth, and a strong civil society, fosters social cohesion. It creates more integrated societies by promoting shared values, economic security, civic participation, and interdependence, enhancing trust and cooperation (Kalmijn & Kraaykamp, 2007; Bell, 1973). From

these arguments, I propose the following hypotheses:

- H1) Education influences social cohesion (H1a), and this effect is stronger in more modernized countries (H1b).
- H2) Education plays a more significant role than social class in shaping social cohesion, especially in more modernized countries.

### **3. DATA VARIABLES AND METHOD**

The analyses presented in the paper are based on data from the 2008-2009 wave of the European Value Study (EVS) that has been carried out on a representative sample of population aged 15+ in 47 countries. As discussed in the previous section, social cohesion is measured following the Dickes and Valentova (2013) approach, while the main independent variables are educational level and social class. Social class is measured according to the ESEC scheme (Rose and Harrison, 2010). I use as indicators of the level of modernization of a country the human development index (HDI) that is the most adequate indicator to capture aspects related to modernization (Inglehart and Baker 2000). To avoid the risk of circularity, the macro variable is measured at time t-1 (i.e., one year before the survey). The descriptive statistics for the main variables used in the analyses are reported in Table 1. To test the first hypothesis, I employ a random intercept multilevel model that is the best technique to detect the role of individual and contextual characteristics as well as their interactions.<sup>1</sup> For the second hypothesis, I need to decompose the direct and indirect effects of education and social class to understand which of the two aspects is more relevant in shaping social cohesion. To answer this research question, I rely on a multi-group structural equation model (SEM), that allows for this decomposition according to clusters of countries ranked by their level of modernisation.<sup>2</sup>

---

<sup>1</sup> All the models presented in the next section control for age, sex, citizenship, civil status, employment condition, and social origins.

<sup>2</sup> Since SEM model requires continuous variables, I use the international socio-economic index (ISEI) and the years of education, instead of respectively of social class and educational level.

Tab. 1. Descriptive statistics for the main variables used in the analyses (N=23,251). Source: European Value Study (2008).

Outcome variables		
	Mean	Std. Dev.
Institutional trust	0.470	0.168
Solidarity	0.571	0.186
Political participation	0.369	0.185
Socio-cultural participation	0.053	0.096
Main independent variables		
Country level	Mean	Std. Dev.
Human development index	0.828	0.071
Individual level	Mean	Std. Dev.
Socio-economic status index	44.031	16.749
Years of education	12.408	3.658
Educational level	%	
Primary	9.7	
Lower secondary	15.5	
Upper secondary	40.0	
Tertiary	34.8	
Social class	%	
Salariat	33.5	
Intermediate	18.1	
Self-employed	8.2	
Lower white collars	11.2	
Working class	29.0	

## 4. EMPIRICAL RESULTS

### 4.1. The role of modernization and education

The results reported in Figure 1 are intended to answer the first research question about the role of education and its interaction with modernization's level. Regarding political and socio-cultural participation, I find that higher levels of education generally correspond to greater involvement in social and political life (H1a), and at the same time the influence of education tends to fan out as the HDI rises (H1b). In this case both H1a and H1b are corroborated by the empirical analysis. The situation is less clear when I move to institutional trust and solidarity, which show peculiar patterns. In the first case, I show that the less educated people have a higher trust in the institution and that the differences between the levels of education disappear in countries with higher values of HDI, which is exactly the opposite of what is stated in H1.

Fig. 1. Predicted values from random intercept multilevel models for the interaction effects of human development index and educational level on the four dimensions of social cohesion (N=23,251). Source: European Value Study (2008).

This unexpected result can be explained by the fact that highly educated people in countries with a low HDI may have a better knowledge of the functioning of the institution and are able to compare the situation in their country with that in more developed countries, which may lead to lower values of institutional trust. The “fan

in configuration” can be interpreted as meaning that in countries with a high HDI, all people, regardless of their level of education, tend to have a high level of trust in institutions, as a sign of the overall good performance of institutions.

Regarding solidarity, there are practically no differences between levels of education and the relationship is negative, which also contradicts H1. One possible explanation lies in the rise of individualism in modern societies, which may become more pronounced as people become less dependent on their communities for survival. This increased focus on individual achievement may reduce the need for collective solidarity.

#### 4.2. Do cultural resources matter more than economic ones?

Table 2 shows the results from the SEM analysis intended to shed light on the second hypothesis. Overall, the effects of ISEI and education are substantially in line with H2: I find that education exerts always a greater influence than ISEI and the role of education tends to become more relevant in more modern countries. The overall picture is challenged, also in this case, by the results regarding institutional trust and solidarity. In fact, I find that the effect of education is positive only in countries with higher level of modernization and, the educational effect is always greater than the ISEI effect. Moreover, education is more relevant than ISEI in high modernized countries, while in the others the main driver of social cohesion is the economic dimension.

Tab. 2. Total effects of ISEI index and years of education on the various dimensions of social cohesion according to different levels of modernization (N=23,251). Source: European Value Study (2008).

	Institutional trust	Solidarity	Political participation	Socio-cultural participation
ISEI index				
Low modernization	0.032**	0.051***	0.047***	0.043***
Medium modernization	0.046***	0.032***	0.090***	0.088***
High modernization	0.043***	-0.006	0.080***	0.079***
Years of education				
Low modernization	-0.118***	-0.062***	0.217***	0.049***
Medium modernization	-0.060***	-0.017*	0.185***	0.126***
High modernization	0.079***	0.075***	0.221***	0.142***

## 5. CONCLUSIONS AND DISCUSSION

In this paper, I tested the predictions of the modernization thesis regarding the relationship between education and social cohesion in Europe. The findings confirm that education plays a significant role in shaping social cohesion: higher levels of education are consistently linked with greater social and political participation, and this effect intensifies as countries become more modernized. However, the results are less clear for institutional trust and solidarity, where the expected relationship with education was either weak or counterintuitive. These unexpected outcomes suggest that while education is important for fostering participation, other societal factors, such as cultural shifts toward individualism in highly developed countries, may undermine solidarity.

Further research should explore the role of exogenous events, such as the Great Recession and the COVID-19 pandemic, which may have reshaped social cohesion by influencing economic vulnerability, participation, trust, and solidarity. These crises have likely exacerbated social inequalities and altered the dynamics of social cohesion, warranting a deeper understanding of their long-term impact on education's role in modern societies.

# UNIVERSITY STUDIES AND CHANGES IN *HABITUS*

Emanuela Susca<sup>a</sup>

Elena Gremigni<sup>b</sup>

<sup>a</sup>IULM; <sup>b</sup>University of Salerno

Pierre Bourdieu's contribution to interpreting disparities in educational opportunities was not limited to research specifically dedicated to the world of education that led to the identification of social reproduction devices within school and university institutions (e.g. Bourdieu and Passeron, 1964; 1970). Some of his conceptual tools developed in the context of other research – such as 'capital,' 'field,' '*habitus*,' and 'symbolic violence' – show significant heuristic potential for understanding the social dynamics that underlie what might erroneously appear to be educational trajectories based on individual choice.

The concept of *habitus* in particular, which Bourdieu enriches with further meanings compared to that already used in philosophy and the social sciences (Sapiro, 2015), is especially useful, not only for understanding the mechanisms of social reproduction but also for identifying the margins of intervention capable of changing the destinies of disadvantaged subjects. While on the one hand, this durable system of internalized dispositions reflects the *habitus* of class or class fraction of origin (Bourdieu, 1979; Bourdieu, 1980), on the other, it can be modified through new processes of acculturation and socialization (Bourdieu and Wacquant, 1992). In this sense, the actions of different primary, secondary, and tertiary educational institutions can be decisive in promoting the development of a different *habitus* that can strengthen the original, or constitute a mediation tool between the internalized dispositions produced by a disadvantaged social class and the practices required in order to access superior social positions.

Starting from Bourdieu's reflections, some scholars who share his theoretical approach, of analytically investigating the effects produced by attending different schools and universities, have identified the active role played by what has been defined as an 'institutional *habitus*' to advance phenomena of social change and transformation. In fact, secondary education institutions promote the formation of different *habitus* based on the characteristics of each

institution, which vary according to the type of users, geographical positioning, specific organization, and available resources.

Among research highlighting the heuristic potential of the ‘institutional *habitus*’ concept in the analysis of educational processes, the investigations carried out by Patricia M. McDonough (1997) in the United States and by Diane Reay (1998) in Great Britain on the role played by secondary schools and the social class of students in their orientation towards tertiary education merit attention. More specifically, McDonough used the expression ‘organizational *habitus*’ (McDonough, 1997) to indicate the influence of each educational institution on the configuration of students’ principles, and practices. Reay, by analyzing the study and life trajectories of some young Londoners through in-depth interviews, coined the expression ‘institutional *habitus*’ (Reay, 1998), highlighting the complex stratification of experiences that led to the formation of a *habitus* significantly influenced by educational institutions. It was observed in particular that private schools attended by the middle class inculcate the idea in students that it is necessary to continue their studies at the best universities, whereas public schools offer less guidance or tend to orient working-class children toward the closest universities geographically, presupposing the impossibility that families are able to sustain the costs of sending their children to other cities. As other scholars have also highlighted (e.g. Ball et al., 2002; Lehmann, 2007; Ingram, 2009; Burke, Emmerich and Ingram, 2013; Tarabini, Curran and Fontdevila, 2017; Gerosa et al., 2019; Romito, 2021), the role of ‘institutional *habitus*’ in educational transitions can therefore be decisive in promoting access to higher education and the consequent social mobility processes of disadvantaged students.

However, acquiring a new *habitus* more suited to the field within which important stakes are being competed for in order to obtain a predominant position should not only be understood in a positive light, as it can also give rise to paradoxical or ambivalent conditions. When the ‘institutional *habitus*’ manages to deeply shape the original, changes occur in the *opus operatum* and in the *modus operandi* that weaken the bond with the disadvantaged environment of origin so much that the social agent ends up losing their primary class consciousness. On the other hand, if the primary *habitus* remains strongly rooted after acquiring a different system of internalized dispositions, a condition of “*habitus clivé*” originates (Bourdieu and Sayad, 1964; Bourdieu, 2004). Indeed, the transformed social agent experiences a painful laceration between new interests and aspirations and those of the social environment of origin, which produces an internal and external conflict with consequent sacrifices

even in terms of emotion (Lee and Kramer, 2013; Friedman, 2016).

This split *habitus* seems to be the best condition to which disadvantaged subjects can aspire, in order to maintain an organic relationship with their class of origin at least in part. Above all, it can constitute a condition that is to a certain extent privileged, promoting a form of epistemic reflexivity capable of understanding the complex experiential layers that are stratified in the *habitus* and consequently permitting an opportunity to escape social determinism.

# UNIVERSITY STUDIES AND CHANGES IN *HABITUS*. EXPLORATORY RESEARCH ON FIRST-GENERATION STUDENTS

Elena Gremigni<sup>a</sup>

<sup>a</sup>University of Salerno

The benefits associated with university studies consist not only in the acquisition of institutionalized cultural capital useful for finding employment but also in the acquisition of internalized dispositions that modify original categories, values, interests, and behavioral patterns with positive consequences on lifestyle, active citizenship, and the quality of cultural consumption. As part of qualitative research on first-generation students at the University of Pisa, this paper seeks to show how students from families with low educational credentials, who manage to gain access to university pathways by overcoming obstacles related to their social origin, can acquire a new *habitus* that, in some cases, contrasts with the internalized dispositions assimilated within the family or social class to which they belong. This circumstance can generate a condition of *habitus clivé* that risks undermining the social agent's identity but can also foster forms of reflexivity that are difficult to acquire for those who do not experience this form of *habitus*.

higher education; *habitus*; *habitus clivé*; first-generation students.

## INTRODUCTION

In Italy, inequalities of educational opportunities due to social origin are significant as the education system is characterized by a form of early tracking that makes it difficult for students from disadvantaged backgrounds, who are mainly concentrated in vocational and technical paths, to access university education and successfully continue their studies (Benadusi and Giancola, 2021). Although social origin has been found to be directly related to the likelihood of finding a job in our country regardless of the level of education attained (Ballarino and Bernardi, 2020) university education can still play a

noteworthy role in fostering a transition to superordinate social positions (ISTAT, 2023). Moreover, a university education enables the acquisition of dispositions that are internalized by positively influencing participation in political and social life, the quality of one's cultural consumption, and food choices that generally promote a healthier lifestyle and, consequently, better health (Parziale, 2019). This contribution, using data collected as part of qualitative research on first-generation students at the University of Pisa, aims to show how students from families with little institutionalized cultural capital (Bourdieu, 1979b), who manage to gain access to university paths after overcoming obstacles related to their social origin, tend to profoundly modify their original categories, values, interests, and behavioral patterns. This circumstance can generate a condition of *habitus clivé* (Bourdieu and Sayad, 1964; Bourdieu, 2004), that is, a split *habitus* that risks undermining the social agent's identity but can also foster forms of reflexivity that are difficult to acquire for those who have not had this type of experience.

## 1. THEORETICAL FRAMEWORK

The importance of cultural capital and the complex intertwining of this resource with other types of capital (economic, social, symbolic, etc.) was highlighted by Pierre Bourdieu. The French sociologist distinguished three forms of cultural capital: titles certified by the state which conferred relatively high symbolic value (institutionalized cultural capital), material cultural goods (objectified cultural capital), and cultural resources acquired through a process of family socialization (embodied cultural capital) (Bourdieu, 1979b). The latter form of capital constitutes a *habitus*, a system of internalized enduring dispositions acquired in one's social context of origin that may be an advantage or disadvantage depending on the field in which a social agent operates.

Research on first-generation students (e.g. Pascarella et al., 2004; O'Shea, 2016; Romito, 2021) – who are the first in their families to attend tertiary-level studies – places the role of *habitus* at the forefront. The life stories that emerge from these studies demonstrate how many of them do not possess a *habitus* appropriate to the field of university studies, inducing them to ignore symbolic codes, behavioral rules, and stakes due to a lack of family socialization to a very different type of education than secondary studies. These students thus end up orienting themselves toward less prestigious degree programs which are perceived to be more suited to their social status (Reay, Crozier, and Clayton, 2010) or that are more influenced by market devices that characterize

orientation fairs geared towards tertiary studies (De Feo and Pitzalis, 2018).

First-generation students who manage to modify their original *habitus* thanks to particularly inclusive study paths then risk experiencing an inner laceration (*habitus clivé*) due to the co-presence of conditioning rooted in the past and new dispositions acquired in the context of their university studies. This condition reverberates in relationships with their family members and peers either by producing positive effects or by generating situations of conflict with those who continue to be part of another social space (Lehmann, 2014). Attempting to overcome this cleavage that produces an ‘unhappy consciousness’ may move in the direction of giving up legitimate aspirations for social mobility or toward a detachment from one’s roots, with painful consequences on the affective level (Lee and Kramer, 2013; Friedman, 2016).

## **2. METHODOLOGY**

In 2022 and 2023, exploratory research was conducted on a sample of first-generation students enrolled at the University of Pisa. Based on indications offered by the international literature analyzing such phenomena, a qualitative technique was chosen and open-ended questions were then prepared which sought to deepen the study and life trajectories of this set of university students. Interview subjects were identified using theoretical sampling based on certain properties deemed significant to the research. In particular, it was considered useful to give voice to students who had experiences of studying in different disciplinary fields (humanities vs. science) and who were nearing completion of a bachelor’s degree or at the beginning of a second-level degree program, two moments of educational transition it was hypothesized would foster a form of reflexivity about the experience that was nearly or just-completed.

Written interviews were conducted via the administration of open-ended questions on the university’s blended learning platform with students enrolled in specific study tracks where a large number of first-generation students were likely to be encountered. More specifically, questions were forwarded to those enrolled in the third year of bachelor’s degree programs in Social Service Science (SSS), Political Science and International Relations (PSR), and Political Science of Administration and Organization (PSO), taught by the Department of Political Science, and to those attending their first year of the second-level degree program in Sciences and Techniques of Preventive and Adapted Motor Activities (STA), activated at the Department of Clinical and Experimental Medicine. Among the 51 students who volunteered their time to answer the first

set of questions, 35 (22 females and 13 males) were found to be first-generation students.<sup>1</sup>

The collected interviews were then subjected to content analysis to identify macro- and micro-text units endowed with particular relevance to the research. These thematic units were later compared using a ‘transversalization’ procedure in order to compare responses to the same primary questions and verify whether an adequate level of theoretical saturation had been achieved (Glaser and Strauss, 1967).

### **3. EFFECTS OF UNIVERSITY STUDIES ON THE *HABITUS* AND RELATIONSHIPS OF FIRST-GENERATION STUDENTS**

Students interviewed generally acknowledged that university studies contributed not only to the growth of their cultural capital but also changed their cognitive categories and the interpretative schemes of social reality. The role played by some of the disciplines studied in the degree programs, held by the Department of Political Science in particular, in fostering such transformations and inducing new forms of reflexivity emerges in some students’ words:

I am reminded of a first-year internship experience that consisted of seminars, one of them held by the Italian Association of People with Downs Syndrome in Pisa; my beliefs about the limited possibilities of people with disabilities were demolished thanks to that experience (SSS\_03).

Studying, reading, and wanting to understand have led me to a maturation that I can see in my everyday actions, even just while watching the news on TV (SSS\_14).

The new systems of classifying reality and the values acquired during university studies seem to produce effects at the axiological level by determining a new evaluation of the social world that inspires practices different from those that the original *habitus* would have induced. These changes in *habitus* inevitably reverberate across social relations with parents who were somehow precluded from this kind of experience and can potentially generate conflictual situations and discomfort.

When I return home and there are lunches/dinners in which we meet, some topics of discussion always come up with which I don’t agree most of the

---

<sup>1</sup> For privacy reasons, the students interviewed are referred to here by a numerical code and an acronym related to their course of study.

time. This is because (...) by attending the University we analyzed some of these issues and, obviously, I elaborated my opinion (SSS\_03).

I don't feel very understood because of certain ideas I have come up with over time. (...) I have more difficulties with my family in areas that might relate to what I have studied, such as, for example, deviance and crime where my view has opened up a lot, but for them, it is not understood that a prisoner can, for example, be able to study or when he gets out has earned a degree (SSS\_05).

The acquisition of new categories and value perspectives creates a distance or rupture with the home environment. Even the taste – what Bourdieu termed “a sort of social orientation, a ‘sense of one’s place,’ guiding the occupants of a given place in social space towards the social positions adjusted to their properties, and towards the practices or goods which befit the occupants of that position” (Bourdieu, 1979a, Engl. Transl. 1984, 466) – is transformed through the university experience. As a consequence, the different commitments and new tastes acquired by first-generation students distance them from their former friends who have not had the opportunity to continue their studies.

Interests sometimes differ: with people who did not go to university it is difficult to talk about a book, or an author, or to organize a theater evening (SSS\_10).

Let's say that a greater distance has been created with friends who didn't continue their studies; by distance, I don't mean in the relationship with them, which remains good but simply about the different interests we've developed. (...) I can give a concrete example that I believe best represents these two aspects. Recently, together with some friends, we decided to spend a weekend in Rome. Here, our different priorities and interests meant that some of us decided to visit the city culturally (myself included) while others preferred to devote themselves purely to leisure. So yes, in this sense, a sort of unease arose between the two ‘subgroups’ (STA\_01).

University studies, on the one hand, enrich the original *habitus* while, on the other, place first-generation students in complex relational situations with significant sacrifices in terms of affection. As citizens of two distant worlds, first-generation students experience a condition of *habitus clivé* that is difficult to resolve into a univocal identity. It is precisely this hybrid position within different fields, however, that can be an advantage for those who would otherwise remain excluded from higher education.

I have a friend who, after finishing high school, immediately began working at a company as a mechanic with the idea of doing it his whole life; but after a few years, decided to resume his studies and is now studying

communication sciences. Every time we saw each other he asked me questions about how the University works, lessons, exams, etc. and he became convinced to continue his studies (STA\_06).

By maintaining an organic relationship with their environment of origin, first-generation students can thus foster the emancipation of those who would otherwise risk being ‘trapped’ in a social selection mechanism that provides no way out of their condition (Broccolichi and Cœuvrard, 1993).

## CONCLUSIONS

This exploratory research only examined a sample of first-generation students who were close to a bachelor’s degree or were already enrolled in a master’s degree program. First-generation students who dropped out early and deserve special attention in order to identify the various factors that produced such a choice, precluding the possibility of social mobility and a change in one’s lifestyle, (Romito, 2021) were excluded from the sample. Moreover, it should be emphasized that the students who offered their willingness to be interviewed were enrolled in undergraduate courses that were not particularly elite, a circumstance that may have facilitated their process of adaptation to an environment in which students from disadvantaged backgrounds generally feel like ‘fish out of water,’ to paraphrase a Bourdieu metaphor (Bourdieu and Wacquant, 1992).

The interviews collected document how the first-generation students surveyed have changed several dimensions of their *habitus* throughout their university studies. While these newly acquired internalized dispositions open perspectives and possibilities in different fields, they also make relationships with family members or their original peer group more difficult. The different layers of *habitus* produce an identity that may be split or torn apart (*habitus clivé*) which can sometimes become a real opposition to the family or social class to which they belong. In other cases, it seems possible for a virtuous circle to be established that moves from the university world toward one’s social environment of origin.

Much remains to be done in order to truly make the rights of all students effective, regardless of their social origin, to attend university and enroll in degree programs that provide access to superordinate positions in particular. These goals must be pursued without forgetting that the cultural capital acquired by first-generation students nevertheless constitutes an insufficient condition to guarantee their social mobility since it represents but one of the

resources that can help reconfigure a social stratification that continues to privilege *Les héritiers* (Bourdieu and Passeron, 1964).

# TO LEAVE OR NOT TO LEAVE: EXPERIENCES OF UNIVERSITY-STUDENT DROPOUTS IN CROATIA

Iva Odak<sup>a</sup>

Nikola Baketa<sup>a</sup>

Saša Puzić<sup>a</sup>

<sup>a</sup>Institute for Social Research in Zagreb, Croatia

The paper examines the experiences of university dropouts in Croatia, with a focus on individual and institutional *habitus*. Theoretical background of the paper was based on Bourdieu's (1977, 1986), and Reay, David & Ball's (2001) work on inequalities, *habitus* and students' integration. Qualitative methodology was used and 24 semi-structured interviews were conducted in year 2022. with persons who dropped out of higher education in Croatia. The main research topics included the students' *habitus*, the reasons of dropping out and the role of higher education institutions. Main reasons for dropping out of studies were motivational reasons, health reasons and employment. The findings indicated weak institutional support related to the process of dropping out of studies and the absence of institutional attempts to prevent the students' drop-out. On a subsample of first-generation students, we analysed the correspondence between students' family *habitus* the new *habitus*. The findings show that students who developed a new *habitus* and felt the connection and integration with the new educational field were more inclined to return to higher education at some point in life. Policy recommendations for preventing dropout from higher education are also discussed in the light of the study findings.

higher education; *habitus*; dropping out of studies

## INTRODUCTION

The European Commission report (Quinn, 2013) highlights a significant issue within the European Union: a large number of students are leaving higher education before completing their studies. This trend poses a challenge to the

labour market, economic growth, and social justice, as it limits opportunities for social mobility and inclusion. Müller and Klein (2023) further emphasize that students from lower-education backgrounds and working-class families are more likely to drop out of university before graduation. This study focuses on the experiences of university dropouts in Croatia, aiming to explore the factors that contribute to this phenomenon. The theoretical framework for this research is based on the works of Bourdieu (1977, 1986) and Reay, David, and Ball (2001) who have extensively studied inequalities, institutional and family habitus, and the academic and social integration of students. According to Bourdieu (2011), the culture of the dominant class often shapes the higher education system, creating an environment that can be exclusive to individuals from less privileged social backgrounds. The reason for this can be traced to classed attributes of socialization that are converted into habitus, i.e. a set of dispositions which “functions at every moment as a matrix of perceptions, appreciations, and actions” (Bourdieu, 1977, 82-83). As such, it is a long-lasting way of acting and thinking that derives from socialization processes in the family. These socialization processes flow from the family members’ conditions of daily life, i.e. their class position. When people change their class position, i.e. when their “conditions of existence” change over the course of their life, they may experience a sense of self torn by loss of coherence (Friedman, 2015). This loss of coherence or habitus clivé is characterized by a mismatch between one’s original family habitus and the habitus that is required in one’s new conditions of existence, e.g. the academic field. Thus, the habitus clivé can produce in individuals feelings of insecurity and inferiority that collide with the requirements of the new social environment (Bourdieu and Passeron, 1990). In the context of student dropout, these disparities between primary and academic habitus increases the likelihood of self-elimination, where students from less privileged backgrounds feel a mismatch between their family habitus and the habitus of the higher education institution and the higher education field.

## **1. METHODOLOGY**

The data collection for this study was conducted between December 2021 and May 2022. During this period, 24 semi-structured interviews were carried out with individuals who had dropped out of higher education programs between 2015 and 2022 at various higher education institutions in Croatia. Out of 24 interviews, seven interviews were conducted with first-generation students. Given the challenges of accessing this hard-to-reach population, researchers

provided compensation to participants for their involvement. Invitations to participate in the study were distributed through the websites of various organizations (non-governmental organizations, higher education institutions, and similar entities) that either addressed related topics or could reach the target population. Additionally, as data collection took place during the COVID-19 pandemic, and participants were given the option to conduct the interviews either in person or online. The average duration of the interviews was approximately one hour. Following the interviews, audio recordings were transcribed and anonymized, and subsequent analysis was conducted using NVivo 12 software for qualitative data analysis. The coding process employed thematic analysis to identify patterns in participants' responses, focusing on shared experiences and the meanings they attributed to those experiences (Braun & Clarke, 2006, 2012). Participants were given the pseudonyms before the coding to ensure anonymity. The analysis emphasized themes related to inequalities, habitus, institutional habitus, and the academic and social integration of students, particularly in terms of their experiences within higher education. The main research topics included the study experiences, linked with personal biographies of dropout students, students' habitus, the reasons of dropping out of studies and the role of higher education institutions in that process.

## **2. RESEARCH QUESTIONS**

The aim of this study was to explore several factors associated with student dropout in higher education in Croatia. With regard to this aim the following research questions were formulated:

- What were the main reasons for dropping out of higher education studies?
- What were the experiences of first-generation students in this regard?
- Was there any institutional support related to the process of dropping out of studies?

## **3. RESULTS**

### **3.1. The reasons for dropping out of studies**

Our research identified several key reasons for dropping out of higher education, which can inform the development of educational policies aimed at preventing and reducing dropout rates. While participants mentioned a variety of factors, three primary reasons emerged as the most significant: motivational issues,

health-related concerns, and the finding of employment. Other notable factors included a lack of discipline, financial challenges, and organizational difficulties. It is important to note that these reasons were often interconnected. For example, some students cited a loss of motivation stemming from organizational challenges they faced during their studies, which ultimately contributed to their decision to drop out. One major issue discussed by participants was the impairment of mental health, often caused by stress related to academic performance, particularly from failing exams. Many participants explained how these mental health challenges led to a loss of motivation, ultimately resulting in dropping out. One participant described the experience as follows:

There was more added anxiety about what would happen if I didn't know something or how I would pass the exam or answer something wrong, and it would be so bad. And then at some point, I stopped going to the exams out of fear, because I would have a panic attack during them. (Emma)

### **3.2. Experiences of first-generation students**

The findings show that the students who developed a new *habitus* and felt the connection and integration with the new educational field were more inclined to return to higher education at some point in life and obtain a higher education degree:

If I manage to gather the strength and courage to check what my current status is and whether I could finish university, I would be happy to write a diploma again and finish it. If I don't succeed, maybe I'll enrol in another master's degree and finish it then, if I really don't have anything else to do. I don't know when I would do it, I'm a little scared because I can't stop working to study. (Anna)

For others, the contrast between students' original dispositions and interests and university field values and norms, resulted in giving up higher education altogether:

Education, as education itself, does not have that much value. Maybe again, on the other hand, when you look at it, someone might know how to do something without that college, maybe the college wouldn't teach him something if he already knows how to do it, if you understand me... I don't know how to explain it to you, somehow practice is better than the theory itself. (Mark)

At the same time, the decision to leave the studies was often preceded by feelings of frustration and stress associated with the fear of facing study obligations. Such feelings were often manifested by a lack of motivation and distancing from duties during studies, and consequently by giving up studying altogether. Furthermore, the experience of acute stress was accompanied by feelings of not being at ease in the academic environment, which resulted in looking for a way out of it, as two participants describe it:

Yes, I had a lot of big problems with motivation. Because I didn't solve it the first time, that is, the first year when I enrolled, I had three subjects left. I was quite depressed... I was terribly depressed. I just used to sleep in my room, I just needed darkness and silence. I, as I would say, closed myself off from my friends because I considered it my failure. So, yes, I lacked motivation because that first failure, I felt a lot, even though I started with great enthusiasm, with desire, motivation, with everything, that is, with enthusiasm, but I ended up like that. (Eva)

Well, at that time, because of the stress itself, so much influence on mental health, I don't know how to explain exactly, everything that was happening at that moment, somehow for my own sake it was better for me to give up than to continue to struggle with such things... (Mark)

These reported feelings of insecurity in the academic field point to a habitus *clivé* where expressions of inferiority collide with striving for knowledge:

A person also strives for that knowledge, which, as strange as it may sound, but I also have a love for learning. Really, some people don't understand that, but people simply love knowledge... (Eva)

The two sides of habitus indicate the academic experience of first-generation students as a non-linear ride in need of institutional buffers. These are clearly missing as the participants did not mention institutional support related to their withdrawal from studies, nor do they mention the institution when discussing reactions to withdrawal.

### **3.3. Lack of institutional support**

It is notable that first-generation students as well as the majority of participants reported a lack of meaningful institutional support related to their decision to drop out of studies, or they were simply unaware of any such support, if it existed. This absence of assistance stands in stark contrast to the expectations students may have for the educational system, particularly when facing challenges that could lead to withdrawal. None of the participants mentioned

receiving any institutional support when discussing their withdrawal from studies. In fact, they did not even refer to the institution itself when explaining their reasons for leaving. This suggests that, for many, the educational system failed to provide adequate resources or guidance during critical moments of difficulty. There were no proactive efforts made by the institution to retain these students or offer assistance in overcoming their challenges. Additionally, there was no subsequent outreach by the institution to understand the reasons behind their withdrawal, which could have informed future improvements or preventive measures. Furthermore, the responses suggest that students, particularly those facing significant barriers, may not know where to turn for help or feel that such support is out of reach. The lack of awareness about available resources, coupled with the absence of institutional efforts to understand and address the reasons behind dropout, highlights a significant area for improvement in higher education support systems in Croatia.

#### **4. CONCLUSION**

Our findings have revealed several important factors in relation to dropping out of higher education. The most significant were motivational issues, health-related concerns, and the finding of employment. Other notable factors included a lack of discipline, financial challenges, and organizational difficulties. In addition, study findings indicated that the academic experience of first-generation students was a non-linear ride in need of institutional buffers. The later should compensate for a mismatch between one's original habitus and the habitus required in the academic field, i.e. a habitus clivé. Instead of providing institutional buffers for first-generation and other less privileged students, our study indicated a significant gap in institutional support, particularly in relation to preventing students from dropping out. There is a noticeable lack of structured monitoring of student progress and retention, as well as a failure to implement proactive measures to help at-risk students stay in their studies. This is especially detrimental to vulnerable groups, who may already face additional challenges. These shortcomings align with Bourdieu and Passerons' (1990) concept of the "false meritocracy" within the educational system, where students from disadvantaged backgrounds are often overlooked. This perpetuates social inequality by reinforcing a system that privileges those from more privileged social positions, making it difficult for underrepresented students to succeed. The issue of student dropout is complex and requires coordinated efforts from multiple levels, including higher education institutions, universities, local governments, and the economic sector. Higher education

institutions play a particularly crucial role in addressing this issue, as it is not only an educational concern but also a matter of social justice. Institutions must recognize their responsibility in supporting all students, particularly those from marginalized backgrounds, to ensure that higher education becomes a tool for social mobility and equality.

**POLICY AND GOVERNANCE  
IN EDUCATION**

# CONTINUING VOCATIONAL TRAINING IN ITALY, BETWEEN UNRESOLVED ISSUES AND NEW SCENARIOS

Roberto Angotti<sup>a</sup>

<sup>a</sup>INAPP, National Institute for Public Policy Analysis.

## INTRODUCTION

In recent years, Continuing Vocational Training (CVT) has become crucial for developing skills and fostering growth for adults and companies (Angotti 2023), aligned with EU policies and the National Recovery and Resilience Plan (NRRP). This article compiles insights from national experts and Inapp researchers from the “Adult Learning and Continuing Vocational Training” research group, presented at the Panel Session D.02, exploring key issues, innovative practices, and emerging policies shaping Italy’s CVT system. The article identifies three key phases: the paradigm of lifelong learning, specific forms and manifestations of CVT in Italy, and the methods of implementing CVT. It provides an overview of CVT dynamics, challenges, and opportunities, emphasising the importance of a lifelong learning culture and the impact of innovative policies. Despite ongoing issues with coordination, the contributions aim to shape and consolidate the CVT system in Italy.

## 1. THE PARADIGM OF LIFELONG LEARNING

Session D.02 opened with the presentation of the paper by Angotti, Campanella and Vergani (*Continuing Vocational Training in Italy: Unresolved Issues and New Scenarios*) which highlighted how adult learning has become increasingly important. This is due to societal changes like population ageing, technological advancements, the green economy transition, and the Covid-19 pandemic. These shifts necessitate continuous learning for adults to remain adaptable and resilient. Assessing Italy’s CVT system is crucial to determine its effectiveness in preparing adults for a dynamic job market. This analysis reviews relevant literature to highlight key areas for improvement in lifelong learning participation.

The first step, which serves as a starting point, identifies the paradigm of lifelong

learning and, within it, adult education in general (hence not just conventionally defined as ‘continuous’ but also as permanent, not just work-oriented but also responding to extra-professional interests) as the framework, both in its overall meaning and its function of ‘floating’ (ideally, also promoting growth and reinforcement) for continuous training. Andrea Cegolon’s essay (*Strengthening Italy’s Continuing Vocational Education and Training System through Lifelong Learning Culture*) focuses on this, emphasising the message that without adequate, particularly practised, formalised learning culture in adulthood (‘formalised’ because we are discussing intentional and conscious training interventions), continuous training struggles to be effective, it operates intermittently and ultimately remains marginal in relation to work and its changes, both on the demand and supply sides.

## **2. THE EVOLUTION OF STATE EDUCATION AGENCIES**

The second step proposed by the contributions addresses the specific forms and concrete manifestations of CVT in Italy, describing them, providing a quantitative representation, and highlighting the strengths and more or less evident criticalities (which are often more consolidated and difficult to modify). The essay by Roberto Angotti and Luca Dordit (*Key Issues for Continuing Vocational Training Policies in Italy, based on the Results of the Inapp Survey INDACO-Companies*) is related to this second step.

Giovanna Di Castro, Valentina Ferri, and Alessandra Pedone, in *Measuring Low-Skilled Adults And Training Participation In The Digital Age* focuses on the training behaviours of low-skilled adults in Italy, highlighting the multidimensional nature of skills and disparities in training access exacerbated by digitalisation. The authors propose a composite indicator for the labour market and offer policy insights to ensure fair participation.

Alessandra Pedone and Giuditta Occhiocupo, in *The Impact of Smart Working on Reskilling and Upskilling Processes in the Private and Public Sectors: a First Analysis* explore the effects of remote working in Italy, emphasising the importance of continuous training to adapt to rapid changes and innovation. It analyses its impact on training plans, skill acquisition, and reskilling and upskilling processes, discussing regulatory evolution and future scenarios.

Interprofessional Funds are the most prominent form of continuous training in Italy, especially in recent years. However, public resource-supported offerings, which were significant before the Funds’ inception, are experiencing a revival. The majority of training (about 80%) is market-driven, funded by enterprises

themselves.

Interprofessional Funds are crucial due to their bilateral and concerted approach, offering significant training opportunities. Training forms can be categorized into three types: routine training (coordinated with unions and funded by Interprofessional Funds), emergency training (addressing crises with public resources), and necessary training (urgent and strategic, funded by companies without public or union involvement).

We emphasise again that, while this form is predominant in the training landscape, we generally know little about it, and what little we do know comes from the Inapp INDACO-Companies (INDACO-Imprese) survey, now in its fourth edition (Angotti et alii 2024; Pedone et alii 2023).

Finally, the third and last step concerns the method, how continuous training is delivered. This is a central issue due to its focus on an adult population and the connection that the method (of formalised learning) has with the contexts and pathways – both professional and life-related – of employed individuals. In the Andrea Galimberti’s essay (*Lifelong Learning as a Key Factor to Reduce the Skill Gap? Reflections on Doctoral Training*), the theme runs along two axes primarily: the first, more typical, is identified with the presentation – even critical – of approaches and forms of adult learning (such as “heutagogy” and the non-conventional learning discussed by Galimberti); the second, more lateral, examines a type of learning in work contexts that does not go through formal training but rather through how the organization is structured and functions to intentionally stimulate and generate learning in its ordinary operation (the emphasis here is that, fortunately, there is more training than learning, but in the model of organizational learning, learning is desired and intentional).

## **CONCLUSIONS**

Continuing vocational training (CVT) in Italy is essential for skill development and worker upskilling, aligning with European policies and the National Recovery and Resilience Plan (PNRR). Influenced by technological innovation (Angotti 2024), market demands, and government policies, CVT faces challenges such as equitable access, programme quality, and worker motivation. A key theme is the recognition of competencies from non-formal and informal contexts, highlighting the need for intentional competency development over institutional procedures.

Despite these challenges, investing in CVT offers numerous opportunities, including a more qualified workforce, enhanced company competitiveness, and

economic growth. Properly managed, CVT can significantly benefit both workers and companies.

# CONTINUING VOCATIONAL TRAINING IN ITALY: UNRESOLVED ISSUES AND NEW SCENARIOS

Roberto Angotti<sup>a</sup>

Giovanna Campanella<sup>b</sup>

Alberto Vergani<sup>c</sup>

<sup>a</sup>INAPP, National Institute for Public Policy Analysis; <sup>b</sup>Ismeri; <sup>c</sup>Università Cattolica di Milano

Continuing Vocational Training (CVT) seems to be at the core-attention of decision-makers in Italy after years. It is going through a season of transformations, also because of the launch of a set of new policy measures, most recently those included in the National New Skills Plan and the National Recovery and Resilience Plan. CVT is therefore experiencing an extremely articulated situation, consisting of no less than eight national policy measures managed by different public administrations (both central and local) and many actors and stakeholders at various levels. Numbers, of participants and interventions, also show the recent increase of CVT relevance. However, a number of issues remain unresolved: the equity of access to corporate training; the North-South areas gaps in the distribution of training supply; the resistance to change and modification of organizational models and practices; the effects of pandemic on corporate training choices and strategies.

continuing vocational training; policy measures; skills.

## INTRODUCTION

The Italian Continuing Vocational Training (CVT) system has once again become a focal point for decision-makers after many years. Recent years have seen an intense development of policy measures in this sector, alongside increasingly numerous and innovative practices by various actors and stakeholders. This highlights the rapidly changing and increasingly complex environment in which training systems operate. However, this complexity does not yet seem to be fully captured by scientific research, which still predominantly focuses on the more structured and regulatory components of the broader education and training

system (known at the European level as VET, Vocational Education and Training). Alternatively, research tends to concentrate on the detailed aspects of a few individual components of the continuing training support system, without fully understanding their structural elements, internal dynamics, and their connection to economic development trends.

One of the primary factors reshaping the landscape for lifelong learning is the Fourth Industrial Revolution, which aligns with long-term global trends such as technological and digital advancements, market globalisation, and ageing populations and workforces. The disruptive potential of Industry 4.0, compared to established production models and structures, is already affecting labour markets. There is a growing demand for new professional profiles and skill clusters, even for traditional roles, to ensure high employability in these new scenarios (Cedefop, 2018; European Parliament, 2021). Recent surveys have highlighted the delays in the digital transition of Italian enterprises, especially small and medium-sized ones (European Commission, 2021).

Additionally, the COVID-19 pandemic has significantly impacted education systems, posing a real challenge for the resilience and development of training systems. The pandemic has stressed the entire education chain, acting as a stress test that affected not only vocational training but also the broader education sector and spaces traditionally designated for formal and non-formal learning. However, it has also promoted new forms of learning through the extensive use of remote work. This shift has led to smart learning, where the traditional boundaries of time, space, and educational settings have become more flexible, emphasising the learner's specific and dynamic needs, rhythms, and learning pace over time.

## **1. POST-PANDEMIC CHALLENGES AND OPPORTUNITIES FOR TRAINING SYSTEMS**

In the face of disruptive phenomena that challenge the effectiveness and sustainability of education policies, several critical issues persist in our country, despite ongoing improvements. Key points include:

- In 2020, the early school drop-out rate among 18-24-year-olds was 13.1%, a slight decrease from the previous year but still above the EU average of 10.1%.
- National standardised tests by Invalsi revealed an increase in the percentage of students finishing secondary education with skills below expected levels, rising from 7.5% in 2019 to 9.5% in 2021.

Disadvantaged students experienced twice the learning loss compared to their more privileged peers.

- In many regions, over half of the students failed to reach minimum proficiency in Italian and mathematics.
- In 2021, only 28.3% of 25-34-year-olds had tertiary education, the second lowest in the EU, compared to the EU average of 41.2% and the target of at least 45% by 2030.
- The adult participation rate in education and training activities for those aged 25-64 was 9.9% in 2021, aligning with the European average of 10.8% after years of stagnation. However, Italy still ranks fifteenth out of thirty countries, largely due to low levels of basic skills and qualifications among the adult population, especially in older age groups (Angotti, 2022).

In this complex scenario, where the need to mitigate the intense pressure caused by the pandemic crisis intersects with the challenges and uncertainties of the new energy crisis, training systems are undergoing a progressive redesign. This redesign aims to reconcile the evolving needs of diverse local labour markets with individual aspirations for career advancement. A key objective is to ensure equal opportunities for all by developing training programmes that create pathways for professional growth and skill updates aligned with the new demands of the business sector. Skills, particularly, play a crucial role in linking educational pathways with potential professional growth opportunities in both formal and non-formal learning contexts. Their portability (Le Boterf, 1994) makes them certifiable and valuable.

In order to understand where we stand in the evolution of the continuing training system (or, rather, systems) in Italy, it is useful to adopt an inverted approach compared to the one traditionally used in the literature (Federighi, 2006), briefly reconstructing the state of the art of the currently available offerings in the various components of the education and training system (Angotti, 2019) starting from initial training, moving through higher technical training and work-based learning, to continuing training and adult learning.

### **1.1. Current State of Initial Vocational Training and Apprenticeship Training**

In the Italian context of initial vocational training, the leFP component is well-established at the foundational level of the technical vocational training chain. According to Inapp's national monitoring, the 2019/2020 training year saw 250,194 enrollments, predominantly in accredited training centers. This period

experienced a notable decline in student numbers, consistent with recent trends affecting professional institutes. Conversely, there was a significant rise in dual mode courses, involving real work contexts or simulated enterprises. However, a substantial disparity in facilities and enrollments persists between the North and South of Italy, affecting both traditional and dual modes.

Following the completion of leFP courses, students typically progress to IFTS courses, which offer technical specialization leading to the qualification of Specialized Technician. In 2020, the IFTS segment had 2,576 enrollments across 120 courses, primarily concentrated in Central-Northern regions. At the higher end of the chain, ITS (higher technical institutes) offered 260 courses in 2020, with 6,874 students enrolled and 5,280 diplomas awarded. The recently reformed ITS Academy conducted 380 courses for over 9,000 students. Despite the comprehensive structure of the technical-professional education pathway, there are challenges in ensuring coherence among the leFP, IFTS, and ITS systems.

Apprenticeship training in Italy is predominantly represented by the professional type, leading to contractually recognized qualifications. In 2020, 92% of apprentices, totaling 116,468, were enrolled in these programs. Other types of apprenticeships are less common, with 8,823 in first-level training and only 805 in third-level training. The broader context of work-based learning highlights significant regulatory changes in extracurricular traineeships, marking a pivotal shift despite their recognition as a model in Europe. (Cedefop, & Inapp 2024).

## **1.2 Evolution of the Adult Learning and Continuing Vocational Training System**

The Continuing Training and Adult Learning systems in Italy are undergoing significant transformations due to new policy measures, particularly the National New Skills Plan and the PNRR (National Recovery and Resilience Plan). These changes aim to support active policies during the current crisis and are developing within an increasingly complex framework. The support measures for ongoing training are multifaceted, involving traditional channels like regional interventions (ESF – European Social Fund) and those managed by social partners (Joint Interprofessional Funds for CVT, national collective bargaining). New programs also focus on enhancing business competitiveness (Training tax credit 4.0), addressing crises (FNC – New Skills Fund), and improving adult skills (GOL Programme – Workers’ Employability Guarantee).

This complex framework includes various national intervention measures managed by different administrations (Regions and Autonomous Provinces, Social Partners, Ministry of Labour and Social Policies, Ministry of Economic

Development) and a diverse set of actors and stakeholders at multiple levels (national, regional, territorial, sectoral, company). The introduction of the National New Skills Plan marks a significant shift, launching a unified and integrated strategic design.

In 2021, the Unified Conference approved the National Strategic Plan for the Development of Adult Population's Skills, aiming to establish integrated territorial networks for education, training, and work services across various learning contexts (formal, non-formal, and informal). These networks aim to address significant gaps in basic skills and low qualifications among the adult population. Key elements include the Provincial Centres for Adult Education (CPIA) and Employment Centres, which cover functions such as reception, guidance, needs analysis, credit recognition, and skill certification (Amendola, Angotti, Di Castro, Vitali & Volpi 2023; Cedefop 2024).

## **2. FUNDING AND PARTICIPATION IN CONTINUING VOCATIONAL TRAINING**

The recent evolution of the Continuing Vocational Training (CVT) system in Italy is evident in the figures. The most widely used public funding channel is the Interprofessional Funds (Inapp, 2021). Currently, 19 active Interprofessional Funds have been joined by about 750,000 enterprises, employing over 9,830,000 workers. In 2021, these Funds received € 590 million from INPS, totaling nearly €9.5 billion since 2004. In 2020, the Funds approved over 45,000 training plans, involving about 1,281,000 workers and over 61,000 enterprises, though there was a decline due to COVID-19. (Italian Parliament 2022).

The second major funding channel is regional programming managed through ESF resources. In 2020, the Regions and Autonomous Provinces committed €122 million across 62 notices, focusing on anti-crisis actions and supporting workers' transitions.

From 2018 to 2020, the Interprofessional Joint Funds published 249 notices with a commitment of €1.318 billion, while the Regions and Autonomous Provinces published 87 notices for €320 million. In its first year, the New Skills Fund (FNC) received €778 million, involving over 6,700 enterprises and 375,000 workers, with around 47 million training hours.

## **3. CHALLENGES AND OPPORTUNITIES IN CONTINUING VOCATIONAL TRAINING**

Despite the substantial volume of activity produced, even in the area of continuing training, a low incidence of interventions was registered in the

regions of Southern Italy, particularly in the area of interprofessional funds, which reflect more the sectoral characteristics of the production system (Italian Parliament 2022).

Regarding the training supply sector, over the last 15 years we have witnessed a wide-ranging transformation in the structure of the system, driven by the entry of new operators specialised in providing services to businesses. From the third edition of the Inapp OFP survey (Vocational Training Offer in Italy) it emerges that among the organisations accredited by the Regions, 86.9% are now dedicated to Continuing and Permanent Training activities, against 58.2% who deal with Higher Education and 38.7% with Compulsory Training. In addition, 42.7% of the structures that activated new courses in 2019 operated with interprofessional Funds or with sectoral funds providing courses for the employed. In total, training facilities launched 26,925 courses, for an average of 54.4 courses per institution, amounting to 1,272,296 hours of training, an average of 47.3 per course. The total number of trainees trained was 253,585, an average of 512.3 per institution and 9.4 per course provided.

However, despite this situation, several issues remain open, alongside new challenges posed by the emergence of global transformational factors and the new opportunities presented by the implementation of the strategic plans envisaged under the PNRR.

Among the primary issues is the equity in access to corporate training for vulnerable categories (low-skilled, over-50s, residents in the South), aggravated by the difficulties that the complex and diversified system of support for continuing training encounters in promoting an extensive coverage of the workforce, at territorial and sectoral level. In fact, public funding still reaches a very limited portion of businesses, leaving most micro-enterprises without coverage. Consequently, the majority of training interventions for employees are predominantly delivered through private financing, leading to short courses that are generally catalogue-based.

Another long-standing issue is the North-South gaps in the regional distribution of quality services and opportunities, which are currently mainly concentrated in the northern regions.

There remains an underlying cultural and value-based issue concerning resistance to change and the questioning of company organisation, an issue that concerns not only micro and small enterprises (and, above all, their owners) but generally all companies that have not yet adopted a learning organisation model.

It is then necessary to consider the impact and fallout of the pandemic on company training choices, which initially triggered a significant increase in the use of distance learning (FaD – Formazione a Distanza), later made optional or ceased altogether at the end of the emergency. However, this approach largely replicated classroom teaching schemes, focusing primarily on the synchronous learner-learner methodology rather than the asynchronous one typical of e-learning. In many cases, however, as mentioned above, the introduction of remote work practices formed the basis for experimentation with different forms of remote work.

Among the new challenges to which Italian enterprises are called today are, on one hand, the redefinition of business models and the definition of a training offer more closely linked to corporate targets and strategies, and, on the other hand, the need to reduce the skills gap on the issues of digitalisation, ecological transition and internationalisation. To this end, it would be useful to intervene by employing age management tools such as, for example, intergenerational learning, to foster an internal realignment that favours the development of up-skilling and re-skilling processes within corporate contexts.

# KEY ISSUES FOR CONTINUING VOCATIONAL TRAINING POLICIES IN ITALY, BASED ON THE RESULTS OF THE INAPP SURVEY INDACO-COMPANIES

Roberto Angotti<sup>a</sup>

Luca Dordit<sup>b</sup>

<sup>a</sup>INAPP, National Institute for Public Policy Analysis; <sup>b</sup>University of Udine

Although the Italian Continuing Vocational Training system (CVET) has assumed an increasingly crucial importance in the socio-economic development of the Country, it has a number of limitations and criticalities that still hold back its massive and widespread use. The paper intends to provide a transversal analysis of the CVET system, aimed at identifying a core of key issues that currently significantly limit access to training practice by a large share of potential users. For each theme dealt with, alongside an examination of the essential data of the scenario, some in-depth observations are proposed.

continuing vocational training; cvts; digital and ecological transition.

## INTRODUCTION

INDACO-Imprese (hereinafter referred to as INDACO-Companies) is the Italian survey that complements the five-yearly national Continuing Vocational Training Survey survey (hence the name INDACO-CVTS). It was jointly designed by ISFOL (now INAPP) and ISTAT and developed through methodological cooperation within the framework of a research protocol initiated in 2002. The survey is carried out under the framework of the National Statistical Plan of SISTAN (National Statistical System) at least once during each five-year period, alternating with the CVTS. The survey employs the same methodologies, classifications, and definitions used in the Eurostat CVTS and therefore also takes the name 'INDACO-CVTS', allowing for comparisons with the corresponding five-yearly surveys carried out in other European countries.

The Survey involves a sample of 20,000 Italian companies, representative by

territory, size, and sector of economic activity. In this paper, the data refers to the year 2019, with the previous edition taking place in 2019, covering the year 2018.

## **1. KEY ISSUES AFFECTING THE CONTINUING TRAINING SYSTEM IN ITALY**

### **1.1. Gaps between Companies on a Geographical and Size Class Basis**

In 2019, nearly 62% of companies with more than five employees provided training to their employees. This investment, consistent with the trend of previous years, mainly involved companies with more than fifty employees, operating in industry and headquartered in northern regions. The propensity to implement training measures increases with the size of the company: it rises from 56.7% for companies with between six and nine employees to 94.1% for the largest companies. Regarding territorial distribution, a gap remains between different macro-areas of the country. Companies in the South and Islands have a lower rate of training participation (58%), compared to regions in the North-East and North-West, where the rate exceeds 63%. The overall rate of access to training courses, calculated on the employees of companies that have invested in training, stands at 58.3%. An analysis of company size reveals that training participation increases as the size class of employees increases, with the sole exception of small companies, which show a lower rate than micro-companies (6-9 employees: 58.7%; 10-49 employees: 52.1%; 50-249 employees: 52.6%; 250+ employees: 65.4%).

Regarding the influence of the size variable, it is not enough to reduce the relationship between the size of the company and its investment in training to a simple correlation. The reality is more complex. While there has been a significant performance, both on the part of micro-companies and – to an even greater extent – of large companies, it is precisely the SMEs (Small and Medium Enterprises) that show the weakest signs of vitality in terms of training. This is a cause for concern, particularly considering that one of the central issues in the medium term refers to what has been called the ecological and digital transition of the workforce. In fact, it is well known how the stimulus provided by investments for the digital and green transitions, if not accompanied by appropriate and systematic retraining measures, may entail, in the future, the risk of massive displacements from production processes – or at least forms of serious marginalisation – for the least qualified workers.

Figure 1. Companies providing training by size class and territorial breakdown –% of all enterprises: Italy 2019. Source: Inapp, INDACO-Companies Survey (2020)

## 1.2. Gender gap and age gap

Women are, on the whole, at a disadvantage when it comes to access to training courses, showing a value 2.6% lower than that of men. This lower access is confirmed across all considered company size classes, with the largest gap in companies with more than 250 employees (-6.2%). At the macro-area level, the gap between women and men is narrower in the South and Islands, while it becomes more substantial in the North-East (-3.8%). In the industrial sector, the female access rate stands at 52.7%, with a particularly significant gender gap (-6.4 percentage points).

Workers over 50 register an access rate of 53.1%, a full 7.5 percentage points lower than the under-50s class. This gap remains consistent across both size classes and territorial distribution, reaching up to 10 percentage points in the southern and island regions, as well as in companies with between 10 and 49 employees. Finally, disaggregating the data on the basis of professional qualification, a rather wide range is observed in course participation, with values decreasing from executives and middle managers (76.5%), to office workers (63.9%), blue collars and auxiliaries (52.3%) and entrepreneurs/owners/shareholders (44.7%).

The strong segmentation of the system of effective access to training within companies engaged in training activities is one of the main barriers to skill upgrading and retraining. Even when the obstacle of companies not willing to

engage in training has been overcome, there are further access limitations affecting specific profiles of employees. The groups that have higher participation in learning courses are the younger, more educated population, and those employed in qualified professions. In contrast, for the typical worker with lower educational levels, over 45 years old, and in an unqualified role, the likelihood of being involved in training activities decreases, with a multiplying effect across the three cited variables.

Tab. 1. Participants in CVT courses, by gender, age, size class and territorial breakdown –% of persons employed in all enterprises: Italy 2019. Source: Inapp, INDACO-Companies Survey (2020)

	Total	Females	Gender gap	Over 50	Age gap
<b>SIZE CLASS</b>					
6-9	51.0	48.5	-4.0	50.0	-1.5
10-49	63.2	60.2	-4.5	62.7	-0.8
50-249	82.9	79.9	-4.5	82.9	0.1
250 and more	93.9	93.5	-0.7	95.6	2.5
<b>GEOGRAPHICAL AREA</b>					
North-West	81.8	81.8	0.1	81.0	-1.0
North-East	78.1	76.8	-2.2	77.5	-0.9
Centre	73.2	69.5	-5.9	74.1	1.4
South and Islands	62.6	61.1	-2.1	66.2	5.3
<b>ITALY</b>	<b>75.7</b>	<b>74.9</b>	<b>-1.4</b>	<b>76.1</b>	<b>0.6</b>

### 1.3. Limits of Public Funding

Overall, 7.6% of training companies in 2019 received funding from external sources, primarily from the Interprofessional Joint Funds for CVT (*Fondi Paritetici Interprofessionali per la Formazione Continua*) (70.3%). Smaller shares used resources from public administrations (17.5%) and other sources (14.6%). Only a small portion of the funds provided by the Industry 4.0 National Plan (Piano Nazionale Impresa 4.0) was utilised (6.4%). This means that more than 92% of the training companies use rely solely on their own resources for training purposes. From a size perspective, the percentage of companies that received funding increases as the number of employees increases, both in relation to the Interprofessional Funds and in general. While in the former case

the difference between large and micro companies is around 35%, in the latter it is over 40%. A shift in trend is seen in the case of funding provided by public administrations, with small companies particularly relying on this (29.9%), compared to larger ones (7.3%). Far smaller, however, are the differences in the use of funds for the Industry 4.0 National Plan. At the territorial level, in the South and Islands the share of companies that have obtained funding is lower than elsewhere, particularly in the North-Eastern regions, where the value is twice as high.

Qualitative surveys carried out as part of the INDACO Companies Survey indicate that, for a significant share of companies, the lack of recourse to public funding for training purposes is due to the considerable amount of administrative work involved in the operational management of training activities. Despite the benefits brought by public resources, this would in fact entail a serious burden in terms of indirect costs (personnel, time, additional expenses, etc.). Furthermore, companies often complain about the difficulty of operating according to rigid and standardised supply models. In this regard, it should be noted that companies currently favour supply systems that are less tied to the options chosen at the planning stage and more open to the recognition of needs identified directly within the company context.

#### **1.4. Training for the Digital and Ecological Transition**

In 2019, 43.3% of companies that introduced 4.0 technologies accompanied the technological transformation process with targeted training. Geographically, the North-East and North-West recorded the highest values of training associated with adopting the 4.0 model, (48.2% and 46.8%), while the areas of the Centre and South and Islands lagged behind (38.4% and 36.4%). Stratification by size class shows that training affected about half of medium-sized and large companies, compared to significantly fewer small companies (41.7%). In the industrial sector, 46.3% of companies have carried out specific training activities following the adoption of Key Enabling Technologies (KET) 4.0, approximately 5 percentage points higher than in the services sector. Breaking down by the various types of 4.0 technologies, among companies that introduced innovations concerning advanced automation and robotics, 57.4% also implemented specific training. For all other types, the share of companies that have carried out corresponding training activities falls below 50%. In descending order: business management software (48.3%), Big Data (46%), simulation between interconnected machines 45.7%, immersive technologies (38.7%) IT security (31.3%), cloud solutions (26.9%), 3D printers (24.6%), and

the Internet of Things (22.5%).

The adaptation of staff skills to the efficient use of previously introduced green measures involves three out of ten companies (30.2%). The values tend to increase with company size: large company 61.2%, medium-sized company 43.7%, small company 27.7%. From a territorial point of view, the percentages are relatively consistent with the overall average.

A critical point to emphasise concerns findings emerging from scientific discussions about the development of the Industry 4.0 model. In fact, it is often highlighted that the transition to digital technologies, through the introduction of enabling technologies, must be preceded – if it is to be fully effective – by a reorganisation of company structures. This means that, in a 4.0 transition scenario, we are witnessing the emergence of a demand for both ultra-specialist and organisational skills, as part of a process that reshapes professional profiles increasingly defined by multi-skilling. This means that investment in new technologies alone, without by a corresponding re-skilling and up-skilling of both technical and organisational skills, may incur unforeseen critical issues. Similarly, the green transition of companies also requires special attention on the front of the adaptation of human resources to the new scenarios. This is necessary both to support the reduction of environmental impact and to foster the development of new products and services.

### **1.5. High Incidence of Compulsory Training**

In terms of the content of the courses conducted in 2019, companies showed a marked preference for a few predominant areas. Foremost among these is Environment, Health, and Safety at Work (carried out by 83.5% of the companies), which has a clear predominance. This is followed, at a gap of more than 50 percentage points, by courses on specific production and service provision techniques and technologies (32.5%) and Office work, secretarial, accounting, finance and administration (20%). Decidedly fewer companies, with percentages of less than 20%, focused on topics related to the Protection of privacy, anti-corruption, anti-money laundering, transparency, (16.6%), as well as the Development of personal skills, motivational activities, teamwork (14.1%). Even smaller percentages of companies prioritised courses in Information Technology (12.2%), Sales and Marketing Techniques (12.6%) and, to an even lesser extent, Foreign Languages, including Italian for Foreigners (5.9%).

Considering the reasons that gave rise to the training intervention, three priorities stand out in particular, in this order: compliance with specific legal

obligations (cited by 84% of training companies), the up-skilling of existing skills (66%) and re-skilling, i.e., the acquisition of new skills (52%). If, on the one hand, the relevance of the motivation represented by adherence to legal obligations confirms the fact that it is a constant feature over time of the continuous training practised in our country, on the other hand it puts the picture of the skills subject to greater training attention in a partially different light. These are predominantly technical and operational skills, often dictated by laws, standards, or regulations—whether tied to professions, sectors, processes, or products. However, when the number of training hours rather than the number of companies is used as the metric, the relative weight of mandatory courses diminishes significantly, accounting for just 32.8% of total training hours provided.

Companies that only realised courses due to legal obligations represent 37.8% of the total. Their share grows as the size profile decreases: from 42.4% of the micro enterprise, to 37.1% of the small enterprise, 23.5% of the medium-sized company and 10.9% of the large enterprise. According to the territorial breakdown, the highest values are concentrated in the North-East (40.1%) and Centre (40.2%), while they are lowest in the South and Islands (34.8%). In the comparison between macro-sectors, industry has the highest percentage share (45.9%), almost 15 points behind the tertiary sector (31.6%).

## **CONCLUSIONS**

The issues touched upon so far represent several open questions in the perspective of a development of the Italian continuous training system that can be deemed both effective and inclusive, capable of accompanying an adequate upskilling and reskilling of human resources. This is particularly crucial in the face of new challenges – most notably the digital transition and the ecological transition – that the entire productive fabric of the country will increasingly need to confront. Resolving the critical issues identified calls into question further systemic aspects, first and foremost its forms of multi-actor and multi-level governance. These could be further refined in light of the need for greater integration of the devices for interpreting ongoing changes and the development of more convergent intervention strategies at the territorial level.

It will be interesting to see in the coming months whether the policy framework, currently being implemented as part of the National Recovery and Resilience Plan (PNRR), will have begun to deliver its initial results. This will likely become evident when data from the next edition of INDACO-Companies is made

available.

# THE IMPACT OF SMART WORKING ON RESKILLING AND UPSKILLING PROCESSES IN THE PRIVATE AND PUBLIC SECTORS IN ITALY: A FIRST ANALYSIS

Giuditta Occhiocupo<sup>a</sup>

Alessandra Pedone<sup>a</sup>

<sup>a</sup>INAPP Istituto Nazionale per l'Analisi delle Politiche Pubbliche

This paper delves into a comprehensive examination of the ramifications brought about by remote working, known in Italy as smart working and agile working, considering the key role of continuing training in supporting public and private organizations to adapt to the increasingly rapid changes and innovation processes. The study analyses the impacts on the development and adaptation of training plans and the overarching processes of reskilling and upskilling within the private and public sectors. The analysis is based on the results of a qualitative research project conducted by INAPP, on private and public-sector throughout the period of 2022-23. The first facet explores the intricate interplay between the demand for technology and digital skills and the training processes within the framework of the evolving remote work paradigm. The second facet takes a prospective stance, elucidating the regulatory evolution of remote working and its consequential impact on training initiatives. Shedding light on the interplay between continuing training and remote working in both private and public sectors, this paper underlines strengths observed during the research phase but also discerns critical aspects and potential future scenarios that warrant attention.

smart working; continuing training; digital skills; digital learning; innovation processes.

## INTRODUCTION

Smart working offers flexibility in both location (e.g., working from home) and time, facilitated by digital technologies. While it had gained traction in large companies (Eurofound & ILO, 2017), it remained less common in SMEs and the

public administration (PA). The COVID-19 pandemic accelerated the adoption of agile work across both sectors, balancing public health measures with productivity needs. This shift impacted work organization (e.g., schedules, remuneration, safety) and the delivery of continuing training, which increasingly relied on distance learning.

The pandemic underscored the need for CVET programs and lifelong learning to redesign worker and management competencies, critical for the sustainability and development of labor markets. Upskilling and reskilling, integrated into national and collective bargaining frameworks, are key strategies for organizational renewal. Agile work should be seen as both a driver of innovation and a source of complexity, central to workforce requalification and the adaptation of corporate models (Osservatorio Smart Working, 2020).

Building on these developments, the “Continuing Training and Adult Learning” research group within INAPP’s “Training Systems” Unit conducted a research project in 2022-23 titled “Analysis of the Evolution of the Impacts of Smart Working on Reskilling and Upskilling Processes.”

The research project focused on the continuing training processes related to agile working, examining the effects of smart working on the programming, management, and delivery of training interventions, as well as its impact on organizational performance and productivity. This analysis included both small and medium-sized enterprises (SMEs) and national (ministries, research institutes) and regional public administrations.

The research project was structured in an initial desk analysis phase aimed at surveying and examining the most recent reference literature and reconstructing the theoretical framework regarding agile working (more commonly known as smart working) and its connections with the needs for continuing training, whether in person or at a distance.

Additionally, the project involved conducting interviews (30) with key informants, namely human resources and training managers in SMEs and in the PA, along with academics and subject matter experts, and other stakeholders (Social Partners, Interprofessional Funds, professional training companies, etc.) involved in the development of a national VET system which, in conjunction with regional training systems, aims to support training supply-demand processes, even in the case of resorting to agile or smart working methods.

The interviews were complemented by case studies (10) aimed at collecting information and evaluations based on a set of indicators of CVET associated with smart working, promoted by companies and Public Administrations.

In particular, attention was focused on several questions aimed at delineating: the description of smart working characteristics in companies and in the PA; the competency needs resulting from introduced technological innovations; the type of training provided (whether only that required by law or other types); the organization of training responses (through the company/PA or through providers); the quantification of training activities delivered following the introduction of smart working (increase or decrease) and the need, or lack thereof, to redesign training compared to methods used prior to the introduction of smart working; the possible implementation of career guidance and skills assessment activities (internal or external); the indication of advantages and/or challenges that training in agile working modes has posed for both organizers (methodology, tools, participant involvement) and users.

Regarding prospective aspects, efforts were made to investigate the relationship between “smart working and smart learning,” as well as any unmet or potential training needs, even in anticipation of the gradual return to in-person work following the cessation of the pandemic emergency. Finally, attempts were made to understand whether continuing training would also be necessary for updating specific skills related to agile working, and the possible methods through which such training could be delivered.

This paper presents the key findings of the research project, including an analysis of the legislative evolution of agile and remote working and their impact on the transformation of training practices and workforce development. It also explores the role of digitalisation and its implications, particularly in shaping training, skills acquisition, and reskilling/upskilling processes in the medium to long term.

## **1. TECHNOLOGIES AND DIGITAL SKILLS: IMPACT OF SMART WORKING ON TRAINING PROCESSES**

The digital transition, primarily involving the digital skills of workers and technological infrastructures, has been promoted and accelerated by the pandemic, leading to a significant increase in the adoption of remote work in all its forms (Eurofound, 2022). This transformation has occurred differently across various European countries (JRC, 2020). Digitalization has been a driving factor in integrating advanced technologies into work activities, enabling more people to perform their jobs from home or any connected location. Workers’ digital skills have become essential to face the new challenges of the modern work environment, requiring continuous adaptation and learning to fully exploit the

opportunities offered by digital technologies. In this context, policy recommendations (OECD, 2021) emphasize the importance of developing digital skills among the enabling framework conditions at national and local levels.

The research findings, presented in this paper, highlight the profound shifts in work practices and training modalities catalysed by recent global challenges, particularly those related to the digital transition.

During the Covid-19 pandemic, technological upgrades and device acquisition varied across regions and sectors in Italy, with more innovative businesses having better access, affecting the speed and success of new work models and impacting work well-being. The shift to remote work was challenging for organizations lacking cloud infrastructure and relying on VPNs. Workers without prior remote work experience faced issues with equipment and connectivity, with many receiving portable devices. Initial tools provided included videoconferencing systems, social collaboration technologies, and cloud sharing to maintain workflow and operational continuity.

During the emergency phase, businesses and public administrations quickly shifted digital skills training to remote formats, though in an unstructured manner due to time constraints. The most common approach involved webinars on various topics, including digital skills, cybersecurity, and remote team management, with a focus on moving from control to trust and goal achievement for leaders.

New training needs emerged, especially in soft skills. Onboarding for new hires was essential to help them understand agile work dynamics, while upskilling and reskilling were required for existing workers, particularly in less digitized contexts. Reskilling also focused on adapting digital skills to new requirements and software, especially where remote work led to changes in work processes, leadership, and time management.

Digital literacy needs were particularly high in public administrations and less innovative SMEs, which had not previously adopted digital platforms for work management. This gap was due to limited prior training initiatives and scarce resources. During and after the emergency, mentoring and digital skills transfer among colleagues were implemented, with some public administrations appointing digital representatives to aid the transition, often in collaboration with IT departments.

## **2. ANALYSIS OF THE REGULATORY EVOLUTION OF SMART WORKING IN ITALY AND ITS IMPLICATIONS FOR TRAINING**

In Italy, smart working (lavoro agile) was formally recognized by Law No. 81 of 22 May 2017, which set non-derogable principles for its application in subordinate employment, including, where applicable, the public sector. Prior to this law, agile work had been introduced in some companies through collective bargaining agreements.

Law No. 81/2017 defines agile work as a flexible work modality of executing subordinate employment. It requires an agreement between the parties and it's structured around phases, cycles, and objectives, with no fixed time or workplace constraints, and may involve technological tools. The law aims to enhance competitiveness and improve work-life balance.

Several key characteristics define agile work. First, it is a work execution method, not a specific contract type, maintaining flexibility. Second, it applies only to subordinate employment, excluding self-employment. Third, it sets requirements for how and where work is performed. Agile work involves both on-site and remote work, with no fixed workstation, subject to legal and collective agreement limits on working hours. This distinguishes it from telework, which requires work exclusively outside the employer's premises. A fourth characteristic is that work outside company premises requires a written agreement (fixed or indefinite, with a 30-day notice period for withdrawal), specifying rest periods and measures to disconnect from work-related technology.

Finally, the law holds the employer responsible for the safety and proper functioning of technological tools provided to workers, including protection against accidents and occupational illnesses. It also emphasizes using technology to support work-life balance, workforce participation, and lifelong learning through formal, non-formal, and informal training, alongside periodic competency certification. During the pandemic, remote work became widespread, diverging from the agile work model in Law No. 81/2017 due to legislative exceptions from March 2020 to 2022. These exceptions waived individual agreements and allowed digital fulfillment of obligations. Agile work became the primary (and sometimes only) mode, often without worker consent. These changes highlighted both strengths and weaknesses in the 2017 framework, sparking ongoing discussions about potential revisions amid rapid digitalization and the growing role of AI.

In the public sector, remote working in its emergency form became the standard

mode of work until 31 March 2021. However, the public sector more swiftly resumed in-person work as the regular mode compared to the private sector, where legislators extended derogatory provisions to facilitate agile work even after the health emergency ended. Specifically, regarding the relationship between agile work and training in the public sector, the directive issued by the Minister for Public Administration in late March 2023 emphasised the development of transversal skills in public employees to support digital, ecological, and administrative transitions. This directive outlined agile work as a tool with an innovative and professional development impact on training, highlighting its reciprocal relationship with professional development initiatives.

#### **4. AGILE WORKING, DIGITALISATION AND TRAINING: ANALYSIS AND PERSPECTIVES**

The main findings from the INAPP research project on the initial impact of smart working on training, together with an in-depth analysis of the legislative evolution of agile work and the effects of digitalisation (Angotti, R., Occhiocupo, G., Pedone, A., 2023) on the demand for skill acquisition and updating within public and private sector work, have offered valuable insights and forward-looking reflections.

Two overarching trends emerge from the research. First, the COVID-19 pandemic accelerated the adoption of innovative work practices, such as agile work, a trend that has continued post-pandemic and is still evolving rapidly. Second, agile work and digitalisation (including the integration of AI) have had a positive impact on work performance and on continuous training, particularly when linked to performance evaluation models and individual development plans.

The pandemic accelerated digitalization, driving the widespread use of digital learning, enhancing digital skills, and fostering a culture of innovation. This shift supported collaborative problem-solving and stakeholder networking.

Digitalizing training processes includes the use of LMS and both asynchronous and synchronous distance learning methods, enabling flexible, on-demand education that reduces costs and time.

Agile work has offered benefits such as cost savings, improved communication, better work-life balance, more time for training, environmental sustainability, and personalized training content. However, challenges during the emergency phase included employee sense of isolation, loss of informal learning

opportunities, collaboration overload, blurred work-life boundaries, and difficulties in managing remote teams. The adoption of agile work and related training adaptations revealed distinct differences between the public and private sectors. In the public sector, where agile work was minimal before the pandemic, its introduction marked a significant shift in work organization and training, focusing primarily on digital competencies and remote collaboration skills. Post-pandemic, agile work is seen more as a tool for work-life balance than for enhancing efficiency, governed by Law No. 81/2017 and sectoral agreements, limiting its use to specific days of the week.

Looking ahead, digital transformation should be viewed as an evolving process supporting organizational innovation and transitions in public and private sectors. Continuous training is strategic (Occhiocupo, 2023) for both employees and management, achieved through smart learning practices, including digital and hybrid training formats. A balance between agile and on-site work is needed, along with a connection between agile work and training that fosters the personal and professional development of employees, managers, and organizations. The rise of hybrid work highlights the need for training in cybersecurity, data protection, and health and safety, particularly for remote work.

As organizations transform, soft skills training becomes increasingly important. Leadership should prioritize innovation management and foster a culture of trust and feedback. Employees, both young and old, must be supported to develop greater autonomy, responsibility, and collaboration, creating inclusive workplaces. Developing a competence certification system is essential to enhancing employability and promoting lifelong learning.

Finally, for distance or online training, innovative design approaches are needed to overcome issues like low engagement and distractions, incorporating microlearning and focusing on engagement dynamics in training programs. Technological innovation is creating the conditions for experimenting with new training and work methods that leverage tools such as artificial intelligence and the metaverse, necessitating a strengthening of competencies to manage the digitalisation of processes and meet the demands of content design and delivery.

# THE CURRICULUM AS A KEY LEVER FOR ACHIEVING EQUITABLE, INCLUSIVE, AND ACCESSIBLE EARLY CHILDHOOD CARE AND EDUCATION

Eloïse Drure<sup>a</sup>

<sup>a</sup>University of Modena and Reggio Emilia, Italy

This paper explores the connection between Early Childhood Care and Education (ECCE) and social justice, emphasizing the crucial role of curricula. Despite strong evidence of the benefits of ECCE, challenges such as inadequate investment and resource shortages continue to undermine its effectiveness. The paper examines how ECCE curricula can integrate the four key principles of social justice—equality, equity, rights, and participation—through concrete examples.

curriculum; ECCE; social justice.

## INTRODUCTION

Recent research, particularly in affective and cognitive neuroscience as well as early childhood development, has highlighted the critical importance of Early Childhood Care and Education (hereafter ECCE), especially as recognized by civil society and international organizations. These bodies emphasize the unique needs and particularities of children in this age group. Early childhood represents a pivotal period in an individual's life, with lasting impacts on both their future development and the broader society (UNESCO, 2015). Despite substantial evidence supporting the benefits of ECCE, there remains a lack of investment—both in terms of human resources and financial support—in this sector. This shortfall may undermine the quality-of-service provision and negatively affect the effectiveness of teaching (UNESCO, 2015).

This paper seeks to explore the connection between ECCE and the main theme of the conference, “Education and/or Social Justice”, illustrated by concrete examples of existing curricula. Indeed, curricula play a crucial role in

transforming ECCE systems to foster greater inclusion, equity, and accessibility. The presentation will examine various aspects of early childhood curricula through the lens of the concept of Social Justice, identifying the key characteristics necessary for effective, contextually appropriate, and sustainable implementation. This will first involve defining the key concepts and constructs central to the discussion.

## **1. PRE-CONCEPTUAL ASSUMPTIONS**

The concept of “Social justice,” as defined by Mona Khechen, is “a normative concept centered on the notion of fairness and the principles of equality, equity, rights, and participation.” It is understood through its dimensions: the redistribution of resources and the recognition of cultural differences.

“Early Childhood Care and Education” refers to children aged 0 to 8 years. One of the major challenges ECCE faces is the lack of resources (UNESCO, 2019), both financial, as the early childhood education sub-sector continues to be neglected, and human, as this field remains unattractive due to low wages and limited social recognition of early childhood professions. A lack of investment in these resources has a negative impact on the quality of educational provision.

Curriculum is understood in a broad sense as a tool for orientation, translating intentions set forth in public policies (international, regional, and national) into the education sector, but also encompassing other sectors such as health and protection. The early childhood education sub-sector is inherently multisectoral and intersectoral, and this brings us to the first challenge. Indeed, early childhood systems are complex due to their multisectoral and interdisciplinary nature, as well as the diversity of stakeholders involved (including health and protection sectors), which can impact effectiveness, understanding, consensus-building, and administrative organization.

Broadly speaking, Quality in ECCE is often seen as contrasting with Quantity. It is not merely a matter of providing early childhood services; the service must be efficient, relevant, and beneficial to both the child and society. Additionally, the concept of “educational poverty”, which stands in opposition to quality, is defined by Save the Children Italy as “the deprivation of the opportunity to learn, experience, develop, and allow skills, talents, and aspirations to flourish freely” (Save the Children, 2019).

Therefore, based on the specific challenges and characteristics highlighted— (1) the complex, interdisciplinary, and multisectoral nature of ECCE (ECCE), (2) the lack of investment and resources, and (3) the impact of quality on both

school life and the broader life of individuals and societies— this presentation will explore how the curriculum can serve as one potential pathway for transforming ECCE systems to be more inclusive, efficient, and grounded in children’s rights.

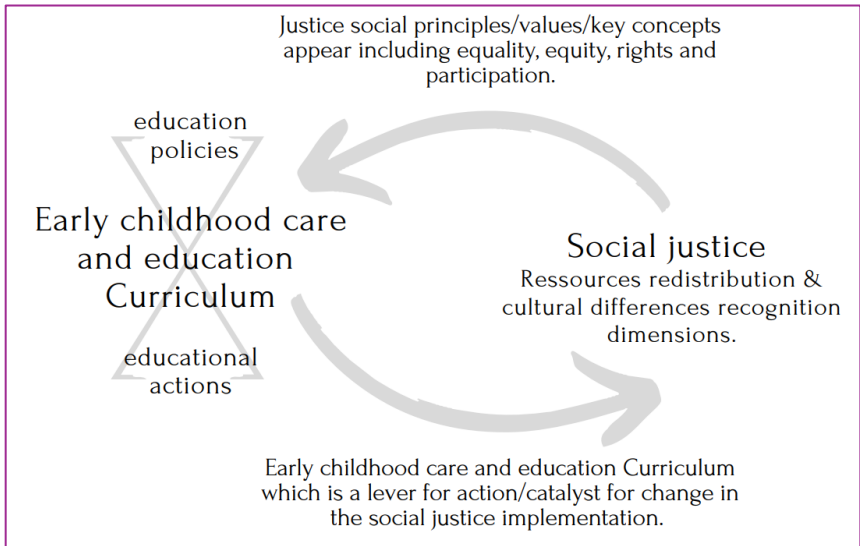

**2. EXPLORING ONE WAY FORWARD: THE CURRICULUM AND PRACTICAL CASES**

To mitigate the challenges identified, one of the most important strategies for improvement and a key lever for change is the curriculum, which functions both as a tool and a process for transformation. A curriculum designed to deliver quality early childhood education must be founded on a set of core values and priorities, as well as characterized by specific features that will be articulated through guidelines, orientations, and objectives. The selection of curriculum content is not a minor matter; it must reflect fundamental values and a clearly defined vision, ensuring that the educational experience aligns with broader societal goals and promotes the well-being of the child.

A curriculum for quality early childhood education must consider the four key principles of social justice as defined by Mona Khechen: equality, equity, rights, and participation. In this context, the following sections provide detailed explanations and examples of curricula that incorporate these principles.

The figure below illustrates the connections between the generalized and simplified ECCE Curriculum presented here, using a single term, and the concept of social justice.

Figure 1. Reciprocal links between the ECCE Curriculum and Social Justice

## 2.1. Equality

Equality<sup>1</sup> is a fundamental principle underpinning the ECCE curriculum. Several core values are central to this approach, particularly the emphasis on play-based curricula. As noted by the Special Rapporteur, “a particular mention must be made of the specific right of children to leisure, play, and recreational activities.” (OHCHR, 2022, p. 73). This highlights the importance of integrating adequate leisure and recreational activities into the curriculum to support the child’s right to play.

Furthermore, the curriculum must foster communication and creativity, allowing children to express themselves freely and develop essential social and cognitive skills. This approach aligns with contemporary values, which emphasize peace, solidarity, and respect for others, as well as a deep appreciation for nature and the environment. At the heart of this curriculum is the centrality of the child. This principle ensures that the child’s needs, interests, and rights are prioritized, creating an inclusive and equitable learning environment that supports the holistic development of all children.

## 2.2. Equity<sup>2</sup>

### 2.2.1. Inclusivity

To illustrate the principle of inclusivity, the American psychologist Howard Gardner has proposed an application of the Theory of Multiple Intelligences to education, advocating for an innovative reorganization of the school system that includes the role of the Curriculum Adviser. This individual would be responsible for aligning the educational goals with the interests of children, ensuring that the various programmes are tailored to meet diverse learning needs. Gardner’s proposal is inherently inclusive, as it recognizes and values the seven distinct types of intelligence and the diverse interests of children, integrating them into the learning process.

---

<sup>1</sup> Khechen Mona (2013), definition of equality: “Fair access to goods and services is a fundamental principle of social justice” and “the notion of ‘fairness’ as related to access is often linked with the notion of ‘equality’ to imply that all people, regardless of their gender, race, age, class, language, religion and occupation, are entitled to benefit from public goods and resources. These include access to livelihood, capacities, education, information, health services, employment and job opportunities”.

<sup>2</sup> Khechen Mona (2013), definition of equity: “The principle of equity derives from the recognition that the concept of fairness as equal or uniform distribution is not always possible or implementable, particularly in view of existing injustices that have prevented or reduced the ability of certain individuals or groups to gain equal access to public goods, resources and opportunities in the first place. With this in mind, equitable treatment implies that people would get a ‘deserved’ treatment, meaning what is right for them”.

### *2.2.2 Endogeneity*

Endogeneity emphasizes the importance of recognizing, respecting, and promoting cultural diversity and the rights of minorities in educational contexts. One effective way to achieve this is by using the mother tongue as a medium for learning, incorporating cultural and artistic elements into the curriculum, and fostering an environment where all children's backgrounds are acknowledged. As articulated in the Generative Curriculum approach,

Diversity is embraced, along with a large measure of indeterminacy. Unlike most curricula, which are based on a singular construction of reestablished content and outcomes, the Generative Curriculum is a co-construction that elicits the generation of new ideas and possibilities that cannot be fully anticipated in advance (Gunilla et al., 2007).

This flexible and dynamic approach allows for the integration of diverse cultural perspectives, fostering creativity and innovation in the learning process.

Moreover, it is crucial that early childhood education systems prioritize the protection and promotion of minority languages and cultures. As stated, "The preschool should help to protect and promote the languages and cultures of the national minorities", and "Children with a mother tongue other than [the national language] should be given the opportunity to develop both the national language and their mother tongue" (Government of Sweden, 2010). This principle ensures that all children, regardless of their linguistic background, are provided with an equitable learning environment that values and nurtures their cultural identities.

### **2.3. Participation**

The concept of participation<sup>3</sup> in the development and implementation of ECCE curricula goes beyond mere consultation; it is a dynamic, ongoing process of collaboration among a wide range of stakeholders, each bringing unique perspectives and expertise.

Key stakeholders involved in this process include professionals working in schools and ECCE institutions, who offer valuable insights into the practical aspects of curriculum design, feasibility, and the identification of local needs and priorities. These professionals are instrumental in ensuring that the curriculum is grounded in real-world experience and is adaptable to the specific

---

<sup>3</sup> Mona Khechen (2013), definition of participation: "Participation in the context of social justice means involving people in decisions that govern their lives".

context in which it will be implemented. In addition to educators, researchers contribute their expertise, providing evidence-based guidance on best practices and innovations in early childhood education, which helps to ensure that the curriculum is both pedagogically sound and aligned with current research.

Parents, parent associations and community play an equally critical role in the curriculum development process. Parents' perspectives are invaluable in identifying what is important for their children's development and learning, as they have a deep understanding of their children's individual needs and interests. For example, the Generative Curriculum Model was initiated in the 1980s in Canada as part of a partnership project between a *First Nations tribal council* and the *School of Child and Youth Care at the University of Victoria*, aimed at developing a unique approach to community-based training initiatives. Furthermore, the principle of participation extends to the children themselves. It is crucial to view children as active participants in their own learning, rather than passive recipients of information. Their ideas, questions, and initiatives should be seen as central to the learning process, allowing for a co-construction of knowledge where children contribute to shaping their educational experiences. This participatory approach fosters a sense of ownership and agency, empowering children to take an active role in their learning journeys and encouraging the development of critical thinking, creativity, and problem-solving skills.

In sum, the participatory and co-constructive model for ECCE curriculum development recognizes the importance of collaboration among all stakeholders—educators, researchers, parents, and children themselves—ensuring that the curriculum is comprehensive, inclusive, and responsive to the needs of the learners and their communities.

## 2.4. Rights

The connection between Rights<sup>4</sup>, here Human Rights, and the ECCE Curriculum is twofold. Firstly, Human Rights must be explicitly integrated into the curriculum, ensuring that they are not only a formal component of the

---

<sup>4</sup> Mona Khechen (2013), definition of Rights: "Rights as a key principle of social justice can be divided into the following two sub-groups: a) legal rights, which include inherited rights, and other lawful rights such as the right to receive payment for one's jobs according to agreed terms; and (b) moral rights, which include people's basic human rights, liberties and such entitlements as the right of "giving people a say in affairs that concern them" (Smith 1994) and the right of certain groups to particular geographic territories (Lee and Smith 2005). In socially just societies, moral rights, even in the absence of legal guarantees, are protected by adequate procedures, norms, and rules, some of which are universally accepted, as is the case with human rights, for instance".

educational content but are also woven into the so-called “hidden curriculum” — which refers to the attitudes, behaviors, and values exhibited by ECCE professionals. These unspoken elements can profoundly shape children’s understanding of their rights and how they are treated, making it essential for educators to model and promote human rights in their daily interactions with children.

Secondly, the curriculum itself serves as both a guarantor and a catalyst for the respect, promotion, and realization of human rights. By embedding principles of equality, participation and inclusivity within educational practices, the curriculum becomes a key instrument in fostering a culture where Human Rights are respected and upheld. It empowers both educators and children to act in ways that protect and promote these rights, helping to create an environment conducive to the full development of the child as a rights-bearing individual.

In addition to these dimensions, a third critical aspect emerges, which forms the core of my research: the right to ECCE itself — my PhD research subject. This right is fundamental to ensuring that every child has access to high-quality early childhood education that is not only equitable but also supports the development of their full potential. The right to ECCE is intrinsically linked to the realization of other human rights, including the right to education, health, and social protection.

The interdependence between the ECCE curricula and Human Rights can also be understood through the lens of the conceptualization of a new human right — the right to ECCE. Recognizing this right can clarify and strengthen the broader understanding and realization of children’s rights, thus reinforcing the need for comprehensive frameworks that protect and promote the rights of children from the earliest stages of their development. By formally recognizing the right to ECCE, we establish a foundation upon which all other children’s rights can be more effectively realized, ultimately contributing to the achievement of social justice and equality for all.

# NEW QUALITY ASSURANCE APPROACHES: OUTCOMES OF AN INTEGRATED PEER REVIEW EXPERIMENTATION IN ITALIAN VET SCHOOLS AND TRAINING CENTRES

Laura Evangelista<sup>a</sup>  
Concetta Fonzo<sup>b</sup>

<sup>a</sup>Istituto Nazionale per l'Analisi delle Politiche Pubbliche (INAPP); <sup>b</sup>Istituto Nazionale per l'Analisi delle Politiche Pubbliche (INAPP)

From 2019 to 2022, qualitative research about an integrated Peer Review – involving both schools belonging to the General Education system and vocational training centers operating in the Regional VET systems – was carried out by INAPP. Through this national research, innovative integrated tools were elaborated by merging the Peer Review methodology, at VET provider level, with the National Evaluation System tools. The new integrated method, based on common quality criteria and indicators, was piloted via a national network. In total 14 Peer Review visits were hosted and more than 50 Peers – many teachers and trainers – were involved in the National experimentation that included three different Italian Regions (Veneto, Lazio and Puglia). During the piloting, the overlapping and redundancy of quality assurance tools and methods, in different education and training settings, created the condition for an in-depth reflection on the role and functions of quality measures in schools and VET centers and on how all the quality measures in place can face inequities among different systems. Starting from the results of the national experimentation, this paper shows how the VET Peer Review methodology can support the development and enhancement of quality in both sectors: General Education and VET.

quality; self-assessment; peer review; education; training.

## INTRODUCTION

Quality assurance and continuous improvement of training provision have

gained increasing importance for institutions and policymakers across Europe (Visscher, 2009), as well as for Vocational Education and Training (VET) providers (Dordit, 2018). Over the past two decades, a particularly promising method for quality development and assurance in VET was the Peer Review at VET provider level — known as Peer Evaluation — which consists in an external assessment conducted by a group of experts, the Peers, who are invited to evaluate the quality of various areas and domains related to the evaluated entity, namely a VET institute or centre (Gutknecht-Gmeiner, 2008). Peers are independent experts who operate “on an equal footing” with the individuals within the context being observed and evaluated (Allulli, 2012). The VET Peer Review methodology aims at external evaluation designed to support VET schools and training organizations in their quality assurance and development initiatives, focusing on the following quality areas: 1. curriculum; 2. teaching and learning; 3. assessment; 4. learning outcomes and results; 5. social environment and accessibility; 6. management and administration; 7. institutional ethics and strategic planning; 8. infrastructure and financial resources; 9. deployment, recruitment and development of human resources; 10. working conditions for human resources; 11. external and international relations; 12. social interaction and participation; 13. gender equality; 14. quality management and evaluation (Tramontano & Allulli, 2012). Each quality area is further divided into specific criteria. In a Peer Review, at least two quality criteria for each selected quality area should be evaluated to ensure a balance between the significance of the evaluation experience and the overall efficiency of the training provision. Additional criteria can be included as needed. All criteria to be evaluated must be part of the self-assessment conducted by the institution or training centre to be evaluated, and they must be documented in a Self-Assessment Report prepared by the evaluated entity. The criteria are further detailed using quality indicators that serve to illustrate them (Tramontano & Allulli, 2012).

## **1. THE ADDED VALUE OF A PEER REVIEW AT VET PROVIDER LEVEL**

Based on a methodology elaborated and defined at European level, promoted by the EQAVET network<sup>1</sup>, the Peer Review at VET provider level is a standard

---

<sup>1</sup> The European Network for Quality Assurance in Vocational Education and Training (EQAVET) was established in October 2005 by the European Commission following the favourable opinion of the Advisory Committee for Vocational Training. Since 2006, its members are designated by Member States, candidate countries, EFTA-EEA countries and the European Social Partners’ organisations, in accordance with an explicit procedure defined by the

procedure which includes four main phases that can be described as follows:

- preparatory phase: during this phase, the institution or training centre prepares a Self-Assessment Report. The Peers are recruited and trained. The evaluated institution and the Peers plan the dates and schedule for the Peer Review visit and define the Peer Review Agenda;
- central phase called “Peer Visit”: this phase is the core moment of the Peer Review process. Peers visit the institution or training centre, evaluating based on established quality areas, criteria, and indicators. At the end of the Peer Visit, Peers provide initial oral feedback to the evaluated entity;
- feedback phase: after the Peer Visit, Peers draft a Peer Report, which is reviewed and commented on by the institution or training centre. The final Peer Review Report is then prepared.
- final phase called “From Plan to Action”: in this phase, the results and recommendations from the Peer Review are translated into actionable improvement plans, implemented by the evaluated entity.

Through the phases of the Peer Review, the evaluated VET school or vocational training centre can gain numerous benefits and initiate a continuous quality improvement approach. Specifically, the institution or organization can receive critical yet collegial feedback from field experts on the quality of its training provision, assess and enhance the quality of its education and training services, reflect on its strengths, shortcomings, and weaknesses, benchmark against best practices shared by Peers, engage in mutual learning processes with Peers and build networks with other schools and VET providers.

Peer Review at VET provider level has been voluntarily adopted across Europe. It serves both as a formative tool for individuals and as an improvement mechanism for organizations, fostering the development of quality assurance across all areas and levels.

## **2. THE EXPERIMENTATION OF AN INTEGRATED PEER REVIEW BETWEEN SCHOOLS AND VOCATIONAL TRAINING CENTRES IN ITALY**

INAPP conducted an experimentation between September 2019 and May 2022, delayed due to the COVID-19 pandemic, which was based on the integration of the VET Peer Review method and tools for Initial Vocational Education and

---

European Commission. Further information is available at: EQAVET – European Quality Assurance in Vocational Education and Training – European Commission.

Training – IVET – (Tramontano & Allulli, 2012) with those used by the National Evaluation System for education, established with the Presidential Decree No. 80/2013.

The foundation of this integration lies in the need to share and, where possible, harmonize and make equally effective the quality assurance practices and systems used in technical and professional secondary schools – which are part of the General Education system – with those adopted by regional VET providers. While schools nationwide uniformly apply the National Evaluation System procedures and tools, regional VET providers operate under a regional governance system that allows for experimenting with and adopting additional quality assurance methods.

### **2.1 The main objectives and goal of the integrated Peer Review experimentation**

Starting in 2019 and building on prior national experimentation actions on the VET Peer Review methodology, INAPP launched a pilot project. The first step of this pilot project included the establishment of a national network, used to test a new Peer Review model used for IVET, aimed at integrating self-assessment carried out by training centres with evaluations conducted by schools (Freddano & Pastore, 2018). Among the main objectives and goal of the piloting are included the following:

- facilitating collaboration, dialogue, and integration between the education and vocational training systems in Italy, involving distinct organizations that serve similar target groups in terms of age and education/training needs, fostering mutual growth;
- verifying the applicability of the Peer Review method for IVET in a “mixed” public-private context;
- creating and expanding a national Peer Review network among schools and vocational training centres.

### **2.2 The conceptual framework and methodology adopted for the integrated Peer Review**

Beyond creating the national network for Peer Review implementation, one particularly challenging and complex task was integrating the quality areas of the Peer Review methodology for IVET with the rubrics of the Self-Assessment Report — known as RAV (*Rapporto di Autovalutazione*) — of the National Evaluation System. This integration aimed to maintain the RAV rubric structure to facilitate its adoption and dissemination in schools involved in the

experimentation. More in detail, the process followed these methodological steps:

- adapting the existing assessment tools based on the PDCA (Plan-Do-Check-Act) quality cycle and quality assurance processes used in VET. The assessment tools identified through the experiences of the two evaluation systems — schools and vocational training centres — were integrated. The initial revision of existing tools laid the foundation for further “desk” revisions. Following the principle of continuous improvement, these tools’ relevance and effectiveness for integration into VET evaluation systems were monitored during pilot Peer Reviews and underwent further revisions post-experimentation;
- enhancing the framework of indicators used for the RAV, leveraging the specific features of the VET Peer Review methodology, which requests and analyses both quantitative and, more importantly, qualitative evidence, emphasizing input from all stakeholders (teachers/trainers, students, administrative staff and so on);
- emphasizing the educational value of the Peer Review quality areas. The variety of indicators provided for each quality area dimension serves as an effective learning tool for all professionals involved in quality assurance processes.

New indicators were proposed alongside a range of possible additional informational sources to account for the Peer Review evaluation methodology’s implementation methods.

### **2.3 The main activities and the data collection procedure carried out for the experimentation**

A prerequisite for the national integrated experimentation, enabling INAPP to compare the two systems — school education and vocational training — was the revision of VET Peer Review tools. To ensure effective implementation of the VET Peer Review methodology and to avoid duplication or redundancies with other existing evaluation instruments, such as ISO quality certification systems, the tools were reviewed, integrated and modified to align them with tools used by schools and vocational training centres. The methodological approach adopted for the national experimentation was based on the following actions:

- identifying major areas of consistency and overlap between the dimensions of the National Evaluation System and the quality areas of the Peer Review for IVET;

- analysing quality indicators and descriptors provided for each RAV area (Poliandri, Freddano & Molinari, 2019) and comparing them with the criteria and indicators offered by the VET Peer Review methodology;
- selecting quantitative and qualitative indicators from the Peer Review methodology to enrich the National Evaluation System. These additions supported self-assessment and enhanced evaluation efforts through the increased descriptive capacity of the quality areas;
- allocating relevant indicators from Peer Review quality areas not yet integrated into the dimensions of the National Evaluation System, aligning them with provided descriptors.

The analysis of different, even similar, quality assurance tools, produced a correlation matrix linking the RAV rubrics' descriptive indicators with those of the VET Peer Review methodology. Given the mandatory nature of the National Evaluation System for education, the new quality areas developed for the experimentation were limited to the first four areas of the VET Peer Review method (Tramontano & Allulli, 2012) and adopted the three-dimensional model (context, outcomes and process) already in use in schools.

### **3. THE RESULTS OF THE INTEGRATED PEER REVIEW EXPERIMENTATION AT NATIONAL LEVEL**

As part of the integration process between the National Evaluation System methods and tools and those used in VET Peer Review, a new set of instruments was created.

Following the development of the new integrated self-assessment tools — such as quality area grids, indicators for integrated Peer Review, self-assessment reports, and improvement plans — specific training was provided to teachers and trainers participating in the experimentation.

The national experimentation reached the main objectives and goals set by INAPP, undertaking and achieving the following activities:

- development of new self-assessment tools, including quality area grids, indicators for integrated Peer Review, self-assessment reports, and improvement plans;
- training of over 50 teachers and trainers on the integrated Peer Review methodology and the use of new integrated self-assessment tools.

Through numerous Peer Review visits, with teachers and trainers trained as Peers participating, the new integrated self-assessment tools were tested. From

the distinct methodologies — Peer Review for Initial Vocational Training and Self-Assessment in the National Evaluation System — the integrated Peer Review procedure was refined and formalized, avoiding unnecessary overlaps, which would be counterproductive and demotivating for participants, preventing excessive procedural complexity, which, if not based on a synthesis of the two methods, could add the Peer Review’s obligations to the National Evaluation System’s requirements, preserving the VET Peer Review methodology’s effectiveness in quality evaluation, which had proven to be successful and well-received in prior experimentations across VET in Italy and abroad.

The national network involved 14 different institutions, including schools and vocational training centres, which hosted 14 external evaluations — Peer Review visits — across three Italian regions: Veneto, Lazio and Puglia. These Peer Reviews followed an external evaluation process structured in four phases, as established by the VET Peer Review methodology.

## **CONCLUSIONS**

INAPP’s national Peer Review experimentation highlighted the opportunities and strengths of the European methodology, tested at schools and training institutions level (Evangelista & Fonzo, 2023). The methodology’s key strengths, directly experienced and confirmed by the Peers, included a collegial approach, cost-effectiveness approach, immediate feedback with meaningful and actionable data, diverse perspectives and broadened organizational horizons. These aspects represent the distinctive value of the Peer Review method. Moreover, the Peer Reviews conducted during the piloting of integrated self-assessment tools successfully brought together actors operating within different regulatory and institutional contexts — mainly from education and vocational training. These actors, despite differences, spoke the same “language” and shared a common understanding framework. This allowed for genuine dialogue not only between institutions, as is typical in Peer Reviews, but also between systems that enriched each other, fostering a reciprocal exchange between public and private sectors, and between general education and vocational training (Marcuccio, 2023).

# BEYOND EXPECTATIONS: HOW MUCH DOES THE STRUCTURE OF EUROPEAN EDUCATION SYSTEMS AFFECTS STUDENTS' PERFORMANCE?

Iacopo Moreschini<sup>a</sup>

Matteo Bonanni<sup>b</sup>

<sup>a</sup>University of Cagliari; <sup>b</sup>'La Sapienza' University of Rome

Educational systems at the upper secondary level in European countries are highly differentiated. It is therefore reasonable to consider that the varying internal organization of these systems has national-level effects on both equity and proficiency, elements that directly affect students. In our work, using an approach aimed at observing the underlying social mechanisms (Coleman's boat), we aim to examine the action/interaction between micro and macro phenomena. This will be conducted on a sample of 32 countries described in the Eurydice 2023 report. Building on the work of Benadusi and Giancola (2014), we have recreated a differentiation index to achieve this objective and observe changes over time in educational systems. The ultimate goal of the study was to determine whether the structure of educational systems contributes to the creation of students who exceed performance expectations, specifically if these are related to the presence of students performing better or worse than predicted by their socio-economic and cultural status, i.e., deviant students (Bonanni & Moreschini, 2024).

Educational systems; Performance; Deviant cases; Selectivity; Structural effects.

## INTRODUCTION: SOCIAL MECHANISMS UNDER EDUCATIONAL SYSTEMS

The European education system, during the reform processes of the 1990s, advocated for the standardization of educational pathways and qualifications (Novoa & Dejong-Lambert, 2003). Perhaps the most differentiated level is upper secondary education, where each country provides an autonomous policies strategy (Volante et al., 2022). The result of it is the fragmentation in the

horizontal structure in the educational systems and between them, resulting in varying levels of selectivity towards students (Benadusi & Giancola, 2014). Differences in the structure of educational systems can, in turn, impact individual factors at the school and/or post-school level and affect the level of inequalities within a country. Early tracking practices, for example, enhance the influence of social backgrounds on educational future choices (Duru-Bellat & Suchaut, 2005). This is also reflected in varying levels of segregation between schools, which, as we shall see, results in a trade-off between efficiency and equity (Sciffer et al., 2022) Given the framework for studying educational systems and their impact—which are a macro aspect—on individual aspects—which are a micro aspect—it is useful to adopt an approach that seeks to integrate macro and micro levels and attempts to observe the micro-macro and macro-macro interaction, such as the Coleman boat model (Coleman, 1994). In this study, we believe that the structure of educational systems impacts on elements that create different educational contexts, specifically on inequalities within these contexts, as well as on performance and its dispersion, both at the individual level and at the school level. This initial macro-micro interaction is followed by individual choices and behaviors influenced by others through social interaction. These, in turn, can have an impact at the macro level, in our case, the distribution of educational credentials. In the Coleman boat model, the macro-macro link can be observed indirectly through micro-interactions. Here the macro-macro link represents the relation between the structure of educational systems and aggregate levels of segregation, concentrating disadvantaged students in underprivileged schools, and perpetuating educational inequalities and divergent life outcomes (Dämmrich & Triventi, 2018).

Aware of the dependency of performances on individual socio-economic status (SES) and accounting for the structure of the educational system, the work aims to study the ability of national school systems to ‘produce’ students who perform better and worse than what would be expected of them based on their social background.

## **1. METHODS AND DATA**

For the analysis we use a dataset that include 32 countries detailed in the Eurydice report (2023), “The Structure of European Education System” (Albania, Austria, Belgium, Bulgaria, Switzerland, Czech Republic, Germany, Denmark, Spain, Estonia, Finland, France, Greece, Croatia, Hungary, Ireland, Iceland,

Italy, Lithuania, Latvia, North Macedonia, Montenegro, Netherlands, Norway, Poland, Portugal, Romania, Serbia, Slovak Republic, Slovenia, Sweden, Türkiye). We added students' level aggregated data from OECD PISA 2012 and 2022 dataset, and country level data from "OECD Education at a Glance" (OECD, 2023a) and "Eurostat" datasets. Furthermore, other measures on the structure of educational systems are taken from the work of Benadusi and Giancola (2014). The second objective of our study is to update the results of this work after a decade. From this data, an index of educational system differentiation for the year 2024 was calculated (and recalculated for 2014 for comparison purposes), following the criteria described in the aforementioned article. Alongside this, several measures of equity and proficiency were used. Among the former, we include the dispersion of mathematics performance, measures of school segregation (Math Score Variance Between and Within School), and a measure of primary effects (calculated as the betas of the correlation between performance to PISA test in math and socio-economic and cultural status of the individuals, i.e. ESCS, in each country, Boudon, 1974; This predictor is considered the best of the performance by the OECD, 2023b). Regarding the latter, the mathematics score (the PISA test topic) obtained by students in the PISA tests and the percentage of adults achieving tertiary education were used. Finally, a proxy measure of educational opportunities was included, represented by what are called deviant cases (Bonanni & Moreschini, 2024). In detail, these are students from low social backgrounds (ESCS, 1st quartile), performing above or below their predicted performance on tests by status, and students of high social status (ESCS, 3rd quartile), performing above or below their predicted performance even by status.

## **2. DIFFERENTIATION INDEX**

The differentiation index derived from Benadusi and Giancola (2014) is the result of a Principal Component Analysis (PCA) based on the structure type of the educational system (Single Structure – Differentiated – Common Core), the number of tracks, the age of first track selection, and the percentage of repeat students. This index has been normalized between 0 and 1, where 0 represents no selectivity, corresponding to comprehensive systems, while 1 represents maximum selectivity, typical of so-called selective systems. In this paper, after a decade from the first new countries enter (Macedonia, Montenegro, Albania and Serbia) with very low levels of selectivity. Reporting the initial findings after ten years: Continental-Saxon countries remain the most selective, Scandinavian the most comprehensive, central Mediterranean and Eastern

countries bridge between these two poles. Changes in the index score between 2014 and 2024 allow us to illustrate the directions taken by educational policies over the last 10 years. Considering the entry of new countries, which alters the scale of the index. Spain, Greece, Bulgaria, Hungary, Iceland, and Norway remain stable in their levels of differentiation (for the sake of brevity, we refer to the summary categories mentioned earlier). France, Ireland, Portugal, Switzerland (which in 2014 had a highly selective system), Poland, Lithuania, and Latvia, on the other hand, are moving toward greater comprehensiveness. Finland and the Netherlands are moving toward greater selectivity: the former starting from very low levels of differentiation, and the latter from already high levels.

### **3. ANALYSIS**

To observe what the theory highlights (the effects of structure on micro phenomena and, in turn, the effect of the latter on other macro social facts and the relationship between macro-level phenomena with one another, and between micro-level phenomena among themselves in turn), correlations were performed between the mentioned variables and the structure/differentiation index (Pearson's R were reported, for all correlations *p. value* < 0.05, other non-significative correlation were indicated in the text).

#### **3.1. From structures to contexts**

Firstly, we can observe that, while positive in sign, the recorded correlation between math performance ( $R = 0.301$ ) and education structure is not significant. Secondly, observing the equity measures, primary effects ( $R = 0.61$ ), performance dispersion ( $R = 0.52$ ) and performance (Between school  $R = 0.641$ ; Within school  $R = -0.446$ ) and socio-economic (Between school ESCS dispersion  $R = 0.481$ ) segregation are all positively correlated with the structural index.

By examining the relationships, following a chronological order of impacts throughout students' lives, we can assert that higher differentiation, and thus more selective systems, is associated with a greater impact of primary effects, meaning that family background has a stronger influence on performance. This represents a form of inequality inherited from the family, and in more selective systems, the school seems to fail in its role as an equalizer of inequalities. Observing performance dispersion, we also find that higher levels of differentiation correspond to less uniform performance. This result suggests that more selective systems are less effective at pushing all students to the

same level. The underlying reason for the last interpreted relationship is strongly related to a systemic effect. Delving into the relationship between the differentiation index and the segregation of ESCS among schools (standard deviation of the country's ESCS), it is observed that higher levels of differentiation correspond to greater segregation. In other words, school segregation also has social foundations, not just performance-related reasons. Schools enroll students of similar social backgrounds, thereby choosing not to bring everyone together. If we observe performance segregation between schools, which also underlies status segregation, in selective systems, the dispersion of performance between schools is more pronounced. Recalling the previous relationship, students in selective systems are not all at the same level because the school in which they are enrolled also dictates their average performance. This is also observable in the relationship between the structure and the variance of performance within the same school. This relationship demonstrates that selective systems tend to differentiate schools internally by performance, which does not occur in comprehensive systems where performance polarization is high. In the latter, there will be schools that are very homogeneous regarding high and low levels of proficiency.

### **3.2. A chained effect**

In line with the Coleman boat approach, we attempted to observe a correlation that explains and confirms the existence of a micro-macro connection, not an effect, but an association. Linked to the last correlation observed in the previous paragraph, between internal school segregation and differentiation, we considered that this might be related to the distribution of educational credentials among the population, specifically the percentage of adults that attain tertiary education by country. Chained to the previous correlation, higher within-school performance variance is related to a higher percentage of adults with tertiary education ( $R = 0.61$ ). This partially states that policy choices oriented toward comprehensiveness, while appearing to not pay off in short term performances instead pay off in the long run: when the system holds all together, students with lower performances perceive to be fit for tertiary education. Certainly, this series of associations will need to be further explored in future studies.

### **3.3. Structure and behaviors**

In the last part of our analysis, we argue that differences in structure affect the ability to deviate from educational trajectories determined by social origin. We

define who perform in ways not adherent to their social status, or in other terms, deviate from the performance predicted by social origins, a deviant student (from deviant cases). Here we took the residuals from the linear regression relating test performances in math on PISA test to socio-economic status and categorized the distribution into ‘expected’ and ‘below’ and ‘above expectations’<sup>1</sup>. We then took our sample of students in each country and categorized them into quartiles based on the ESCS index. We computed, for each country, the percentage of students in the first quartile performing above and below expectations and the percentage of students in the third quartile performing below or above expectations. In this way, we can observe how structure affects students’ behaviors as expressed by their performances and distinguish between advantaged and disadvantaged students.

Figure 1. Association between differentiation index and percentage of downward disadvantaged deviant students. Source: Authors elaboration.

<sup>1</sup> The linear model was performed on the whole sample, and not dividing by country

Figure 2. Association between differentiation index and percentage of downward advantaged deviant students. Source: Authors elaboration.

Firstly, we can observe that relating the two portions of socially disadvantaged (see figure 1) and advantaged (see figure 2) students who perform below what is expected with the structural index shows that in more selective systems, students are more likely to perform below what is predicted by their social status, regardless of their social origin ( $p$  values < 0.05). Here we observe the upward disadvantaged and advantaged deviant students.

Figure 3. Association between differentiation index and percentage of upward advantaged deviant students. Source: Authors elaboration.

Figure 4. Association between differentiation index and percentage of upward disadvantaged deviant students. Source: Authors elaboration.

#### 4. CONCLUSIONS

Ten years after the initial analysis of Benadusi and Giancola (2014), it is evident that most systems, though not all, are moving toward greater comprehensiveness. Moreover, we have seen how policy choices are related to overall educational outcomes in terms of equity and proficiency. We observed in particular that selective systems tend to trade equity for proficiency, maintaining, compared to the other systems considered in the sample, higher levels of educational inequalities. The less selective systems create educational environments that appear to favor long-term returns as observed in the relation between the differentiation index and the percentage of adults attaining tertiary education. We think that this result is due to the more favorable conditions created by comprehensive systems. Moreover, the comprehensive systems seem to help students perform above what is expected based on their social background and protect them from underperforming relative to expectations. This seems to not occur in selective systems, which give the impression of being more addicted to suppress the opportunities to perform beyond what is predicted by status.

PCTOs (Pathways for Transversal Competencies and Orientation) are a strategic initiative in the Italian education system designed to foster the holistic development of upper secondary school students and support their educational and career choices. This PRIN 2022-funded project aims to analyze PCTOs' characteristics and evaluate their impact on personal resources, student dispersion, and orientation outcomes. The research is structured into three studies. The first examines the inclusion and objectives of PCTOs within the Three-Year Training Offer Plans (PTOF) of 200 schools, assessing adherence to ministerial standards through document analysis. The second involves five case studies in Lazio, Lombardy, and Emilia-Romagna, gathering data from institutions, teachers, and students to explore factors influencing PCTO planning and outcomes. The third study surveys first-year university students to assess the long-term impact of PCTOs on career decisions and well-being. The project will culminate in an open-access digital platform to help schools self-evaluate and enhance their PCTOs. By integrating theoretical, educational, and technological insights, the project seeks to inform educational policies, improve practices, and foster collaboration within the academic community.

## **1. INTRODUCTION**

The Italian education system is undergoing significant transformation to address challenges such as high dropout rates, territorial disparities, and the need for a workforce equipped with interdisciplinary and practical skills. In response, Pathways for Transversal Competencies and Orientation (PCTO) have emerged as a cornerstone of educational reform. These pathways aim to develop students' transversal competencies, preparing them for complex global challenges while fostering autonomy in their educational and career decisions.

Since their redefinition in the 2019 Budget Law, PCTOs have been mandatory in upper secondary education and integrated into the Three-Year Training Offer Plans (PTOF) of each institution. However, the implementation and effectiveness of PCTOs vary significantly across regions and schools, reflecting systemic disparities.

Moreover, while studies on PCTOs, especially those on larger samples, seem to privilege highlighting governance models, criticalities, and success factors (Giancola & Salmieri, 2021), surveys aimed at giving voice to students' experiences and detecting the effects of such pathways on their resources, levels of well-being, and, ultimately, on their educational and professional choices seem rare.

This paper investigates these dynamics through a research project funded by PRIN 2022, which explores the characteristics and impact of PCTOs in fostering personal resources, reducing student dispersion, and supporting informed decision-making in education and careers.

## **2. RESEARCH DESIGN AND METHODOLOGY**

The project, still ongoing, aims to provide a multi-dimensional analysis of PCTOs. It adopts a mixed-methods approach and it's structured into three interconnected studies, each addressing distinct but complementary aspects of these pathways.

### **2.1. Study 1: Document Analysis**

The first study investigates how PCTOs are conceptualized and implemented within the Three-Year Training Offer Plans (PTOF) of 200 schools, selected to represent diverse geographical and institutional contexts. Using thematic and lexicometric analyses (Bianquin et al., 2018; Bolasco, 2021), this phase examines the alignment of PCTOs with ministerial guidelines and identifies variations in their objectives, content, organization, and evaluation mechanisms.

### **2.2. Study 2: Multiple Case Studies**

The second study explores the lived experiences of PCTO stakeholders through five case studies conducted in Lazio, Lombardy, and Emilia-Romagna. Employing the Training Research methodology (Asquini, 2018), data collection spans multiple levels, including institutional practices, teacher perspectives, and student experiences. This comprehensive approach aims to identify both enabling and inhibiting factors in the design and implementation of PCTOs, while assessing their impact on students' educational trajectories and career choices.

A key objective of this study is to contextualize the role of PCTOs in cultivating personal resources and competencies, as well as in guiding students' decision-making at the conclusion of secondary education. Adopting a participatory framework, this study positions students as key informants, enabling them to provide valuable feedback on their PCTO experiences (Pastori, Pagani & Sarcinelli, 2020).

The insights gathered through student surveys and focus group interviews serve as a foundation for engaging teachers in each school in a collaborative Training Research process. This iterative dialogue between students and educators aims to refine PCTO practices, fostering an environment of shared responsibility and continuous improvement.

### **2.3. Study 3: Retrospective Survey**

The third phase consists of a retrospective survey targeting first-year university students to assess the long-term impact of PCTOs on career choices and individual well-being. This phase offers insights into the role of PCTOs during key transition periods, providing a broader understanding of their effectiveness in shaping students' educational and professional trajectories.

## **2.4. Digital Platform**

A key outcome of this research is the development of an open-access digital platform designed to support schools in self-evaluating and enhancing their PCTOs. This platform will provide tools for benchmarking practices, sharing best practices, and fostering a culture of continuous improvement. By addressing gaps in implementation and standardization, the platform aims to reduce disparities and ensure that all students benefit from high-quality educational pathways.

## **3. EXPECTED IMPACTS**

This project promises significant contributions across theoretical, pedagogical, and technological domains, leveraging an extensive dataset and comprehensive analyses derived from its diverse research methodologies. By offering a detailed examination of PCTO practices, it adopts an integrated approach that highlights the diversity of implementations and educational strategies across institutions.

The use of a “multi-level” methodology provides a nuanced understanding of the dynamics at play, directly engaging institutions, teachers, and students to evaluate the tangible effects of PCTOs on students’ life trajectories. The active involvement of students and teachers, a hallmark of the Training Research methodology, ensures a participatory process that facilitates in-depth data collection while identifying critical barriers and enablers in the design and implementation of PCTOs.

A key innovation lies in the project’s focus on the long-term impacts of PCTOs. The retrospective survey offers a unique longitudinal perspective on how these pathways influence students’ career decisions and life trajectories, generating insights rarely captured in existing research.

Furthermore, the development of an open-access digital platform marks a significant advance in applied outcomes. This platform not only disseminates the project’s findings but also provides schools with a practical tool for self-assessment and improvement. By fostering continuous evaluation and iterative enhancements, it supports the sustained development of effective and equitable educational practices.

In conclusion, this project bridges theoretical insights and practical applications, translating research findings into actionable tools that can inform educational policies and advance school practices. By doing so, it seeks to elevate the quality and equity of student learning experiences, ensuring that the

educational system effectively meets the needs of a diverse and evolving society.

# EVIDENCE, MYTHS AND TEACHING PRACTICES: THE CASE OF TEACHING READING IN ITALIAN SCHOOLS

Sergio Miranda<sup>a</sup>

Antonio Calvani<sup>b</sup>

Paola Damiani<sup>c</sup>

Lorena Montesano<sup>d</sup>

Luciana Ventriglia<sup>e</sup>

<sup>a</sup>University of Salerno; <sup>b</sup>Scientific Association SAPE; <sup>c</sup>University of Modena and Reggio Emilia; <sup>d</sup>University of Calabria; <sup>e</sup>Ministry of Education, Ministry of University and Research, MIUR

Academic studies reveal growing convergence and intersections across various fields (evidence-based pedagogy, cognitive research, learning design, brain science). Regarding brain science and learning, reading instruction has emerged as a crucial focus area. This study shares experimental findings, supported by neuroscientific evidence, highlighting the notable benefits for phonetically consistent languages like Italian when teaching reading through a systematic, explicit, phono-syllabic approach introduced gradually. The research concludes by strongly advocating adherence to this proven framework for reading instruction whilst warning against “innovative” teaching methods found in schools that prove less effective or potentially detrimental, contradicting these vital insights from educational research.

education; reading education; alphabetical and phono-syllabic methods

## INTRODUCTION

Educational research has experienced remarkable growth in recent decades, driven by evidence-based education (Hargreaves, 1996; Davies, 1999; Coe, 1999; Hattie, 2009; Education Endowment Foundation, 2021), which strives to determine “what works in which contexts” and compile research findings (best evidence synthesis, systematic reviews, meta-analysis). Notably, this evolution has enabled integration with previously separate research domains, including classroom teacher observations (Rosenshine, 2010), instructional design

(Gagné & Briggs, 1974; Merrill, 2002), and cognitive psychology (Chandler & Sweller, 1991; Clark, Nguyen, & Sweller, 2006).

Within cognitive sciences, cognitive neuroscience now plays an expanding role, enhanced by brain imaging technologies (Education Endowment Foundation, 2021). Neuroscientific research in education focuses on engaging teachers actively, converting evidence into practical teaching methods (Goswami, 2006; Geake, 2009; Sabitzer, 2010; Churches et al., 2020), whilst avoiding oversimplification and neuromyths (Geake, 2008; Howard-Jones, 2014; Kim & Sankey, 2017). Valuable insights emerge particularly in areas such as attention challenges (Posner, 2004; Amso & Sherif, 2015), literacy (Dehaene, 2009; Fisher, Bernstein, & Immordino-Yang, 2007; Goswami, 2012), numeracy (Dehaene, 1997; Singer, 2007; Izard, Dehaene-Lambertz, & Dehaene, 2008), and emotional aspects (Panksepp, 1998; Immordino-Yang & Damasio, 2007; Immordino-Yang, 2017).

In contemporary neuroscience, Stanislas Dehaene's work stands prominent, advocating for neuro-psycho-pedagogy, a unified and cumulative science where teacher autonomy remains preserved (Dehaene, 2009, p. 381). His research encompasses both learning principle identification and specific subjects like mathematics and reading instruction.

## **2. HOW TO TEACH READING**

According to the UNESCO Conference of 1951, reading methods are categorised into three distinct groups: a) synthetic methods; b) analytical methods; c) analytical-synthetic methods.

The synthetic and analytical methodologies rest on fundamentally opposing principles. Synthetic or alphabetical approaches maintain that spoken language and reading develop along separate paths: whilst oral communication is an innate ability, written language represents an artificial construct, a secondary system that must be acquired through deliberate cognitive effort. Conversely, global methods assert that acquiring speech and literacy skills are parallel processes within natural linguistic development.

This debate has gradually subsided over time; scholars now acknowledge that historical ideological biases influenced this discourse, particularly regarding the global method. By the 1990s, Liberman and Liberman (1990) had effectively demonstrated the global method's limitations. Extensive research, primarily in English-speaking regions, has established phonological awareness as the crucial skill in reading acquisition, though variations exist across different

orthographic systems (Kamirloff-Smith, 1986; Morais, 1989; Goswami, Gombert, & Barrera, 1998; Carretti & Zamperlin, 2010).

Neuroscientific advances, enhanced by brain imaging technology, have provided additional insights. Dehaene (2009) offered conclusive evidence, definitively resolving the methodological debate. “We must acknowledge certain conclusive findings. Current evidence confirms that global or ideo-visual methods are ineffective; children from all social backgrounds benefit from explicit, early instruction in letter-sound correspondence. Continuing to debate this point under the guise of experimentation or teaching freedom would be irresponsible” (Dehaene, 2009, p. 381). In this context, the Italian language offers significant advantages (Ziegler, Stone, & Jacobs, 1997).

### **3. THE RESEARCH DESIGN**

Despite compelling evidence suggesting the need to abandon global or ideo-visual methods, researchers determined that additional investigation was necessary to thoroughly assess the viability and advantages of implementing a systematic phono-syllabic approach. The Alphabet140 programme emerged from years of practical materials and experiences developed in Italy by Luciana Ventriglia (2016). Its design phase occurred in 2019-20, followed by testing in the subsequent year.

Educators are reminded to maintain a playful, enthusiastic and humorous approach throughout the programme. Teachers should demonstrate enthusiasm when pronouncing sounds, including challenging ones, using deliberate emphasis and exaggerated gestures. They engage students by intentionally making mistakes and encouraging corrections.

The study employed a quasi-experimental approach, featuring experimental and control groups arranged in clusters (school classes), though not randomly selected. The project involved seven universities (Aquila, Basilicata, Calabria, Roma Tre, Salerno, Torino, and Udine), with each institution nominating a school for potential collaboration. Participating schools were asked to designate minimum one experimental and one control class, excluding notably disparate classes. For control group (CG) selection, teaching methodology was assessed through textbook analysis, confirming no instances of systematic phono-syllabic approaches. The final participation included twenty-three schools across seven regions, comprising 30 classes with 467 children in the experimental group (EG), and 21 classes totalling 325 children in the CG. The study excluded students with documented intellectual disabilities, those with

significant language barriers due to non-Italian speaking backgrounds, and children who could already read. The experimental groups received the complete Alphabet140 programme resources.

### **3.1. Assessment**

The pre- and the post- tests were applied in October and May. At the beginning, two tests were used:

- Visual recognition of letters (Battery PRCR-2, Cornoldi, Miato, Molin, & Poli, 2009);
- Phonological awareness (Miranda & Montesano, 2021).

At the end, three tests were used:

- Recognition of non-words (Lexical Decision-DLC of Caldarola, Perini, & Cornoldi, 2012);
- Dictation of words with increasing phonological complexity (Stella & Apolito, 2004);
- Phonological awareness (Miranda & Montesano, 2021).

At the beginning, in October, teachers from both test and control groups completed an initial survey to gather classroom insights; in April, educators from the test group responded to a Final Survey evaluating methodology effectiveness and programme adaptability.

## **EXAMINATION OF THE FINDINGS**

Prior to assessing the potential impact of the educational intervention, it was crucial to confirm that both groups' pre-test scores were comparable. CG showed higher scores in both assessments, this variance lacked statistical significance ( $p > .05$ ). The standardised mean differences fall below 0.25 SD, meeting What Works Clearinghouse (2020)<sup>1</sup> criteria, thus indicating the groups were statistically equivalent (see Tab. 1).

---

<sup>1</sup> <https://ies.ed.gov/ncee/wwc/Docs/referenceresources/WWC-Standards-Handbook-v4-1-508.pdf>.

Tab. 1. Results obtained by the Experimental and Control Group at the pre-test.

	N		Experimental Group (EG)	Control Group (CG)	t	p	Standardized average differences
	EG	CG	M (DS)	M (DS)			
MeTaFono IN	394	244	11.24 (5.30)	11.97 (5.02)	-1,752	.080	0.14
Visual recognition of letters	407	287	9.98 (2.95)	10.05 (2.82)	-.304	.761	0.02

To evaluate the outcome at the end of the school year, the scores obtained by the EG and the CG in the exit tests were compared (see Tab. 2).

Tab. 2. Results obtained by the Experimental and Control Group at the post-test.

	N		Experimental Group (EG)	Control Group (CG)	t	p	Cohen's <i>d</i>
	EG	CG	M (DS)	M (DS)			
MeTaFono OUT	446	255	10.52 (2.11)	10.13 (2.25)	2.251	.025	0.18
Recognition of non-words	432	286	13.12 (5.53)	12.40 (5.19)	1,771	.077	0.13
Dictation of words	432	286	17.22 (4.16)	15.17 (5.57)	5.291	.000	0.43

EG performs significantly better than CG in the phonological awareness test (10.52 vs 10.13,  $p = .025$ ; ES  $d = 0.18$ ). Also, with regard to the recognition of non-words, a better performance is observed in the EG, even if not reaching statistical significance (Tot. correct score 13.12 vs 12.40,  $p = .077$  ES  $d = 0.13$ ). Significantly more consistent differences emerge between the two groups in the dictation writing test (17.22 vs 15.17,  $p = .000$ ; with an ES  $d = 0.43$ ). Applying the parameters provided by the Education Endowment Foundation (Higgins et al., 2016, p. 5) the first two values translated into time correspond to 2 months of advantage while the third value to 5 months.

At the end of the experiment, to obtain further information on how their experience was lived by teachers and by children, a questionnaire including a rating scales (1–5) and open questions was addressed and completed by experimental teachers. Teachers were asked to evaluate the programme as a whole, its methodological guidance, its sustainability and replicability, the level of motivation and its effectiveness exercised on the classroom and on children with special needs (Fig. 1) and, more specifically, the phono-syllabic method and its other main features: progressiveness, division in units, phonological modelling, assessment unit by unit. As can be seen, the teacher satisfaction is generally very high, mostly with average values > 4.5.

Fig. 1. Teachers' evaluation of the quality of the programme.

## CONCLUSIONS

This research has highlighted a crucial intersection between education and neuroscience, demonstrating significant pedagogical and societal implications whilst paving the way for an emerging interdisciplinary science of teaching and learning. Neuroscientific research, particularly Dehaene's investigations, has made a substantial contribution to the longstanding debate on reading instruction methodologies, definitively establishing the necessity for all children to receive alphabetical instruction.

This study provided additional experimental validation in Italian, a highly phonetically transparent language. The large-scale national experiment demonstrated that a progressive, structured and explicit phono-syllabic teaching methodology, implemented over approximately 140 hours across 7-8 months in primary education, yields considerable advantages in phonological awareness, word/non-word discrimination, and particularly in dictation exercises. The Experimental Group (EG) students achieved superior outcomes

with Effect Sizes ranging from 0.2 to 0.43, representing an advancement of between 2 to 5 months compared to their peers.

The programme received overwhelmingly positive feedback from participating teachers, with ratings consistently exceeding 4.5 (on a 1-5 scale) regarding the programme's effectiveness, pupil engagement, methodology and systematic approach. These results strongly support the sustainability and transferability of this teaching method. These findings align with both international evidence and other Italian studies employing syllabic-phonetic approaches (Padovani et al., 2018), as well as those incorporating phonological workshops into existing curricula throughout the academic year (Franceschi, Savelli, & Stella, 2011).

There exists no rational basis, beyond purely commercial interests, for supporting these creative teaching methods and associated materials. These approaches, lacking scientific foundation, continue to proliferate within educational settings, exerting a detrimental influence on classroom practices. This persistence of scientifically unsupported methodologies raises serious concerns about the quality and effectiveness of reading instruction in our schools.

# PROVING IMPACT IN COMPLEX PROGRAMS. CHALLENGES, OPPORTUNITIES AND CONSEQUENCES FOR PRACTICE USING THE EXAMPLE OF THE FEDERAL PROGRAM “LIVE DEMOCRACY!”

Alexander Stärck<sup>a</sup>

<sup>a</sup>German Youth Institute

## INTRODUCTION

In this article I will discuss the challenges and opportunities of evaluating the impact of complex programs. Which programs are these? Since 1992, the German government, especially the Federal Ministry for Family Affairs, Senior Citizens, Women and Youth (BMFSFJ), has funded measures to prevent right-wing extremism and promote democratic thinking. The programs are specifically designed to strengthen civil society. They were developed both as a lesson from the historical National Socialism and as a consequence of the resurgence of right-wing extremist attacks in the 1990s. The programs have names like “Diversity Does Good,” “Promoting Tolerance – Strengthening Competence,” or “Initiative to Strengthen Democracy.” The German Youth Institute has evaluated these programs since 2001.

## 1. THE EVALUATION OF “LIVE DEMOCRACY!”

Currently, the German Youth Institute is evaluating the second phase of the “Live Democracy!” program (2020-2024), which intends to promote democracy, foster diversity, and prevent extremism (BMFSFJ 2024). The program aims to:

- Raise awareness of democratic rights through education on principles like equality, the rule of law, human rights protection, and political participation.
- Develop solutions for living free of discrimination, recognizing and valuing diversity.
- Prevent anti-democratic and extremist attitudes, including right-wing, Islamist, and left-wing extremism.

The program operates at municipal, state, and national levels. “Partnerships for Democracy” enable local areas to develop their own strategies. “Federal State Democracy Centres” coordinate measures within each state, connecting stakeholders and providing counseling services. “Competence Centres and Networks” advance expertise and professional standards, while pilot projects develop innovative approaches for broader educational practice.

The “overall evaluation”<sup>1</sup> addresses questions spanning all program areas, considering the program’s multicentric and multi-level nature. Proving impact (understood as change and stabilization processes that can be attributed with a certain probability to specific measures) is challenging due to the complex political debate about evidence and effectiveness (Nehlsen et al. 2020). We use diverse methods, including quantitative and qualitative instruments, to assess the program’s effectiveness.

## **2. REGIONAL STUDIES**

### **2.1. Overview**

In the following, I will illustrate our approach and the challenges of impact assessment using a specific study we conducted. In our regional comparative studies (Author group 2023, König/Stärck/Zierold in press), we focused on two main questions:

- How does the program contribute to stimulating and strengthening civic engagement?
- What effects does the interaction of various program-funded actors on-site produce?

Quantitative surveys alone were insufficient, because the results were too abstract, so we conducted additional regional studies at the level of districts and municipalities. Regarding the investigation of collaboration, we paid particular attention to the interaction between civil society and state actors on-site. From our own evaluation practice and the scientific literature (e.g., Grande/Grande/Hahn 2021), we know that the relationship between state and (civil) society is not without tension.

What did we specifically do in the regional studies? In nine selected regions, we empirically demonstrated the effects of the practical implementation of the program “Live Democracy!” with regard to its three core goals (promoting democracy, fostering diversity, and preventing extremism). We conducted 62

---

<sup>1</sup> This is the area in which I work.

guideline-based individual and group interviews and evaluated them using content analysis, the documentary method, and incorporating quantitative data (see Flick 2013). Additionally, we carried out social network analyses in several of the regions examined. To capture outcomes “ex post” as effects in complex environments, we utilized “outcome harvesting” (Wilson-Grau 2018). “Outcome harvesting” helped identifying key mechanisms behind observed changes. I will illustrate this concretely by examining two regions from the study, which I will briefly contrast.

## **2.2 Portrait of Sophiacity**

Sophiacity is a large city with a heterogeneous social structure, where different social classes are unequally distributed across the districts. Almost half of the residents have a migration background, and the unemployment rate is around seven percent, which is above the state average. The strongest factions in the city council are the Green Party, the Socialdemocratic Party, and the Christian Democrats, while the right-wing populists AfD narrowly missed ten percent in the last local election.

In Sophiacity, diversity management is particularly central. Additionally, promoting democracy and preventing right-wing and Islamist extremism play important roles, with Islamophobia, racism, and anti-Semitism also being significant issues.

For many years, state and civil society actors have been using funding from federal programs. Since 2009, the city has benefited from model project funding, and local democracy work is supported by a “Local Action Plan” as well as the “Partnerships for Democracy” (PfD). A department in the city administration plays a central role. The “Sophiacity Declaration for Diversity” has been signed by over 350 institutions, clubs, and organizations. The city’s PfD and alliance coordinators act as supporters and intermediaries to the numerous civil society actors, promoting cooperation in the city by sharing information and resources.

An important form of cooperation in Sophiacity are so-called thematic partnerships. These partnerships bring together actors who have not previously cooperated, as the approval of funding is tied to the condition of establishing new cooperative relationships. This results in sustainable working alliances and innovative ideas. Some actors used the funding to develop concepts for follow-up projects, which are then proposed to other funders for support. Here, the federal program acts as a kind of “start-up financing,” with the previous funding serving as a “seal of approval.”

In the interviews, the participants described a network of actors with no single dominant figure. They emphasized that many actors are considered important, which is reflected in the way they conceptualized the network. The actors are organized in concentric circles, indicating a range of significance without placing any one actor at the center.

### **2.3. Portrait of Jennifertown**

I will now turn to the description of the second region. Jennifertown is also a large city with a heterogeneous social situation. Both the unemployment rate and the proportion of people receiving social security benefits are significantly above the national and state averages. Almost 40 percent of the population have a migration background. The dominant parties are the Socialdemocratic Party, the Christian Democrats, and the Green Party, while far-right parties have won a few seats in the parliament.

In the interviews, right-wing extremism is identified as the most pressing issue to be addressed. City actors from the administration and politics have taken up this issue after it was addressed by the voluntary civil society for years. Since 2007, there has been a municipal action plan to strengthen democracy and prevent right-wing extremism, and for more than ten years, there has also been funding from federal programs for the “Partnerships for Democracy” (PfD).

A municipal coordination office and a voluntary special representative of the mayor are responsible for implementing the action plan. But the cooperation between various civil society actors and municipal offices is characterized by parallel structures and inconsistencies. Volunteers criticize the dominant role of the administration and the strict guidelines for addressing the issues, which leads to frustration. Volunteers feel partly restricted and demotivated in their ability to act due to the administrative requirements.

The central role of administrative actors in addressing the issues is evident from the structure of the network in the Jennifertown region, with these actors occupying a prominent position. Additionally, the numerous civil society actors and networks active in Jennifertown are clearly highlighted.

### **2.4. Comparison**

What does the comparison of the regions show? Sophiacity and Jennifertown are both large cities with high unemployment rates, heterogeneous social structures, numerous civil society actors and a significant role in the federal program.

Sophiacity focuses on fostering diversity, while Jennifertown places more

emphasis on the prevention of right-wing extremism. The administration in Sophiacity acts supportively and mediating, promoting cooperation on an equal footing, leading to broader and more effective participation of civil society. In contrast, in Jennifertown, the administration dominates coordination, causing frustration and demotivation among volunteer actors.

In Sophiacity, there are no dominant actors. In Jennifertown, there is more tension among the actors, with the administration taking a more hierarchical role.

In summary, Sophiacity demonstrates how a supportive and mediating administration can promote civil society participation, while Jennifertown could benefit from a less hierarchical, more participatory approach to strengthen the motivation and capacity of civil society actors.

### **3. DISCUSSION**

Overall, our regional studies have shown that it is fundamentally possible to plausibilize the effects of the federal program “Live Democracy!” through case studies. Using Sophiacity as an example, we were able to trace how the program helps establish new cooperative relationships through targeted guidance via funding.

However, based on our study design, we could not make comprehensive statements about the specific effects of these new cooperation arrangements. Further investigations would be necessary to derive detailed impact pathways. Nevertheless, we received indications that the appreciation of work results by key actors in the city motivates the involved actors.

Regarding the activation of civil society, a central concern of “Live Democracy!”, we were able to reconstruct a specific impact pathway (thematic partnerships). A comparison of the regions showed that the nature of governance and action coordination between the executive and civil society is crucial for how strongly people engage voluntarily.

The examination of Jennifertown highlighted that the effects of the program are not one-dimensional. While the program funding contributes to addressing relevant issues, hierarchical governance can inhibit the activation of civil society. This interplay is moderated by the attitudes of the actors towards each other and their material resources.

Our studies show that extensive resources are needed to conduct impact-oriented analyses in a complex program like “Live Democracy!”. Despite the

effort, regional case studies are an adequate method to investigate and plausibilize effects.

Additionally, comprehensive quantitative studies comparing regions with and without federal program funding could verify the results from the case studies. Other investigations by us (online surveys and surveys of actors external to the program) have provided findings that support the results of the regional studies. In summary, comparative case studies at the municipal level not only reveal specific effects at the regional level and insights into corresponding causal relationships but also, in conjunction with other data, enable generalizations regarding the federal program as a whole.

### **Acknowledgements**

I would like to thank the other authors of the Regional Studies, especially Diana Zierold and Frank Köng. The study is funded by the Federal Ministry for Family Affairs, Senior Citizens, Women and Youth (BMFSFJ) as part of the federal program “Live Democracy!” The article does not represent the views of the BMFSFJ or the BAFzA.

# SYSTEMATIC REVIEW: QUALITY ASSURANCE MECHANISMS AND EVIDENCE-BASED APPROACHES IN GUIDANCE

Concetta Fonzo<sup>a</sup>

Enric Serradell López<sup>b</sup>

<sup>a</sup>Universitat Oberta de Catalunya; <sup>b</sup>Universitat Oberta de Catalunya

Starting from an in-depth analysis of the most widespread definitions of guidance – used in Europe and other geographical contexts – provided in different educational and training settings, an extensive body of research evidence was carried out that endeavours to demonstrate how to analyse and to report on the impact of guidance interventions and how to deal and to focus on evidence-base for guidance policies and systems developments (ELGPN, 2015). Based on the already explored domains of guidance, a literature review was carried out with the aim to get informed about new designs and developments of evidence and quality of career and guidance-related interventions. The work was situated within the devolved theories about quality assurance (Plant, 2004; 2012) and indicators (Hooley, 2014) for effective career guidance provision. The study focused primarily, though not exclusively, upon research findings from career and guidance-related interventions aimed at identifying, gathering and analysing quality assurance mechanisms and evaluation procedures of different guidance services. Accordingly, the paper will focus on the lessons learned from the research findings designed to inform and consolidate professionals' understanding and articulation of what constitutes effective guidance-related interventions, as well as identifying gaps in the evidence-base for measuring and assessing their impact.

guidance; evidence; quality; evaluation; lifelong learning.

## INTRODUCTION

The European Councils' Resolutions on Lifelong Guidance (2004; 2008) outlined key concepts such as "career guidance" and "career management skills," and emphasized the importance of "quality" and "quality assurance" in guidance services to ensure their efficiency. The 2008 Resolution specifically focused on "priority area 3: develop quality assurance in guidance provision,"

aiming to enhance the quality of career guidance services. It suggested improving career information and advice, tailoring services to individuals' needs, and creating tools to better match job supply and demand. The Resolution urged Member States to invest in high-quality guidance services, with a focus on enhancing the professional profiles of guidance practitioners through education and training, measuring the effectiveness of services, and establishing quality standards for guidance services that emphasize outcomes for beneficiaries and their methods.

In the last decades, despite some progresses were made in improving guidance services (Cedefop, 2011), further efforts are required. The development of high-quality guidance services is a shared goal among Member States. To achieve progress in this area, Member States should consider several actions, tailored to their specific contexts:

- improving the quality and objectivity of career information and advice, ensuring it aligns with users' expectations and the realities of the labour market;
- tailoring information, advice, and support to meet the needs of different users;
- developing tools for forecasting jobs and skills, leveraging both national and European resources, particularly those from Cedefop, ETF and other European institutions;
- relating information on training opportunities and labour market dynamics to local contexts;
- enhancing the professional profile and standards of guidance practitioners through initial education and continuous training, focusing on their competencies in providing information, counseling, and support to better meet citizens' and policymakers' needs;
- measuring the effectiveness of guidance services by gathering reliable data, which includes users' perceptions and the benefits they gain in the medium term.
- developing quality standards for guidance services that not only define the service offered but also focus on both the goals and results for the beneficiaries, as well as the methods and processes involved.

## **1. QUALITY ASSURANCE AND EVIDENCE IN CAREER GUIDANCE**

Literature highlights the growing emphasis on quality assurance in career

guidance over recent decades. Quality assurance in lifelong guidance has been recognized as a priority in numerous policy documents (EU Council, 2004; 2008), as investments in guidance systems and services contribute significantly to the development and progress of individuals, communities, and societies (ELGPN, 2015). Consequently, guidelines and standards for career guidance services serve as a foundation for their organization and improvement. To ensure the quality of these services, it is essential that they meet specific quality criteria or standards.

Regarding quality criteria, indicators and standards in career guidance, the ELGPN glossary (2015) provides the following definitions:

- quality criteria are “independent standards for measuring the quality of guidance provision or services” which means that “quality criteria are the indicators used to show that a guidance service or guidance activity meets quality standards”;
- quality indicators are “formally recognised figure(s) or ratio(s) used as yardsticks to judge and assess quality performance”. In other words, “quality indicators are statistical measures that give an indication of output quality. However, some quality indicators can also give an indication of process quality”;
- quality standards are “technical specifications which are measurable and have been drawn up by consensus and approved by an organisation with recognised and relevant expertise at regional, national or international levels. The purpose of quality standards is optimisation of input and/or output of guidance”. The standard(s) that an organisation sets for all of its key business operations and that help clarify what an organisation expects of its employees in delivering these operations or a client can expect when using the service”.

Quality standards in career guidance can be understood as a defined set of rules, processes, practices, and related methods for measuring quality. Unlike guidelines, which are simply recommendations allowing for more flexibility in implementation, quality standards are prescriptive in nature. In other words, while guidelines offer suggestions and flexibility in application, standards set clear requirements that must be met to ensure quality (Sultana, 2012; 2018).

## **2. MECHANISMS AND APPROACHES TO QUALITY AND EVIDENCE ACROSS EUROPE**

In Europe, national and international bodies—such as ministries, agencies, and

governments—have played a key role in shaping the development of standards and quality assurance mechanisms within career guidance policies, systems, and services (ELGPN, 2015a; 2015b; 2016). European research has also highlighted the importance of quality assurance for career guidance services (Cedefop, 2011; ELGPN, 2015).

The influence of New Public Management (NPM) ideology has led to the introduction of quality assurance frameworks across all public services, including career guidance (Sultana, 2012). This trend is tied to the “value for money” philosophy, which emphasizes monitoring and evaluating public spending on guidance services and other public sectors, such as education and employment (Borbély-Pecze & Watts, 2011). Quality assurance is thus essential for ensuring both service effectiveness and the responsible use of public funds (Hooley & Rice, 2018).

A review of lifelong guidance systems across Europe reveals significant variation, with notable differences between countries. However, there is a growing investment in quality assurance measures at the national, regional, and local levels. Career guidance providers across Europe implement various quality assurance mechanisms—such as accreditations, licenses, standards, and labels—often tailored to specific sectors, including education, training, and employment.

In compulsory education, career guidance is usually delivered by schools or guidance centers, with its quality evaluated within national education frameworks, often overseen by education inspectorates (e.g., Belgium-Flanders). Here, career guidance is assessed as part of a broader inspection process, with inspectors typically including not only education officials but also service users.

Public employment services in countries such as Austria, Germany, and Italy have developed national minimum standards for career guidance, which apply to both service providers and the professionals delivering the guidance (Bulgaria). These standards are based on clearly defined quality criteria and performance indicators, with the European competence framework often serving as a reference point for guidance professionals.

In addition to their formal education qualifications, career guidance professionals generally undergo further training to maintain high standards of service delivery (e.g., France). Practitioners, whether in public or private centers, are required to possess a wide range of multidisciplinary skills (Denmark, Italy, Malta), with continuous professional development being a

common requirement.

While not all European countries have an official professional profile for guidance practitioners, there is significant investment in ensuring a professional workforce in career guidance. In some countries, certification processes for guidance professionals are an important step toward establishing a formal professional identity (Greece).

European and national competence frameworks have been developed to guide both the initial and ongoing training of career guidance professionals. These frameworks ensure alignment with both career development and continuous professional growth. In some cases, certification processes also recognize competencies, even for those without formal qualifications (e.g., diplomas or degrees).

At the national level, quality standards for career guidance services and providers are typically established to assess both the services and the staff, guiding staff training (e.g., Finland, Italy, United Kingdom – England). In some cases, regional or local authorities set their own standards, though these are usually applicable only within their jurisdiction (e.g., Finland).

In addition to formal mechanisms, career guidance associations and networks—both transnational and national—play a crucial role in promoting quality assurance. These associations foster professional learning communities, encourage best practices, and support ethical standards. While not always legally required, these practices are widely adopted by guidance professionals in their daily work. In Ireland and Germany, national forums have been established to develop quality assurance frameworks, offering guidelines for maintaining high standards across the country.

A common feature across European career guidance providers is the adoption of self-assessment procedures (e.g., Bulgaria, Italy), which may or may not be part of an accreditation process. Self-assessment allows providers to evaluate their activities internally using their own procedures. This internal evaluation is often supplemented by external assessments by professional evaluators or inspectors, offering a more comprehensive approach to quality assurance.

To measure the effectiveness of services, many European countries regularly use user satisfaction surveys (e.g., Denmark, Estonia, Finland). These surveys gather feedback from a variety of users, including students in upper secondary education, vocational training, and adults outside of formal education or employment.

In conclusion, an analysis of European career guidance systems and the quality

assurance measures in place reveals diverse approaches and tools for ensuring service quality. Despite this diversity, national authorities and service providers must develop mechanisms to continuously monitor guidance needs, resources, and service quality. Evidence suggests that while numerous quality assurance tools are in use, few comprehensive systems exist that integrate administrative, practitioner, and user-centered approaches to ensure quality across all aspects of career guidance services.

Furthermore, the current state of knowledge indicates that the most prevalent approach in Europe for assuring quality in career guidance is the administrative-centered model. This model, often combined with a top-down approach, is especially common in countries where decentralization has led to differing standards of service delivery across regions. National policy frameworks—such as guidelines, standards, and targets—are used to ensure more consistent and equitable service provision.

Ultimately, the adoption of quality management frameworks and the professionalization of guidance practitioners are central to the evolution of career guidance services. This process has not only established formal standards and qualifications but has also empowered practitioners to develop a distinct occupational identity, which contributes to the overall quality and impact of career guidance services.

## **CONCLUSIONS**

Key findings, from systematic review and comparative desk research carried out by the authors, highlight the limited implementation of comprehensive quality assurance frameworks for career guidance. Despite some progress, few European countries have established robust systems for evaluating career guidance, with many services still in an early phase of development. The fragmented nature of career guidance provision makes it challenging to implement unified quality assurance policies, and quality measures are often more focused on education and related sectors rather than career guidance specifically.

A central issue identified is the lack of integrated and systematic monitoring of career guidance policies, systems, and services. While some frameworks exist, they are mostly theoretical and not widely applied. Furthermore, career guidance is often provided by diverse actors (e.g., education, training, employment sectors), which complicates the definition of universal quality indicators and evaluation models.

The study also points out that current quality assurance practices are often limited, fragmented, and lack a focus on continuous improvement. They typically address quality as an administrative task rather than as an ongoing process aimed at social change. The research suggests that quality assurance in career guidance should be more provider-centered and better integrated across sectors.

Additionally, the study stresses the need for harmonized national quality assurance frameworks, supported by centralized coordination mechanisms, to ensure consistency in monitoring and evaluating guidance services. This should include clear guidelines for data collection, analysis, and quality assessment. Finally, the study highlights the importance of adopting a multidimensional and human-centered approach to quality, which goes beyond quantitative measures to include qualitative analysis and focus on user-centered outcomes. In conclusion, there is a need for more comprehensive, coordinated, and effective quality assurance systems in career guidance across Europe. These systems should be institutionally supported, with clear principles and standardized data gathering and analysis procedures to ensure continuous improvement and effectiveness.

# SCHOOL COMMUNITIES AND EDUCATIONAL EVALUATION: REFLECTIONS, EXPERIENCES, PERSPECTIVES

Carla Gueli<sup>a</sup>

Cristiano Corsini<sup>a</sup>

<sup>a</sup>Università Roma Tre

The contribution aims to return the perspective of school communities – principals, teachers, students, families, and educational staff – in relation to the reflection made on the issues of instructional design and assessment from an educational perspective. In particular, it is intended to reflect on design and assessment practices that can support students' awareness of the pathways that involve them. This intentionality involves reflection on emerging needs within the school and perceived crises in the spaces of relationships between various actors, starting with social actors' perceptions of their own roles. How to construct useful in-itinere feedback to guide learning, that is, characterized by timeliness, clarity and participation, coherence and future orientation? How do we propose activities that do not fuel a climate of competition among students? We draw attention to emerging obstacles and difficulties, but also to innovative experiences in design, relational, instructional and evaluative choices, with reference also to self- and peer-assessment experiences.

formative assessment; teacher voice; school community.

## INTRODUCTION

The underlying theme of the research questions was that of different perceptions of the idea of evaluation among teachers in relation to their belonging to different evaluation cultures. This theme was accompanied by that of training, as a frequent topic of discussion that as conductors of training research we experienced was often that of the construction of tools deemed most effective for the sustainability of the process (such as observational grids, examples of Feedback, curriculum reviews, and so on).

The perceived crisis that prompted our research question, i.e., what were the main concerns of teachers and what was the perception of the meaning of evaluation, led us to hypothesize that research participants had a different conception of grading regardless of the change imposed by legislation and that this could further complicate training practice, in a framework in which the demand for training, as other research has also revealed, revealed a profound disorientation of teachers. Therefore, we want to highlight the impact that the research activity carried out so far in training has had on design, teaching and evaluation choices, including in the continuity between primary and secondary schools albeit in the different contexts of schools located in various areas of the Lazio region.

Our research questions were: What are the relationships between the functions attributed to assessment and the teaching strategies used by teachers?; What are the major obstacles to the structural use of formative assessment in elementary school?; What intervention strategies, from the perspective of initial teacher training, enable the development of methodological skills necessary for the employment of formative assessment as a teaching strategy?; What are the relationships between the functions attributed to assessment and the instructional strategies employed by teachers?

## **1. METHOD: DESIGN, PROCEDURE, PARTICIPANTS, INSTRUMENTS AND GATHERED DATA**

The research-training was carried out through the following steps:

- the administration of a questionnaire for teachers, aimed at conducting a survey of attitudes toward the reform;
- a training aimed at teachers on issues of formative assessment;
- the conduct of focus groups to explore perceptions of change and to deepen training.

Teachers participated in the planned activities on a voluntary basis.

For the purpose of organizing and guiding the focus groups, a semi-structured questionnaire was administered on teachers' views toward the shift from grades to judgments. The analysis of the results of the questionnaire (administered online to a non-probabilistic sample of 780 elementary school teachers) revealed that expressing a clear aversion to descriptive judgment (considered too complex to process and not very useful when compared to numerical grading) was a group of teachers who, prior to the normative change, did not

employ analytical and descriptive feedback during ongoing assessment. On the other hand, the group of teachers in favor of the new assessment is composed of teachers who already before the abandonment of numerical grading used descriptive feedback more frequently than the rest of the sample with respect to the activities carried out in itinere. In addition to revealing different positionings with respect to the effectiveness and sustainability of descriptive assessment, the questionnaire revealed difficulties in communicating with families and, almost unanimously, problems with the use of the electronic register (Corsini, 2022).

At the end of the training, teachers were invited to take part in focus groups lasting about an hour, aimed at: – identify emerging issues on the part of teachers in implementing the transition from grades to ratings;

- accompany reflection on assessment practices already implemented or in fase of planning, exploring aspects that are still less clear, both in relation to normative indications and the underlying pedagogical assumptions;
- support organizational, teaching and related choices in communication with pupils and families;
- to understand in a more articulate way what was found through the questionnaires, particularly on elements such as descriptive feedback in itinere and the use of the electronic register;
- understand what strategies teachers were putting in place to solve problems as they arose.

Training groups based on emerging problems among teachers on issues related to formative assessment were also conducted. These were the explicit goals that emerged from the research training:

1. explicit goals in terms of growth and development of teaching professionalism and documentation of results with analysis of spillovers in terms of change
2. creation of a group composed of researcher and teachers who, in the specificity of roles, choose objectives and methodological choices;
3. centering on the specifics of contexts through an analysis of the constraints and resources present;
4. continuous discussion on the documentation of results and processes;
5. focus on the effective spillover of outcomes in the school, from the perspective of learning and professional development. The intervention

is based on a sequential mixed method that involves, in the first-cycle institutions of the ARETE network: – the administration of a structured questionnaire on formative assessment (09/22); – the conduct of focus groups on a sample of participating teachers, with guiding questions constructed from the analyses of the results collected with the questionnaire (10/22).

## **2. ANALYSIS**

### **2.1. Questionnaire**

The analysis of the questionnaire responses revealed that the greatest resistance to change came from a group of teachers who believed more than the rest of the sample that the new assessment was less precise than the previous one, that it gave excessive space to assessment over teaching, made teaching cumbersome, and confused teachers, families, students, negatively affecting their learning and motivation to learn, and penalizing excellence.

Compared to the rest of the sample, this group of teachers rarely tended to provide analytical and descriptive feedback during in-progress assessments even before the ministerial ordinance.

During the focus groups, we frequently associated the same teachers with the categories “requests for clarification on the functioning of the dimensions present in the guidelines” and “expression of difficulties in formulating judgments,” and these aspects indeed guided the open training space at the end of each focus group in all the meetings.

Both in the questionnaire and in the category associations conducted on the transcripts of 15 out of 20 focus groups, the group of teachers who expressed the most support for the new assessment highlighted its positive effects on inclusive processes, learning, classroom climate, and communication with families. These teachers stated, both in the questionnaire and in the emerging category associations in the focus group, that they believe in the value of descriptive feedback, used instead of grades within the framework of using assessment as a means of regulating learning with an intentionally careful approach not to generate competitive dynamics. The idea of school that characterizes these teachers refers to cooperative, active, inclusive, and community pedagogical models.

### **2.2. Focus Group**

In total, 20 focus groups involving 219 teachers were conducted. Given the

formative slant of the focus groups, it was decided to distinguish-re two phases for each meeting.

After a brief presentation of the activity, in which the teachers were made aware of the aims and objectives of the meeting, we proceeded to request permission to record and to do an initial round of presentation, accompanied by free reflections on this track:

- From the analysis of your responses to the questionnaire, some aspects of particular complexity emerge from which we propose to start. What do you think of the shift from grades to judgments? Do you think it is useful? What kind of difficulties are you currently experiencing?

This first question was, in our opinion, useful to make a survey of the issues perceived as most “urgent” by teachers.

In the continuation of the reflection, we explored the areas highlighted below in italics through the following questions:

- One of the most complex aspects seems to be that related to the definition of “dimension” and the construction of levels. What is your opinion on this?
- What difficulties are you experiencing in using the electronic register as a tool for communication with families?
- Another aspect that seems to need attention is related to ongoing assessment. What is your experience in this regard?
- Planning, as a moment connected to the evaluative moment, has necessitated revision, either at the individual or team level. Can you recount your experience and any difficulties that arose?
- In the webinar accompanying the transition from grades to judgments, new practices for collecting documentation were proposed, for example, that of evidence collection and the use of a logbook. Did you find these proposals workable?
- In the collegial dimension, did you encounter difficulties in linking goals?

### **3. WHAT EMERGES FROM THE FOCUS GROUPS AND R-F TRAINING RESEARCH?**

- Operational difficulties due to the timing of the ordinance and lack of experimentation
- Electronic Registry
- Awareness of the need for training

- Clash of different cultures of assessment
- Difficulties in sharing evaluative vocabulary among teachers
- Need to open primary secondary spaces
- Need to expand training not so much of ordinance issues but on the deep sense of educational culture, otherwise risk of uncritical “transfer” from one model to another (analogy with L.517/77).

These categories of intervention introduced us to the issue of constructing levels as a “trace” of grades. Some teachers reported evaluating their students with levels by adapting each one to a numerical grade. The final training intervention addressed these concerns by redirecting them to propose working in the future on developing judgments expressed in understandable language. Significant differences between numerical and descriptive evaluations were explored with the teachers. In particular, regarding feedback, the possibility of finding an agreement among colleagues from the same institution on which references and criteria to consider during student feedback was suggested. It would also be appropriate to share these criteria with the student, making the feedback more precise and detailed, allowing the student to better understand the dimensions on which they are evaluated. Feedback should always include comments on what works and what doesn’t, paying particular attention to the mental process and strategies the student uses in solving a specific problem.

Gathering the points of reflection that emerged at the end of the focus groups, a primary point is the need to involve the rest of the staff, both teaching and non-teaching, in the formative practices. In the comprehensive schools, in recent months, even secondary school teachers have participated in reflections on the need to prioritize descriptive evaluation. Starting in early September 2023, around 40 secondary school teachers from the same network, also involved by school principals, participated in support training on educational evaluation, focused on workshop meetings and accompanied practices. This ongoing experience is interesting because it once again seems to anticipate the need to work on shared cultures and practices among teacher networks. It highlights the interest in descriptive evaluation at a time when the ministry politically proposes synthetic judgments. The use of descriptive evaluation represents the crucial point of this transition. The interest expressed in the focus groups by these teachers (to be detailed later) to continue the experience of self-training on descriptive evaluation, as a network of teachers from different schools, even in a self-managed way, contrasts with the tendency to use levels as if they were grades in itinere. This tendency was clearly revealed in the quantitative survey

(Corsini, 2022) and confirmed in the focus groups. It indicates a reluctance to conceive of evaluation as a teaching strategy centered on providing analytical descriptive feedback tied to performance. This inclination to dissolve feedback into grades (whether numerical or otherwise), replacing the knowledge generated by the evaluative process with an ordinal synthesis that places students within a hierarchical scale, represents the greatest obstacle to establishing a pedagogically grounded evaluation.

On the other hand, if it is true that changes without experimentation are blind and experimentation without changes is empty, the establishment of a scientifically defensible evaluation culture can only be achieved through the dialectical exchange between educational research and schools. This is the only way to test the ability of pedagogical knowledge to propose possible solutions to the problems emerging in educational practice.

# FORMATIVE ASSESSMENT PRACTICES TO “LEAVE NO STUDENT BEHIND”: AN EXPERIMENT TO ENHANCE TEXT COMPREHENSION ABILITIES IN THE LOWER SECONDARY SCHOOL

Elisa Guasconi<sup>a</sup>

<sup>a</sup>University of Bologna

The effects of using formative assessment (FA) in schools to sustain students' learning have been widely deepened in international literature. In Italy, recent school regulations encouraged teachers to use FA in classrooms, but little experimental research has been carried out to investigate the potential of FA for improving students' achievements. The paper describes an experiment to study the effects of FA practices on students' text comprehension abilities. The participants were 34 students from first-year classes of a middle school who were randomly assigned to the experimental (EG) and control group (CG). In the former, the experimenter developed 15 FA activities related to text comprehension, while in the latter, students joined the same number of teaching activities. The same test was used to measure students' abilities at the experiment's beginning and end, and the post-pretest difference between the two groups was calculated. Findings didn't show significant differences, but students from EG with more difficulties in the comprehension task at the beginning revealed a higher increase than those from the CG. Results of the focus group with students from EG add insights to value this result.

formative assessment practices; text comprehension skills; secondary school; experimental design

## INTRODUCTION

In Italy, being born in the southern part of the peninsula and/or living in a disadvantaged context strongly affects the opportunity to achieve academic success and, in doing so, to acquire essential skills. Data from OECD-PISA 2022 (OECD, 2023) have shown that such characteristics can influence students'

performance in math, science, and reading tests. These differences can also be exacerbated by the passage from primary to secondary school, as national data from INVALSI (2023) have revealed.

In the international debate, several factors have been investigated for their capacity to improve teaching quality and equity of instruction. One of the most highlighted is formative assessment (FA). In fact, not only have metanalyses revealed the positive effects of FA on students' achievements (Hattie, 2009), but several experimental studies have also emphasized its potential for improving students' skills, bringing interesting *evidence*<sup>1</sup> to the debate.

In Italy, FA has received great attention from experts in assessment studies since 1970 (Vertecchi, 1976). In addition, some of the most essential guidelines for schools encourage teachers to use FA practices in the classrooms. However, the lack of experimental research on how to create conditions to implement those practices in classrooms and on the effects of this implementation on student achievement represents a gap in the educational debate that can boost the confusion on what FA is and how to use it successfully to help each student's learning process.

Therefore, the paper outlines the assumptions and results of an experimental study aimed at exploring the effects of using FA practices in lower secondary schools to improve student's reading comprehension skills and reduce achievement gaps.

## **1. FORMATIVE ASSESSMENT AND STUDENTS' ACHIEVEMENTS: SOME INSIGHTS ON THE DEBATE**

Formative assessment could be defined as a process that occurs during the development of a didactic unit by which teachers gather evidence on students' learning to adjust teaching-learning activities. Its connection with the improvement of the students' learning goes back to the origins of the debate on the topic. After Bloom's theories on the Mastery Learning program, of which formative assessment and feedback were two essential components (Bloom, 1971), Black and Wiliam (1998a) developed a literature review and a metaanalysis of 250 studies focusing on the linkage between FA and learning gains, which included also research derived from Bloom's program. The two scholars claim that using FA could substantially increase students'

---

<sup>1</sup> We must be very careful when we use the term "evidence", since educational contexts are systems characterized by the interaction of different factors. Therefore, it seems unbearable to claim of having strong evidence of the impact of a method.

achievement by providing an *effect size* value between 0.4 and 0.7 (1998b). Later, Bennett (2011) criticized some of their methodological choices, and highlighted the lack of a “theory of action” of FA.

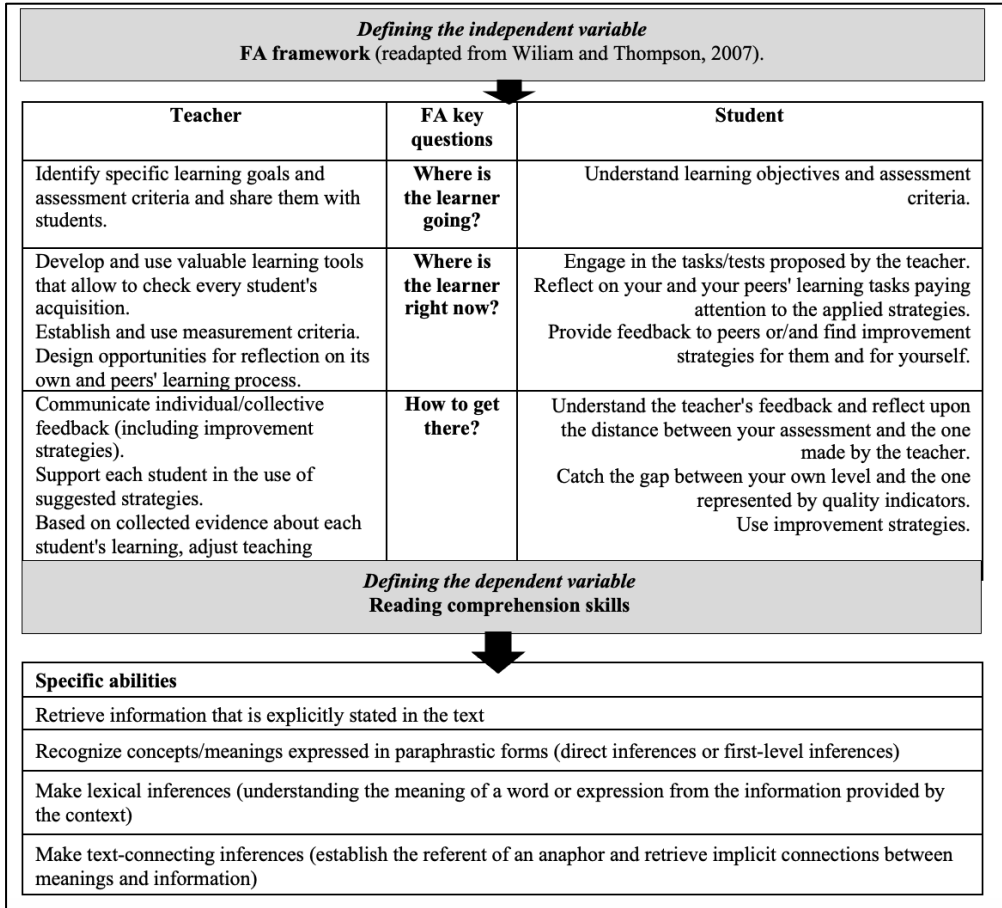

Since the beginning of the twentieth century, several empirical studies on the topic have been carried out all over the world. Among them, some were domain-specific, such as the ones related to math, literacy and arts (Lee et al., 2020) and others weren't related to a particular subject (Kingston & Nash, 2011). Although the findings showed a positive trend for FA practices' effectiveness in raising students' learning results, a large variability has been found. According to this situation, it seems reasonable to affirm that the international debate on FA effectiveness presents some open questions regarding the subject issue, the definition and framework of FA, and how the context could affect its implementation in the classrooms.

In Italy, the discourse on FA developed thanks to the contribution of authors such as Vertecchi (1976) and Calonghi (1983) and recently has been enriched by suggestions from scholars such as Vannini (2022) and Corsini (2023). Still, interesting empirical studies (Bevilacqua, 2023; Scierri, 2023) have also been carried out. However, there is a lack of data retrieved from experimental studies in secondary schools to sustain a profound reflection of schools and policymakers on the requirements to implement FA in classrooms successfully.

## **2. HYPOTHESIS AND DESIGN OF THE STUDY**

The overall hypothesis of the study claimed that FA practices could improve lower secondary school students' text comprehension skills (and reduce the gap between achievements), so an experimental design has been planned to explore this hypothesis. The construct of the independent variable (FA) has been developed (Fig. 1) adapting the one provided by Wiliam and Thompson (2007). Then, 80 indicators corresponding to FA strategies have been developed, and 15 FA activities on text comprehension have been planned. Likewise, the construct for defining what abilities comprise the skill of comprehending a text has been elaborated (Fig. 1). In this respect, the choice was to focus on the inference process, due to its crucial role in understanding a text that has been claimed in studies such as the one of Cain and Oakhill (1999).

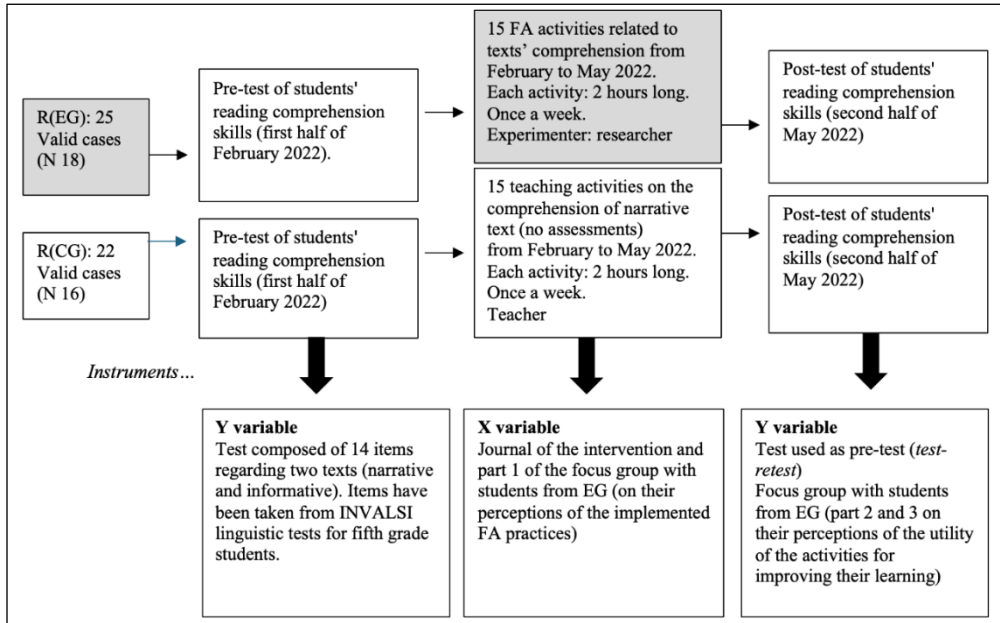

Fig. 1. The frameworks of FA practices and reading comprehension skills

### 2.1. The experimental design

Participants were 47 students from two first-year classes of a lower secondary school in the northern part of Italy (Emilia-Romagna). They were randomly assigned to the experimental or the control group, and the design followed the classical experimental path (see Fig. 2).

Fig. 2. Diagram of the experimental design

- Pre-test (T1): measurement of the students' texts' (narrative and informative) comprehension skills at the beginning of the study.
- Intervention: students belonging to the experimental group (EG) joined 15 FA activities related to the texts' comprehension carried out by the experimenter (the researcher) for four months, once a week (each activity lasts two hours), while students from the control group (CG) took part to the same number of teaching activities on texts' comprehension, without assessment moments.
- Post-test (T2): measurement of the students' texts' comprehension skills using the same test employed in the T1 phase, at the end of the intervention.
- Analysis of the difference between the groups: the difference between the two groups in the post-test – pre-test difference has been computed with a specific focus on students who had more difficulties at the beginning of the study.
- Three specific assumptions have been made, starting from the main hypothesis (Fig. 3). In this contribution, only the first two will be focused.

Fig. 3. The specific hypotheses of the research

<b>Statistical significance</b>	<p>H<sub>0</sub>: There are no significant differences between the post-test – pre-test <math>\Delta</math> values of the two groups.</p>	<p>H<sub>1</sub>: The difference between the post-test – pre-test <math>\Delta</math> values of the two groups is positive for EG students.</p>
	<p>H<sub>0</sub>: There are no significant differences between the post-test – pre-test <math>\Delta</math> values of students with the lowest scores in the pre-test of the two groups</p>	<p>H<sub>1</sub>: The difference between the post-test – pre-test <math>\Delta</math> values of students with the lowest scores in the pre-test of two groups is positive for EG students.</p>
<b>Practical significance</b>	<p>FA activities don't have a practical significance.</p>	<p>FA activities have a practical significance.</p>

The research has been approved by the Ethic Committee of the University of Bologna and data have been collected anonymously. Teachers and students knew the domain of the project (texts' comprehension), but they didn't know all the details of the intervention to avoid participants' reactivity.

## 2.2. The intervention

The intervention could be divided into three parts: the presentation of the entire set of FA activities, which were divided in "cycles", their development, and the conclusion. Every "cycle", or every set of FA activities related to a specific learning objective<sup>2</sup>, was composed of the following strategies.

1. *Sharing learning objectives and assessment criteria with students.* Examples of texts (often read aloud and supported by images and/or videos) accompanied by questions were used. The students were invited to answer and think of which ability was needed to find a response, in order to present the learning objective. Instead, the discussion on assessment criteria was implemented by using exemplars and rubrics.
2. *Eliciting evidence of each student's learning.* The FA tasks were mainly composed of multiple-choice questions related to narrative and informative texts. In addition, they also contained semi-structured questions to understand students' reasoning and use it to structure appropriate feedback. Texts have been selected from the literature and INVALSI tests of previous years.

<sup>2</sup> Totally five cycles were realized corresponding to the five abilities included in the text comprehension framework)

3. *Providing students with formative feedback.* The researcher used three symbols inside the feedback to represent the concepts of strengths (a star), weaknesses (a cloud), and improvement' strategies (a balloon) and provided it to students. During the individual feedback moments, the researcher read the comments with each student eliciting reflections and deepening the strategies student had used to tackle the task. Then, the researcher monitored the student's understanding of the feedback received. Otherwise, during the collective feedback, the errors' analysis was carried out, which was followed by a reflection on the improvement strategies.
4. *Using suggestions and strategies for improvement.* After giving the feedback, the researcher asked the students to answer again to the questions they had responded incorrectly using provided suggestions.

### **2.3. Instruments and analysis**

Two types of instruments have been employed for different purposes.

- Reading comprehension test (pre-test and post-test): for collecting data on the skills included in the framework of the dependent variable, a test has been developed using items and texts from INVALSI reading comprehension tasks of previous years<sup>3</sup>. The test was composed of 14 questions (most of them of multiple-choice type), and they referred to a narrative (9) and an informative text (5).
- Focus group (at the end of the intervention): a protocol for the focus group was developed to collect information on how EG students perceived FA practices.
- Journal: the researcher kept a research journal on the developed FA activities to document the intervention.

Data from the reading comprehension test were analysed using SPSS software. Since the number of students per group was lower than 20, the Mann-Whitney U non-parametric test was used to see if the post-pre-test difference between the groups was significantly affected by the participation in FA activities. The same procedure was followed considering only data from students who struggled more in the pre-test.

Students with mild or severe disabilities were excluded from quantitative data analysis.

---

<sup>3</sup> Items and texts from INVALSI test of the 2013–2014 year for fifth grade pupils.

### 3. RESULTS

Valid cases were 34: 18 students for the EG and 16 students for the CG. Descriptive analyses revealed that the average of both groups in the reading comprehension test increased between T1 and T2. Indeed, at the beginning of the study, EG students had an average score of 10,44 (maximum score: 14) and it rose to 11,72 points at the end of the intervention (+ 1,28). Students from the CG showed an average of 10,25 in T1 and 11,25 in T2 showing a growth of 1 point. However, standard deviation declined in the EG between T1 (3,03) and T2 (2,05) more than in the CG (T1 Sd: 2,27, T2 Sd: 1,84). These data suggest there are no large differences between the two groups increase from pre-test to post-test: indeed, not surprisingly, the Mann-Whitney U test has revealed that the difference between the two groups post-test – pre-test  $\Delta$  values was not significant (Mann-Whitney U: 127,5; p-value > 0,05). Nevertheless, students from EG showed an increased homogeneity of achieved scores compared to peers from CG. To deepen this last result, students were divided into three groups based on the score they achieved in the pre-test (lower, in line, and upper the group’s average). Data revealed that the highest growth in the post-test was the one of the students in the lowest score range in the pre-test. Then, the same operations were repeated with students of the CG to compare the gain of the students with more difficulties in the pre-test of the two groups.

Tab. 1. Each group’s divisions with improvement averages between T1 and T2

Groups	Groups’ division (based on the pre-test average of each group)	N	Improvement average (T2-T1)
EG	Students below the average	6	3
	Average students	5	0,8
	Students over the average	7	0,1
CG	Students below the average	6	1,8
	Average students	5	0,8
	Students over the average	5	0,2

Results show a larger increase of EG students with more difficulties in the pre-test (+3 points) compared to the same CG students (+1,83 points), although the Mann-Whitney U test confirmed that this difference was not statistically significant either.

#### 4. CONCLUSIONS

Findings indicated that differences between the two groups were very slight (on average, EG students increase by +0,28 points if compared to CG peers), and that was corroborated by the negative statistical significance test. These results could be easily explained by thinking of the limits of the research designs (low number of valid cases, FA was not embedded in a teaching unit, no structured control over the control condition...) and the fact that several students from EG at the beginning of the experiment already mastered texts' comprehension skills, as the analyses of the focus group confirmed. However, the study offers different suggestions. First, the variability between students' results decreased more in EG, and students who have taken advantage of this decline were the ones who struggled more in the pre-test. This result converges with what has been stated on the effectiveness of FA for sustaining the learning of students with more difficulties. Second, the study offers a "framework for action": in this study FA has declined in specific strategies and practices thought to be implemented in Italian schools, and it could offer a reference for building new experimental designs on the topic.

# FORMATIVE ASSESSMENT IN PRESCHOOL FOR INCLUSIVE EDUCATION

Iolanda Sara Iannotta<sup>a</sup>

Roberta Scarano<sup>a</sup>

Alessia Notti<sup>a</sup>

<sup>a</sup>Università degli Studi di Salerno

Teachers have to face many challenges in different instructional environments and composition of classes in preschool requires an inclusive design that considers the specificities of “each and every one”, as in Universal Design for Learning (UDL). Evaluation plays a key role, and students need to improve their self-assessment and reflection. To grow better capacity for self-regulation, learners need to learn how to control emotions and reactivity, seeing as how individuals differ considerably in their capability and propensity for metacognition (CAST, 2024). The evaluation process “activates the actions to do, regulates those done, promotes the critical assessment of those carried out” (MIUR, 2012, p. 19) accompanying the teaching/learning process from beginning to end. The reflections briefly described represent the framework of an empirical research started in a preschool situated in Campania. Through a design framework based on a narrative background represented by the story of Frida, children will have the opportunity to approach a theme of particular interest for the current historical period and, at the same time, reach the educational goals set in the design phase.

equity; quality; teaching/learning process; preschool; formative assessment

## INTRODUCTION

Teachers have to face many challenges in different instructional environments and composition of classes in preschool requires an inclusive design that considers the specificities of “each and every one”, as in Universal Design for Learning (UDL). UDL is a framework to improve and optimize teaching and learning for all people based on scientific insights into how humans learn (CAST, 2024). As known, the framework includes three principles, each of which

contains checkpoints that precisely drive learners' ability to access, build and internalize the information they are learning. Evaluation plays a key role, and students need to improve their *self-assessment* and *reflection*. To develop better capacity for self-regulation, learners need to learn how to control emotions and reactivity, seeing as how individuals differ considerably in their capability and propensity for metacognition (CAST, 2024). The evaluation process “activates the actions to do, regulates those done, promotes the critical assessment of those carried out” (MIUR, 2012, p. 19) accompanying the teaching/learning process from beginning to end. The evaluation promotes equity: this concept calls for an education for everyone, aimed at enhancing the differences, merits and potential of each student. Fair educational systems guarantee that “all young people are able to develop their talents and realize their full potential, regardless of their background” (Eurydice, 2021, p. 11). *Formative assessment* (Black et al., 2003; Earl, 2003) is a useful tool to identify the abilities of the individual, understand the differences and grasp the motivations of those who learn, to make the most appropriate educational choices based on the specificities of each (Iannotta, 2023). The reflections briefly described represent the framework of empirical research started in a preschool situated in Campania. The school is in a varied context, in which the upgrading of infrastructure by institutions, in recent years has allowed the school system to grow. The preschool welcomes children from different social backgrounds and teachers need to adopt, as usual, an inclusive design to meet the needs of each child. In addition, in relation to the need to be shared, at all school levels, the common values of the Member States of the European Union – including freedom, democracy, equality, respect for human rights, equality between women and men (Treaty on European Union, 2012) and on International Women's Day – the narrative background is represented by the story of Frida. Through this design framework, children will have the opportunity to approach a theme of particular interest for the current historical period and, at the same time, reach the educational goals set in the design phase.

## **1. FORMATIVE ASSESSMENT AND INCLUSION: A POSSIBLE COMBINATION**

Assessment for learning refers to a process of obtaining feedback *in itinere*. Feedback can be understood as information on the overall progress of the learning paths activated with the aim of providing information that allows an adaptation of teaching to individual differences (Allal, Cardinet & Perrenoud, 1979). In fact, the evaluation carried out during the implementation of the educational activity can lead to the elaboration of positive judgements,

problematic judgments, negative judgements. Based on this feedback, it is necessary to direct teachers' decisions towards a confirmation of the adopted working lines and/or towards the identification of specific interventions to improve the didactic proposal. The teacher can use formative assessment to find out what students know and can do, as well as identify, in-process, misconceptions or gaps that could negatively affect the success of the learning process.

Formative assessment works implicitly and explicitly to construct learning. It is also a tool for the learning of pupils and for promoting their potential, motivation, attitudes and abilities. The ability of teachers to evaluate themselves, to reflect on their own work, to question their choices, to change teaching strategies in line with the real needs of pupils. Assessment for learning, therefore, aims to improve both learning outcomes and processes (*regulatory assessment*). Drawing on Ausubel (1968) and Rogers (1973), Falcinelli describes how formative assessment manages to take over a multiplicity of elements concerning the learning process: cognitive, emotional and affective aspects, the way pupils relate to each other and to teachers. The formative evaluation has the task of observing these learning processes and following the psycho-pedagogical and didactic debate on the construct of competence. It is also responsible for observing, monitoring and evaluating the learning process as a process of competence development.

### **1.1. Evaluating to preserve equity**

Evaluating allows to assign value to facts, procedures and events, in relation to the purposes that those who evaluate intend to pursue (Tammaro, 2018). Evaluation, characterized as a process of complex nature, activates the actions to be undertaken, regulates those initiated, promotes critical balance over those carried out in time (MIUR, 2012). This makes it easy to understand how the assessment follows the whole teaching/learning process. It allows the improvement of educational processes and the promotion of a fair and quality education, central aspects of current national and international policies. The concept of equity gives a sense of learning for all and for each and is closely linked to evaluation as a process that describes, measures, judges 'transformations' towards an end considered 'good' or 'better' (Galliani, 2015). Promoting equity allows us to work for education for all and for each, aimed at the exploitation of differences, merit and potential of every student, from the very first years of formal education. Equity is diversification and requires teaching that considers the characteristics of each student, offering stimuli not

attributable to undifferentiated and standardized patterns. An approach with these characteristics allows the recognition and exploitation of each person's potential, while respecting individual learning times and styles to guarantee everyone the right to a quality education (Besozzi, 2009). The principles of personalization are therefore recalled, according to which each pupil will reach specific personal goals, valuing differences and ensuring that they do not change into inequalities (Bonazza, 2014). The school, therefore, adopts the idea of heterogeneity and, consequently, also the evaluation carries forward the principles of inclusion through the valorization of peculiarities, the ability and attitudes of individuals in that they are based on the idea that learning does not originate from a single form of intelligence. In fact, the subjects in training do not resort to a single cognitive style but to a multi-process one (Gardner, 1989; Bruner, 1988; Fodor, 1988).

### **1.2. Evaluating to preserve quality**

In our reflection on the formative value of evaluation, we should focus on the practices and tools used for surveys to define the concept of quality to be sought at the design stage (Notti, 2017). The concept of quality, which is neutral, must be adapted to the strategic and competitive objectives of education systems, in the light of standards negotiated in national and international contexts. Structural and organic interventions (such as regulatory ones) are necessary to achieve the objectives. Actions aimed at innovation of teaching techniques and teaching methodologies are also needed, aiming to define a school able to understand the expectations and needs of stakeholders. Real training opportunities are feasible through the flexibility and personalization of teaching-learning paths, using human and professional skills qualified and appropriate to the purpose. Building a school that guarantees the right and duty to education for all is a complex undertaking involving many dimensions of the institution. Reference is made to the study plan, the training offer, the approaches and teaching models which are able to provide answers suited to an increasingly diverse and demanding target group.

### **1.3. Evaluating to promote learning**

Evaluation plays an essential role in verifying the impact and repercussions of design on the educational and training reality of pupils, up to considering the extent to which learning is conditioned and/or modified by the choices made. Evaluation is a fundamental institutional task in the education system, which monitors, regulates and improves the educational proposal designed and

delivered. The task of school assessment does not end with the verification, measurement and evaluation of learning from students. These actions only reflect a small part of the evaluation interests which, however, extend to several levels (from the micro context of the individual classroom to the whole architecture of the education and training system, on a national and international scale). In the different ways of *assessment of learning*, *assessment for learning* and *assessment as learning*, the evaluation accompanies the entire teaching-learning process, returning relevant and meaningful information to the various stakeholders involved.

## **2. OBSERVATIONAL RESEARCH**

### **2.1. The context: kindergarten**

The pre-school, in our country, still lives from the low consideration with respect to the subsequent school orders, although it plays a role of extreme importance in the integral and harmonious development of the child. The kindergarten provides the basis for the effective promotion of logical-communicative skills and active citizenship, before the structured interventions of primary school. Recent studies in the field of neuroscience on cerebral plasticity and cognitive functioning, testify that significant experiences from early childhood leave indelible traces able to condition future action (Siegel, 2017). The phenomenon known as neuroplasticity is the property that allows the brain to modify its structure and functioning in response to mental activities and experiences (Doidge, 2015). In the educational field, providing learning stimuli to children in the 3-6 range can trigger changes in neural structure: neuroplasticity is the basis of learning and determines retention, representation and processing of new information. The nursery school is the first context of the child's effective integration into the education system. Although the objective is not to organize and teach early knowledge content but rather amplify the experiences of the little ones through the encounter with images and words, mediated by the teacher.

### **2.2. The case study**

In this contribution is presented the synthesis of an observational research carried out at the end of last winter in a kindergarten in the province of Avellino. The aim was to investigate whether and how evaluation with an eminently formative value was integrated into educational practices. This methodological option allowed to observe the teachers' behaviour, without changing the natural course of activities, with the intention of suggesting possible different strategies

if there were conditions and/or need. The context is that of a suburban school complex with a population of about 120 children, divided into 6 sections. Our reference section is a homogeneous 4-year section, predominantly male, in which there are 3 children with disabilities and/or difficulties. In addition to the two regular teachers, there are rotating teachers, two support teachers and the teacher engaged on empowerment. Teachers usually carry out training evaluation activities, aimed at monitoring the progress of the proposed educational and symbolic activities.

Teachers prefer a design for integrative background, which is often applied in the kindergarten (and/or educational contexts where there is the presence of children with special educational needs). The teaching action takes place in a context or “background” that can make learning meaningful for the individual. It is of fundamental importance the construction by the teacher of the conditions necessary to create the background: in most cases, it is represented by a particular environment, a narrative plot or context (Zanelli, 1986). The background promotes integration between affective and cognitive moment, motivating children to learn, and encourages the structuring of contexts that facilitate the progressive reorganization of the ‘conceptual frameworks’ of children. Indirectly, promoting different mediations facilitates the development of cooperative relational modes. In this case, the background is the “forest” and, in particular, the “wood of mimosa trees”, which lends itself to provide a framework for the stories of women and their rights. The whole month of February and the principles of March are dedicated to enriching narratives and each activity is followed by observations (structured through checklists), aimed at reinforcing positive behaviours and correcting those incorrect.

The teachers also produce a rich documentation of all activities carried out by and with children, accompanied by individual evaluation notes. The evaluation, assumed with an eminently formative function, has allowed the structuring and restructuring of the different activities foreseen in the background, bringing the sensitivity of children to a particularly important theme in the horizon of contemporary sense, or the recognition of gender rights.

## **CONCLUSION**

The challenges facing schools today are many: there is a need for cultural awareness of the theme of differences in school and society. The construction of inclusion, in fact, is not limited to students with disabilities or difficulties, but focuses on the ability of schools to accommodate a variety of exigence

(Demeris, Childs & Jordan, 2007).

It is therefore necessary to value each student and implement appropriate interventions so that individual differences do not turn into inequalities. In this perspective, evaluation, especially in its sense of formative assessment, is an effective tool in the hands of the teacher who, through continuous feedback, has the possibility of adapting and readapting its teaching activities on the go to better meet the needs actually identified in the classroom context.

# THE EFFECTIVENESS OF PCTO ON SCHOOL-TO-WORK TRANSITION IN ITALY: THE POINT OF VIEW OF EXTERNAL TUTORS

Alessandra Decataldo<sup>a</sup>

Sara Recchi<sup>a</sup>

Valentina Pacetti<sup>a</sup>

University of Milano-Bicocca

The article examines the effectiveness of the PCTO program in facilitating school-to-work transition in Italy, by focusing on empirical data from a longitudinal survey administered to tutors from the host organisations. The analysis highlights the encouraging number of collaborations following the realisation of PCTO, even though with significant regional disparities. Therefore, the article suggests some policy revision.

school-to-work transition; PCTO effectiveness; South-North divide

## INTRODUCTION

Our contribution addresses the effectiveness of the school to work alternance (SWA) policy on school-to work-transition (SWT) in Italy. The academic debate presents ambivalent findings regarding the impact of these work-based learning (WBL) experiences on SWT. While the “Percorsi per le Competenze Trasversali e l’Orientamento” (PCTO) programs offer valuable opportunities for many students, their effectiveness is tempered by regional disparities, the quality of placements, and the fragmented nature of Italy’s labour market, highlighting the need for structural reforms and more targeted interventions.

Considering the point of view of external tutors from the host organisations, this paper aims to analyse the effectiveness of PCTO by exploring post program collaborations. We adopted a mixed methods approach, combining semi-structured interviews (N. 27) with a longitudinal e-mail survey (2021-2022) to host organisation tutors, selected from a representative sample of 78 Italian

schools.

The empirical material we refer to comes from the survey. A first wave considered 367 projects involving third-year students and the second considered 776 projects realised by the same students during their fourth year of school. The survey involved 356 external tutors (130 in the first wave and 226 in the second one), coming from different host organisations: 65% from enterprise, 10% from university or other educational institutions and 25% from public authority or association. In terms of size, they were classified as micro (up to 9 employees, 42%), small (10 to 49 employees, 33%), medium (50 to 249 employees, 9%) and large organisations (more than 249 employees, 16%).

## **1. THE ROLE OF PCTOS IN THE SCHOOL-TO-WORK TRANSITION IN ITALY**

In Italy, young people are particularly vulnerable during the school-to-work transition phase and face significant obstacles when entering the labour market<sup>1</sup>. This vulnerability stems from structural features typical of the SWT regime in Southern European countries, characterised by a highly segmented and deregulated labour market (Bertolini et al., 2024), a welfare state with minimal investment in active labour market policies for young people (Pastore and Zimmermann, 2019; Cefalo and Kazepov, 2020), and a traditionally rigid and sequential educational system. Indeed, the Italian education system is historically sequential, thus WBL experiences are typically postponed until after high school (Pastore, 2015). This weakens the connection between education and the labour market, leading to prolonged transitions and skill mismatches (Pompei and Selezneva, 2017). In contrast, the European Continental SWT regime employs a dual system that integrates school-based learning with WBL (Eichhorst et al., 2015; Bonnal et al., 2002).

Law 53/2003 and Decree 77/2005 established the Italian SWA program, which became mandatory for all high school students. In 2019, SWA was replaced by PCTO, which significantly reduced the required hours of work-based learning experiences. This shift also marked a change in objectives. While SWA emphasized strengthening connections between schools and the labour market, PCTO focuses more on developing soft skills and providing orientation activities, in line with the recommendations of the (European Commission, 2018).

---

<sup>1</sup> This is reflected, for example, in the youth unemployment rate (18%, 7 points above the EU average), the number of NEETs in the country (19.8%, compared with 11.7% in the EU27) and the early school leaving rate, which is the third highest in the euro area at 11.5% (ISTAT, 2023).

The overall impact of SWA on the school-to-work and tertiary education transition remains debated. For lyceum students, these training experiences seem to have a positive influence on their career orientation, increasing the probability of continuing their studies (Bernardi et al., 2024). Different results are observed when looking at students enrolled in vocational and technical schools. These experiences play a crucial role in developing both soft and technical skills, thereby facilitating the transition to the labour market (Giubileo and Scarano, 2018; Giancola and Salmieri, 2021). Furthermore, these learning pathways have been noted for improving access to formal employment networks, particularly for students from disadvantaged backgrounds. However, some studies also highlight significant limitations (Teselli, 2018), as not all schools are adequately prepared to offer innovative educational experiences (Nicoli and Salatin, 2018). Moreover, despite their potential, SWA have shown uneven results across the country (Pinna and Pitzalis, 2024), with more limited success in southern Italy. The lack of robust industrial infrastructure in the south has resulted in fewer quality on the job experiences, which hinders the effectiveness of work-based learning (Unioncamere and ANPAL, 2019). Additionally, the prevalence of small, family-owned businesses involved in these initiatives, which are often unable to provide comprehensive training opportunities, exacerbates the challenges in these regions (Arlotti et al., 2016). This programme has been criticised for not fully addressing the mismatch between education and the labour market. In some cases, SWA is seen as a mere extension of schooling rather than a means of preparing students for real-world employment (Bertoni et al., 2021).

These ambivalent findings mainly focus on the earlier version of the program. Since the introduction of PCTO in 2019, there is still limited evidence regarding their effectiveness. This article aims to address this gap by analysing the impact of the PCTO on SWT.

## **2. ARE PCTOS EFFECTIVE?**

Although the objectives of PCTO include enhancing students' technical and transversal skills and guiding them in their future academic and career choices, we have decided to use post-PCTO work collaborations as the main indicator of the policy effectiveness. By focusing on further collaborations with the host organisation, we can better assess how effectively PCTO prepares students for the labour market, enabling them to secure internships, apprenticeships, or employment opportunities that are directly influenced by their participation in

the program.

The data presented in Table 1 highlight macro-regional differences in opportunities for continued collaboration between students and organisations across Italy. Overall, 39% of respondents affirmed successful collaborations, with the North-East reporting the highest rate at 49%, followed by the North-West (47%), Centre (38%), and South-Islands (24%). Interestingly, barriers to further collaboration vary by geographic area. In the South-Islands, a significant proportion (29%) attributed the lack of collaboration to a recent hiring freeze within host organisations, indicating potential regional economic disparities impacting recruitment. Conversely, a larger percentage in the Centre (36%) and South-Islands (31%) reported structural or procedural constraints. Furthermore, “lack of suitable individuals” as a reason was most cited in the North-East (20%) and North-West (16%), but this was less of a barrier compared to structural or economic constraints. This suggests that while some regions may have established procedures for integrating students into organisations, organisational readiness and regional hiring trends heavily influence collaboration continuity.

Table 1. Further working collaborations with students by geographic areas (%)

	North-West	North-East	Centre	South-Islands	Total
Yes	47	49	38	24	39
No, because we did not meet suitable people	16	20	10	16	16
No, because the host organisation has not recruited in the last period	16	16	16	29	20
No, because the process does not allow it	20	14	36	31	24

In order to provide substantiation for the aforementioned points, Table 2 presents the distribution of different types of host organisations (Enterprises, Universities, and Public authorities/associations) across the four geographical areas in Italy. The table indicates a decreasing presence of enterprises – the only ones able to offer post-PCTO collaborations – from the North-East (81%) and North-West (72%) down to the Centre (59%) and the South-Islands (48%). This

suggests a strong business concentration in northern Italy, with a notable decline in enterprise presence as we move southward, likely reflecting broader economic disparities across geographic areas. On the other side, Universities are less prominent in the North-East (1%) and North-West (7%), with higher representation as hosting structures in the Centre (15%) and South-Islands (17%). This distribution may suggest that educational institutions are more integral to central and southern macro-areas, potentially serving as hubs of development in areas with fewer enterprises. Lastly, the share of public authorities and associations progressively increases from the North-West (21%) and North-East (18%) to the Centre (26%) and reaches the highest proportion in the South-Islands (35%). This trend may indicate a stronger role of public and associative bodies in southern Italy, possibly as a response to lower enterprise density. Consistent with expectations, when considering the type of school, the percentage of host organisations that initiate further collaborations increases to 51% for vocational schools and 41% for technical schools. This suggests that PCTOs have a measurable positive impact on school-to-work transition.

Table 2. Type of host organisations by geographic area (%)

	North-West	North-East	Centre	South-Islands
Enterprises	72	81	59	48
Universities	7	1	15	17
Public authorities/associations	21	18	26	35

Small organisations report a significantly higher rate of collaborations following the implementation of PCTOs (56%) compared to micro (32%) and medium-large organisations (30%). The latter group asserts that the process does not allow for collaborations (53%). It is important to note that 75% of large organisations engage with students from lyceums, for whom the PCTOs focus on university orientation rather than recruitment. In contrast, nearly half of the micro-organisations (42%) collaborate with students from vocational schools, who are more likely to enter the labour market after graduation. However, 29% of micro-organisations do not pursue further collaborations with students, due to the lack of hiring in the recent period, thus highlighting the structural weaknesses of smaller enterprises in Italy, further exacerbated by the COVID-

19 pandemic. The weaknesses of the Italian industrial structure must once again be considered when assessing the effectiveness of policies. For micro-enterprises, the availability of financial and organisational resources is a critical concern. Additionally, some external tutors argue that the economic incentives provided to companies are inadequate in relation to the resources invested and the responsibilities undertaken to implement PCTOs.

### **3. DISCUSSION AND CONCLUSION**

The characteristics of the Italian labour market make PCTOs an instrument that is as necessary as it is fragile. Indeed, small and medium-sized enterprises (most of our sample and of the Italian production system), which have difficulty finding qualified young people, are the ones that would benefit most from effective work-based experiences. However, it is precisely these companies that often lack the financial and human capital needed to guarantee quality training pathways.

Our research reveals some partly unexpected results. Despite the limitations of the instrument, we can highlight its effectiveness, which is represented by a relatively high percentage of “further collaborations” between the host organisation and the students involved in PCTOs. Nevertheless, the data reflect notable regional differences in Italy’s economic structure, highlighting a north-south economic divide where the density of enterprise decreases, and the role of the public sector and academia increases from north to south. This uneven distribution of opportunities across the country reflects broader regional inequalities in the labour market, which remain a significant barrier to the success of these programs (Arlotti et al., 2016).

However, to ensure that positive experiences do not remain isolated, some important changes to the instrument would be needed. Firstly, it could be useful to introduce incentives for companies, especially small ones, to encourage their participation. Incentives could also support the creation of training courses for external tutors (81% of external tutors stated that they had not received any training on the educational value of PCTOs). Secondly, we believe it is important to promote greater synergy between the various actors involved, for example by strengthening cooperation at the planning stage and promoting a dialogue that enables host organisations to better understand the needs of pupils and schools to keep up with the emerging demands of the labour market. Finally, greater involvement of local associations and institutions could encourage the creation of partnerships and projects more directly linked to the characteristics

and potential of different territories, regions and cities, thus helping to overcome the north-south divide.

Overall, to effectively facilitate the school-to-work transition, PCTO policies must be situated within a framework of comprehensive structural reforms that address the traditional weaknesses of the Italian economic and educational systems. In the absence of such reforms, the efficacy of targeted initiatives remains limited, especially in southern Italy, where enduring regional disparities in infrastructure and labour market opportunities perpetuate structural inequities.

The aim of the Italian government policy Pathways for Transversal Skills and Orientation (PCTOs) is to enrich the educational process of upper-secondary school students. Participating in PCTOs can help students develop an awareness of their skills, especially in view of their future paths and educational and/or professional scenarios. Projects should foster co-planning, student self-orientation and take into account the needs of the schools' socio-economic fabric. For this study, the team designed an integrated multi-stakeholder matrix that compiles and intersects data from three surveys – aimed at students (4.045), project tutors (264) and headmasters (73) (2021/2022 school year) – and a content analysis as a study of the projects uploaded onto a platform by a sampling of Italian schools (251 projects from 78 schools).

Pathways for Transversal Skills and Orientation (PCTOs), Multilevel and multistakeholder model of analysis, Italian upper secondary schools, Reproduction of social inequalities

## INTRODUCTION

The 2019 Budget Law (art. 1, section 785, law 30 December 2018, n. 145) defines PCTOs as “a didactic methodology integrating classroom learning, whereby curricular knowledge and skills are passed on to students, creating

educational experiences that help them better understand how the work world operates. Students can also acquire transversal competences (soft skills), i.e. skills applicable in various settings that are in high demand from young people in the workplace”. PCTOs are part of the transition from upper-secondary to post-secondary education or the job market and may be defined as tools to bring out or consolidate student aspirations, interests, study orientation and professional vocation (Fasanella *et. al.*, 2024). PCTO projects are designed with three main dimensions: curriculum, experience and orientation.<sup>1</sup> Orientation activities help students identify their aptitudes and align their skills with job market demands or choose a post-secondary course of study. They also include educational and vocational orientation. One important way PCTOs provide vocational orientation is through collaboration with host institutions and organizations,<sup>2</sup> weaving a local network of schools and businesses so students can acquire hands-on skills directly from the workplace, ensuring a perfect match between skills required and skills offered.

Considering the new law implementation, this paper investigates the role of PCTOs as orientation tools. The research question can be defined as follows: What impact do PCTOs have on students’ educational careers? The following section will present the research design and additional details.

### **PCTO ANALYSIS: RESEARCH DESIGN NOTES**

Our results are based on empirical data from a Research Project of National Relevance entitled “*Evaluating the School-Work Alternance: a longitudinal study in Italian upper secondary schools*”, focusing on PCTOs and carried out from 2019 to 2024 by the National Institute for the Evaluation of the Education and Training System (INVALSI) and the University of Genoa, Milano-Bicocca and Sapienza University of Rome.

PCTOs are a measure introduced by the Italian Ministry of Education and Merit to provide youth with opportunities to identify/valorize their interests, aspirations, talents and socio-emotional resources. They are meant to enrich the school curriculum of third, fourth and fifth year upper-secondary-school students by stimulating learning and strengthening the key organizational-planning skills students need to transition into the job market or post-secondary

---

<sup>1</sup> These three dimensions are defined as strategies to avoid skill mismatch (Giannoni *et. al.*, 2024).

<sup>2</sup> Host structures are defined as businesses, associations, chambers of commerce, public and private entities, museums and other institutes operating in the area of cultural heritage and activities.

education.

This evaluative study has a complex mixed-method research design. In order to comprehend the measure's impact on students' educational career, a broad empirical base was built for the 2021-2022 academic year which the research team analyzed from a micro and macro perspective, performing a multilevel, multistakeholder analysis to account for the different methods of governance and policy implementation. The integrated data matrix includes archived and interconnected data from three surveys with questionnaires and a textual content analysis of the projects carried out in the schools sampled. The data in the dataset refer respectively to: 4,045 students, 264 project tutors, 73 headmasters, 251 projects (carried out by 78 participating schools, compared to the 100 originally sampled). This stratified proportional sampling uses a matrix of general information compiled for the 2018-2019 school year by the INVALSI Statistics Service from 4,161 institutes (excluding state-recognized private schools, prison and hospital school complexes, boarding schools, etc.). The 100 schools previously identified, like the 78 that actually participated in the study, reflect the national school population distribution on a smaller scale and were identified by combining the geographic variable, organized into five areas and school specialization, divided into lyceums, technical schools and vocational schools.

Therefore, the final, integrated, multilevel, multistakeholder matrix has four different units of analysis (students, tutors, headmasters, PCTOs) originally from four different matrixes. In order to integrate them, we had to relabel the cases in each matrix to avoid overlap and identify any variables that could link and perfectly align the data. To build the integrated matrix, we used three different linking variables: project (students-projects), tutor ID (students-tutors) and finally the institute's data processing code (students-headmasters).<sup>3</sup>

## **SCHOOL GOVERNANCE AND STUDENT SELF-ORIENTATION**

In addition to projects characterization, which is presented elsewhere for space reasons, the three tables below show the indices constructed relate to the section of PCTO policy on the importance of co-planning with students and self-orientation as some of the building blocks of good planning (PCTO Guidelines, p. 20). The variable 'contribution to school governance' reflects the various stakeholders' degree of involvement in the projects. Table 1 shows how

---

<sup>3</sup> Due to space limits, the full process of aligning and integrating the various matrixes will be explained in future works currently being prepared.

survey participants were asked to what degree different school stakeholders contributed to project development on a scale of 0 (no contribution) to 5 (maximum contribution). The mean values show the low involvement of the scientific committee, teaching staff and school committee compared to the high involvement of school tutors and headmasters. This data was used to build an index using two-step principal component analysis (PCA).

Tab. 1. Variables in the index: 'stakeholder involvement' in project development (N=4.045)

How much do these stakeholders contribute to project development	Headmasters	Teaching staff	Class committee	Scientific committee
Mean	3,22	2,33	2,91	1,92
Standard deviation	1,54	1,42	1,41	1,69
Interval	5	5	5	5

Then, we built two indexes: one of students who 'autonomously joined/participated in PCTOs', used in the models (see below); the other of students who were 'persuaded to join/participate in PCTOs'. The indexes reflect the degree of student agreement on a scale of 0 to 10 with specific items, theoretically attributable to the two concepts of theoretical interest given in table 2. Regarding students' autonomous participation, the mean values clearly show that many students choose self-proposed PCTOs. However, overall, with only a slight deviation, students base their choices on the advice of their school tutor.

Tab. 2 Variables in the index of students who 'autonomously joined/participated in PCTOs' and those who were 'persuaded to join/participate in PCTOs' (N=4.045).

Autonomously joined/participated in PCTOs					Persuaded to join/participate in PCTOs			
You participate in a PCTO because:	You know the host organization	You read comments on social media	You self-propose it	Follow your tutor's advice	Your school has offered the project for many years	You follow your classmate's advice	You follow your friends' advice	
Mean	5,70	4,16	6,33	6,67	6,21	5,23	5,30	
Standard deviation	2,51	2,69	2,82	2,13	2,35	2,44	2,53	
Interval	9	9	9	9	9	9	9	

## **PCTO PARTICIPATION AND SCHOOL EXPECTATIONS**

The foregoing demonstrates how PCTOs seem to play a crucial role in orienting students' post-secondary-school choices, a topic that has been the object of many theoretical (Giancola & Salmieri, 2024) and empirical (Parziale, 2016) studies, both in terms of whether students continue studying or not and what they study. In this case, PCTO activities should impact expectations as to whether students will continue to study post-diploma by directing and orienting their choices and supporting them on a cognitive, informational and motivation level (Giancola & Piromalli, 2024). Likewise, when it comes to academic performance and their inclinations and choices, a seemingly unchanging pattern (Giancola & Salmieri, 2022) indicates that there are strong elements of inertia linked to students' socio-economic background (Triventi, 2014) and the "chain reaction" connecting students' socio-economic background and their chosen upper-secondary-school study path. In order to estimate whether and to what extent PCTOs can curb the reproduction of educational inequalities, we opted to use a set of three logistic regression models where the result (the dichotomous dependent variable) is whether they continue studying post-diploma or not (at least as an overtly expressed prospect in this survey).

The first model only includes individual variables, plus one higher-level variable: geographic area. The higher level in model 2 is this geographic area, with one new grouping variable: educational path (an essential factor of stratification in the Italian and international education system with considerable impact on performance and inequality, (Benadusi & Giancola, 2014), followed by the individual variables. Finally, the third model again has geographic area as the high level variable, followed by educational path plus an intermediate level consisting in the PCTO project (which groups students into subgroups) and by the contribution of school governance, and finally, the individual variables. Therefore, the differences in the coefficients generated by adding project-level variables represent, albeit partially, the moderating effect of the projects.

Moving on to our analysis, we can see how, in terms of whether or not students go on to post-secondary school study, the first model shows the significant impact of family cultural capital and the substantial, yet contained, impact of social class. This forces us to carefully reflect on the production and reproduction of unequal opportunity, consolidates evidence already available and shows how the structure upon which educational expectations are socially built is essentially maintained over time (Argentin & Pavolini, 2020). One positive contribution comes from academic performance whereas one negative effect

derives from students having to repeat a school year on their educational path. Finally, as for geographic area, with 'central' Italy taken as the reference category, students from south Italy seem more likely to continue their studies, unlike students from regions in north Italy – perhaps because there are more job opportunities in these areas (Ballarino *et. al.*, 2014). As a final note, we would like to mention that the variables used in this model correctly predict that students are geared to continue their studies post-diploma (expressed as educational expectations in 67.2% of the cases).

In model 2 (predictive ability 74.7%) the highest level variable is geographic area, which still has a significant impact and far lower regressor power. Below this is educational path, which has considerable impact. In terms of the lyceum attended, vocational schools appear to very negatively impact whether students continue on to university. The same is true for technical schools, although to a lesser extent. The impact of social class is mostly absorbed by educational path. Family cultural capital still positively impacts students' likelihood of continuing their studies, along with academic performance, while educational path irregularity loses significance. Overall, adding educational path as the second-level variable lowers the weight of the individual variables without having any significant impact on the explanatory structure previously observed.

The third and last model includes the variables characterizing the PCTO the student surveyed took part in (Fasanella *et. al.*, 2024). One of the first variables is the digitalization level of the project participated in (Fasanella *et. al.*, 2021). Digitalization is especially relevant given the huge pre- and post-pandemic investments in it (Giancola *et. al.*, 2019; Parziale, 2023). Next, a set of variables is used that derive from the construction of a project typology (Fasanella *et. al.*, 2021), made up of four dummies (plus one reference category) that refer to this typology. It is important to note here as well that project type is associated as much with geographic area as with students' educational path. Then a variable was used relating to project governance that is a synthesis of the participation of all the school stakeholders in project development. All the project variables are second-level variables (hence, higher than the individual level). Finally, the last variable added (this time individual) is student autonomy in their project choice.

This model offers interesting insight into the impact of the type of PCTO students take part in. What we mainly see is the weakening of the explanatory power of many individual variables with respect to the dependent variable. In terms of social class, the dummy variable of belonging to the highest social class still has

a statistically significant impact compared to other modalities which, albeit to a lesser extent, are in any case an expression of the social reproduction process observed in previous models. The same may be said for cultural capital, the impact of which varies depending on whether family cultural capital is high or average to low. Instead, academic performance continues to have a marked (positive) power, while again educational path irregularity loses significance.

As for the type of PCTO students participated in, whether or not students chose autonomously has a positive effect on the likelihood of them continuing their studies. There are various ways of interpreting this. For example, one could say that choosing autonomously is a clear sign of motivation and self-direction in terms of students' school path with a ripple effect on their future prospects. In terms of the set of project content variables, we see both positive and negative effects. Legal-regulatory PCTOs and vocational PCTOs are associated with the choice not to continue studying, whereas artistic-social PCTOs (the most common project types in Italian lyceums) positively impact students' future study prospects. School governance of projects has no effect (coefficients Beta and Exp(B) are both almost zero, hence not significant). This does not mean that this variable is irrelevant to the implementation of PCTO policy (it may be hypothetically linked to organizational dynamics), but it certainly does not influence students' future choices.

Tab. 3 – Model 3

Model 3	B	S.E.	Sign.	Exp(B)
South	0,003	0,115	0,040	1,003
North (ref. cat. center)	-0,137	0,115	0,023	0,872
Vocational	-2,078	0,132	0,000	0,125
Technical (ref. cat. Lyceum)	-1,708	0,100	0,000	0,181
Advanced digital skills projects	0,124	0,116	0,033	1,198
Contribution of school governance	-0,042	0,046	0,365	0,959
Legal-regulatory projects	-0,376	0,104	0,000	0,687
Vocational projects	-0,162	0,138	0,024	0,851
Artistic-social projects	0,030	0,151	0,043	1,030
Simulation-managerial projects (ref. cat. critical-thinking projects)	-0,173	0,163	0,288	0,841
Autonomous joining/participation in PCTO	0,029	0,042	0,048	1,030

Middle- Upper-bourgeoisie	0,002	0,158	0,050	1,020
Middle class (ref. cat. working class)	-0,003	0,103	0,977	0,997
Autonomous lower-middle class (cat. ref. working class)	-0,050	0,130	0,700	0,951
High family cultural capital	0,127	0,112	0,026	1,135
Medium family cultural capital (cat. ref. low cultural capital)	-0,081	0,104	0,434	0,922
School performance	0,623	0,049	0,000	1,865
Being held back a year (cat. ref. regular path)	-0,184	0,124	0,136	0,832
Constant	1,553	0,130	0,000	4,726

A variable that does appear to have a positive and decidedly relevant impact is advanced digital content. These projects can be positively associated with the likelihood of post-diploma study. If we go up another level, educational path has the exact same effect as previous illustrated. So, again vocational and, to a lesser but still significant and relevant degree, technical schools have a decidedly negative effect on study continuation. Finally, the impact of geographic area is unvaried. The differences between southern and northern regions is slight, though the impact is greater for the north, even considering, as aforementioned, the area's production structure and the professional opportunities offered, which may represent an alternative to post-secondary-school study.

## CONCLUSION

Overall, the PCTO design clearly reflects the geographic organization of the Italian economy and, even more, the hierarchical-social differences between upper-secondary school paths. At same time, project diversification fails to compensate for the strong impact different educational paths have on student orientation, confirming that aptitude is mainly shaped by the family environment, and hence by parents' social condition. The data seem to show that the dimension of theoretical interest in PCTO policy is secondary to the considerable weight of the 'tracking' system (Azzolini & Vergolini, 2014; Panichella & Triventi, 2014), still the basis upon which social inequality is clearly built in students' choice of educational path (then of individual schools, Giancola & Salmieri, 2023), impacting academic outcomes, student motivation and future prospects. Hence, this policy, which comes into play once choices

are made and is connected, at least in terms of the projects offered, to the different geographic areas and types of schools, can only have a very marginal impact on changing students' educational destinies.

## **DUAL PATHWAYS WITHIN THE TECHNICAL PROFESSIONAL TRAINING SYSTEM: AN EFFECTIVE EDUCATIONAL POLICY.**

Andrea Carlini<sup>a</sup>

Francesca Penner<sup>a</sup>

Christian Poggi<sup>a</sup>

INAPP, Italy

The initiatives for reforming and strengthening of vocational pathways have been characterised by initiatives relating to apprenticeships, the pilot of the dual system, and the restructuring of vocational education pathways. These initiatives were allocated funding in accordance with the National Recovery and Resilience Plan. Substantial funding was allocated to the dual system initiative, as well as the process, still in the approval phase, of reforming technical education, which would see the establishment of the technical and vocational pathways. The dual model is consistent with policies aimed at facilitating the transition from the world of school to the world of work.

dual system, vocational training, work-based learning

The regulatory changes implemented in recent years, within the Italian education and training system, and more specifically those that apply to vocational training, have on the one hand increased the appeal of vocational pathways, thus resulting in an increased percentage of young people with skills and degrees that are more in line with the needs of businesses in the regions, and on the other hand, have had the effect of reducing both the occurrence of skill gaps and issues in relation to skill shortages.

To address the low levels of employment particularly within the 15-24 age group, some reforms of the education system were introduced in Italy at the start 2014. These reforms sought to build on the experiences of those countries, such as Germany, that have effectively reduced youth unemployment. A factor that was noted from a review of other countries' education systems was a "dual" approach within the education and school system, based on a focus on industry/work experience gained through apprenticeships. The dual system is

founded on a model of worked-based learning, where the theoretical knowledge and practical skills, acquired in traditional off-the-job training, is applied rigorously within real work settings.

Recently, the attention of institutional and regional stakeholders (regional administrators, entrepreneurs, young learners in the right to work) has focused on this learning model, since it has proven effective in developing industry and work relevant competencies young people and reducing the mismatch between skills acquired in vocational training programs and the skills required by the labour market. Consequently, this has facilitated the transition of young people from the world of school to the world of work, leading to a reduction in the time required by a student to make that transition. This model of vocational education and training, which has been an integral part of the Italian educational system for almost 20 years, has been most effective in enabling students to complete vocational education pathways, which lead to recognised qualifications, occupational outcomes, and greatly improved work-readiness.

The “dual” model was introduced in Italy in 2015, immediately following labour market reforms (Jobs act), and as result of the already mentioned reforms of the school system (L. 107/2015). With the agreement approved at the state-regions conference of 24/09/2015, the first phase of pilots was conducted and overseen by the Ministry of Labor and Social Policies. In this initial trial phase, 200 accredited training institutes (CFP), located throughout the country, were involved. Subsequently, the model was finalised by establishing stipulated protocols between the Ministry and the regional administrations. These protocols aimed to facilitate the implementation and startup of vocational training programs adapted to the specific needs of each region. The autonomous provinces of Trento and Bolzano, which have for some times have integrated the application of a rigorous school-to-work component with their vocational training programs, did not join the ministerial trials.

The two-year trial phase, and the subsequent implementation phase, which has been supported by ongoing funding since 2018, have made it possible to expand the target cohort for vocational pathways, leading to the acquisition of qualifications in dual mode, to include not only students pursuing vocational education and training pathways (in paths from the first to the fourth year), but also to include young people need by offering structured vocational education and training pathways, thus engaging with all vocational training pathways

(IeFP, IFTS and ITS<sup>4</sup>).

The model is founded on a collaboration between training institutions and businesses in the area, in order to enable school-aged young people complete their compulsory phase of secondary schooling by pursuing a vocational pathway education and training pathway and develop more of the skills necessary to facilitate the transition from the world of training to the labour market. Within the dual system, there are two different options in which this model can be implemented, with the possibility of both options being offered within the same pathway, but still with a minimum number of 400 hours per year, within a total number of hours of classroom training ranging from 990 and 1,200 per year (depending on the regions):

- simulated training enterprise;
- enhanced school-work based learning.

The dual system also makes it possible to attain a qualification, diploma or certification in higher education (IFTS) through a first-level apprenticeship (or training/dual apprenticeship). It is the preferred pathway for entering the labour market for young people, as it allows them, on the one hand, to obtain a qualification and, on the other hand, to gain first-hand industry experience as part of the work contract.

From sy 2016-17, the year when pilots of the dual system were launched, to sy 2021-22, the number of learners involved in vocational training courses overall<sup>5</sup> almost tripled, from 20,425 enrolments in sy 2016-17 to 56,263 in sy 2021-22. Further, enrolments have consolidated in the dual system, within IVET, exceeding the 50.000 student enrolment threshold. It may also be concluded that the prospect of the new funding provided through the National Recovery and Resilience Plan (PNRR) funds, may trigger additional increases in Regional Administrations' investment in the dual system.

The growth in participation rates in the four-year pathways of Vocational education and training (thus excluding IFTS, modular and neet youth pathways), recorded in the previous 5 years, is shown in fig. 3 below, which represents the growth trends from sy 2016-17, the year the pilots began, to sy 2021-22.

---

<sup>4</sup> Higher Technical Education (ITS), on the other hand, provides high-tech post-diploma pathways leading to a higher technical qualification. They are carried out in collaboration with companies, universities, research centres and local authorities to develop new skills in technological areas considered strategic for the country's economic development and competitiveness.

<sup>5</sup> Total means the number of participants from the entire vocational training system involved in the application of the dual system (IeFP, IFTS, NEET and modular pathways).

Initially, these pathways were implemented in 15 regions and the percentage of participants stood at 13.4 percent compared to those in the entire Vocational education and training system. In addition, those enrolled in the 4th year of the dual system accounted for 54.3 percent of total enrolments. Currently enrolments have grown significantly, with the number of learners spread over almost the entire country: dual system enrolments now account for almost 26 percent of all participants in the Vocational education and training system. Most significant is the increase in the 4th year training pathway for graduation, with participation rates reaching 82 percent of those enrolled in IVET.

Fig. 1. Progression of the number of enrolments in the dual system in Vocational education and training along 2016-17/2021-22. Source: Inapp.

The distribution by geographic areas sees the northwest accounting for more than half of the total enrolments; the gap with other geographic areas is still wide, with the islands and the northeast not exceeding 20 percent of the national total, while the central and the south regions are below 10 percent.

The low percentage of enrolments in the south is mainly due to the lack of pathway offerings in some regions; these regional disparities can be attributed to structural problems within the southern regions and relate mainly to a discontinuation of their training pathways, as well as to the different dynamism of their local enterprises. In fact, weakness in the labour market often correlate to less vocational training qualification pathways offered in these regions. The lack of commitment of regional administrations in the south-central regions will have to be addressed, where weakness in the local labour market impacts negatively on attracting investment, leading to a progressive slowdown in

economic development. First of all, to address these issues there will need to be the introduction of training pathways that are able to respond efficiently and effectively to the skills needs of businesses in the regions. With funding being available under the National Recovery and Resilience Plan (PNRR), combined with national funding on the dual system, presents a valuable opportunity to take the necessary action to implement change. It's important note the educational success rate, for students enrolled in dual system pathways. At the national level, 77.5 percent of students enrolled in the third year attain their qualification and 85.4 percent of students enrolled in the fourth year complete their course and graduate. In almost all the regions of the central-north the success rate is above 85 percent, while other regions experience lower success rates. Where there are lower success rates reported, it is often due to factors that are yet to be resolved, such as the time required to conduct final exams, and the end date of the exams.

Fig. 2. Educational outcomes of students enrolled in 3<sup>rd</sup> and 4<sup>th</sup> years (2021-22) of the dual system. Source: Inapp.

When analysing the ages of the learners, the percentage of 16-year-old graduates is still slightly lower than that of those who are at least 17 years old. Learners aged 14 and older, who finish the standard three-year pathway without interruptions, account for 47.9 percent of the total graduates, while those who graduate at age 17 or older represent 52.1 percent. The percentage share of 16-

year-old graduates is 60.5 percent, while 39.5 percent of older learners graduate.

With respect to vocational occupations, the qualified as a ‘health care worker’ represent the highest number of graduates, more than 28 percent of the graduates of the 3<sup>rd</sup> year program. This is followed by ‘food service worker’ and ‘motor vehicle repair worker’, which account for 14 percent and 11 percent of total graduates, respectively.

This year the most represented occupations among graduates are the hairstyling technician (14.3 percent of the total), followed by the beauty treatment technician (13.5 percent), while the kitchen technician drops to 11.2 percent.

This data have led the Ministry of Labour and Social Policy to allocate consolidated annual funding, enabling regions to continue current pathways programs, and facilitate continuing growth in the range of pathways programs offered, thus engaging an increasing number of learners. The total financial resources committed to the development of dual system pathways in Italy totalled 219,528,762 euros, more than 150 million of which were financed by the Ministry of Labour and Social Policies.

Fig. 3. Distribution of financial resources and source (%). Source: Inapp.

As part of the Next Generation EU (NGEU) development plan, adopted by the EU to support member states in planning the reforms and investments needed to overcome the social hardships and economic lags caused by the economic slowdown first, and the pandemic later, an unprecedented financial instrument has been put in place with the specific goal of “making European economies and societies more sustainable, resilient and better prepared for the challenges and opportunities of changes driven by addressing in the world’s environment and

advances in digital technologies.” Such is the National Recovery and Resilience Plan (PNRR), which through the Recovery and Resilience Facility (RRF), with a six-year duration (2021-2026), and the Recovery Assistance for Cohesion and the Territories of Europe (REACT-EU) Package, with a shorter duration (2021-2022), is a powerful financial policy tool to support the reforms needed to revitalize our economy.

Each member state was required to develop a national plan, through which they would establish the level of investment and the reforms required to achieve its objectives, thus ensuring the commitment of the required resources. The regulation governing the operation of the Recovery and Resilience Facility (RRF) stipulates that the elements contained in the Recovery Plans must aim to strengthen potential growth and economic, social and institutional resilience of the member state, contribute to the implementation of the European Pillar of Social Rights, and support initiatives aimed at addressing in the world’s environmental issues and managing transition because of advances in digital technologies.

In this context, one of the flagship initiatives promoted by the EU Commission is specifically targeted at raising the skill levels of the population (upskilling and reskilling), for which Italy has proposed the following:

- the Guarantee for Workers’ Employability (GOL) reform program, an initiative that is the lynchpin of policies directed at labour reform efforts
- the dual system investment (SD) program, which aims to promote the acquisition of new skills by young people, facilitating synergy between the education and training system and the demands and needs of the labour market, through the strengthening of school-work based learning pathway programs and the uptake of apprenticeships.

In conclusion, it is now clear that the training paths, aimed at qualifying young people who need to meet their compulsory education requirements, enable the achievement of two objectives. Firstly, that of equipping the learner with basic and transferable skills necessary for their participation in the social and political life of the community in which they live and, secondly, to qualify them through the development of technical-professional (and other) skills required by the labour market, to enhance their employability.

The dual system is an effective strategy that facilitates the transition to work, as it is being driven by the training needs of young people and the demand for professionals from businesses.

The dual system pathways programs, within IVET system, offered through accredited centres, have experienced strong growth, acknowledging that the innovation introduced with the 2016 pilot is designed not so much as a school-work based learning model, which was in fact already very common prior to the pilots beginning, but in an expansion of this model, both in terms of numbers of courses offered and volume of hours allocated per year. In addition, the resources earmarked for the dual system have made it possible to better structure courses and increase the number of fourth-year courses where students graduate with a vocational diploma, even in those regions where they were not previously available, improving completion rates for vocational education and training in Italy.

The dual system training model has experienced steady growth in the participation of students in vocational education and training, reaching 22 percent out of all students enrolled in the IVET system, and 34 percent out of all students enrolled at Vocational Training Centers. This data is of significant value in that it demonstrates, in real terms, the interest of young people and their families, in this type of training. This positive attitude is also reflected by increased interest from businesses, which see in the dual system an additional opportunity to raise awareness of their skills needs for improving productivity, ensuring that vocational outcomes for, and work readiness of, graduating students reflect these skills needs, and thus significantly reducing the time required for students to transition from school to work.

There, however, remain high risks of the efficacy in the uptake of the dual system in the different regions, both from the point of view of programs implemented and student participation, and from that of the quality of pathways and school-work based programs offered. While there will continue to be significant regional disparities, in recent years we are seeing the implementation of vocational pathways in southern regions, with participation rates in the coming years dependent of program continuity, required to demonstrate that they are indicative of a school-work based training system.

The hope is that the initiative envisaged in the National Recovery and Resilience Plan (PNRR) for the development of the dual system will be seized as an opportunity to tackle many of the critical issues that have so far limited its spread, promoting this system throughout the country, and focusing on raising the quality of learning in all areas of the country.

# SCUOLA DIFFUSA (WIDESPREAD SCHOOL) IN REGGIO EMILIA AND ITS EFFECT ON TEACHING METHODOLOGIES AND CLASSROOMS RELATIONS

Michele Campanini<sup>a</sup>

Chiara Bertolini<sup>b</sup>

Laura Landi<sup>b</sup>

<sup>a</sup>Officina Educativa, Comune di Reggio Emilia; <sup>b</sup>Università di Modena e Reggio Emilia

This ongoing research focuses on whether this exposure to informal and non-formal education changes teachers' teaching and assessment methodologies and improves the quality of relations within the classrooms. The analysis is based on data from focus groups and a survey, with primary and lower secondary school teachers. The survey investigates self-efficacy and agency. These teachers have confirmed experiencing lasting changes after WS. Preliminary results show that changes in teaching and assessment methodologies occur when teachers: share the design and responsibility of WS; could witness educators' actions and co-conduct the activities. WS has also a positive effect on classroom relations, both among students and with the teachers.

Education Outside the Classroom; community education pacts; teaching methodology; assessment; inclusion

## INTRODUCTION

UNESCO report (2021) suggests reforming education by promoting it as a common good, shared by society. The challenge is defining educational spaces with these characteristics and fostering positive societal engagement. In Reggio Emilia the schools, the Municipality and the city have been in dialogue for the past 75 years to share children's education responsibility. Their common action has revolved around reflecting on space, content and time, designing a 0-99 community educational project and creating contexts able to make childhood culture visible, to give value to differences and promote the right of children to experience cultural and institutional places. Within this framework operates OE,

educational Service of the Municipality. OE educational philosophy, inspired by Vygotsky and Dewey, is based on a specific image of the learner, i.e. a citizen, a subject with rights, with high potentialities for development and ready to build relationships and learn. Learners are social and active agents: students construct knowledge and meaning through active experience with the world around them, where environment, cultures, and community have a decisive role. Knowledge is interwoven with reality in a *complexus* (Morin, 1999), which implies interdisciplinary, multidimensional and ecological thinking (idem; Bateson, 1971). An ecosystemic approach to knowledge refers to interconnections among educational contexts and considers processes dynamically, acknowledging different ways of researching, learning, and communicating (Gardner, 1983; Gallese, Sinigaglia, 2011). The 6-14 educational system provided by OE a public project based on a strong alliance between adults (policy makers, school managers, teachers, educators, pedagogical coordinators) grounds the socio-educational ecosystemic. The “Pact for Education and Knowledge”, signed by the Municipality and the Comprehensive Institutes of Reggio Emilia, sets the political, educational and cultural framework to the collaboration. The Pact considers education as a common good allowing for participative processes that open schools to the territory (Paterlini, 2023).

During the pandemic the Municipality, the schools and the city joined forces and signed “Community education pacts” to guarantee every child the same access to education, by multiplying and spreading throughout the city the educational contexts (Campanini, 2024). Cultural and working spaces became learning environments for prolonged time (weeks, months, a year) to foster innovative learning experiences, participation and shared culture for students and their families (Cannella et al, 2023).

Through the years the whole city has become a suitable and appropriate place of learning. Key aspect is the co-designing process that involves OE educators, teachers and non-teacher educators from the hosting sites. This process has helped define curricular, cross-curricular and multi-disciplinary areas related to the places. Theaters, museums, exhibitions, ateliers, farms host week-long experiences of 100 classes with their teachers and OE educators each year.

The gains for students in these settings have been investigated. Whether this exposure to informal and non-formal education changes teachers’ teaching and assessment methodology has not been so widely researched. To explore the global potential gains and analyse the possibility of expanding this educational

proposal to the European context, Reggio Emilia Municipality and some of its partners were granted funding for a 3-year European ERASMUS+ project “Widespread School: innovating teaching approaches outside the classroom”. The partners worked on a common theoretical framework and understanding of EOtC, through field and desk research and developed a common definition of the experience.

Widespread Education (WE) is a pedagogical approach that engages primary and secondary schools developing curricular objectives in cooperation with other organizations and actors outside the school across time (minimum 5 days) on contextualized, real, and authentic problems that matters to students and communities by co-researching, co-designing and co-teaching, bridging formal, non-formal and informal agents and connecting learning experiences in and out of school (Esteban-Guitart et al., 2024)

This definition has guided our research on teachers’ professional growth and inspired the designing of tools for teachers and policymakers to implement WE experiences in other contexts.

## **1. RESEARCH DESIGN**

The gains of WE in terms of students’ engagement, participation and inclusion have emerged in previous studies, and so have teachers’ renewed understanding of active teaching methodologies and research-based learning (Mangione et al, 2021; Cannella et al, 2023; Bertolini et al, 2024; Landi, 2022).

This paper presents data from 2 focus groups, with primary and lower secondary school teachers, around the following research questions:

- What does change during WE experiences in terms of teaching and assessment methodology and relationships?
- How can these changes be maintained once the class is back in school?

Teachers’ background information was collected through a survey that investigates:

- professional satisfaction – 11 items on a 1-4 Likert scale (Talis, 2018);
- self-efficacy – 12 items on a 1-9 self-anchoring scale, 3 groups with 4 items for teaching strategies, 4 for class management and 4 for engagement (Tschannen-Moran et al, 2001);
- agency – 24 items on a 1-7 self-anchoring scale, 4 groups with 6 items for Iterational (professional and personal competences), Projective on self and on students (short/long term goals), Practical-evaluative (the

working environment with its potential and constraints) (Leijen et alii, 2024)

- teaching methodologies, through 4 open-ended questions, coded on 2 scales, i.e. on the horizontal axis from learning as transmitted to learning as constructed by learner and on the vertical axis from learning as individual endeavor to learning as socially construct (Landi et al, 2023).

Researchers conducted 2 focus groups in April-May 2024, one with 8 primary school teachers and the other with 4 lower secondary school teachers. The questions are presented in tab.1.

Tab. 1. Questions for the Focus Group

Let's get to know each other better. We ask you to introduce yourselves and go back in your memory to your experiences in WE to briefly tell how they unfolded.
What has changed in your teaching and assessment strategies since the experience of WE? What has fostered this change?
Have you noticed different relational dynamics developing during the week? What conditions were conducive to these developments? Could you describe the characteristics of these new relationships?
Has your relationship with the students changed during the experience of WE? In which ways?
In case you have noticed positive relational dynamics during WE week, under what conditions could they be maintained at school after the experience?
In your opinion, what aspects/dimensions of learning are most enhanced by WE?

The focus groups were transcribed and coded using a thematic analysis approach, both theory driven and grounded theory (Braun and Clarke, 2006). The thematic coding particularly referred to theory on teaching methodologies and assessment (Nigris et al., 2019; Gardner, 2012).

## 2. ANALYSIS

### 2.1. Survey

12 female teachers participated in the survey and focus groups. They are experienced teachers, with an average of 23 years on the job, and highly educated, 7 have a master degree. 83% have collaborated with Officina Educativa since 2010, all of them participated in the WE experience "Scuola Diffusa" at least once. They are generally satisfied with their job and do not

regret the decision to become a teacher (Talis, 2018).

Respondents feel their self-efficacy, especially on teaching strategies (combined mean of all 4 items= 31,3), while they feel more insecure on the ability to engage students (combined mean of all 4 items= 29,2). The personal history and professional development (iterational component, combined mean of all 6 items= 33,3) has the strongest influence on teachers' agency, while the short/long term professional development goals (Projective on self) have the lowest influence.

From the coding of the open-ended questions, it emerges that they see learning not as transmitted but as constructed by learners, as emerges from Fig. 1 plotting on the horizontal axis with all teachers' scores higher than 10. As for the other dimension, half of them see learning as a social construction and half as an individual construction.

Fig. 1 Teachers profile emerging from open-ended questions

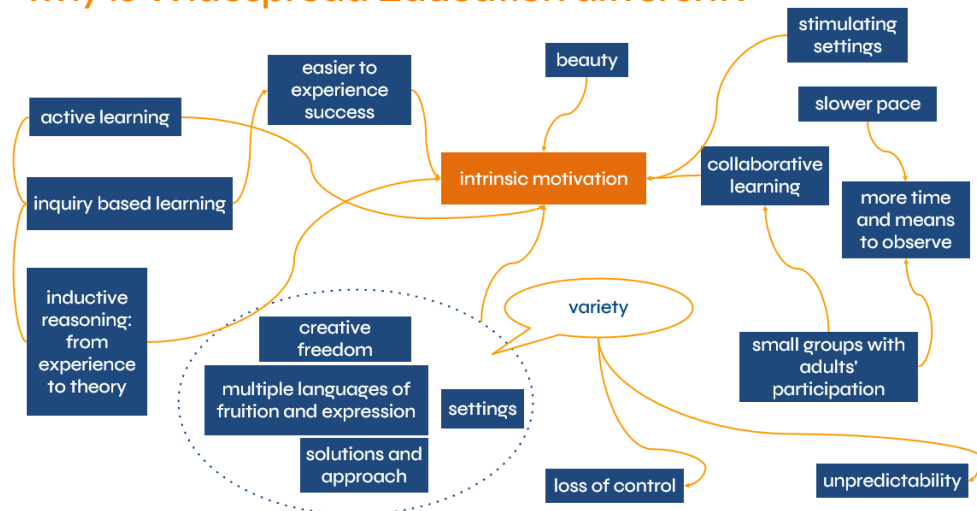

## 2.2. Focus Group

All teachers share a common, coherent vision of WE as summarized in Fig. 2. All elements recognized in a WE experience, i.e. active learning, creativity, aesthetic pleasure, collaborative setting, dynamism, concur in supporting intrinsic motivation. Intrinsic motivation seems to be the key element to create a positive, learning-intense, inclusive, productive learning environment. Motivation and active participation are supported by the lack of testing, in the words of a secondary school teacher "they know they are being observed but

with eyes that aim to valorize them”. This lack of traditional assessment causes a lack of fear and inhibition. Students feel spontaneous, free to ask and state when they do not understand. Teachers recognize that this is unusual in classroom settings.

Fig. 2. emerging codes from focus groups’ analysis

## why is Widespread Education different?

Their activity is spurred, as a primary school teacher said, by the students’ role as “creators of their own knowledge (...) (In the WE setting) they were completely free but more importantly they were really called upon to have their say”. Teachers reported a similar activation in class during group work. Moreover, students displayed fewer behavioral problems during WE, especially if they were given a role and tools to fulfill it autonomously. If the motivational hook is maintained once back in school, the same benefits continue. Teachers wondered: “how to make them feel responsible for their own learning (outside WS) in other settings and using different strategies”. Especially secondary school teachers considered that the enquiry/research-based learning experienced during WE cannot be the rule in the classroom, because it would not be effective in supporting formal learning. Therefore, their question is how to have the same level of motivation and activation during regular schoolwork.

Primary school teachers seem more willing to use active methodologies in their lessons, but they also express doubts on the full applicability of WE methodologies in the classroom, as one of them says: “given the time

constraints and the numbers [of students in the classroom] is not always possible to give them their freedom in seeking their own paths in knowing (...) to adjust and change group according to their interest”. Three aspects strike as transferable: the observational tools students experience during WE, working in groups and providing more time for students to display their growth and learning. Teachers admit that those are transferable also because students explicitly ask for them once they are back in class.

In WE setting students work in small groups “moving independently, discovering, relating to each other”, each student having a specific role and task. A secondary school teacher notices that these organizational strategies support relations and inclusions since each group works separately but to build a common class product with contributions of everyone; she says: “they still had to think beyond their group to also explain what they were doing to others and seek a consistency of meaning with other groups”. Regarding relations and inclusion, all teachers agree that the unusual setting requires new skills allowing academically weak students to display competencies other students do not have. Students’ perceived value changes in the eyes of teachers and classmates. This renewed confidence can only be maintained if there is methodological and organizational continuity between WE and school, otherwise teachers admit that you lose some of the gains.

## **CONCLUSION**

The teachers who participated in this study are experienced, in majority highly educated teachers, with a sense of instructional self-efficacy and an understanding of learning as constructed by learners and therefore coherent with WE. These teachers recognize WE as positive, energetic, inspiring, inclusive, highly motivational, effective learning experiences. Yet, bringing those teaching and assessment methodologies back to school is not easy, due to pressure to reach learning goals, pace of learning, differences in the environment. The more transferable aspects are group work and observational tools both for students and teachers. Sharing the design and responsibility of WE; witnessing educators’ actions, co-conducting the activities in WE and continuing in school the research started during WE are ways to support lasting changes in school setting. However, further research is needed to ensure gains’ transferability to the classrooms. In terms of classroom relations, the dynamic environment typical of WE settings cannot be duplicated in class. Yet, continuity in teaching methodologies and in students’ new roles acquired during WE, can

maintain the relational gains back in the classroom. Given the participating teachers' characteristics, strongly coherent with WE theory, there is a need to confirm the preliminary results with further research.

# INTERPROFESSIONAL EXPERIENCES TO OVERCOME SOME POTENTIAL INEQUALITIES IN LEARNING CONTEXT

Giuseppina Cannella<sup>a</sup>

<sup>a</sup>INDIRE, Italy

During the Covid-19 pandemic, the closure of schools and remote teaching as the only way to guarantee students schooling opportunities generated educational inequalities among students, and Italy reported an increased level of social exclusion (Save the Children, 2020). The research activity carried out by INDIRE on the forms of diffused and extended schooling (Mangione, Chipa, Cannella, 2022; Mangione, Cannella, Chipa, 2021) has made it possible to deepen those experiences that make use of third-party spaces to build a “community ecosystem” (Teneggi, 2020). During the pandemic the learning experience of lower secondary schools in Reggio Emilia as “extended school in third spaces” has been financially supported by the local administration and carried out to extend the classrooms out of the school walls to guarantee the continuity of the educational offer. It involved 11 comprehensive schools of the city and 19 spaces outside the school starting from the 2020-2021 school year. The model has been observed and monitored to be transferred and small and rural school context.

Community, Multiagency, Curriculum

## INTRODUCTION

The use of multi-agency partnerships, including research-practice partnerships, to facilitate the development, implementation and evaluation of educational interventions has expanded in recent years. Gaps remain in the understanding of influences on partnership working and the characteristics that lead to effective partnership.

The observations carried up in the “scuola diffusa” model identifies key partnership characteristics such as high levels of engagement, regular communication, clear role and responsibilities, formal moments of meeting from the side of the teachers and continuity. It highlights the importance of

implementing organisational structures and systems to support effective partnership working.

Some future challenges should be considered: the members of the interprofessional team recognize that formal daily moments of communication between teachers and experts would be necessary to share observations and findings, and adequate documentation tools to transfer the experiences made, but the lack of time did not always allow space for this type of activity. From a transferability perspective teachers and experts involved noted a lack of time that often did not allow for moments of reflection where sharing of the documentation produced by the students. Emerged the necessities to go beyond established roles to achieve the goal of learning and well-being of the students. The influences on partnership working and their effectiveness, the value of being involved in partnerships to different stakeholders, and how partnerships may influence the capacity to evaluate the effectiveness of educational proposals remain as open questions.

## 1. WHY INTERPROFESSIONAL COLLABORATION

It is generally accepted that schools, encouraged by policy, see ‘engagement’ as important, and think of it in relation to students, parents and communities, ‘engagement’ can be understood in many ways. As Ralls highlights (2017), engagement should not be *doing to* stakeholders who are characterised by deficits, but as *doing with* stakeholders as full partners in the educational process.

“Interprofessionalism represents a necessary condition to allow the school to rethink its educational offer spread throughout the territory”. This hypothesis rests on the role attributed to alliances between teachers and educators in the co-designing of an educational offer that is broad, involves the territory and provides for the use of the cultural spaces offered by the territory.

The research hypotheses set out are classified as ‘deduced hypotheses’ from the theories and international reports disseminated by the major organisations that map out the future of schools worldwide (OECD, 2020; UNESCO 2022).

What is the role of school-territory alliances in rethinking the school in a form extended to cultural spaces (museums, libraries, open-air theatres)? The research question accompanied the research activities carried out by Indire in the city of Reggio Emilia focusing on the learning experience of lower secondary schools in Reggio Emilia as “extended school in third spaces”. It has been financially supported by the local administration and carried out to extend the

classrooms out of the school walls to guarantee the continuity of the educational offer and as permanent laboratory classrooms during the pandemic time.

To explore the role of the experts, their effectiveness on the breath of curriculum, we explored the experiences and perceptions of stakeholders who were involved in partnerships to develop, implement and/or evaluate a local project defined as “Scuola Diffusa” (extended school) in Reggio Emilia.

The research activity was organised in two phases based on a service research approach. The first phase, focused on the analysis of institutional and narrative documentation (instrumental case study) to intercept the key dimensions for the research by linking them to the feature of the standard model. The second phase used an observational instrumental case study methodology, aimed at evaluating the introduction of a change and how this can foster an improvement in the educational field (transferability).

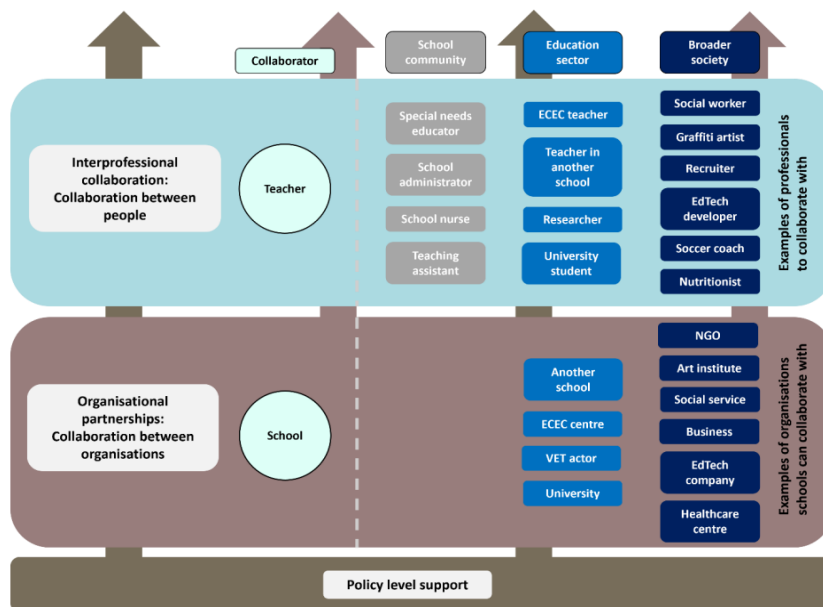

A reasoned sampling allowed the researchers to identify three contexts among Italian schools, housed in different types of decentralized classrooms – outdoors (farm holidays), in cultural spaces (civic museums) and in maker spaces (ateliers). These cases of extended school have been the object of indirect observation through a device of a narrative nature. The selected case is to be considered *typical* for investigating the characteristic features of an extended and participatory community school model.

The approach to the interprofessional collaboration comes from three different experiences that highlight the multifaceted aspects of the topic. Cheminais (2009) proposes multiagency working when educational organizations that relate to the idea of ‘community schools’ serving to the local area to give support to ‘at risk’ groups (Every Child Matters Act, 2003). This approach highlights the social *function* of the interprofessional collaboration. Edwards (2009) values the competence as the negotiated realisation of tasks and sees expert preventive practices as the negotiated realisation of the prevention of social exclusion. This requires seeing expert interprofessional work as a resourceful practice operating through the system within the *context*.

Finally, one of the OECD recent report (2022) focuses on the idea that cross-sector/interprofessional collaboration is one of many terms used in the literature, along with collaborative, new public, and integrated governance highlighting that a group of experts are engaged in “multi-actor collaboration, usually led by a public sector organisation (...) on a formal set of policies designed and implemented to generate public value.” (p. 9). OECD focuses the

activity on the role of the *governance* that led the process among the different stakeholders.

Fig. 1 typology of cross-sector collaboration

A distinction of the collaborative levels: i.e the different level at which the collaborative effort takes place: The policy level, Organisational level, or the interprofessional level. (OECD, 2022)

Collaborations can take two main shapes – 1) teachers and experts team up in an intertwined manner to support students, and 2) the other professional supports students and prepare them for learning by utilizing skills that teachers do not have (OECD, 2022, p. 9).

## 2. THE RESEARCH METHODOLOGIES AND THE FINDINGS

In 2020-2021 school years research activities involved 3 lower secondary schools learning in 3 cultural spaces: the local Civic Museum, a factory and an atelier Maker Spaces located in the Loris Malaguzzi Centre in Reggio Emilia.

In a second phase, the research assumed a more evaluative character of interprofessional collaboration using a set of tools already used in UK context (Cheminais, 2009) to monitor and evaluate any interprofessional collaboration in a school context. Using tools such as “the ladder of participation”, a “Diamond Ranking”, to evaluate the level of cohesion among the member of the

group, a “Force Field Analysis”, to help the mixed group of teacher and experts to reflect on their collaboration activities allowed the team to list weak and strong side of their interprofessional experience.

The use of the abovementioned tools was accompanied by qualitative tools such as interviews with teachers, experts and local administration, allowed the group to intercept the component of interprofessional collaboration and how trigger a transformative process that is still ongoing by involving all the school’s stakeholders.

A *Force Field Analysis* has been used to reflect on the collaboration activities between stakeholders and the strategies to foster effective interprofessional collaboration. A SWOT analysis helped the research team to investigate the weak and strong side of their collaboration about organisational (co-design/co-design) and professional strategies as unity, role of parents, student assessment. To investigate the participation and the effectiveness of the collaboration a *Participation ladder* and a *Diamond Ranking* have been used. The former had been adapted by Wilcox (2000) 5 levels –participation-ladder. The latter had been readapted by Cheminais (2008) to evaluate the level of internal cohesion using a ranking tool with items in order of priority, from most important to least important.

### **2.1. The finding. Case 1: the school in Museum**

For the inter-professional sub-dimension, the interviews with teachers and educators highlighted how among the central elements enabling the school’s openness to third spaces is the need for schools and agencies in the area to position themselves on the same educational vision and to accurately define the aims and objectives of educational pathways (Cheminais, 2009; Cannella and Mangione, 2023). The extended school experience in Reggio Emilia Civic Museums involved teachers and educators in a path of mutual professional growth. The co-design process took a fair amount of time for the mixed teams to get to know each other and create a shared relational climate (Cheminais, 2009). The evidences collected highlight that the group is at a high level on the scale of participation. Their collaboration has led them to a shared decision-making capacity:

it was an opportunity for professional development and experience through mutual exchange. (...) For us, the experience was much more planning (...) and we planned the week and then basically during the week at the museum they were the hosts, but we could intervene and we could ask the children if we wanted to go further (Teacher).

The choices made by the group using the various instruments to measure cohesion and participation allow us to deduce that the group worked without competition but with clear objectives.

## **2.2. The finding. Case 2**

The extended classroom on the farm was in a predominantly agricultural setting, with small workshop rooms and a garden overlooking vineyards and cultivated countryside. The group worked with an approach that let emerged a general level of participation with some peaks of increased collaboration and cohesion in consultative processes and mutual support as one of teacher affirmed:

the lack of common planning to overcome the extemporaneous condition and to make the work with the experts more stable and together with them better rethink the spaces (Educator).

These positions point to a working group that has begun to reflect on the value of interprofessional exchange based on cohesive relationships, but with still undefined workflows.

## **2.3 The finding. Case 3**

The extended school experience of the three classes of the Leonardo Da Vinci Comprehensive Institute took place where the learning spaces are called Ateliers and are lively multifunctional spaces because of the presence of materials to manipulate (natural, for writing, etc.) and digital tools for observation (e.g. digital microscope). The interprofessional collaboration process involved the collaboration of several professionals: two teachers (one from the humanities and one from the science area), a support teacher due to the presence of a child with certification, and the Educators and Pedagogists.

As for the participation and internal cohesion of the group, the ‘participation scale’ tool, scores the group in high position regarding the group’s decision-making capacity (Deciding together) and the degree of cohesion and effective participation to the interprofessional group’s objectives. The group pointed out the importance of documentation:

Documentation is essential because it allows this to be done, i.e. to keep in mind, to make visible even related issues that in the traditional school are done using the textbook (Teacher).

Although interprofessional practice is not very widespread in school-territory relations, it offers many opportunities to both the school and the territory. From

the cases it emerges that frequent communication, documentation, and systematic exchange of information may be elements that support effective collaborative processes, but they are still immature and not very systemic tools even if they are supported by the great collaboration between institutions that move with the same objective.

# RETI PROJECT: INNOVATIVE PROCESSES TOWARD EDUCATIONAL COMMUNITIES

Irene Culcasi<sup>a</sup>

Maura Benedetti<sup>a</sup>

Marcella Tellini<sup>b</sup>

Italo Fiorin<sup>a</sup>

<sup>a</sup>LUMSA University of Rome; <sup>b</sup>Social Services Office, Porto Torres Municipality.

In recent years, there has been increasing recognition of the need for a new social contract for education, emphasizing collaboration among social actors to foster collective action for the common good. This evolving educational ecosystem promotes the active participation of diverse social actors and a shared methodology aimed at creatively re-imagining education. This paper presents the R.E.T.I. Project – Educational Research for an Inclusive Territory, coordinated by the EIS Postgraduate School at LUMSA University, with support from Eniscuola. The project integrates Service-Learning, Photovoice, and creative methodologies to address youth marginalization and strengthen partnerships between schools, families, and community actors. This paper outlines the stages involved in building a new Community Educational Pact, where all social actors are co-responsible and interdependent, offering a potential pilot model for inclusive educational governance.

## INTRODUCTION: REBUILDING THE EDUCATIONAL VILLAGE

Educational poverty, as defined by Save the Children, refers to the deprivation of children and adolescents' opportunities to learn, grow, and develop their skills and aspirations (Morabito, 2022). Studies have shown a strong link between economic and educational poverty. In Italy, INVALSI (2021) reveals that students from low socio-economic backgrounds achieve significantly lower educational outcomes compared to their wealthier peers, which often leads to school failure and dropout. This highlights the need to tackle both types of poverty simultaneously. However, education remains an essential condition for

personal, social, and economic development.

Reflecting on the role of education raises questions about the school's mission. Schools must redefine their approach, moving beyond academic outcomes and disciplinary knowledge to focus on the holistic development of students, addressing cognitive, emotional, relational, social, ethical, and existential dimensions. As Delors (2021) suggests, schools should teach not only how to learn and act, but also how to live and live together with others.

Choosing to create an educational environment that fosters the holistic development of individuals has significant implications for its relationship with the wider social community. Education is a lifelong responsibility that cannot be shouldered by schools alone, but requires collaboration with multiple stakeholders. The African proverb "it takes a village to raise a child" highlights that schools are part of a broader community, and education is a shared duty. However, social fragmentation has weakened, and often created conflict, in the traditional unwritten educational pact that in the past ensured coherence of values among the various educational agents: family, schools, and social groups. The UNESCO Report *Reimagining Our Futures Together* (2021) calls for a renewed social contract based on care, reciprocity, and solidarity, emphasizing education as a public good. Rebuilding this educational pact requires transformation both within schools and within the wider community, adopting innovative approaches to create an intergenerational educational alliance that actively engages local social actors (Locatelli, 2023).

The R.E.T.I. Project (*Educational Research for an Inclusive Territory*) emerged from the desire to mend the social fabric of the local community in Porto Torres, weaving together the commitment and expertise of multiple stakeholders into a shared vision. Its aim is to rebuild the educational community or "village". This article outlines the developmental stages of the Project, which brought together the Postgraduate School EIS (Educating on Encounter and Solidarity) of the LUMSA University in Rome and the Municipality of Porto Torres. Through the direct involvement of schools and stakeholders, RETI initiated a model of intervention rooted in Community Educational Pacts, fostering a sense of shared educational responsibility to promote collective and locally anchored educational action.

## **1. PORTO TORRES CONTEXT**

Porto Torres is located in the northwest of Sardinia (Sassari) – with a population of 20.895 – serves as an example of the economic and social transformations

affecting former industrial areas. Once a significant hub of the chemical industry, the city experienced profound repercussions following the collapse of the industrial model developed in the 1960s. The resulting economic decline has left visible scars: high unemployment rates, significant emigration of the workforce, and progressive social fragmentation. These dynamics have had a particularly adverse impact on younger generations, who face an uncertain future characterized by diminishing educational and employment opportunities. At the regional level, Sardinia exhibits particularly concerning data regarding school dropout, with a rate of 18.8%. (Openpolis, 2019). Young people face a range of educational, economic, and social difficulties in a context where the lack of opportunities and support exacerbates their distress. The post-pandemic environment has further intensified the social and educational vulnerabilities in the region. Several studies, such as the VI HBSC Italy survey (Istituto Superiore di Sanità, 2022), highlight that 41% of Italian adolescents report a deterioration in their mental health and overall quality of life. This situation is also reflected in Porto Torres, where young people are confronted with increasing challenges that are reported to local social and healthcare services in the form of referrals. With the RETI project, the Municipality of Porto Torres has initiated a comprehensive revision of its educational and social policies. The project introduced a community-based approach to educational intervention, moving beyond the traditional individualistic paradigm. Through the Educational Pacts for Communities, tools promoted by the Ministry of Education in 2020, a collaborative network was established among local authorities, schools, associations, and third-sector organizations, aimed at fostering the existential and social well-being of the area. This new model, outlined below, is based on an approach of “proximity education”, where the local community plays an active role in educational governance.

## **2. R.E.T.I.: EDUCATIONAL RESEARCH FOR AN INCLUSIVE TERRITORY**

The RETI project in Porto Torres began in the 2020/2021 school year to address educational poverty and strengthen the alliance between schools and the community through Service-Learning (SL). This pedagogical approach combines experiential learning with community service, involving teachers, students, and the community in joint actions aimed at improving the local area. The decision to adopt SL stemmed from a process of listening and co-designing with local stakeholders, which led to the formulation of three key questions: how can we face educational poverty and promote youth participation in the community?; how can we enhance their well-being and empower them to

become transformative agents in school and life?; how can we build an educating community capable of sharing responsibility and expertise in the educational process?

## **2.1. RETI I**

In the first year of the project, 87 educators, including preschool and lower secondary school teachers, social workers, psychologists, and volunteers, participated in a training program on SL, which led to the launch of 8 local projects. Additionally, 50 middle school students took part in a three-day workshop on art, play, and critical thinking, facilitated by the Pontifical Foundation Scholas Occurrentes and specially trained volunteers. The students shared their visions, needs, and ideas for improving the community. The year concluded with a public event at the local theater, where students presented their proposals to local authorities and community members, alongside the projects already in progress, fostering collaboration and celebration.

The first year also helped reduce the gap between schools and institutions, initiating an empowerment process that transformed the local community into an educating community. This journey focused on recognizing the “educational competencies” of community members, positioning them as educators, and creating spaces for collaboration among schools, families, educational agencies, local authorities, and other stakeholders. Through SL, students, teachers, and the community worked together to impact key areas: 1) renewing teaching methods, 2) addressing needs within the school and community, 3) strengthening peer relationships and adult connections, and 4) expanding collaborations between schools and the local area (Culcasi et al., 2023).

## **2.2. RETI II**

In the second year of the project, the work of the steering committee was further strengthened. Since the early stages of RETI I, the committee has fostered dialogue among various community stakeholders, ensuring that educational and social challenges were addressed from multiple perspectives and areas of expertise. For the first time in the city’s history, the project brought together all local educational agencies on a shared platform, where they could exchange experiences and propose integrated solutions for the benefit of the community, particularly the youth. In RETI II, a workshop-based training on Photovoice was introduced. This participatory action-research methodology uses photography as a tool to capture and represent important social issues, sparking change and participation (Mastrilli & Santinello, 2016). The activity, combined with Service-

Learning, involved 20 teachers and culminated in a participatory exhibition. The exhibition focused on teachers' perspectives of school and aimed to open a dialogue with community actors in the post-pandemic era, emphasizing the importance of co-reflection, co-design, and active participation in shaping the educational experience (Russo et al., 2023).

### **2.3. RETI III**

The third year of the project highlighted a profound process of rethinking the role of the municipal social services, shifting from a model focused on individual case management to a shared and integrated vision of educational responsibilities, creating an intervention context where social services offices cooperate with community actors for youth “care and intervention” sharing educational responsibility. RETI III focused on the formal establishment of a group of local stakeholders – composed of sports, artistic and cultural associations, as well as individual citizens – whose goal was to operationalize the construction of a community educational pact. The EIS Postgraduate School supported the networking process by training and supervising the involved actors in co-design processes necessary for building the Community Educational Pact. The year concluded with a public event where the network, consisting of the Municipality, schools, and third-sector organizations, was presented to the community. This network, coordinated by the Municipality's social services, aimed to launch the Community Educational Pact.

### **2.4. RETI IV**

The fourth year of the RETI project, currently underway, began with the Municipality's publication of a Call for Interest to invite local entities to formally join the working group. The goal is to strengthen existing positive practices, processes, and individual, social, and territorial resources from a perspective of promotion and enhancement. Indeed, starting in 2020, and building on the work carried out within RETI I, II, and III, the Social Services of the Municipality of Porto Torres have adopted a new vision and mission through the SL approach and Community Psychology and action-research methods (Francescato & Tomai, 2023). This shift places a greater emphasis on fostering a sense of shared responsibility among community actors, aimed at initiating collaborative actions in both educational and social contexts. This new focus is opening up the opportunity to experiment with a community-based social intervention model, where welfare is community based, transforming it into a support system for inclusion. This community based intervention model has enabled

Social Services not only to respond to a broader demand for intervention in fragile conditions, but to promote personal resources and aspirations of young people, in a preventive perspective with the involvement of community network.

### **3. CONCLUSION: WITH THE EYES OF THE FUTURE**

An educational project is inherently concerned with the future and transformation. The beginning of every educational act is listening to the needs and expectations of individuals and communities. This listening process leads to a shared planning effort, where a community embarks on a journey of growth, navigating a path that is both defined and open, created through collective action.

The RETI project originated from a deep understanding of the needs of the Porto Torres community. This process of attentive listening guided all the key phases of the project's development. During a training session with middle school students (RETI I), they were asked about their vision for the city's future. Their responses revealed no hope for the future. Some even referred to Porto Torres as "Morto Torres", reflecting a sense of hopelessness. This disillusioned perspective was a key challenge for the project.

In his 2022 New Year's address, President Sergio Mattarella emphasized the importance of changing our perspective to "read the present with the eyes of tomorrow". He noted that young people are "the eyes of tomorrow" and raised questions about what they would ask of today and how they would envision their city, its spaces, and relationships. The challenge lies in measuring the gap between this imagined future and the current reality, and using this gap as an opportunity for human and urban regeneration. Listening to young people's perspectives must be followed by a responsible response.

The RETI project was developed as a responsible answer to a challenge posed by the future. It embraces the dream of transforming an initial situation that, like an alarm cry, mobilized a variety of stakeholders who gradually became part of the same collaborative network, sharing the responsibility of an educational pact, an alliance.

The project focuses on imagining the kind of future we want for the young people who will inhabit it, and taking action toward that vision. Key questions include: What should be different about Porto Torres? How should relationships between people evolve? How can the community become open and welcoming? What kind of spaces for learning, living, and leisure do we want?

Looking at the present from the perspective of the future, the RETI project aims

to transform the dystopian vision of “Morto Torres” into the utopian vision of the dreamed Porto Torres.

*Eutopie*, that is, places, historical experiences, and collective, associative endeavors, characterized by what is implied in the prefix *eu-*, meaning “good”. These are spaces of sharing and conviviality, participation and solidarity, where stories and narratives are exchanged, giving meaning to the present and opening up to the future. They not only enrich the present of individuals and their relationships with meaning, but also point to the direction of the journey, the goal toward which to orient oneself (Manicardi, 2024, p. 17).

This is the journey undertaken by the RETI project, moving toward an horizon driven by dreams and utopias.

# FOR A SUSTAINABLE IDEA OF SCUOLA DIFFUSA (WIDESPREAD SCHOOL): MEANINGS, PRACTICES AND CHARACTERISTICS

Paola Damiani<sup>a</sup>

Moises Esteban Guitart<sup>b</sup>

Edgar Iglesias Vida<sup>b</sup>

Laura Landi<sup>a</sup>

<sup>a</sup>Università di Modena e Reggio Emilia, Italy; <sup>b</sup>Universidad de Girona, Spain

This paper intends to illustrate the actions that led to the definition of a sustainable (valid, actualized, shared and feasible) idea of Widespread Education, founding concept of the three-year European ERASMUS+ project “Widespread School: innovating teaching approaches outside the classroom”. The project Widespread School, inspired by the Reggio Emilia “Scuola Diffusa” experience, aims at strengthening the alliance between school and territory and experiment an approach to education based on the idea of Education Outside the Classroom (EOtC). Evidence shows that EOtC, roughly defined as conducting curricular activities out of the school building, effectively enhances the capacity to learn. Starting from European theories, models and experiences, the concept has been defined to support and implement its effective development at the cultural, political and practical level (Index model).

socio-educational ecosystem; widespread education; educational sustainability; Education Outside the Classroom

## INTRODUCTION

Research in education and neuroscience have led to an extended and complex idea of the learning environment, encompassing both physical space and relational aspects. Neuro-phenomenological and embodied cognition perspectives are interpreting sociocultural dimensions as embodied cultural dimensions (Caruana and Gallese, 2011), as they are mediated by actors’ bodies, also and especially in the educational and school context (Damiani, Gomez Paloma, 2018; Gomez Paloma, Damiani, 2021). The space is redefined

in an ecological-systemic perspective for the interdependent interaction of all key components of the school-system (students, teachers, tools, content...) (OECD, 2010), that opens beyond “traditional” school.

This paper intends to illustrate the actions that led to the definition of a sustainable (valid, actualized, shared and feasible) idea of Widespread School (WS), an educational experience grounded in Reggio Emilia Pedagogy. Building on the literature regarding the educational and transformative value arising from synergies between diverse contexts, and interprofessional collaboration in support of the idea of schools as hubs of empowerment and learning connected with community and other local services (UNESCO, 2021), the project WS aims at strengthening the alliance between school and territory and experiment an approach to education based on the idea of Education Outside the Classroom (EOtC).

Schools and territories, as part of an educational ecosystem, implement a virtuous process where the variety of teaching, learning and assessment strategies positively influence, encourage and support the development of key competencies in both teachers and students (Mygind, 2019; Mangione, 2021). Inequality and illiteracy in the world are at historically high and rising levels (UN, 2020). A viable idea of WS could be a lever for co-development, well-being and prevention.

To achieve this macro-finality, reflection on the essential and necessary characteristics of WS and EOtC represents an essential step, still not fully investigated by literature (Cannella, et alii, 2023). It is important to specify that the strongly situated and dynamic nature of the concept, anchored to individual experiences and to specific contexts (cultural, physical and temporal), does not allow one to arrive at a closed and univocal definition; for these reasons, the objective of the present work consists in identifying ‘meta’ level foundational elements, capable of making certain types of learning environments and training experiences recognisable and common, also from a comparative point of view, while supporting and enhancing the variety and complexity of the dynamics and contexts. This brings us closer to a ‘sustainable’ guiding idea of WS, open and respectful of differences, but rigorous in the declination of certain key elements (founding characteristics) that guarantee validity, feasibility, efficacy; documentability, thus allowing for its evaluation and implementation.

## 1. RESEARCH DESIGN

Since all project partners had some experience with EOtC programs, a brainstorming round helped defining keywords that guided both the literature analysis phase and the development of a practice collection form.

The researchers carried out a thematic literature review using Education Outside the Classroom as a search term. Of the 29 articles extracted only 15 were considered relevant based on inclusion/exclusion criteria. Articles focusing on digital resources and practices (i.e., Mixed Reality Immersive Learning, Mobile Learning), were excluded. Studies that explicitly investigated experiences with EOtC, theoretically and empirically, were included.

Literature thematic analysis, both driven by a general and provisional definition of WS, but also grounded in the data (Braun, Clarke, 2006), focused primarily on the conditions that favor or hinder EOtC practical implementation. Namely, it sought to respond to the following questions:

- What teaching strategies or methodologies are used in EOtC experiences?
- What impact do they have according to teachers' and students' opinions?
- What challenges and obstacles are suggested for implementing EOtC?

The project partners designed a form to collect EOtC experiences, focusing on prolonged experiences (minimum 5 days, even spread throughout several weeks) of primary and lower secondary school developing curricular objectives through active educational practices, carried out outside the school building with an interaction between teachers, students, the environment and possibly “non-teacher educators”, such as: museum educators, librarians, farmers, artisans, musicians. In this setting formal and non-formal/informal education interact. Key element to identify experiences was the co-designing of learning activities in and out of school. This co-designing process, done before, during and after the experience, takes place among teachers and external educators and has the “non-schooling” educational environment at its core.

Tab. 1. Guiding questions from the practice collection form.

WHO WE ARE? “Our educational ecosystem” (Describe the formal, non-formal, informal agents involved in the experience)
WHAT IS OUR PURPOSE? (Define the objectives of the project/experience/case/example)
HOW WE DO? (Describe the methodology/pedagogical strategies/procedure/tools of the experience and the design process—who is involved in the designing process, what tools do you use –i.e., co-designing grid, flipped chart, conceptual maps, etc.-, what do you design—)
HOW LONG WE STAY? (Describe the timeframe of your experience. How many days? How many hours per day? In which time-period?)
WHAT ARE SOME STRENGTHS, WEAKNESSES AND AREAS FOR IMPROVING? (Describe 2-3 strengths, 2-3 weaknesses and 2-3 areas for improving the project in line with Widespread Education)

Through the form guiding questions (see tab. 1) some pillar elements emerged: description of the educational ecosystem (formal, non-formal, informal agents involved in the experience), i.e. the who; educational objectives of the experience, i.e. the what; methodology/pedagogical strategies/procedure/tools of experience and design process, i.e. the how; timeframe, strengths and weaknesses.

## 2. DATA ANALYSIS LEADING TO A GUIDING DEFINITION

### 2.1. Literature review

The literature analysis (Esteban-Guitart et al., 2024b) confirmed the co-existence of various interpretations and definitions of EOtC, which focus on different practices and characteristics.

According to Mygind et al. (2019):

Education outside the classroom (EOtC) can be characterised as a compulsory curriculum-based programme which is described as a holistic, school-based and pupil-centred strategy that can advance learning, physical activity, social relations, school motivation, and mental health involving all senses (p. 599).

Some scholars focus more on teaching in different places, as “Education outside the classroom (EOtC) is characterised as a teaching method in which teachers make use of the local environment as well as places distant from

schools when teaching specific school subjects” (Jorring et al., 2020, p. 414). Others are more interested in students’ active learning “Education outside the classroom (EOTC) offers students an opportunity to experience new and enriched learning activities and contexts, to take greater responsibility for their learning, and to connect more deeply with their local places and communities” (Watson et al., 2020, p. 25).

As for the research questions on strategies and methodologies, EOTC often involves child-led approaches to interdisciplinary experimentation, project-based learning, peer cooperation, physical activity, games conducted around “real-world” problems, yet no specific in-depth analysis of the teaching methodologies can be found in the literature.

As for impact of EOTC, they are mostly collected through reporting by teachers and are presented in Tab. 2. Benefits for students expand from different dimensions of school learning to soft skills such as research skills, to various dimensions of physical well-being, to better behaviour, to improvement in relationship, to a greater understanding of civic engagement and world real problems. While teachers benefit from the improved relationship with students and other professionals and greater understanding of active teaching and learning methodologies. Some well-being dimensions are captured through physical data such as cortisol levels, trying to measure learning gains for students has been mostly inconclusive.

Tab. 2. Impact of EOTC.

Support, development, and consolidation of school learning.
Development of life skills.
Research skills.
Greater school satisfaction and engagement.
Better understanding of the world.
Civic engagement.
Richer understanding of oneself (increased self-esteem, self-efficacy).
Increased physical activity.
Better regulation of biological stress-reactivity.
Positive impact on personal and social well-being (e.g., social relationships, group work).
Negative associations with hyperactivity-inattention.
Negative association with peer problems in pupils.

Improved student-student and student-teacher relationships.
More situated and experiential learning situations.
More active pedagogical strategies (e.g., experimentation, problem-solving, peer collaboration).
Addressing more authentic problems and projects due to contextualization.
Greater collaboration between teachers and other professionals.

The literature reviewed has identified various challenges and difficulties associated with the development and implementation of Education Outside the Classroom (EOtC) mostly grouped in psychological, social, geographical, material, and political. At a psychological level there is a tendency for gains to be context connected and hard to keep once the students go back to regular schooling. Socially, EOtC requires more work and cooperation from teachers and a reorganization of working environments. Some places might not be suited to have experiences of EOtC due to weather and geographical conditions. At the material and political level, resources could be necessary to ensure transportation, renting spaces, hiring educators, finding partnerships and so on.

**2.2. Collection of European Experiences**

Partners collected 19 concrete experiences of EOtC from Italy, Spain, Norway, Croatia and Finland (Esteban-Guitart et al., 2024a). We summarized key elements such as location, adults involved and timeframe in tab. 3.

Tab. 3. Summary of collected practices.

#	Country	Places	Adults involved	Time
7	Italy (Reggio Emilia, Naples)	Neighborhood and its activities; farm, theatre, natural site, castle	Teachers, Educators, local artisans, families, experts, professionals from the welcoming sites.	1 week (5 days) per year
3	Spain (Catalonia )	Natural site, historical Site, museum	Teachers, professionals, university researchers, families	Many outings throughout the school year/3 hours per week
2	Norway (Oslo)	Public space, private companies	Teachers, professionals, social activists	2 months

3	Croatia (Zadar)	School garden, downtown, technological forum	Teachers, families, professionals, historians, museum personnel, tourist guides	2 hours per week throughout the school year; 1 week;
4	Finland (Espoo)	Local forest, Animal habitats, library, Yrityskylä (business society)	Teachers, professionals, literary art counselors, librarian	2 hours per week during the school year; 5 days during school year

There is a great variety in timeframe (5 days, 2 hours throughout the school year, 2 months), although they are all prolonged experiences. Also, the places (indoors and outdoors, natural and manmade, places of business or of culture, and so on) and learning areas involved vary greatly: from library readings to archaeological digging; from recycling at a company to studying of castles; from farming to forest exploring. Yet, there are some strong elements in common across countries and cultures:

- students' active learning: research-based, project-based; STEAM, interdisciplinary;
- the richness of the socio-educational ecosystem involved, both in terms of actors involved and variety of fields and professions;
- teachers' active involvement in EOtC designing and implementation.

### 2.3. Defining a concept to guide actions

The aim of the Erasmus+ project is to design tools supporting implementation of schooling outside the school building throughout Europe. To that end a common definition was needed. Yet, as we have seen, EOtC is very broad concept that describes a variety of schooling experiences carried out outside the school building but lacks the precision necessary to guide and support implementation. On the other hand, WS, the educational experience that inspired the project, is a specific experience connected to a specific place, culture and idea of education (Cannella et alii, 2023).

The project group decided to move beyond these 2 concepts and characterize Widespread Education, as a culturally transferable, yet somehow prescriptive and defined concept able to orient action in the different contexts.

Widespread Education is a pedagogical approach that engages primary and secondary schools developing curricular objectives in cooperation with other organizations and actors outside the school across time (minimum 5 days) on contextualized, real, and authentic problems that matters to

students and communities by co-researching, co-designing and co-teaching, bridging formal, non-formal and informal agents and connecting learning experiences in and out of school

This operational definition of Widespread Education is coherent and instrumental to supporting the generative and transformative pedagogy in an ecological-relational perspective.

## CONCLUSION

The identification of a common frame for systematizing and defining Widespread Education is aimed at building a Toolkit for teachers, consisting of guidelines and materials for the implementation of Widespread Education. The toolkit will support the development of practitioners and contexts in a coherent and sustainable “widespread” perspective.

Moreover, interviews and focus groups with practitioners, policy makers and leaders help the research group define the key organizational and managerial aspects of Widespread Education, to design policy guidelines helping implementation of Widespread Education experiences across Europe.

# BRIDGING THE GAP: IMPLEMENTING INNER AREAS GOVERNANCE IN EDUCATION. A CASE STUDY OF THE TERRITORIAL EDUCATIONAL PACT OF CASENTINO

Luca Grisolini<sup>a</sup>

Giovanna Del Gobbo<sup>a</sup>

Giulia Biagi<sup>a</sup>

Francesco De Maria<sup>a</sup>

<sup>a</sup>University of Florence

In 2021, UNESCO's International Commission on the Futures of Education stressed the need to foster participatory processes in order to reshape the educational landscape, highlighting the importance of collaborative governance as a prerogative of the 'new social contract'. Indeed, education as a common good requires a transformation that goes beyond traditional approaches and actively involves all stakeholders. This paper explores how the creation and implementation of public-private alliances at local level can be an exemplary response to this vision, providing a model that promotes sustainable development through community engagement in the collaborative governance of the educational and cultural sector. In this sense, the Casentino Territorial Educational Pact, signed in May 2024, constitutes an innovative experiment that seeks to strengthen the educational offer of Italy's Inner Areas, focusing on the valorisation of intangible cultural heritage as an educational tool and an element of local development. Collaboration between the area's municipalities, educational institutions, third sector organisations and cultural institutions has enabled the development of a unique educational ecosystem that responds directly to the needs of the area and uses local knowledge as a central element to promote a territorial system for lifelong and lifewide learning.

collaborative governance; Inner Areas; Territorial Educational Pact; cultural heritage

## **INTRODUCTION**

As is well known, the report “Reimagining Our Futures Together: a new social contract for education”, produced by the UNESCO International Commission on the Futures of Education (2021), advocates the need for a new vision of the future that is democratic and local, valuing individual and collective action and the wealth of cultural diversity as assets for sustainable, peaceful and inclusive development. The challenges of the modern world, in this sense, entail the need for a change of direction that identifies inclusiveness and high-quality education as driving forces for change. This is not only because developments in the world of work due to the speed of digital technology necessitate a reconsideration of the skills of individuals with respect to economic and employment needs, but also and especially because global and local development entail the increasingly democratic and active participation of individuals in their multiple roles as administrators, workers, volunteers and ordinary citizens in order to plan and manage development interventions that are truly in line with local socio-economic needs and requirements. The challenge posed by the UNESCO document is how to narrow the gap between the vision presented in the report and the current reality, taking into consideration the way in which politics shapes education. The key principles of UNESCO’s ‘new social contract’ (2021) – ensuring the right to quality education throughout life and strengthening education as a public common good – are translated and pursued through a series of interventions that converge in the establishment of local alliances capable of involving the various actors of society in the process of defining educational policies for lifelong and lifewide learning. In this sense, education can no longer be an exclusive area of planning limited to the public sector and implemented in schools, but necessarily becomes a collective goal that can only be pursued by activating and involving the entire community in governance processes, as a form of government that encourages the involvement of all social partners in the definition and implementation of synergistic development strategies.

## **THE FRAMEWORK OF COLLABORATIVE GOVERNANCE**

The term collaborative governance – similar to the definition of governance offered by the OECD (2001) – refers to a form of governance based on the involvement of economic and civil society structures in the public policy-making process (Ansell and Gash 2008; Emerson, Nabatchi and Balogh 2012). Since the adoption of the Community Leader Directive (1991), this modality has been the main route chosen by European and national structures to ensure the

participation of civil society in the planning of territorial interventions in the pursuit of systemic objectives of sustainable development, cohesion and social inclusion. The shift from rigid, centralised and hierarchical forms of governance to flexible governance processes based on pluralism in decision-making has been accompanied by a growing awareness of the role that local communities can play in defining and resolving the needs arising from their geographical, economic and social contexts (Trigilia 1999, Barca, 2009), thus opening up the various stages of local development interventions to the participation of non-institutional local actors.

The issue of collaborative governance in education is certainly not new, but has been a constant objective in the European public policy-making process. In the case of Italy, over the past decade, education has been a priority area for the state's executive structures, as evidenced, for example, by the Educational Community Pacts introduced by the MIUR (Ministry of Education, University and Research) with the 2021 School Plan and numerous examples of collaborative municipal agreements implemented at regional and municipal level to achieve shared administration of cultural heritage.

A focus on the 'educating community' has developed in parallel to and in correlation with directives and policies aimed specifically at so-called marginal areas, i.e. rural, mountainous and/or inland areas which – due to depopulation and socio-economic and geomorphological reasons – risk the impoverishment of local resources, with the consequent negative effects. A typical example of this correlation is the National Strategy for Inner Areas (SNAI), launched in 2013 and promoted by the Agency for Territorial Cohesion with ERDF, EAFRD and ESF European funds. Within the SNAI planning for 2014-2020 and 2021-2027, the strengthening of local educational systems, together with the implementation of healthcare and mobility services, is identified as a primary objective, both to foster resilience and combat school drop-out, and to mitigate the risk of educational poverty, due in part to the limited availability of services for citizens. Areas of possible intervention were not so much focused on strengthening school personnel and restoring and renewing buildings and their organisation, but more on expanding the educational and training offer through the valorisation of all formal, non-formal and informal educational pathways, in order to create the conditions to increase and enhance the human and social capital of communities, with a view to driving local development that is also in line with the strategic objectives of international and European guidelines and policies.

## 2. THE TERRITORIAL EDUCATIONAL PACT OF CASENTINO

This paper aims to examine the Territorial Educational Pact of Casentino, implemented by the local Unione dei Comuni del Casentino with scientific coordination by the FORLILPSI Department of the University of Florence.

This formal alliance was the subject of a specific case study in the REACT interdepartmental research project *'Regenerating the cultural landscapes of inland areas in a people-centred perspective'* (<https://www.react-casentino.unifi.it/>), carried out by four departments of the University of Florence and focusing on the cultural landscape of the Casentino, with the aim of valorising the region's available heritage and human resources, and identifying strategies and actions for place-based development.

The Casentino, a Tuscan valley with a wealth of natural and cultural resources, is an emblematic example of the educational challenges facing Italy's Inner Areas. Declining birth rates, an ageing population and high teacher turnover are leading to undersized schools and a lack of educational opportunities, increasing the risk of educational poverty (MIUR, 2015). These factors threaten to aggravate depopulation, emigration and economic impoverishment, leading to a gradual loss of the area's natural and cultural heritage. In this context, it is essential to improve infrastructure and service provision in order to attract investment and counteract youth migration. At the same time, facilitating tourism opportunities, strengthening public-private partnerships and leveraging European and national investment are key steps to revitalising the area, but will require an integrated and participatory approach that can:

- combine improved educational opportunities, the valorisation of local heritage and local development needs into shared vision and action that can effectively address the critical issues facing the area and promote a sustainable future;
- encourage the active participation of the rich social and economic fabric of the valley in processes of public policy formulation and implementation, through forms of shared governance that enhance the role of the community and its human capital in the co-programming, co-planning, implementation and monitoring of local development initiatives in the fields of culture and education.

In this sense, the Casentino Educational Territorial Pact – finally signed in May 2024 by 49 stakeholders (of which 24 are public bodies and 29 are private) – represents the concretisation of an existing informal alliance started in 2020 between 7 schools and 19 economic and business partners with the aim of

strengthening local ties and therefore investment in the skills and knowledge of the Casentino community, in order to contribute to local development processes and action to limit and combat depopulation. The Pact is implemented in relation to Action 2 of the “Casentino and Valtiberina Mountains of the Spirit” area strategy (2014-2020 planning period), which explicitly aims to “provide support and tools for young people to train and build the body of knowledge that is essential for their human and cultural development, and for the adult population to update and integrate professional skills to support their working life”. The contents of the document are the result of a co-design process started in 2020 by the CRED office of the Italian Union of Municipalities for the implementation of the interventions envisaged in Appendix 2.2 ‘Casentino Valtiberina: community in education, intangible heritage, sustainable development and training opportunities for young people in the area’, whose planned interventions were geared to building an Educational Community and creating an Atlas of Intangible Heritage, inspired by the UNESCO Convention on Intangible Heritage (2003) and the Convention of Faro (2005), through an inclusive, participatory process of involving the local population in its various forms of organisation.

## **2.1. Case study methodology and objectives within the REACT research context**

The Casentino Educational Territorial Pact has been the object of study, as a relevant form of social organisation and the expression of social capital, within REACT research, specifically in the WP2 project to define a knowledge framework for Casentino. In particular, the Pact was the subject of a specific in-depth study under theme T.2.1 ‘Forms of community organisation’ as part of thematic area no. 2 “Traditions and social practices”. The case study was carried out between March and July 2024 by the research unit of the FORLILPSI department. The research model, inspired by constructivist grounded theory (Charmaz, 2006), draws on a qualitative methodology based on triangulation (Danzin, 1970) between document analysis<sup>1</sup>, participant observation and open interviews with privileged stakeholders in the Pact in order to ensure the validity

---

<sup>1</sup> The process involved, firstly, analysis of material collected by the PUSH-D Research Unit – Pedagogical Approach for Sustainable Development and Heritage Valorisation of the University of Florence during the action research and participant observation phases carried out between January 2021 and July 2024 to support the participatory processes accompanying the Pact. At the same time, desk analysis of international, European, regional and local policy planning documents was carried out in order to identify elements of continuity and innovation in the Pact with regard to the regulatory and legal context and the panorama of participatory governance tools related to education and culture.

of the research. Specifically, the aim of the case study was to identify and define:

- the Pact's innovative features in relation to existing processes at local and regional level and to different models of collaborative governance in the education sector;
- the strengths, weaknesses, threats and opportunities that facilitate and/or hamper achievement of the Pact's goals and the functioning of the structures dedicated to their pursuit;
- the potential impact of the Pact on the economic, social, environmental, institutional and cultural sustainability of the Casentino area.

## **2.2. Results**

The Casentino Territorial Educational Pact is an innovative collaborative governance tool that seeks to facilitate the sustainable development of a mountain region characterised by complex challenges such as depopulation, social fragmentation and the need to valorise cultural and natural heritage. The Pact's originality lies in its ability to combine educational, cultural and economic objectives, adopting a cross-sectoral approach that seeks to bring local resources together in an inclusive and sustainable development model. In contrast to the school-centred vision that generally characterised Educational Pacts promoted by the MIUR 2021 School Plan, this Pact aims to create educational opportunities that embrace a lifelong and lifewide approach to learning, valuing continuous development and the integration of educational experiences in formal, non-formal and informal contexts. In particular, the focus on the intangible heritage of Casentino, inspired by the UNESCO Convention on Intangible Heritage (2003) and the EU Convention of Faro (2005), is a key element to stimulate awareness of identity and a sense of belonging. Cultural heritage is identified as an asset for local development, but also as a real educational tool, giving the Pact a distinctive originality in comparison with other similar experiences at national level. Despite its many strengths, the Pact faces significant challenges. The lack of dedicated economic resources and the organisational complexity of the multi-level network are major obstacles. Moreover, the political and social fragmentation of the area threatens to compromise the continuity of the participatory process. Nevertheless, the approach adopted is in line with the most advanced European and Italian policies, such as Agenda 2030 and the Inner Areas Strategy, which encourage inclusive governance models to address the challenges of marginal areas.

The impact of the Pact has several dimensions. On the economic level, it seeks

to boost the skills of the local workforce, making it more competitive and responsive to the needs of the production fabric. The valorisation of the natural and cultural heritage as an educational and tourism resource can generate new economic opportunities, helping to combat depopulation. From the social perspective, the Pact promotes community empowerment and social cohesion through participatory practices that strengthen the sense of belonging and collaboration. Intergenerational and intercultural inclusion is central to fostering a more equitable and inclusive community. On the environmental front, the Pact integrates sustainability objectives into the dynamic conservation of local ecosystems, stimulating responsible and collaborative behaviour among citizens. Finally, from a cultural point of view, the Pact encourages the preservation and transmission of local heritage through educational projects and joint initiatives, contributing to the consolidation of territorial identity and the promotion of intercultural dialogue.

The Casentino Territorial Education Pact is thus designed as an innovative model of integration between education, culture and local development. Despite its criticisms, it offers a strategic vision capable of enhancing the area's endogenous resources and building a resilient and inclusive community. Its implementation requires the ongoing commitment of all parties involved in order to overcome the challenges and guarantee a positive and lasting impact on the Casentino.

### **3. CONCLUSION**

In its own small way, the Casentino Educational Pact constitutes an intervention that is perfectly in line with the aspirations of UNESCO's International Commission on the Futures of Education, which seeks to promote a 'new social contract' based on the vision of inclusive, participatory and widespread high-quality education. The characteristics and opportunities offered by the Pact, as well as changes in the Italian legal and regulatory circumstances, confirm the importance of participatory processes and collaborative governance as essential social drivers for moving beyond the existing situation and achieving the objectives advocated in the 2021 UNESCO report. In this sense, the communities of the Inner Areas often prove capable of promoting innovative models of governance and development in order to cope – through the joint action of institutions, economic actors and civil society – with the endogenous and exogenous exigencies that have long threatened the eco-systemic resilience of their local areas, showing a mature awareness of the role of lifelong

learning as a key element for the achievement of local and global development objectives. At the same time, the precariousness of these areas and their importance in the pursuit of cohesion, subsidiarity and sustainability alert central and regional governments to their responsibility to adopt ongoing and targeted policies aimed at supporting local education systems.

# THE SOCIAL CONTRACT FOR EDUCATION AND EDUCATIONAL TERRITORIAL PACTS: PEDAGOGICAL INNOVATION AND TERRITORIAL GOVERNANCE. A MULTILEVEL ANALYSIS OF THE VERONA CASE

Giuseppina Rita Jose Mangione<sup>a</sup>

Stefania Chipa<sup>a</sup>

Rudi Bartolini<sup>a</sup>

Chiara Zanoccoli<sup>a</sup>

<sup>a</sup>INDIRE, Istituto Nazionale di Innovazione Documentazione e Ricerca Educativa

The article analyzes the role of Educational Territorial Pacts (ETPs) in implementing the social contract for education promoted by UNESCO as a response to global educational challenges. Focusing on the case of Verona, the Territorial Collaboration Pact (TCP) emerges as a model of multilevel governance aimed at fostering an inclusive, participatory, and sustainable school. The TCP identifies four macro-objectives: preventing school dropout, engaging families, opening schools to the community, and enhancing urban and natural spaces as learning environments. Using a qualitative approach based on the analysis of ETP texts and the reflective journals of the 12 participating schools, the study highlights the potential of ETPs to build resilient educational networks and promote a school model deeply rooted in the local territory. The article also examines the role of the National Observatory, coordinated by INDIRE, in supporting the institutionalization of ETPs through training, monitoring, and the promotion of best practices. The Verona experience stands out as a paradigmatic case of educational and social innovation, offering a replicable example of how schools can act as agents of territorial regeneration and community cohesion.

Territorial Collaboration Pact, Educational Territorial Pact, Social Contract for Education, Innovation.

## INTRODUCTION

In a global context marked by social inequalities, environmental crises, and technological transformations, education is increasingly recognized as a central element in building sustainable and inclusive societies. The concept of the social contract for education, relaunched by UNESCO in 2021, represents an innovative and systemic response to the educational challenges of our time. It proposes a redefinition of the school's role as an open and participatory institution, capable of collaborating with families, local authorities, and communities to address complex issues such as school dropout, educational poverty, and structural inequalities (UNESCO, 2021).

This perspective places solidarity-based connections and the school as a common good at its center, moving beyond the vision of the school as a mere service provider to consider it as a place of social innovation and democratic participation. This approach is particularly relevant in the Italian context, where schools often act as strategic nodes in networks of proximity and territorial collaboration (Bartolini, Mangione, Zanoccoli, 2022; Bartolini et al., 2021).

According to recent contributions (Locatelli, 2019, 2023b; Cannella, Chipa, Mangione, 2021), the new social contract for education rests on four fundamental pillars: *Participation* (involving students, families, and local actors in the co-creation of educational projects), *Inclusion* (viewing diversity as a resource for building cohesive communities), *Solidarity* (creating educational ecosystems that strengthen the bond between school and community), and *Regeneration* (positioning schools as agents of change and social innovation).

These principles reflect the need to adopt a relational and transformative pedagogy capable of responding to contemporary challenges. In Italy, they have supported the realization of proximity school experiences based on a symbiotic relationship between schools and their territories, where educational institutions assume the role of cultural and social hubs to promote social justice, urban regeneration, and community cohesion (Mangione and Calzone, 2022).

Educational Territorial Pacts are strategic tools to support and implement this vision of schools. They provide a normative framework that formalizes alliances between schools, families, associations, and local institutions, creating an operational space to co-design targeted educational interventions. Through these Pacts, schools take on an active role in enhancing local resources, regenerating public spaces, and building cohesive and resilient educational communities.

The relationship between Educational Pacts and proximity schools is not merely operational but deeply pedagogical. As Biesta (2022) observes, community-centered education fosters the creation of meaningful relationships that inspire belonging and participation. Educational Pacts, therefore, are not simply governance tools but pedagogical devices that can support school models (Maulini and Perrenoud, 2005) based on equity, diversity, and sustainability.

The institutionalization of Educational Pacts in Italy is supported by the National Observatory, coordinated by INDIRE and LABSUS, which plays a key role in monitoring and promoting the dissemination of this tool. Furthermore, through training, support, and research initiatives, INDIRE is working to consolidate Educational Pacts as a systemic practice.

## **2. THE CASE STUDY: THE PACT IN THE CITY OF VERONA**

In Italy, within the framework of the Educational Territorial Pacts, the collaborative experience of the City of Verona represents a particularly significant case, as it is structured on two levels: a general level of strategic governance and coordination encompassing the entire city, and a local level that concretely impacts specific portions of the territory.

The Territorial Collaboration Pact (TCP) of Verona represents the strategic level of educational and social governance, aimed at defining a shared framework for the construction of educational alliances in various parts of the territory. It acts as a steering mechanism, involving schools, local institutions, families, and other stakeholders to identify common educational priorities and direct resources toward strategic objectives.

From this general level, the Educational Territorial Pacts (ETPs) are developed, operating at the local and proximity levels (e.g., neighborhoods or districts of the municipality), translating the macro-objectives into specific actions and concrete collaborations within the territory.

The TCP of Verona was conceived by a steering committee composed of the Municipality of Verona, the Veneto Regional School Office (USR Veneto-UAT of Verona), the Prefecture of Verona, the Police Headquarters of Verona, and the Diocese of Verona, to define the major strategic guidelines of the city's educational project. It is organized around four macro-objectives:

1. *Prevent school dropout* through systemic interventions and inclusive educational policies.
2. *Engage families as active partners* in the educational process,

strengthening their role through training and participatory initiatives.

3. *Open schools to the community*, transforming them into cultural and social hubs capable of promoting cohesion and participation.
4. *Enhance urban and natural spaces as places* for shared learning and active citizenship.

The TCP serves as a platform for coordinating resources, tools, and expertise, ensuring a unified and sustainable vision for the educational project. After establishing a broad and diversified network of stakeholders, the steering committee, with the methodological guidance and training support of INDIRE, identified tools for monitoring and shared reflection.

Building on the strategic framework outlined by the TCP, the schools of Verona were involved by INDIRE in a training and support process for drafting the Educational Territorial Pacts (ETPs) within their proximity territories. These Pacts, signed by 12 Comprehensive Institutes, are configured as local co-design tools through which schools collaborate directly with local actors—families, associations, public and private entities—to implement targeted interventions.

Below are some significant data collected at the start of the training and support process to outline the context of reference for the macro-objectives set by the steering committee: 1,484 students were involved in extracurricular activities, 26% of whom held non-Italian citizenship, 750 parents participated, with a significant representation of immigrant families, 60% of the participating schools used external spaces, such as parks and open fields, for their activities, 50% of the schools utilized indoor spaces outside the school, such as libraries and cultural centers.

These data already highlight a significant synergy between these schools and their reference territory. The dimension of proximity was crucial for effectively addressing the various needs and challenges faced by the individual schools involved, located in different areas. For instance, in some areas, emphasis was placed on the inclusion of migrant families, while in others, focus was on enhancing cultural and natural heritage.

The complementarity between the Territorial Collaboration Pact and the Educational Territorial Pacts is a strength of the model adopted in Verona. On the one hand, the TCP ensures a unified strategic vision and systemic coordination; on the other, the ETPs allow this vision to be translated into targeted interventions capable of responding to the needs of local contexts.

This dual level of intervention enhances the participation of local actors and

fosters educational innovation, creating an ecosystem that combines learning, social cohesion, and sustainability.

INDIRE has initiated an instrumental case study (Stake, 2000; Evers & Wu, 2006) with the aim of investigating the impact of the Pact on the territory with respect to the identified objectives. The following analysis focuses on the school visions proposed and the transformations made possible by solidarity-based alliances, exploring how these elements contribute to addressing educational and social needs.

#### **4. RESEARCH METHODOLOGY**

The research conducted on Verona's Educational Territorial Pacts is based on a qualitative approach, which allows for an in-depth exploration of the experiences and dynamics underlying the design and implementation of these tools. This type of analysis, as suggested by Creswell and Poth (2018), is particularly effective for investigating complex phenomena in educational contexts, capturing both the pedagogical visions expressed by participants and their perceptions of emerging challenges and opportunities.

The study involved 12 first-cycle schools, which participated in the project by drafting Educational Territorial Pacts and maintaining reflective journals as monitoring tools. These two data corpora—the texts of the Pacts and the log files from the reflective journals—enabled the analysis of both the visions and objectives outlined by the schools, as well as the connections among them. At the same time, the data revealed the challenges and opportunities encountered by school leaders and teachers who participated in the INDIRE-guided accompaniment process.

The analysis was conducted in four main phases:

- *Data Collection and Preparation.* The texts of the Educational Territorial Pacts and the log files from the reflective journals were collected, digitized, and normalized to ensure consistency and uniformity. This process included reviewing documents to unify terminology and make the corpus suitable for textual analysis.
- *Thematic Coding.* The data was organized into three predefined categories: school visions, objectives, and perceived challenges/opportunities. Manual coding, inspired by the method of Miles, Huberman, and Saldaña (2014), allowed for a contextualized interpretation.

- *Textual Content Analysis.* Using digital analysis tools such as Voyant Tools, the data categorized a priori was explored through text mining techniques to identify significant linguistic patterns. Keywords such as “inclusion,” “community,” and “spaces” guided subsequent categorization, enabling the identification of recurring themes.
- *Validation and Collective Reflection.* Monthly monitoring meetings between participating schools and researchers provided an opportunity to discuss preliminary results and incorporate additional reflections. This process enhanced the quality of the analysis by valuing the direct contributions of the project’s participants.

The qualitative approach adopted in this research allowed for a comprehensive understanding of the complexity of the schools’ experiences. It highlighted not only the explicit content of the Pacts but also the relational and organizational dynamics accompanying their implementation.

## **5. IMAGINATION AS DRIVING FORCE OF EDUCATIONAL PACT: VISIONS AND OBJECTIVES**

Educational imagination, understood as the ability to visualize what schools could and should be, is at the heart of the design of the Educational Pacts. INDIRE’s focus on these tools, in fact, arises from their potential to pave the way for a new *formes scolaires*. This process of imagination is not an abstract exercise but a transformative practice that guides school and territorial actors toward a shared vision of the educational future.

As Greene (1995) emphasizes, imagination not only expands the boundaries of the possible but also inspires concrete actions that aim to translate innovative visions into tangible realities. Verona’s Educational Pacts offer a concrete demonstration of this approach, in which schools articulate pedagogical aspirations through a plurality of visions, closely tied to the operational objectives outlined.

The visions emerging from the Pacts can be seen as collective imaginings that reflect both the needs of the local context and the ambition to redefine the role of schools in society. Three are particularly clear.

- *The Inclusive School.* The vision of an inclusive school is a common thread running through all the Pacts analyzed. It imagines the school as an equitable and cohesive educational space, capable of valuing cultural, social, and linguistic diversity. This translates into objectives such as the introduction of innovative teaching methodologies, like

service learning and experiential workshops, aimed at actively involving students with special educational needs or from disadvantaged social groups. As Fraser (2009) suggests, this vision promotes a form of social justice that goes beyond the simple redistribution of resources, focusing on a deep recognition of differences.

- *The School as a Civic Hub.* In this vision, the school is imagined as a social and cultural hub, a meeting place for students, families, and local actors. A “school-city,” therefore, which translates into concrete objectives such as: keeping schools open in the afternoon, organizing cultural events and intergenerational workshops, creating collaborative networks with associations and local institutions. This clearly echoes the concept of community schools described by Schafft (2016), where the school becomes a point of reference for community cohesion and participation.
- *The Ecological and Sustainable School.* Sustainability is another central dimension of the educational imagination found in the Pacts. The school is conceived as a place that educates for environmental awareness and uses the surrounding territory as a learning space. Key elements include the creation of educational gardens, organizing excursions to natural spaces, and promoting interdisciplinary activities that demonstrate how sustainability can be integrated into the curriculum. This vision reflects OECD (2021) recommendations on the importance of linking school learning to global challenges.

The objectives outlined in Verona’s Pacts show a strong correspondence with the visions imagined by the schools. This convergence is particularly evident at the levels of students, families, and spaces. The increased participation of students in innovative educational activities, such as action-research laboratories and projects tied to local traditions, demonstrates how the objectives are designed to make students active participants in their learning. These experiences promote autonomy, collaboration, and critical skills, aligning with Dewey’s (1938) reflections on active learning. The objectives aimed at involving families—through, for example, literacy courses, seminars, and intergenerational activities—reflect the school’s commitment to fostering broad educational synergies. Epstein and Sanders (2019) stress the importance of such parent partnerships for improving educational outcomes and strengthening the cohesion of the educational community.

Finally, the redevelopment and innovative use of both school and external

spaces—such as parks, libraries, and cultural centers—highlight the commitment to realizing a distributed school deeply integrated into the urban and natural fabric. As Lefebvre (1991) observes, space can become an active agent of educational transformation when designed and used participatively.

The visions outlined—from the inclusive school to the ecological school—find concrete expression in objectives that aim to create a new *formes scolaires* (Maulini & Perrenoud, 2005): open, participatory, and resilient. From the pedagogical perspective of social and solidarity connections (Locatelli, 2023a; Chipa et al., 2023), this convergence between imagination and practice shows how schools can use the alliances formalized in the Pacts not only to meet immediate educational needs but also to shape a vision of a more just and sustainable society.

## **6. PERCEPTION OF CHALLENGES AND OPPORTUNITIES: ANALYSIS FROM REFLECTIVE JOURNALS**

The perception of stakeholders is a crucial element in educational innovation processes.

As highlighted by Fullan (2016) and Hargreaves and Shirley (2020), the way individuals experience and interpret change significantly impacts its implementation and sustainability. Perception, therefore, is not only a subjective dimension but also a valuable indicator of the dynamics of organizational and relational innovation.

The reflective journals of the schools involved in the Educational Territorial Pact of Verona serve as the documentary basis for a qualitative analysis of their experiences. From this analysis emerge the challenges they faced, the opportunities they encountered, and the transformative potential of the journey undertaken in Verona's experience.

One of the *main challenges* identified concerns the *management of collaboration networks*. The average of 13 stakeholders involved per Pact—with up to 40 in some cases—highlighted the complexity of coordination. This issue echoes findings from international research (Cheminais, 2009), which emphasizes that building multilateral partnerships requires significant investment in distributed leadership and negotiation skills. The diversity of stakeholders, including public institutions, associations, families, and local professionals, often led to misalignments in expectations and operational priorities.

Another challenge identified relates to the *adaptation of physical spaces* to

meet the needs of a distributed educational model. Although 60% of the participating schools reported using external spaces such as parks, museums, and libraries for educational activities, logistical and maintenance issues persisted. As explored by Chipa et al. (2023), learning environments must be designed not only as functional contexts for educational processes but also as elements that facilitate participation and active engagement. However, the lack of resources for restructuring and adapting spaces remains a significant obstacle.

Finally, the *divergence of priorities* among stakeholders represented another layer of complexity. Schools, focused on educational objectives, often found it challenging to balance these priorities with the institutional or operational agendas of territorial partners. This phenomenon aligns with observations by (Cannella, Mangione, and Chipa, 2023) on how interinstitutional collaboration can be undermined by the lack of shared goals and fragmented communication. Despite these challenges, the reflective journals also highlight a *significant set of opportunities* that emerged during the process. One of the most significant opportunities is the *strengthening of school-community relationships*. Activities such as intergenerational workshops, literacy courses for immigrant parents, and cultural initiatives fostered closer and more constructive dialogue between schools and families. As Epstein and Sanders (2019) note, such efforts can transform families from mere beneficiaries into active partners, contributing to greater cohesion within the educational community. From a pedagogical perspective, the introduction of innovative methodologies aimed at fostering contextualized learning and an interdisciplinary approach served as a key lever for engaging students, fostering a sense of belonging, and developing transversal skills. This aligns with OECD (2021) recommendations, which promote educational practices that connect school curricula to real-world experiences, strengthening the link between education and sustainability.

Another positive aspect was the *enhancement of reflective professionalism*. The monthly monitoring meetings with INDIRE provided teachers and school leaders with opportunities to discuss the strategies they had adopted, fostering a culture of critical reflection and continuous improvement. As Biesta (2022) emphasizes, professional reflection is essential for adapting educational practices to evolving contexts and for promoting inclusive and participatory educational leadership.

The challenges and opportunities identified through the reflective journals are essential indicators for understanding the dynamics of educational innovation.

On the one hand, the challenges highlight structural and organizational limitations that require targeted interventions. On the other hand, the opportunities underline the transformative potential of the Educational Pacts.

Addressing these challenges through a collaborative and reflective approach can transform schools into authentic spaces of learning and active participation, capable of effectively responding to the complexities of contemporary society.

## **CONCLUSIONS AND PERSPECTIVES**

The Territorial Collaboration Pact of Verona and the Educational Territorial Pacts of its schools represent an innovative model of educational governance, capable of translating ambitious pedagogical visions into concrete actions. This experience has highlighted the centrality of territorial alliances in promoting an inclusive school rooted in its territory and oriented toward sustainability.

The ongoing study emphasizes the transformative potential of territorial alliances, which are emerging as essential tools for building an open, participatory, and resilient school. The relationships between schools and communities have strengthened the sense of belonging, enhanced local resources, and allowed for flexible responses to the educational and social needs of the territory. At the same time, monitoring activities have revealed the need for targeted interventions to strengthen coordination among stakeholders and address logistical challenges, such as the management of spaces and resources.

Through quantitative longitudinal monitoring, it will be possible to assess the impact of these alliances on the macro-objectives identified by the steering committee of the Verona experience—student inclusion, family engagement, opening schools to the community, and enhancing spaces—and to outline guidelines for replicating the model in other contexts.

The Verona experience demonstrates that Educational Territorial Pacts are not merely operational tools but levers for systemic transformation in education. Schools reaffirm their role as central hubs for the development of cohesive, inclusive, and future-oriented communities, inspiring educational strategies that address contemporary challenges.

# EXAMINING THE ROLE OF GLOBAL CITIZENSHIP EDUCATION IN THE CONTEXT OF UNESCO'S RECENT REPORT AND RECOMMENDATION

Massimiliano Tarozzi  
Università di Bologna

In recent years, UNESCO's "Reimagining our Futures Together" (2021) and the revised 1974 "Recommendation on Education for Peace, Human Rights, and Sustainable Development" (2023) have significantly shaped educational policies. Both emphasise Global Citizenship Education (GCED) as a transformative, cross-cutting approach aligned with Target 4.7 of the Sustainable Development Goals and the broader 2030 Agenda. This paper explores GCED's evolving role through these documents, and it examines how GCED is conceptualised in academic discourse as an educational framework addressing social justice and interdependence. Unlike earlier UNESCO reports, which focused on national citizenship, the 2021 report envisions education as a global social contract fostering justice, inclusion, and civil society participation. This vision broadens the notion of citizenship, emphasising shared responsibility beyond national borders. The revised 1974 Recommendation reflects this shift, emphasising global education's role in creating peaceful, just, and sustainable futures. Its expanded title underscores the integration of global citizenship into education reform. Pedagogically, GCED calls for a "pedagogy of hope" (Freire, 2021) that empowers students to envision and build equitable futures, reinforcing its centrality in rethinking curricula. GCED emerges as a pivotal organising principle for fostering active global engagement and sustainable development through education.

Global Citizenship Education; UNESCO Recommendation; UNESCO's Report on Futures of Education; Pedagogy of hope

## INTRODUCTION

In recent years, two influential UNESCO's documents have had a major impact on educational policies and practices, namely *Reimagining our Futures*

*Together: a new social contract for education* (UNESCO, 2021) and the updated 1974 *Recommendation on Education for Peace, Human Rights and Sustainable Development* (UNESCO, 2023).

This paper examines the pivotal role these documents play in advancing the transformative approach of Global Citizenship Education (GCED), conceptualized as a cross-cutting educational framework that raises awareness of issues outlined in Target 4.7 of the Sustainable Development Goals and, more broadly, across all 2030 Agenda goals. Specifically, in this paper, I will explore the role of GCED within these documents, highlighting (1) how GCED contributes to reimagining the future of education as proposed by the Report, and (2) how its role emerges from the revised 1974 Recommendation, admittedly inspired by the Report. By comparing the original and revised versions, I will illustrate how GCED has become a central theme.

The Report has been translated into Italian by Rita Locatelli and Domenico Simeone (UNESCO, 2023), while the Italian translation of the Recommendation is currently available at: [UNESCO Italy](<https://www.unesco.it/it/temi-in-evidenza/educazione/la-nuova-raccomandazione-sulle-educuzione-alla-pace/>).

## **1. GCED WITHIN THE REPORT REIMAGINING OUR FUTURES TOGETHER: A NEW SOCIAL CONTRACT**

The UNESCO's Report has already been illustrated elsewhere in these conference proceedings; here, I will briefly pinpoint the role of GCED in it. The report endorses a paradigm shift based on pedagogies enabling the construction of a future capable of repairing the wounds created by selfish, socially inequitable and ecologically unsustainable policies.

GCED plays a crucial role in this paradigm shift aimed at redefining the new social contract for education, which is however not well defined in the Report (Milana and Tarozzi, 2022). This shift is essential to address the challenges outlined in the initial section. The report goes beyond offering guidelines and recommendations; it underscores the imperative to reimagine a 'new social contract' to foster more just, peaceful, and sustainable futures. Central to this vision is an expanded concept of citizenship, expanding the sense of belonging beyond national borders, and emphasising the active involvement of citizens and civil society in reshaping the public purposes of education as a common good.

What is the role of GCED in this document? I would like to stress three main elements:

1. The composition of the international commission who wrote it: unlike the previous reports, it is global and chaired by Sahle-Work Zewde the president of the Democratic Republic of Ethiopia, the first woman and non-European in this important role. Overall, the Commission is an authoritative independent international team of thought-leaders from diverse fields and different regions of the world, including from the global south
2. GCED was not mentioned in previous 20<sup>th</sup>-century Reports, where citizenship was essential but not global. In the Faure (1972) and Delors (1996) reports, education was aimed at developing skills to support national citizenship; here, futures (plural) are shared, closely interconnected and global and combine various spheres of the human and non-human.
3. The second part of the report includes concrete proposals and guidelines for renewing education, and here a GCED view is explicitly mentioned:

It is crucial to reconceptualise how human beings relate to each other (the human sphere), to the planet (the non-human natural sphere) and to technologies (the non-human artificial sphere). This integrated and holistic vision echoes the one represented by GCED, which embraces an educational approach that frames the core idea of interdependence and integration between the social and natural spheres.

## **2. THE 2023 REVISION OF THE 1974 RECOMMENDATION**

The “Recommendation on Education for Peace, Human Rights and Sustainable Development” was approved in November 2023 after a long revision process. It is a non-binding aspirational document but is the more powerful legal tool for UNESCO education because it requires member states to produce a report every 4 years on the implementation of the Recommendation.

It is also the only global standard-setting instrument that outlines how education can and should be used to build lasting peace and sustainable development. Therefore, it also provides the legal foundation for Target 4.7 of the SDGs.

The 2023 Recommendation is inspired by UNESCO’s *Future of Education Report*

(2021) and *U.N. Transforming Education Summit* (2022) and it aims at ensuring people with the knowledge, skills – including socio and emotional ones – values, attitudes and behaviours for effective participation in building more peaceful, just, healthy and sustainable societies.

In a nutshell, Agenda 2030, UNESCO’s 2021 Report, and the Revised 1974 Recommendation all together aim to ensure that education systems are well-equipped and “fit for purpose” to meet the challenges of the XXI century.

Where does the need to revise the 1974 recommendations come from? In 1974, the international community was in the middle of the Cold War, and World War II had just passed. Since then, the world has drastically changed. So, the Recommendation has been updated to reflect better contemporary concepts and areas of action related to education for sustainable development, global citizenship education and education for health and well-being. More broadly for advancing Sustainable Development Goal 4, in particular Target 4.7. and that already says something about the central role of GCED in this document.

There are many new elements in this text, compared to the original 1974 text, namely:

- It is holistic because it covers all levels and forms of education
- Its scope is system-wide, since it addresses all dimensions of the education system
- It addresses some of the key contemporary challenges, i.e., digital citizenship, health and well-being, gender equality,
- It provides tools for monitoring and policy learning.

## **2.2. The revision process**

The took place over three years, along three main steps:

1. Preparation: Review of relevant documents, evidence and research, from December 2021 to January 2022.
2. Technical consultations. After a survey, regional consultation, thematic (2022), International Expert Group (composed by women and men from all geographical regions and with diverse backgrounds), a first draft of the Recommendation was delivered
3. Formal consultations with Member States From September 2022 and until adoption in November 2023.

The political consultation had a major impact on the nature of the text and is the result of predictable political mediations. Democracy, the rule of law, and

human rights are not perceived in the same way by all member states. The concept of global citizenship, too, is often seen in opposition to national citizenship and perceived by some as a threat to nationalist policies.

The discrepancy between the initial draft prepared by the experts and the version approved by the assembly is particularly noticeable in the evolution of the titles, especially concerning GCED.

### **2.3 The titles' evolution**

The original title of the Recommendation in 1974 was as follows: 1974 Recommendation concerning Education for International Understanding, Cooperation and Peace and Education relating to Human Rights and Fundamental Freedoms.

The original title of the draft version after the technical consultation was: Recommendation concerning Education for Global Citizenship, Peace, Human Rights and Sustainable Development. Which could have been commonly referred as “Recommendation on Education for Global Citizenship”.

Then, after the member states consultation GCED disappeared from the title. In its place, reappears the concept, in my opinion very outdated, of International Understanding.

In the end, however, after the final long consultation. GCED reappears in the subtitle, and the full title approved by the General Assembly is as follows:

2023 (final) Recommendation on Education for Peace and Human Rights, International Understanding, Cooperation, Fundamental Freedoms, Global Citizenship and Sustainable Development.

But it is commonly referred to as the “Recommendation on Education for Peace, Human Rights and Sustainable Development”.

## **3. KEY TERMS IN THE ORIGINAL AND REVISED VERSIONS**

I analysed the text in more detail, comparing the use of key terms and the role of the GCED in the recommendation. I also examined how the themes that guide this text have changed over 50 years.

I do not have the space here to report in detail on the analysis, which is still in progress, and I will only point out some highlights that emerge from the analysis of the terms:

- Notably, “GCED” or “Global Citizen” and “Sustainability” were not mentioned at all in the original version, so it is for “Transformative”.

- “Peace” and “human rights” are even more used (also because this version is much longer with almost twice as many articles).
- Concepts related to “nation” are less used in words composed (“International”, “International understanding”), while the very term “national” is obviously still very appreciated by member of the General Assembly, which represents nation states.

There was (and still there is) no mention to “Post-colonial”, or “De-colonial” issues, but a mention of “Post-colonial criticism was included in Article 24 with regard to the innovation of the history curriculum: “fostering critical views of and supporting the struggle against colonialism and neo-colonialism in all their forms and manifestations”.

The emphasis on the concepts of “Equality”, and also “Cultural diversity”, has grown considerably.

Finally, it is worth noting the great growth in the concept of “Skill” or “Competence”, which reveals the pedagogical approach underlying this text.

Tab. 1 Comparing the use of key terms in the original and revised versions. \*Not in the title.

	1974 (45 articles)	Revised 2023 (72 articles)
Global Citizenship	0	16
Sustainable	0	43 (sustainable development 35)
Global	5	43
International	75	32*
Transformative	0	11
International understanding	16	11
Peace	28	45
National	10	22
Human Rights	32	54
Civic	5	3
Equitable/equal/equality	3	14/15/6
Diversity	7	15
Skill	1	19 (+7 competencies)

Of course, the approved version is a compromise document affected by the international situation, which has been marked by the resurgence of

nationalism. However, it remains an important reference point for educational policies and practices that focus on a transformative approach to education for sustainability and global citizenship.

In the revised 1974 Recommendation, GCED is one of the core issues, mentioned in many parts of the document. Three elements demonstrate its centrality as a core theme in the new document: (1) it is mentioned in the official title (even if is not the main title, as it was supposed to be in the first draft; (2) the document provides a definition of GCED as one of the key terms; (3) It is Recognized as one of the guiding principles in the second part of the Recommendation and (4) it is acknowledged as a core component in the learning objectives, at every level in formal education from pre-school to higher education.

## **CONCLUSION**

In conclusion, both documents underscore the critical importance of adopting a global perspective in education and emphasize the need to provide learners with a global ethos at all levels. Furthermore, GCED is presented in both as a cross-cutting perspective that equips individuals with a fresh lens through which to view the world, raising sensitivity of global challenges and a shared sense of responsibility for promoting just, peaceful, and sustainable development.

The resurgence of nationalist political discourses, which often view global perspectives in education as a threat to national identities, is undoubtedly cause for concern.

However, the new educational social contract can only aim at fostering a deep sense of awareness and responsibility for a different political belonging to the planet and the global social community.

# REFRAMING UNIVERSITY. IMPACT AND RELATIONAL VALUE IN THE HIGHER EDUCATION SYSTEM

Valentina Martino<sup>a</sup>

Lucia D'Ambrosi<sup>a</sup>

Paolo Brescia<sup>a</sup>

Vytautas Beniušis<sup>b</sup>

<sup>a</sup>Sapienza University of Rome; <sup>b</sup>Vilnius University

This paper examines the connections between universities' emerging missions, emphasizing the valorisation of knowledge for non-academic stakeholders, and the evolution of traditional institutional missions such as teaching and research. Adopting a corporate and public communication perspective, an exploratory multi-case study was conducted across four academic institutions in Belgium, Italy, and Lithuania. The findings reveal how these New Missions can leverage innovative strategic relationships with stakeholders, amplifying universities' social, economic, and cultural impact on their surrounding environments.

civic university, university communication, corporate communication, university missions, university impact

## INTRODUCTION

This paper explores the links between universities' emerging missions, emphasizing the valorisation of knowledge for non-academic stakeholders, and the evolution of traditional institutional missions—teaching and research—within the European context.

With rapidly changing scenario, the concept of the *Civic University* (Dobson & Ferrari, 2023; Goddard et al., 2016) has gained prominence. This vision, underpinned by reforms and international guidelines, integrates higher education's *economic* and *cultural* missions ("Third Mission"; Boffo & Moscati, 2015) with its *social* one ("Fourth Mission") into an all-embracing field of "University impact". In this perspective, universities are increasingly tasked with generating medium/long-term social and economic benefits for their

communities, transforming both their external and internal environment.

Within this framework, this study focuses on the internal organizational dimensions of University impact (Dobson & Ferrari, 2023). It adopts a relational perspective to investigate how New Missions (NMs) can act as *multipliers of relationships* within academic and non-academic environments (D'Ambrosi et al., 2024), reshaping the strategic model of the University by integrating new areas, activities, and actors (Carayannis et al., 2012).

## 1. THEORETICAL FRAMEWORK

Recent crises and reforms have compelled universities to reconfigure their relational models, emphasizing active engagement and responsibility towards stakeholders and society. This shift reflects a departure from the traditional image of universities as *ivory towers* (Etzkowitz et al., 2000) towards institutions committed to societal well-being.

Universities are adopting innovative strategies that prioritize stakeholder engagement, inclusivity, and alignment with the UN Agenda 2030 Sustainable Development Goals. Research on this topic has examined the socio-cultural values of higher education through the lens of various disciplines, highlighting its significance in contemporary society (Riviezzo et al., 2020). Moreover, universities today are evolving into institutions focused on educating citizens who are not only aware and capable of critical thinking, but also motivated to engage actively in common good (Boffo and Moscati, 2015).

The social mission of universities encompasses a broader range of strategic goals and activities that underscore their responsibility to internal and external stakeholders. This expanded mission is oriented towards *social innovation*, which has become increasingly important in the post-Covid-19 era. It strengthens the University's capacity to generate and disseminate knowledge, while generating social and economic benefits. In this context, it becomes an imperative to ensure social inclusion, innovation, collective well-being, and sustainability. The convergence of these missions, often likened to the concept of a multiple *helix* (Etzkowitz and Leydersdorff, 1997), represents the most strategic approach that universities should proactively adopt to ensure meaningful impact.

In Europe, universities are increasingly called upon to address contemporary challenges, upholding the model of the Civic and Ecological University (Barnett 2018; Dobson and Ferrari, 2023) as an institution dedicated to serving the wider community, especially through social engagement. Post-pandemic universities,

especially in the Anglo-Saxon system, have increasingly focused on rankings to highlight their performance and enhance their global competitiveness in terms of social impact. In Italy, the new evaluation criteria established by ANVUR<sup>1</sup>, focusing on the 2020-24 period, introduce for the first time the assessment of the social impact generated by universities through the interaction with stakeholders and communities.

## 2. RESEARCH METHOD

From such a scenario, the research addressed the following RQs:

- How do the New Missions (NMs) help universities enhance relationships in academic and non-academic contexts?
- What are the effects of the NMs on relationships among students, researchers, and university staff, as well as between different universities and disciplines?
- How can the NMs contribute to innovate the institutional missions of research and didactic fostering the vision of a Civic University?

A multi-case research was conducted between March and May 2024, focusing on two universities in Italy (Sapienza University of Rome and Polytechnic of Milan), one in Belgium (Ghent University), and one in Lithuania (Vilnius University), representing different regions in Southern Europe (Italy), Central (Belgium), and Eastern (Lithuania).

To examine trends and perceptions using an explorative and grounded theory approach (Grenness, 2022), four case studies were developed, employing several qualitative methods. First, a context analysis of internal documents and communication materials (e.g., strategic plans and corporate websites) was performed. Secondly, four semi-structured interviews were conducted, recorded, and transcribed with experts involved in the management of the NMs at each university<sup>2</sup>. The questionnaire included 14 questions aimed at exploring the effects of the NMs on didactics and research from various perspectives, including internal relationships among researchers, students, and personnel; the impact on their knowledge and skills; opportunities to engage with economic and social stakeholders; and collaboration with other universities.

---

<sup>1</sup> ANVUR is the Italian National Agency for the Evaluation of Universities and Research Institutes.

<sup>2</sup> The privileged witnesses included: the Dean of a Dept., Sapienza University of Rome; a member of the Management Committee at the Dept. of Educational Policy, Ghent University; a former head of the strategic planning unit, Vilnius University; a Vice Rector, Polytechnic of Milan.

At Sapienza University, a focus group with a selected group of experts was also conducted in the form of an *autoethnography* (Butz and Besio, 2009), involving two Authors of the current study and three members of the library staff. Additionally, the research incorporated an audio podcast featuring an interview with a representative from Ghent University, which was transcribed and analyzed.

The interviews were conducted remotely, lasting up to 1 hour to 1 hour 30 minutes. The interview and focus group sessions specific to Sapienza University were conducted in person.

### 3. FINDINGS

#### 3.1. Case studies

The contest analysis, based on documentary sources, highlighted some distinctive themes related to each of the four universities under examination:

- Ghent University (GU) focuses on *challenge-based education*, participating in the European University Network, promoting multidisciplinary policies and centers, and fostering regional and lifelong learning academies. It also engages in the European Dialogues Initiative and supports entrepreneurship via initiatives such as the Dare to Entrepreneur Center.
- Sapienza University of Rome (SU) emphasizes *strategic networking and partnering* with companies and organizations. This librarian platform fosters innovative didactic, scientific, and cultural activities (e.g., researches, publishing, workshops, events), in collaboration with academic and not academic stakeholders.
- Vilnius University (VU) positions itself as an *entrepreneurial university*, promoting innovation through Science and Technology Parks, a Technological Business Incubator, Innovative Enterprises, and a Career Center. It is also a member of the ARQUS European University Alliance and advances interdisciplinary research by funding and supporting such projects.
- Polytechnic of Milan (PM) is recognized for connecting academic research with practical applications, such as projects addressing underprivileged areas and *sustainability-related innovation programmes*. It prioritizes social responsibility through collaborative platforms with nonprofit organizations.

### 3.2 Interview Insights

Thematic analysis of the experts' accounts highlighted that the NMs have a special potential to cultivate relationships across the *non-University environment* (by connecting academic institutions with private, public, and nonprofit stakeholders, starting from the surrounding urban and local territory), and also within the *University system* itself (by stimulating a closer collaboration among researchers, students, personnels, as well as among different academic institutions, academic departments and offices):

We work closely together with the city, the province, and regional stakeholders. Challenge-based education, promoted in partnership with the city, involves the participants in a 'quadruple helix environment' we have created: an ecosystem where different stakeholders can come together, find each other (GU).

In challenge-based courses, students are brought closer together with the staff and teachers to jointly work on challenges which are defined together with companies, public, and nonprofit organizations. Researchers and students from different faculties are encouraged to cooperate (GU).

Impact creates the necessity to bring together different structures, supporting research and education. And they need also to collaborate with other structures, for instance human resources, IT, and so on (GU).

Social responsibility is a cohesion agent for the academic community, it facilitates collaboration and commitment (PM).

The NMs could enhance *material assets* supporting didactic and research tasks (physical and digital workplaces, technologies and laboratories, cultural heritage, patents, startups, spin-offs), as well as the University's *intellectual and social capital*. An intangible value for both the academic system and society emerges, for instance, from the new soft skills academic leaders and actors need to acquire to interface effectively with the external stakeholders and with one another (e.g., within "communities of practice"):

It is not simply a transfer or exchange of resources and knowledge, for which University plays traditionally an upper paternalistic role, but an integration: to align an university's missions ones to others, and also with the missions of other organizations and universities (SU).

Cross-disciplinary has been largely dealt with by setting up so-called "valorization centers", focused on specific topics, where researchers from different groups and faculties are brought together (GU).

The NMs are an unique occasion for diverse academic actors to relate and co-work. They stimulate old and new relationships inside University (SU).

The NMs have the potential to transform the individualistic culture of universities into one more open to a *coopetition* style (Dagnino and Rocco, 2009), grounded in strategic partnerships with stakeholders. This complex form of cooperative relationship evolves from a shared set of goals and values to achieving mutual benefits that partners could not attain independently (Giesecke, 2012; Schiuma and Carlucci, 2018). A key precondition for quality partnerships is the sharing of resources and complementary expertise: to achieve this, universities must step out of their “comfort zones” and experiment with a more participatory and *symmetrical* model of interaction (Grunig, 2016) with society and stakeholders, emphasizing listening, dialogue, and mutual learning:

Partnerships are about understanding the culture of other organizations, as well as developing those “antibodies” you need to be not other-directed and preserve your own identity. For University a unique opportunity to learn from other organisations, but also about itself (SU).

The value of partnership lies in connecting organizational actors that are traditionally different, separated, or even in competition. A highly strategic convergence is possible within academic communities by linking different universities, researchers from various disciplines, and lecturers/personnel/students collaborating in teams.

One of the most strategic relationships that the NMs encourage is the collaboration between different scientific disciplines, following a *transdisciplinary* approach (Lawrence, 2010) that goes beyond pure interdisciplinarity. As suggested by the etymological concept of *vertere ad unum* inscribed in the idea of the University, on one hand different research perspectives are called to engage in dialogue and converge on global challenges affecting the contemporary world. On the other hand, to address and solve societal problems, research must also incorporate first-hand knowledge from non-academic experts.

European policies don't need narrow-minded researchers working on one topic, but researchers who have a wide understanding of different and even transdisciplinary topics. This takes years to see results (VU).

Not least, interviewees highlight the continuity between the emerging topic of impact and an ancient tradition. Indeed, in addressing contemporary social challenges, universities can rediscover and relaunch their unique identity as *purpose-driven organizations* (Basu, 2017), whose strategic potential for the common good (beyond the traditional missions of research and didactic) expresses significant value for the community and society (in addition to stakeholders). To achieve this, universities must invest not only in public engagement, but also in empowering their corporate strategy and culture by implementing specific training, rewards, and evaluation systems to support researchers and personnel committed to the NMs:

The NMs risk increasing the pressure on academics. We need to invest in human research planning and academics should have the opportunity to specialize their career (VU).

Academics are used to their ordinary work, like writing and teaching, while to do research addressed to global challenges is more difficult. Academics resist because they are not educated to think about stakeholders and how to solve their problems. European funding pushes them to think about their impact: this is just a beginning (VU).

Staff need training and support to acquire new knowledge and skills (GU).

In the early stages of resource planning (new buildings etc.), the NMs should be already taken on board (GU).

#### **4. FINAL CONSIDERATIONS**

The study illustrates that the NMs express not only an impact on stakeholders and society, but also a strategic *rebound effect* that innovates, in the medium-long term, the academic system itself. By regenerating both the tangible and intangible assets of universities, the NMs foster research and higher education processes: they stimulate researchers and personnel to adopt bottom-up practices and approaches of *self-reform* and innovation, deeply rooted in stakeholder relationships, listening, engagement, and partnering (D'Ambrosi et al., 2024).

Impact, from this perspective, can be considered a *transformation of value through relationships*. The study highlights the unique potential of the NMs in providing academic institutions with material resources and processes of *innovationship* (Buono and Frattini, 2023), based on quality relationships that, in the medium-long term, cultivate both didactic and research.

Among the limitations and developments of the current study, the small sample of universities investigated in Europe and the research design limited to qualitative methods can be mentioned. In the future, a larger number of insights and case studies could be collected to develop a real dashboard of indicators to measure and assess *University meta-impact*—the medium-long term effects the NMs produce on didactic and research—in addition to the “external” impact on non-academic stakeholders and society.

The study also offers recommendations for institutionalizing such relationship-driven innovation. The results suggest that, to effectively drive change, academic leaders should update their strategic vision and promote the opportunities that the NMs can offer to academic communities, in order to concretely encourage and support individual efforts for the rise of a Civic University.

Indeed, the traditional model of the University is reframing itself due to shifts in the nature of relationships with stakeholders and society. The transformation includes moving from knowledge transfer to *co-creation*, tactical cooperation to *strategic partnerships*, interdisciplinarity to *transdisciplinarity*, public engagement to *academic empowerment*, and mission to *purpose*. Not least, it involves the shift from *impact* to *value* (Porter and Kramer, 2011), which universities, stakeholders, and society could mutually share.

# GROWING PUBLIC ENGAGEMENT INITIATIVES SIGNALING CHANGING FUNCTIONS IN ITALIAN UNIVERSITIES

Barbara Grüning<sup>a</sup>

Roberto Moscati<sup>a</sup>

Università di Milano-Bicocca

With its ever-increasing role in both the economy and society, knowledge is having significant consequences on university functions and internal organization. Our research on Italian Universities has shed light on a recent development of a new definition of the 'Third Mission' aiming at activities establishing relationships both with the economic world (Technological Transfer) and society (Public Engagement), but which are at the same time sensitive to sustainability initiatives. By means of a comparison between twelve universities, our research reveals the different development of the two types of activities as consequences of the choices made by the individual governances and/or the predominant disciplinary areas in each university, in addition to the characteristics of the reference territories.

Changing Universities; Third Mission; Technology Transfer; Public Engagement; Sustainability

## INTRODUCTION

Following the development of knowledge and its applications in society, universities have been modifying their functions slowly but progressively with the passing of time.

The recent opening of universities to society has been characterized by a constant advancement, though at different speeds in Anglo-Saxon and European countries. The former, in fact, have always been open to society, a characteristic inherent in the spirit of the institutions since the beginning, and even more so in the United States, thanks to the creation of the land-grant universities in the second part of the 19<sup>th</sup> century. In Europe, the Humboldtian model has put up more resistance to changes. With the passing of the years,

however, the process has accelerated in various areas (in the European context as elsewhere), as is well-known, due to the growing demand for the use of knowledge by the economy. Thus, the *knowledge economy* exerts an ever increasing influence on the transition from an elite to mass and then universal university (Throw, 1974). Following this dimension, a more specifically social optic has gradually been added, evidenced in universities participating directly and formally in public policies, both local and national. The spread of the globalization process has, in fact, familiarized both aspects, as well as problems of collective life to which universities are called upon to provide solutions.

The multiplication of requests from the outside world has however created internal contradictions within universities, which reflect on the management activity, relations between governance and different subject areas, as well as the roles of academics and technical/administrative staff. In fact, adding on initiatives open to the outside world has produced an accumulation of tasks and duties for university leadership as well as for academics and other staff. In particular, for academics not at the top of their careers, involvement in activities lacking scientific recognition has created difficulties and resistances. To counteract this situation, some universities are starting to introduce incentives and positive evaluations useful for career paths. Furthermore, involvement in activities with external social/economic realities may create problems of professional ethics related to the characteristics of external referents, who as clients may request scientific and/or cultural performances giving rise to ethical doubts.

The pressure towards opening up to the outside world is summed up in a new sector of university activity which in Italy is conventionally termed “The Third Mission” (Boffo, Moscati, 2015). Its growing importance is leading to an emphasis on university autonomy and therefore growing diversification, due to the interpretation of the new roles of the universities and the characteristics of each context of reference – economic, social and cultural.

It needs to be remembered that activities that can be linked to the Third Mission today were already present in some subject areas of applied hard sciences –like engineering or natural sciences – or in the form of *technology transfer* activities, based on research projects or experimental/application activities of scientific discoveries (chemistry applied to medicine is a classic example). These projects are now partly patentable and transferable to the market in the form of start-ups and spin-offs.

This new, ever-increasing opening of universities toward the outside world has brought to new forms of relationships between universities, public bodies, local administrations (State) and the business world – the so-called “Triple Helix”. These forms of relationship have assumed characteristics responding the rules of the market in the neo-liberal version (Etzkowitz, Leydesdorff, 1995; Etzkowitz, Leydesdorff, 1998). Thus, in the first phase Third Mission activities denoted universities taking on central roles as driving components of economic development: Burton Clark’s model of “entrepreneurial university” (Clark, 1998; Etzkowitz et al., 2000). Subsequently, universities opened up to other non-economic social realities, developing the idea of a “civic university” (Goddard et al., 2016; Goddard, Vallance, 2013) which has made possible the implementation of the Third Mission even where economic development is not particularly widespread.

Within the process of opening the university to outside reality, the “civic university” proposal marks a decisive leap in quality, signaling a comprehensive (“holistic”) reinterpretation of the institution and its aims (Barnett, 2000; 2011; 2018; Delanty, 2001). As a result, universities have been progressively brought to include civil society issues in their activities, thus giving rise to the process called “Fourth Helix”. In the same direction, a further development and specification of the civic dimension emphasizes the characteristics of the natural context and the transformation of the environment. The “sustainable development” of the *knowledge economy* requires a parallel evolution of the *knowledge society*.

A later specification of sustainability issues is to be found in the growing awareness of the new importance of the ecological problems characterizing the “Fifth Helix” (Carayannis et al., 2012). The development of activities in the Public Engagement sector is particularly interesting also because it very often involves external referents (public bodies) which had no tradition of collaborating with universities. And nevertheless, recent research shows that even in Italy there are increasing cases of university involvement in regional development activities that have long been widespread in other countries<sup>1</sup> (Pinheiro et al., 2012).

---

<sup>1</sup> It is significant that this trend has been highlighted by the Global University Network for Innovation (GUNI) of UNESCO, while the European Union has produced a guide for regional authorities entitled *Connecting Universities in Regional Growth*.

## 1. THIRD MISSION IN ITALY

In the Italian higher education system, the development of the Third Mission follows a slow but progressive pace, according to the characteristics of the universities and their socio-cultural contexts. In our research on twelve Italian universities (Boffo, Moscati, Rostan, 2024), it emerges that the perception of both the responsibilities/duties of universities towards society as well as the possibility of developing initiatives with local bodies and institutions is spreading in different ways and degrees in relation to the relevance of different subject areas (more or less oriented towards the activities of applying scientific production), as well as the readiness of individual university's governance to establish relations with society. In particular, how succeeding rectors interpret relations with the outside world is a central element in continuing policies opening up to the external world. It is also true of the new regulatory framework that puts the evaluation of outreach activities together with that of scientific research as both representing the central requirements for a stable Third Mission development.

The progressive spread of the Third Mission sector may be traced through two indicators: the increase of representatives in governance dedicated to Third Mission (cultural and scientific) activities cooperating with external actors; and the development of “strategic programs” as a new instrument for orienting university politics, especially towards society.

In several cases, Third Mission sectors have been developed in line with the main subject areas within a university. For instance, as it emerges from our research results, in the universities – ‘Polytechnic of Milan, University of Turin, University of Milan-Bicocca and University of Pavia – where STEM disciplines play a crucial role, the main Third Mission activities are projects related to Technology Transfer, which are the more and more oriented towards creating patents (beyond the traditional dissemination of research results), which are carried out by professors together with assistant researchers and PhD students.

As stated above, in each university Third Mission activities are mostly related to the territory where they are located. Another example is given by the University of Venice “Ca’ Foscari”, which provides support activities for urban political and cultural activities, favoring the rationalization of the public and private initiatives by forming a unique coordination, and becoming consequently a reference center for the city.

The conspicuous increase in Public Engagement activities is, however, the most

meaningful aspect of Third Mission expansion in Italy.<sup>2</sup> Public Engagement initiatives are especially widespread in peripheral and territorial contexts with little economic development, such as some areas of Southern Italy. In those regions, universities like those of Sannio, Calabria, Catania and Bari, have built relations with local entrepreneurs, and promote and are involved in activities concerning the civic society, in particular in educative projects, mainly through master courses with private companies, lifelong-learning training courses in state schools or courses in prisons.

Projects designed to impact on the quality of cultural life have been promoted in very different urban contexts. So, for instance the University of Padua has begun to cooperate with the town council's sustainability programs, while Roma Tre University supports cultural initiatives within its district area like running the communal theatre (the "Palladium"). The most relevant case is however the "Poli-social" project of Milan's Polytechnic, which redefined its public engagement policy in "social responsibility". The "Poli-social" project consists in "off-campus" centers scattered in peripheral and sometimes rough neighborhoods, in an attempt to involve local communities in educational and research activities.

The most rapid increase within Public Engagement programs is however with *sustainability*, which is interpreted in different ways. For instance, Milan Polytechnic's "Strategic Program of sustainability" relates the concept of sustainability to ideas of equality, inclusion, shared growth, in order to carry out research activities oriented towards "sustainable development". The University of Padua also talks of "sustainable development" in its strategic program "Unipadova sostenibile", and refers to projects on environmental sustainability. The University of Turin offers

a holistic vision where people are at the heart of the environment and the community (...) favoring a culture based on the equilibrium "human-environment" (...) and enhancing politics of environment sustainability (...) including those oriented to the mitigation of and adaptation to climate change (UniTo. Piano Strategico 2021-2026, p. 29).

The University of Milan Bicocca has gone as far as to create a center for sustainability named "BASE" (Bicocca, Environment, Society, Economy) to develop the university's strategic program.

---

<sup>2</sup> A little-known example is the University of Macerata's Third Mission politics, dominated by social science and humanistic subjects (Rinaldi, Cavicchi, Robinson, 2022).

All the Universities, however, emphasize the importance of investing in activities for their own sustainability, with revisions of the mechanisms of energetic production and waste prevention, and sometimes collaborating with the local public institutions, as in the case of the University of Padua. The University of Calabria has produced a “Program of conscious development” to enhance environmental resources, by constituting work groups dedicated to the topics of education, energy, climate change, social justice, mobility and rubbish disposal.

It must be underlined that the twelve universities in our research have incorporated the guidelines of the ONU 2030 Agenda 2030 for sustainable development in their Third Mission, and participate in the “Academic Network for the sustainable development” (RUS), which connects 86 Italian universities.

## **2. SOME FINAL REMARKS**

The recent development of Third Mission programs in Italian universities challenges any future analysis of their impact on the society and their internal organization. One of the main aspects to observe over the next few years concerns compatibility – their orientation towards the economic sphere, which may push them to be more competitive even within the same academic system and their orientation towards the civic society with the aim of countering social inequalities in their territory. This issue seems to be particularly important if we consider the historical, social and cultural differences between different geographic areas of Northern, Central and Southern Italy, as well as the fact that universities have gained more and more autonomy in the last few decades, though under a strong centralized organization, as is shown by the role of the National Agency for the Evaluation of University (ANVUR) in defining the goals and evaluation of Third Mission activities.

A further issue to explore is the relationship between universities and the University Ministry in order to understand how and to what extent the latter fosters or deters autonomous university politics, with in mind how national evaluation criteria are applied to very different social and cultural contexts. Finally, with regards to the issue of sustainability, which has been strongly supported by the government’s national recovery and resilience plan (PNRR) two questions come to mind. The first is whether the funds given in the last few years to support sustainable programs will be in the future included in the Ordinary Finance Fund (FFO). The second is how universities will be able to balance environment issues and issues concerning social-territorial

inequalities, in order to avoid environment sustainability, with its economic costs, becoming a privilege for only few territorial areas.

# THE SOCIAL MISSION OF A SOUTHERN UNIVERSITY. STORIES WORTH TELLING

Emanuela Pascuzzi<sup>a</sup>

Stefania Chimenti<sup>a</sup>

<sup>a</sup>University of Calabria

What is the social mission and why is it important in a Southern university? Based upon the results of a participatory research and development project at the University of Calabria, the contribution offers an insight into the Public Engagement experience of this university, useful to deepen the nature of this side of the Third Mission and to focus on the needs for improvement.

Public Engagement; Civic University; Community Participatory Action Research; Mixed methods

## INTRODUCTION

Today's social challenges call universities to strengthen their Third Mission (TM, thereafter) and to commit to activities contributing to economic, social and cultural development: a commitment that should be innovative, participatory, transparent and accountable to society (Vargiu, 2015; Goddard et al., 2016; Palumbo, 2019; Lo Presti et al., 2023), not confined to technology transfer (Boffo, Moscati, 2015), following “an alternative model of the civic university that integrates teaching, research, and engagement with the outside world such that each enhances the other” (Goddard, 2018, p. 362).

## 1. WHAT SOCIAL MISSION IS AND WHY IT SHOULD BE DIFFERENT IN A SOUTHERN UNIVERSITY

The Social Mission is a recent category introduced in the language and the institutional framework of the Unical and corresponding to what elsewhere is called Public Engagement (PE, thereafter). Despite its overall goal – the dialogue between university and society, the transformative role of science, its social

impact – is rooted in the origins of the same university, traced back to 1968. Following the national debate on the PE and the guidance by the ANVUR (the Italian National Agency for the Evaluation of Universities and Research Institutes), the Social Mission has been formally established by the 2020-2022 Unical Strategic Plan and consolidated by the subsequent one as TM second pillar beside the Technology Transfer (TT). Despite being included in the Strategic Plan, up to the present no fundings were assigned by Unical to support PE projects; neither, in most cases, fundings were assigned before. So, all initiatives collected found other ways to be supported and realized.

As pointed out by literature, PE is a discussed and evolving topic. ANVUR defined it as “the set of initiatives with educational, cultural, and social development value, addressed to or involving a non-academic audience” (ANVUR, 2016, p. 41). Discussion concerns issues such as perimeter, stakeholders, the profile of the engaged academics, territorial dimension, and individual/institutional nature of the initiatives (Arzivino et al., 2018). For instance, the perimeter of PE is evolving with the indications of ANVUR referring to the framework evaluation of the research and the TM (VQR), so that some actions (e.g., production of public good, participation in policy-making, etc.) earlier included within the PE taxonomy were later assigned to a new autonomous field (see public calls for VQR 2015-19, and VQR 2020-24).

Not only the boundaries of PE are uncertain and changing, but also the kind of initiatives under the PE umbrella are very much institution and context-related, which means that they are shaped by the needs, assets, and features of the university and of the territory in which this is rooted (e.g. the academic knowledge in place, the organisational infrastructure, the nature of the stakeholders within the academics’ networks, the cooperation attitude of the internal and external environment, the type and extension of social problems, etc.).

As for the social context of Southern universities, the persistence of the North-South divide, the economic underdevelopment of Southern Italy, and the higher incidence of social risks are well known. “The disparity in the economic and social conditions of the regions of Southern Italy compared to the rest of the country is exceptional, both for its persistence and the breadth of the geographical area involved” (Bastasin, 2024, p. 2). Furthermore, within the South, “Calabria is (...) a region that is not only much poorer but also more unequal than the others” (Cersosimo, 2023).

For instance, a look at some national statistics on well-being (see tab. 1) shows

that: people in the South (and even more in Calabria) live shorter and in worse health; when Southern people get old, they can count less on home care services; when young (15-29 years), they are often Not in Education, Employment, or Training (NEET); when they are students, they achieve less adequate literacy skills, and even less adequate numeracy skills.

Tab. 1. Some well-being indicators, Calabria-Italy. Source: ISTAT – BES, 2023.

	Calabria	Italy
Average number of years one person can expect to live at birth	82.0	83.1
Average number of years in total health	55.4	59.2
Share of elderly people treated in integrated home care	0.9%	3.3%
NEET	27.2%	16.1%
Share of eighth-grade students who do not reach a sufficient level of literacy	49.4%	38.5%
Share of eighth-grade students who do not reach a sufficient level of numeracy	60.7%	44.2%

This scenario poses several arduous challenges to universities’ Social Mission. So, what is the University PE in such a context?

## 2. DATA AND METHODS

Based on the assumption that social change is all more adequate, satisfying, and lasting if rooted in a shared process, the participatory research and development project presented here was informed by the Appreciative Inquiry approach (Barrett, Fry, 2005; Cooperrider, Whitney, 2005; Stavros, Torres, 2018).

In 2021-22, 93 face-to-face qualitative interviews were conducted with academics and staff, discovering the most positive experiences of PE (around 40) at Unical, as perceived by the participants, and gathering their aspirations for the future. The analysis portrayed the most common PE representations and their evolution from the early Seventies. The PE initiatives in Unical (1,975 in 2019-23) were also collected by a questionnaire (annual monitoring) – inspired by guidelines of ANVUR and based on a monitoring form developed by the APEnet network (Associazione – Rete italiana Atenei ed Enti di Ricerca per il

Public Engagement) and adapted on Unical needs – that allowed to delve into PE characteristics.

### **3. FINDINGS**

#### **3.1. Recent trends of PE**

In 2019-2023, most PE activities were organised by Unical (69%), mainly from the Social Sciences departments (61.5%). Research dissemination activities (seminars, workshops, publications addressed to the public, etc.) were more than one-third of the total (39.3%). The main stakeholders were the general audience (23.1%) and the schools (17.4%).

The PE activities contributing to social SDGs UN Agenda 2030 were 1,369 (69.3%). Among them, most contributed to SDG4 – Quality education (36.8%), SDG8 – Decent work and economic growth (18.5%), and SDG3 – Good health and well-being (10.7%). A lower share contributed to SDG5 – Gender Equality (9.8%), SDG16 – Peace, Justice and strong institutions (9.7%), SDG10 – Reduced inequalities (8.8%), SDG1 – No poverty (5.7%).

Those working against social inequalities were mostly “initiatives to valorise, consult and share research” (26.9%) and “participatory democracy initiatives” (20.2%).

#### **3.2. Some stories**

Four of the discovered stories are presented below, grouped in three fields, corresponding to as many directions of community engagement: I. Support in Social Emergencies; II. Working with schools; III. University students’ engagement.

##### *Support in Social Emergencies*

The first story dates back to the first academic year of Unical, 1972-73, when following a flood, the then Rector, Andreatta, sent a group of academics, first-year students with other professionals’ volunteering to provide aid to Fabrizia, a small flooded town in the inner Calabria hit by the catastrophe. Some scholars stayed there for months doing first aid (food and stuff), listening to people, giving professional advice, and helping low-income families create cooperatives to rebuild their houses. The aid to Fabrizia was the nascent state of PE in Unical.

Andreatta said that we had to go and provide help (...). We went with the students (...). We slept together with the families. Families who had lost their houses slept in the school classrooms. People were desperate! We began

distributing the stuff we had brought. (...) Many people could not afford the costs of the building appraisal, which were very high for that time... So, we decided to do the “Red Rescue” with engineers from Lotta Continua, and they were there to do all the assessments for free...We stayed there for 4 months. We had become the confessors of all the people (...) They rebuilt everything there! (...) We were there in the middle and helped them with their choice. It was more coaching that we did (Interview No 12).

The second story occurred almost fifty years later, at the beginning of the COVID-19 pandemic, when the conventional alcohol-based gel was needed and could not be found anywhere. An Unical academic spin-off with the Department of Pharmacy produced the disinfectant gel using alternative, low-cost, and local ingredients. It supplied it for free, sending it even to Codogno, the first Italian town hit by coronavirus. The primary resources were the Unical Spin-off, a team of academics, research fellows, Ph.D. students, administrative staff, department labs, and company donations. This was an example of solidarity from the South.

We produced disinfectant gel. We sent 100 kg to Codogno as the first step...We managed to produce an immense quantity – we’re talking tons – because we made a formulation using a rheological modifier donated to us by a local company: a pectin, a substance used to make jams, in the end. We were a team, and everyone did something different... We produced as a Pharmacy Department, and the last step was left to my spin-off to finalize and control everything (...). Even the police knocked on my house... because they knew where I was and asked me for 5-6 litres of gel (Interview No 72).

### *Working with schools*

Schools are among the main stakeholders of universities, especially secondary schools, which are involved in orientation activities.

Paths for transversal skills and orientation (PTSO), earlier named School-Work Alternance, are part of these orientation activities, and sometimes they have a solid educational impact, like in the story of “Physics goes to Town” when – while preparing the conference of Italian Physical Society (SIF) the department of Physics visited the upper schools of the city of Cosenza and discovered a hidden treasure: dusty ancient instruments that were not used. The researchers brought the most interesting ones at university and, with a PTSO program, involved school students in their restoration and, afterward, in the presentation of their functioning during the Annual SIF Conference.

On the occasion of the SIF, we organised the exhibition open to all schools and the students of the PTSO who had collaborated in the restoration of the instruments and knew how they worked, made the presentation. (...) They were people who did not want to study. At the end, these students were so committed and passionate that I heard principals and professors say: “We have never seen something like this!”...They were lost, they were... apathetic students who instead tried to explain a scientific concept on a machine from the early 1900s that they knew how to operate and how to explain its scientific functioning. This is a spectacular thing! (Interview No 54).

#### *University students' engagement*

In the story *Hackathon! We respond to your business challenges* university students have been involved in an experience of collaboration/co-creating a solution to solve a real problem of a company or public body in Calabria promoted by a professor of International Marketing, Department of Business and Legal Sciences, since a.y. 2019-20.

Companies express their needs and pose challenges to students of my class who are around 50-60. They begin to develop possible solutions, having more or less 3 months to learn the tools to respond to challenges. Afterward, the students discuss the topic with companies and institutions in a meeting and start the work. They have 48 hours, day and night, to work and solve the business challenge. (...) The students came up with innovative ideas, so much that the companies even invited some to intern with them to develop the ideas formulated (Interview No 24).

#### **4. PE: FROM THE PAST TO THE FUTURE**

As shown, PE's roots go back to the original transformative mission of UNICAL. However, it did not develop into a systematic vision/action because of its fragmentation during the university expansion.

The stories collected confirmed that PE does not have clear-cut boundaries: these are variously interpreted by different disciplinary fields and with original combinations in each department. The PE refers to a vast range of practices: cultural initiatives aimed at the general audience; activities with educational purposes aimed at targets other than university students (training for primary and secondary school students or teachers, summer schools, training courses for disadvantaged social categories, etc.); museum, cinema and theatres offerings as well as research dissemination publishing; health campaigns and health promotion initiatives on campus and in the local area.

It is not easy (nor always helpful) to separate the PE from other areas of the TM and narrow excessively the semantic fields. PE is sometimes upstream and

downstream of TM initiatives that fall into the area of TT. Moreover, according to the experience analysed, there is a strong connection between PE and some university entry/exit orientation activities, and PE is often linked with other academic missions: with teaching, when students are involved in PE activities or when stakeholders contribute to educational activities; with research, especially when this has a social nature and is shaped as participatory action-research, or in the citizen science activities.

The research showed that social inclusion at Unical is usually present in the PE practice but needs to expand and consolidate in less occasional and more durable projects contributing to responding to the social context's complex challenges.

In the Unical experience, PE is made by people committed to values such as social justice or strongly believing in a "redemption dream" for Calabria: "PE is doing things one believes in, with the skills one has" (Interview No 50). PE is also made by people socialized to the dialogue and collaboration with society. This is prevalent among social sciences scholars: "PE is embodied in the way of doing research, of teaching, which was taught and passed on to me by scholars with whom I trained, and I can say that they have made the history of our department" (Interview No 1).

Yet, according to interviewees, PE is hindered by the current university system organization and functioning and by standards and requirements of the academic profession: e.g. the time saturated by teaching, research and institutional workload and the lack of incentives and support for TM activities. Indeed, many agree that recent decades' shifts in the university have reduced the time and energy that can be dedicated to PE. So, there is a strong perception that PE requires a personal sacrifice (of career, rest, family) that is not sustainable nor accessible to everyone. For instance, young researchers who need to invest in more rewarding activities in terms of careers are not encouraged to get involved in PE activities.

Not surprisingly, academics and staff suggest improving the Social Mission above all with structural and organisational measures such as: assignment of balanced time between teaching, research, third mission and institutional commitment; work recognition and incentives; training on PE planning and implementation; skilled staff and permanent organisational support; funding assigned to PE projects; impact evaluation and dissemination of PE activities.

# THE TRANSFORMATIVE MISSION OF UNIVERSITIES: PERSONAL TRAJECTORIES AND INSTITUTIONAL DRIVERS OF COMMUNITY ENGAGED SCHOLARSHIP

Andrea Vargiu<sup>a</sup>

Emanuela Reale<sup>b</sup>

Andrea Orazio Spinello<sup>b</sup>

Valentina Ghibellini<sup>a</sup>

<sup>a</sup>Università degli Studi di Sassari; <sup>b</sup>National Research Council (CNR)

Higher Education policies acknowledge the need to reframe science-society relationships. Public Engagement with Research (PER) is one of the components of the increasing efforts aimed at this end. Growing financial and operational support for PER requires a better understanding of the science-society dynamics. This paper provides an overview of a research project titled PLACES which employs comparative case studies to examine academic community-engaged scholarship in Italy, France, and the UK. PLACES seeks to fill crucial evidence gaps on proactive science-society relationships at the individual, institutional, and systemic levels. The literature reveals ambiguity in the terms ‘public’ and ‘engagement’. Thus, we limit our research to PER forms intended to foster genuine societal change, which we term “transformative community engagement”. This paper presents the theoretical framework underpinning this concept, focusing on the prescriptive, analytical/descriptive, and methodological dimensions of transformativity.

higher education; community engagement

## INTRODUCTION

Contemporary higher education policies emphasise reframing the relationships among society, science, and innovation globally, necessitating inclusive governance for shared responsibility. Public Engagement with Research (PER) is vital for these efforts. Enhanced financial and operational support for PER requires a better understanding of science-society dynamics to inform effective

research-based policies. Evidence indicates that publicly engaged research and higher education have progressed globally in recent decades (Tapia, 2018), along with a growing interest in PER (Fransman, 2018).

Despite increased interest in university engagement, numerous obstacles persist. Engagement missions and activities have faced pressure, and within Higher Education Institutions (HEIs), the global emphasis on excellence and world-class status has not prioritised engagement.

Engagement that generates financial benefits aligns with institutional objectives, but engaging marginalised communities, which may not yield financial returns, demands a courageous commitment to surmount systemic pressures and foster dialogue (Benneworth and Jongbloed, 2013). Research indicates a conflict between academics' propensity for engagement and the pressures they encounter (Farnell and Ćulum Ilić, 2021). There has been limited reflection on enhancing PER by addressing these tensions.

Understanding this phenomenon necessitates an examination of the current organisational structure of HEIs. Empirical evidence indicates that if not implemented carefully, PER may become merely rhetorical or social technology. A thorough examination of higher education's societal engagement, focusing on non-rhetorical forms, is essential. This paper discusses the primary theoretical foundations of a research project conceptualising "transformative community engagement".

## **1. RATIONALE AND OBJECTIVES OF THE PLACES PROJECT**

Different methodologies and institutional frameworks produce varied forms of PER, influencing science-society relationships and societal impacts. PLACES (Portraits and Landscapes of Academic Community Engagement Scholarship) is a research project funded by the Italian Ministry of University and Research under the PRIN scheme. It aims to bridge the knowledge gap regarding how institutional strategies of HEIs and higher education and research policies shape transformative PER. This study seeks to understand how external pressures from systemic and institutional contexts influence scholars' public engagement practices and values and, conversely, how scholars' engagement can transform these contexts.

To this end, it adopts a dual-pronged approach to comprehensively understand PER in academia. The "Landscapes" stream examines the institutional and policy context shaping PER, analysing how HEIs develop engagement strategies and how higher education and research policies impact these practices. This

stream identifies structural elements that facilitate or hinder science-society interactions. The “Portraits” stream explores individual scholars’ behaviours, motivations, and perspectives, investigating their engagement with citizens and factors driving their commitment. By examining personal narratives, PLACES uncovers the human elements that bring PER to life in academic settings.

To conduct this research, we utilised a comparative case study methodology, focusing on Italy, France, and the United Kingdom, to compare different university traditions (Carazzolo et al., 2024). The case study approach is deemed ideal for examining the complex factors that influence CE in higher education across different contexts (Yin, 2018).

The findings of this research are expected to enhance the understanding of policy, institutional, and personal factors that facilitate or hinder effective community engagement in higher education. This paper outlines the key components of the theoretical framework that supports this study.

## **2. TRANSFORMATIVE COMMUNITY ENGAGEMENT**

The literature presents diverse conceptualisations of PE. Based on previous studies, we differentiated between market, state, and community engagement (Vargiu, 2014). This distinction is conceived by considering the different epistemologies (Habermas, 1968) and regulatory actors and relationships (Polanyi, 1944) that shape science-society relations. This aligns with the coordination forces governing universities’ external relationships according to Clark’s triangle (Clark, 1983).

Community engagement, defined by reciprocity, emancipative interests, and critical epistemology, often overlaps with state engagement, particularly in evidence-based policy research. However, state engagement focuses on redistribution, practical interests, and interpretative epistemology (Vargiu, 2014). From this perspective, community engagement pursues active involvement and joint action, fostering symmetrical collaboration between community actors and universities. In contrast, state engagement typically features asymmetrical relationships, with universities controlling the process and the public mainly receiving information (Vargiu, 2014; Wellstead, Cairney, and Oliver, 2018). Market engagement, characterised by exchange principles and technical aims, such as patenting and knowledge transfer, was excluded from this analysis. These distinctions highlight varying participation levels from active community involvement to a more asymmetrical state and market engagement.

To operationalise our research, we define community engagement as a specific form of collaboration between institutions of higher education and their larger communities which engage academic and non-academic actors in an interactive and mutually beneficial process characterised by reciprocity, respect and equal partnership and aimed at generating transformative changes for all parties involved through mutual understanding and co-creation.

This definition posits that community engagement in higher education transcends mere outreach, encompassing a comprehensive approach to integrate academic pursuits with real-world applications and societal needs. According to this definition, community engagement in higher education constitutes a dynamic and collaborative process that bridges the gap between academic institutions and surrounding communities.

The essence of community engagement lies in its reciprocity, with both the institution and the community sharing knowledge, skills, and resources to achieve mutual goals. Its impact on higher education influences institutional practices and community development, thereby fostering lifelong learning and social responsibility. This reciprocal relationship creates a cascading effect beyond immediate participants, implying high levels of transformativity.

### **3. GENERATIVE TRANSFORMATIVITY**

Transformative change is significant in community engagement, and academic interest in transformativity has surged in recent times, with scholars from different disciplines exploring it in diverse contexts. In literature, transformative change is often referred to as durable, intense, and intentional. It is generally assumed that, through this process, academic institutions and communities can shift perspectives, develop new capabilities, and create innovative solutions to complex societal issues.

The literature on transformative universities highlights their capacity to affect positive societal change through research, teaching, and engagement. In the PLACES project, we uphold the transformative mission as the core mission of universities, viewing research, teaching, and service as operational realms to achieve this mission. The transformativity of universities is often discussed in both prescriptive and practical terms as well as in descriptive and analytical ways. These distinctions will be elucidated hereafter.

#### **3.1. Prescriptive level**

Transformativity in higher education suggests that universities should serve as

agents of change, fostering student development and tackling societal challenges. This transformative role is integral to the university's mission, focusing on critical thinking, social justice, and innovation. In contrast, the neoliberal university model, which has recently gained traction, prioritises market-driven principles, viewing education as a commodity and students as consumers. Thus, the tension between transformativity and neo-liberalism in higher education is a significant debate among scholars and policymakers.

Transformativity advocates profound institutional change, urging universities to transcend traditional roles and structures. It emphasises aligning institutional practices with societal values, such as democracy, justice, equity, equality, and inclusiveness, to address societal challenges and promote positive social change. This transformative approach is grounded in diversity, openness, responsibility, and autonomy, and aims to make universities more responsive, inclusive, and impactful in advancing knowledge and societal change.

Addressing societal change requires acknowledging the complexity and unpredictability of social transformations. Change agents must maintain clear objectives, while adapting to evolving circumstances, integrating new insights, and seizing unexpected opportunities. This flexible yet purposeful approach fosters meaningful societal change, recognising the complexity and dynamism of social systems, aligning with the concept of generative transformativity.

### **3.2. Analytic/descriptive level (generative transformativity)**

The analytic/descriptive level of community engagement investigates its transformative potential by examining how stakeholder collaboration can drive significant change. This approach emphasises that integrating diverse perspectives and knowledge systems leads to a thorough understanding of community needs and resources, necessitating a critical view of power dynamics. By valuing multiple epistemologies, this method aims to comprehend these power relations, ensuring that marginalised voices are considered equally with dominant perspectives.

Addressing these issues involves viewing transformative change as a generative process and promoting dynamic interactions, unexpected outcomes, and collaborative contributions, thus creating value greater than individual inputs. It acknowledges that valuable outcomes often arise from the synergy of various viewpoints and experiences, enhancing the likelihood of serendipitous discoveries and breakthrough thinking (Vecchiato, 2016; Holland, 1998).

This approach requires recognising a shift from linear models to a complex

systems perspective, understanding that societal change is nonlinear, unpredictable, and influenced by interconnected factors. Outcomes evolve rather than being predetermined (Doyle 2018). This emergent nature of impact formation challenges the idea of predicting results based solely on initial objectives, highlighting the need for flexibility and adaptability in impact evaluation, along with the need to introduce mid-range indicators for impact assessment.

### **3.3. Operational/methodological level**

Generative community engagement operates at multiple levels, intersecting the analytical and practical aspects of research and education. The analytical framework helps articulate engagement dynamics, whereas operational aspects translate these insights into actions and methodologies. The implementation of generative community engagement is influenced by values, such as openness, participation, inclusiveness, and social and epistemic justice. These principles shape the design and execution of engaged methodologies, informing procedural choices and the ethos of community-based projects. By prioritising these values, practitioners aim to generate knowledge, empower communities, foster equitable partnerships, and contribute to societal transformations, ensuring alignment with ethical considerations and societal needs for meaningful and sustainable outcomes. Epistemologically, this affects the acceptance of methodologies, such as action research by the academic community (Oquist, 1978).

Transformative learning, as conceptualised by Mezirow (1997) emphasises critical reflection and perspective transformation in learning. Transformative research methodologies, such as Community-Based Participatory Research, operationalise generative transformativity in research settings (Hall and Tandon, 2017). Community-based research and learning prioritise collaboration among researchers, learners, and community members, emphasising iterative cycles of enquiry, reflection, and action, and fostering dynamic knowledge generation and change.

## **4. CONCLUDING REMARKS**

This paper delineated the principal theoretical foundations of the PLACES project, with a particular focus on what we define as “transformative community engagement”. This notion necessitated a working definition of community engagement, as well as a more comprehensive understanding of the concepts of transformativity. Our literature review led us to identify three frequently

overlapping approaches in addressing transformativity, which encompass the prescriptive, analytical/descriptive, and methodological/operational levels.

This examination delineates the intentional, durable, and socially relevant nature of authentically transformative processes along with their emergent characteristics. The non-linear, substantially unpredictable nature of transformativity portrays it as a generative process, insofar as it amplifies resources and outcomes by fostering diverse perspectives that intersect to yield novel insights and innovative solutions.

The extant literature on transformative community engagement is characterised by a long-standing tradition, which provides a robust theoretical and methodological foundation for practitioners. Within this context, there remains a paucity of comprehensive understanding of the specific policy and administrative mechanisms through which higher education institutions can effectively pursue requisite changes to fully embrace transformative community engagement. Furthermore, it is necessary to address the unresolved issue of political willingness, which can engender such changes beyond rhetorical exercises and institutional makeup.

# THE EXPERIENCE OF SCHOOL VICTIMIZATION AMONG ADOLESCENT ADOPTEES

Laura Ferrari<sup>a</sup>

Sonia Ranieri<sup>a</sup>

Rosa Rosnati<sup>a</sup>

Simona Caravita<sup>b</sup>

<sup>a</sup>Università Cattolica del Sacro Cuore di Milano (Italy); <sup>b</sup>University of Stavanger (Norway)

Bullying victimization by peers has been recognized as a relevant social issue during adolescence as it may be associated with emotional difficulties, greater psychological distress, and lower academic performance. Despite research on adopted adolescents showed higher levels of internalizing problems, lower peer acceptance, fewer prosocial behaviour and close relationships than non-adopted peers, few studies focused on the prevalence of and factors associated with bullying victimization in this group. In order to fill this gap, this contribution is focused on the bullying victimization among adopted adolescent and the associations with their adjustment and well-being, taking into account individual and social risk and protective factors.

adoption; bullying victimization; psychosocial adjustment

## 1. ADOPTION IN THE SOCIAL CONTEXT: THE BULLYING VICTIMIZATION EXPERIENCE

In the adoption literature, several studies investigated the level of psychosocial adjustment among adoptees compared with non-adoptees peers. Adoption research consistently reported a higher level of emotional and behavioural problems, lower academic performance, and mental health problems among transracial adolescent adoptees compared with non-adopted peers. In this research trend, the cross-cultural comparisons are under investigated. A recent empirical study carried out in four European countries, Italy, Spain, Norway and France (Cáceres et al., 2024) showed that, in all the four countries considered, adopted adolescents (all born in East European countries) were more likely to show higher levels of emotional and behavioural problems than expected: it

turned out that about 27% of adoptees had borderline or clinical scores for general psychological problems, and about 30% fall into this range for hyperactivity. These results were similar in the four receiving countries, suggesting that these adjustment difficulties of adoptees are reliable beyond national boundaries.

Referring to their experience at school, a current research trend within the field of adoption showed that, compared to their non-adopted peers, adoptees are more likely to report lower levels of school performance as well as more special educational needs, contributing to experiencing greater educational disadvantages (Pitula et al., 2019; Raaska et al., 2012). In order to deeply understand/shed light to the challenges faced by adoptees in everyday living in the school context, some studies have analysed adoptees' perceptions of their peer relationships. Even if the studies on this topic are few, some preliminary findings suggested that adoptees are likely to show a specific vulnerability to the experience of being bullied within the school context. For example, Cáceres and colleagues (2024) found that more than half of the 199 internationally adopted adolescents in their study sample had been exposed to some form of peer victimization in the previous 2 months, with verbal harassment and social exclusion as the most common forms of victimization. These percentages are in sharp contrast with the ones found in community samples, with frequent victims being at around 10% and sporadic victims at around 22%. Besides, differences among receiving countries were not statistically significant, suggesting a common pattern for adopted adolescents living in the four receiving countries.

The risk of being peer victimized may increase for transracial adoptees that must confront multiple specific challenges related to their adoptive status and their ethnic differences. In fact, the ethnic differences give visibility to adoption, with subsequent negative influences on their peer relationships. These factors might expose them to high risk of peer bullying as well as increase their vulnerability to the experience of victimisation (Ferrari et al., 2022). The experiences of peer victimization play an important role hindering adoptees' psychosocial adjustment. A recent study (Cáceres et al., 2024) confirmed an increased risk of emotional and behavioural difficulties in association with being bullied. Specifically, among frequent victims of bullying, 44% obtained above the cutoff clinical scores on the global scale of emotional and behavioural difficulties, and this percentage went down to 8% among non-victims.

## **2. BULLYING VICTIMIZATION: RISK AND PROTECTIVE FACTORS FOR ADOPTEES**

In light of these difficulties, it is important to disentangle those factors that could exacerbate or minimize the negative consequences of bullying victimization among adoptees. Ferrari and colleagues, (2022) carried out a study involving Italian internationally adopted adolescents. Findings showed that the association between being victimized, and the levels of emotional and behavioural difficulties varied according to the levels of other risk or protective factors. First, adoptive identity resulted to play a significant role. Adoptive identity refers to the sense of belonging to the group of adoptees, together with commitment, pride, and positive feelings about this group (Grotevant et al., 2000). Adoptees have to seek to integrate their adopted status into a coherent definition of self, attributing a different degree of salience to their adoptive status, and feeling part of the group of adoptees. Previous studies have empirically shown that adoptive identity is related to the adoptees' positive adjustment, especially in terms of low level of behavioural problems and high level of self-esteem (e.g., Grotevant et al., 2000; Ranieri et al., 2021). Partially in contrast with this literature, Ferrari and colleagues (2022) found that the association between the adopted adolescents' victimization and their emotional and behavioural problems was moderated by adoptive identity, in the sense that this link was stronger by an increase in the levels of adoptive identity. Specifically, victimization had a more detrimental and negative impact on psychological adjustment for those adopted adolescents who showed higher levels of adoptive identity. We could infer that these discriminating events may target their adoptee status and thus target a central and relevant dimension of the adoptees' identity, profoundly hurting them. Indeed, when individuals are highly identified with their in-group (for example, the adoptive group), episodes of group related discrimination are more likely to be appraised as self-relevant. The more the belongingness to and the identification with the group is central and a core aspect of self, the more the discriminatory events are psychologically significant and threatening.

This research has focused on a further moderating factor that is likely to influence the association between being peer-victimized and adjustment outcomes among international adoptees, the reflected minority categorization. It refers to the adoptees' perception of others' appraisal of their belongingness to the minority or the majority group (Ferrari et al., 2022; Khanna, 2004). This contextual feedback is often related to the visibility of adoptees' ethnic difference and to their physical appearance. Adoptees who report high reflected minority categorization believe of being perceived by others as members of the

minority group, while low levels of reflected minority categorization indicate the adoptees' perception to be categorized by others as a member of the majority group. The association between adoptees' victimization and their emotional and behavioural problems was moderated by reflected minority categorization. Specifically, bullying victimization was found to have a lower detrimental and negative impact on psychological adjustment for the adoptees who reported more to be perceived by others as members of a minority group. Adoptees with a stronger reflected minority categorization might consider their own ethnic group as the target of ethnic victimization (external attribution) and not directly themselves as individual targets because of their own characteristics (internal attribution).

## **CONCLUSIONS**

To summarize, results indicate that adoptees are highly vulnerable to bullying victimization and this experience is associated with more emotional and behavioural adjustment difficulties (Càceres et al., 2024; Ferrari et al., 2022). Peers' rejection represents a risk factor for the psychological adjustment of the adoptees. Besides, the association between being victimized and higher levels of maladjustment resulted to be stronger among those adolescents who have higher adoptive identity. The experience of victimization, often related to the adoptive status, more strongly affects adolescents who feel proud of their adoptive status and strongly identify with the adoptive group. Additionally, adoptees who perceived others' appraisal about them as members of an ethnic minority group reported lower psychosocial difficulties in association with experiencing victimization than those reporting lower levels of reflected minority categorization. Therefore, findings from this study emphasize the potential value of strengthening the relational context whom the adoptees belong to and to create a more inclusive environment in order to increase their psychological adjustment. Taking into account that adolescents are particularly sensitive to peer feedback, other's perception of their ethnic background could be a key dimension to better understand the quality of their social relationships.

Up to date, adoption research has mainly focused on pre-adoption negative experiences and traumas. Alongside these risk factors, research must also broaden the horizon and consider the role played by the current social context and peer relationships quality in fostering or hindering adoptees' psychological wellbeing. Overall, the results summarized in this contribution move adoptive research beyond targeting only mental health problems of adoptees, compared

to non-adopted peers, to include both individual and social factors, concerning the adoptive identity and the broader peer's network, in understanding the process of psychological adjustment to adoption. As a matter of fact, adoption is intrinsically embedded into the social contexts.

# OPEN ADOPTION: EDUCATIONAL REFLECTIONS AND PEDAGOGICAL PROPOSALS ON THE RECENT JURISPRUDENTIAL INTERPRETATION OF THE CONSTITUTIONAL COURT (JUDGMENT 183/2023) OFFERING NEW PERSPECTIVES ON THE PROTECTION OF THE CHILD

Angela Muschitiello<sup>a</sup>

Michele Corriero<sup>a</sup>

<sup>a</sup>University of Bari

Forty years after the approval of law no. 184 of 4 May 1983 “A child’s right to a family” as later amended by law no. 149/2001, the very recent sentence no. 183 of 28 September 2023 no. 183 of the Constitutional Court, coherently with the previous judgments of the European Court of Human Rights, has endorsed the most popular interpretation according to which in certain specific cases the Juvenile Courts may, at the same time as issuing the legitimating full adoption judgment, provide that the adoptee shall maintain *de facto* (not juridical) relations with the original family (even if he/she has forfeited parental responsibility) while acquiring the full *filiationis* status of the adoptive family. This is the so-called open adoption or full open adoption, which, basing its provision on the institution of jurisprudential creation of the ‘mild adoption’, intends to add a family to the child without replacing it in those cases where breaking the existing significant emotional relationship would be contrary to the child’s interest to break. These judicial decisions show the extent of the cultural and social change, that recognises the importance of a person’s affective and family history and value the weight of the environment to which the child belongs. This jurisprudence has interpreted the progress and acquisitions resulting from interdisciplinary scientific fields such as psychology, sociology, pedagogy, ethology, neuroscience and psychoanalysis; these disciplines have highlighted how there are specific situations in which maintaining relations with the family of origin may represent an appropriate response to a series of critical issues that full adoption sometimes faces and that, on the contrary, prohibits the same relations (such as the so-called ‘blameless abandonment’ cases due to non-voluntary deficiencies or fragility). However, a more in-depth educational reflection cannot fail to point out how in the open form of adoption complex inter-subjective

dynamics come into play and how that may awaken in all the parties involved (child, family of origin, adoptive family) silent traumas (sense of guilt, narcissistic wounds, bereavements not fully processed, etc.), creating ambivalent or conflictual situations that are detrimental instead of promoting the child's development. In fact, if it is true that the success of the adoption process – whatever its form – depends on the degree of stability and reliability of mutual affective recognition between child and adoptive parent, achieved at the end of a progressive and delicate process of building and consolidating ties, it is therefore urgent to reflect – from a pedagogic perspective – on the good practices to be implemented in the socio-educational systems involved in this process (pre- and post-adoption services, schools, etc.) to promote relations between natural and adoptive parents capable of hinging on the conscious and responsible acceptance of the different roles and functions within the open family environment. This is in order to avoid subjecting the child to what Winnicott called “impingement”, i.e. negative pressure that causes a fracture in the sense of continuity of the self and instead guarantee a unified existential narrative.

Children, Open adoption, Identity, Educational reflections.

## INTRODUCTION

Forty years after its approval, Law No 184/83 “Discipline of the adoption of child custody”, subsequently renamed “Right of the child to a family” by the subsequent amending Law No 149/2001 (with subsequent legislative amendments), represents a still modern instrument in the complex *panorama* of family protection legislation. In fact, thanks to the interpretative activity of the jurisprudence (that has been able to adapt to the transformative pushes of the UN Convention and to the national social and cultural instances generated by the need to adjust some practices not always able to protect the best interest of the minors as in the Bibbiano case or the abuse of *sine die* foster care), the discipline of foster care and adoption has been able to extend and adapt guarantees and protections also to cases apparently lacking specific regulations or poorly defined, always guaranteeing a clear reference for all the juvenile institutions.

In this perspective, the very recent judgment of 28 September 2023 no. 183 of the Constitutional Court, in line with previous judgments of the European Court

of Human Rights<sup>1</sup>, which upholds the majority interpretation according to which in certain specific cases the Juvenile Courts may, at the same time as the legitimating adoption judgment (which attributes to the child the full *filiationis* status of the adoptive family) provide for the adoptee to maintain *de facto* (not juridical) relations with certain members of the original family, even if they have lost parental responsibility (a grandparent, uncle or aunt, a parent, for instance, suffering from a psychiatric illness), who, while not being able to take full responsibility for the child from a socio-educational or economic point of view, have constituted an affective, emotional or even only symbolically significant reference point for the child.

This is the so-called ‘open adoption’ or full open adoption that bases its provision on the jurisprudentially created institution of ‘mild adoption’<sup>2</sup> intended to safeguard – where they exist – certain significant emotional relationships with the family of origin that it would be contrary to the child’s interest to break. This ruling refers to so-called ‘blameless abandonment’ cases in which the lasting situation of incapacity of the biological parents does not depend on voluntary behaviour on the part of the parents of origin, but on deficiencies and frailties of a different nature linked, for instance, to economic or health problems (Vecchione, 2023). In these cases, keeping the emotional bond between the adopted child and these parents alive would, according to the Constitutional Court, provide greater protection for the adoptee.

## **1. OPEN ADOPTION AS A PEDAGOGICAL RESPONSE TO A CHILD’S DEVELOPMENTAL NEEDS**

By offering the adopted child the opportunity not to ‘lose everything’ that made up his or her past before meeting the adoptive couple, open adoption is pedagogically oriented towards the promotion of the child’s developmental journey characterised by the constant search for a thread that gives meaning to his or her identity-building story. As Ricoeur states, in fact, identity “is a narrative process because understanding oneself is equivalent to being able to tell intelligible and acceptable stories in a coherent cognitive-emotional plot that allows one to give meaning to each lived experience in a transformative dimension within which one can find the stimulus to desire to realise one’s

dreams” (p. 8).

An identity weaving that in adoption is much more complex due to the succession of unfavourable experiences (i.e. traumatic events, inadequate, ambivalent, disorganised primary attachment experiences, separation from the biological family and stays in the community that, together with the alternation in each phase of the process of undefined and tormented operators, places and times, characterise the path. Events that often define, on a psycho-educational level, the constitution of an intrinsic fragility, of a low resilience in the confrontation with new experiential challenges, of emotional instability, of an insufficient capacity to redefine one’s everyday life and to activate spaces and paths of self-reflection and awareness ( ). The fact that then, with the start of the adoptive relationship, only one (adoptive family) of the two poles that make up the adoptee’s existence (past and present) manifests itself on a concrete level does not equate tout court with the pale of the other (family of origin), because the prominence of figures who are physically absent but present on a symbolic level may take on a different weight for the adoptee over time, perhaps remaining in the background for years but becoming in some periods (especially in adolescence) a foreground presence in a logic in which the space-time dimension seems to dilate for some and disappear for others (Malaguti, 2005). In the face of this, in many cases not even the re-establishment of an adequate system of affective and caring relations within the new family environment is enough to make up for the impossibility for the adoptee to be able to activate a path of reflection and signification of the previous experiential experiences due to the lack of family figures belonging to his/her original nucleus. A lack that in fact prevents the construction of a harmonious circularity of one’s memories and, on the contrary, leaves lines of shadow and meaninglessness that favour vacuous areas of the definition/construction of personal identity and history that expose him/her to the risk of becoming a stranger to himself/herself.

Faced with the impossibility of preserving and maintaining ties with past experiences, in fact, in order to make up for the lack of the foundations necessary to rewrite one’s own history, it may happen that the child decides to sacrifice excessively painful parts of himself in two different ways. He may adopt an action of cutting off and erasing those shadowy areas of his past that he has experienced as too painful or, on the contrary, he may decide to reject his present by entrenching himself in the idealisation of past parental or parental figures in the conviction that he is guilty of not having been up to the task of deserving their love. Emotional survival strategies, not so rare, which, as Aulagnier states, soon show themselves to be failures. In the first case, in fact,

the mutilation of parts of one's own history is dramatically reflected in the amputation of parts of one's own identity built up precisely from the significant encounters that, for better or worse, punctuate the life of each subject and whose permanent traces shape the psyche; in the second case, on the other hand, the rejection of the present risks keeping one in a state of immutability and existential suspension that hinders elaboration and prevents one from opening up to future time.

In this sense, allowing the child's parental figure of origin to maintain a stable and continuous bond with him (with timed and monitored encounters) represents an unparalleled opportunity to find answers to the need for meaning that characterises his or her existential history, relieving the latter of the tiring choice between belonging to the past or to the present and enhancing the possibility of keeping and emotionally cultivating both within oneself.

The notion of need, in fact, when referred to a child, possesses in pedagogical literature (Rossi, 2008) a great relational value because it is expressed in the context of a bond that implies a responsibility and therefore foresees a commitment on the part of the significant persons in the child's life to provide an adequate response to that need (Milani, 2017, p. 95). This implies that all the adult subjects that make up the open adoptive system – the family of origin and the adoptive family – participate responsibly and proactively in the open educational project addressed to the child: giving him/her back acceptable and plausible motivations capable of reconnecting the experiences that have characterised his/her past with his/her present experience. In order to open up with confidence to the future, it is necessary to be able to construct a past within the present by means of a new signification of the previously lived experiences with which the individual is in continuous relation.

Family of origin and adoptive family, emotional ties and ties of consanguinity are in fact not realities that can be opposed or separated but different experiences that – if well accompanied – can come together in often unpredictable and promotional compositions of positive relationality (Muschitiello, 2023).

## **2. CRITICAL NODES**

Alongside the considerations that defend the appropriateness of open adoption to overcome certain developmental criticalities that full adoption may encounter, educational reflection cannot fail to take note of the complex intersubjective dynamics that may come into play, awakening in all the subjects involved (child, family of origin, adoptive family) silent traumatic remnants

(sense of guilt, narcissistic wounds, bereavements not fully processed, etc.) or creating ambivalent or conflictual situations that are more detrimental than promotional of the child's development.

The successful outcome of the adoption process – whatever its form – depends in fact on the degree of stability and reliability of mutual affective recognition between child and adoptive parent, achieved at the end of a progressive and delicate process of building and consolidating ties. In open adoption, because of its characteristics, this reciprocity can be severely tested if the right preparation, knowledge and awareness of the educational value of this particular form of adoption is lacking on the part of the adult figures that make up the entire open family system.

In fact, the expectation that the new adoptive family system must also include the preservation of the relationship with a parental figure belonging to the child's original environment risks making the adoptive couple feel threatened, as they too are grappling with their own experiences to be processed (infertility, empty cradle, etc.) and often with the desire – even unconscious – to seek an exclusive relationship that can replace or restore the previous one. A desire that, although it may initially appear as a reassuring solution able to ease the pain linked to the child's experiences of abandonment and deprivation and to fill the couple's emptiness, in reality soon reveals itself to be illusory and insufficient to stem the child's inner split that originates from the profound rupture of his existential continuity brought about by the abandonment.

On the other hand, the parental figure of origin, who continues to maintain contact with the child, may – voluntarily or involuntarily – act in a way that provokes feelings of guilt, inadequacy and abandonment anxieties and terrors, unconsciously forcing the child to engage in defensive operations detrimental to its healthy development.

Situations that could leave the child divided in the pain of losing the object of maternal love and the despair of losing the bond with the caregivers (Valdilonga, 2011) thus producing a negative pressure that Winnicott defines as impingement to refer to situations in which the interference of the environment when negative interrupts the continuity of the self, causing an intrapsychic fracture and a split. According to the scholar, that is, when the child's ego does not receive sufficient support from adults significant to it, a traumatic condition occurs that sets in motion a pattern of fragmentation of being. The child is thus faced with a developmental task that is almost from the outset burdened in a psychopathological sense. If this were the case, adoption in its open form instead of

soothing the abandonment experience linked to the first estrangement from the family of origin (the one that led to its declaration of adoptability) would only constantly re-propose the same wounds, making them deeper and more irremediable.

To prevent all this from happening, it is therefore necessary to guarantee the adoptive couple and the original parental figure adequate pedagogical and psychological support to support and monitor them in the elaboration at the unconscious and relational level of effective strategies for accompanying and flanking the adopted child in the arduous path of constructing a self-narrative capable of accommodating cracks and fractures in his or her own history along the jagged edges that separate the past from the present, the before from the after.

### **3. THE ROLE OF PRACTITIONERS AND NEW CULTURE OF OPEN ADOPTION**

Which are, then, the good practices to be put in place in the socio-educational systems called upon to support all components of adoption in its open form? First, the training and updating of operators who deal with socio-educational services, particularly with adoption and family fostering, because when important changes and new perspectives take place, as in the case of open adoption, knowing the contents and reasons for such changes (protection, safeguarding, supreme interest and recognition of the rights of the child) and reflecting on the practices of psycho-socio-pedagogical intervention becomes essential in order to know how to activate complex socio-educational planning in such an unprecedented context in the world of adoption. Moreover, the lack of legal and psycho-socio-pedagogical case histories and practices and of the outcomes of the first open adoption experiences sets in motion a series of new interventions with the emergence of new educational needs, of network and interdisciplinary work that requires, from all the operators involved, renewed skills and quality in intrapersonal and interpersonal training.

Open adoption brings up new cultural and social scenarios for all psycho-socio-educational practitioners and further insights into some of the classic themes of adoption, ranging from multiple attachment styles, the adoption crisis, intra-familial conflicts and the, legitimate, aspirations of adopted children to know their origins, their history and to recognise themselves in an identity process that is as complete as possible. In the case of open adoption, however, we have further significant elements that need to be considered, for instance, the family constellation expands, the perceived complexity of maintaining relations

between adoptive and biological parenting (no longer idealised) is renewed, the ambivalent representation of the biological family (or of some of its members) as an obstacle and competition or as a bond functional to well-being. In addition, legal, culturally and socially defined paradigms, from which it may be difficult to distance oneself (mistrust, resistance and fears with respect to open adoption and its characteristics and management), are also called into question for practitioners. There is, in fact, a pervasive storytelling of adoption that identifies as “good adoption” or “adoption gone well”-that in which the child who has been adopted shows and will never show any temptation to search for his or her biological origins. The guiding word of this narrative is ‘legitimacy’, the family must feel legitimate and legitimised (Ferritti, 2019, p. 30). With the ruling of the Constitutional Court (no.183/2023), the historically established and socially shared principle that with the legitimising adoption of a child, the ties with the family of origin are definitively severed (this is only legally, because we know well when this bond is indissoluble and symbolically present in an unconscious and/or conscious manner in minors), although legally the principle remains valid, after this ruling it is no longer valid for all cases of adoption. Adoptive parents, therefore, must be supported in representing the adopted child as connected to his or her history and birth family; they must be supported in thinking of him or her in all his or her parts, including the dissociated ones; it is this virtuous process that supports the integration of the self. Integration must also be able to heal the temporal split: adoption cuts off a part of the adoptee’s self that remains in the past, therapy (and the educational relationship) must foster the integration in the present of those parts of the self that have been left in the past, bringing order to the “a good” and “an evil” confusedly mixed in memory and disoriented in temporal location (Cancrini, 2020, p. XV-XVI). Both the adult parties involved (the family of origin and the adoptive one) must be carefully prepared not to collude with the child’s possible attempts to erase the past or reject the present by letting one part of his or her history prevail over the other, and to experiment and implement, with the proper support of the operators, strategies for understanding and meaningfully interpreting his or her behaviour within the complexity that characterises the construction of an open adoptive bond. In particular, the adoptive couple must know how to tune in to the child’s evolutionary need to be able to freely desire the meeting with the original relative without the fear of betraying his or her new present and, on the other hand, the original relative must know how to implement relationship modalities capable of promoting the child’s wellbeing in order to support him or her in the elaboration of personal strategies that allow him or her to keep in and

separate from his or her roots and the processing of feelings connected to them. This shed light on new reflections in terms, more than in legal terms, of pedagogical, educational and psychological management of the relational and symbolic worlds of adopted families, boys and girls. A challenge that must be translated into a good awareness of change on the part of operators working in the adoption and foster care system. As operators, it is important to be clear that, in many cases, adoptive families live an intense relationship with the adoptee predominantly in a dimension of the future, projects and legitimate prospective aspirations, rather than on the sometimes uncomfortable reflection on the adopted child's past, which inevitably (regardless of the actual maintenance with the biological family) reverberates in the quality of the parent-child relationship and in the construction of sufficiently good identity development processes, which are based precisely on the awareness of the child's pre-adoptive history.

For good psycho-socio-educational management of open adoption and to avoid the risk of the child being exposed to traumatic lacerations again, in other words, exposing him or her to the risk of the environment failing by producing an impingement, it would be useful to imagine networks and structures capable of working on several levels – psychological, socio-legal pedagogical-educational – to accompany the families (biological and adoptive) in promoting effective educational relations, capable of hinging on the conscious and responsible acceptance of the different roles and functions that each of the elements of the system possesses face-to-face the child within the open adoptive family environment. In particular, knowing how to work in a network, a network of care, a multidisciplinary and interdisciplinary work can today face the management of change and project a more effective psycho-socio-educational alliance and limit the many professional fragmentations that weaken the quality of intervention. It is important, therefore, to work on the interdisciplinary boundaries between educational-pedagogical and therapeutic-clinical, as each of these sectors naturally trespasses into the other and the challenge lies precisely in the ability, despite the diversity, to implement interventions that inevitably become complementary (Corriero, 2023). There is therefore no clear-cut differentiation between the different situations involving caring for the other. But each one can influence the adjacent sphere by creating a synergy that expands the preventive area with its guiding principles (Berto, Sclari, 2013).

For an adopted child, maintaining the bond with the family of origin, under certain conditions, can be a protective factor (e.g. in managing anxiety with

respect to the abandonment experience, feelings of guilt, the perception of a family betrayal of the original bond, family adaptation, excessive idealisation that may become dysfunctional, etc.) and generative of a quality relationship with the adoptive family itself, a protective factor with respect to a possible dramatic and dysfunctional ‘adoptive rejection’, precisely because of deterministic legal and/or social rigidities, invisible to the adoptive family, due to the dramatic and dysfunctional deterministic rigidity of the legal and/or social system.) and generative of a quality relationship with the adoptive family itself, a protective factor with respect to an eventual dramatic and dysfunctional “adoptive rejection”, precisely because of legal and/or social deterministic rigidities, invisible with respect to the children’s needs to maintain a relationship with the family of origin, managed, monitored and functional to the exclusive interest and wellbeing of the children and children.

To date, open adoption cases are still numerically meagre to be able to make statistics and give definite answers on the developmental impact that this form of adoption produces over time on the developmental balance of adopted children, but it is certainly urgent as operators in the sector (including schools) not to be found unprepared and to commit to adequately train social and educational workers called upon to deal with adoptive and biological families involved in this form of open adoption in terms of psycho-educational skills, fostering resilient developmental processes as an unexpected hope (Cylurnik, 2005).

# FOR A CULTURE OF FOSTER CARE

Paola Ricchiardi<sup>a</sup>

<sup>a</sup>University of Turin

Achieving the full inclusion of children in out-of-home care depends primarily on a supportive school and social community that creates welcoming and accepting environments. Prejudices and limited awareness about these children, their birth families, residential facilities, and foster families restrict foster family availability and limit the supportive strategies that teachers and other adults in the child's support network—such as classmates' parents, coaches, and religious educators—might implement. Persistent myths about foster care, perpetuated by the media, further complicate these challenges. This research seeks to assess the perceptions of prospective teachers to inform targeted training programs that foster better inclusion of children in foster care. The study identifies ongoing issues and significant information gaps, along with an analysis of media influences on perceptions. It concludes by proposing innovative training solutions to enhance foster care inclusion.

foster care; prejudice; training

## INTRODUCTION

Achieving full inclusion for foster children depends primarily on a school and social community that fosters welcoming and supportive environments. Persistent prejudices and gaps in knowledge about foster children limit the support strategies that teachers and other adults in the socio-educational network can offer. False myths surrounding foster care are numerous (Howard, 2010; Delgado et al., 2022). For instance, misconceptions include the belief that foster parents are solely motivated by financial gain, that foster placements are excessively long regardless of circumstances, or that children in foster care are frequently mistreated. Research highlights that the stigma associated with not living with biological parents can negatively impact these children, often leading them to hide their foster care status, particularly in school settings (Dansey et al., 2019; Farmer et al., 2013; Abena Owusu, 2023). Challenges with

peer integration, coupled with common academic struggles, can harm the self-esteem of children in foster care (Hedin et al., 2011). Additionally, frequent transitions in their lives often require them to repeatedly rebuild relationships, which can be especially challenging. However, peers can serve as valuable support systems. According to research, much of this support depends on the competencies and attitudes of adults, who play a crucial role in fostering an inclusive environment and providing adequate support (Rogers et al., 2017). Given this, we conducted a survey targeting future teachers who may work with foster children.

### IMPORTANCE OF TEACHER PERCEPTIONS: THE SURVEY

In the training of future educators, psychologists, and social workers, topics addressing the conditions of children living outside their family of origin are generally covered. However, a specific focus on these issues is seldom included in initial teacher training, despite the crucial role teachers play in welcoming and supporting these children. To address this gap, a survey was conducted among kindergarten and primary school teacher trainees to assess their knowledge, perceptions, and potential misconceptions about foster care, with the goal of designing targeted training pathways. The survey sample comprised 355 university students enrolled in initial teacher training at the University of Turin, with 65% of participants aged between 18 and 24.

## RESULTS

### 2.1. Sources of Knowledge and Level of Awareness

The survey reveals that approximately 45% of the students surveyed have limited or no knowledge of foster care (see Fig. 1).

Fig. 1 – Do you know Foster care?

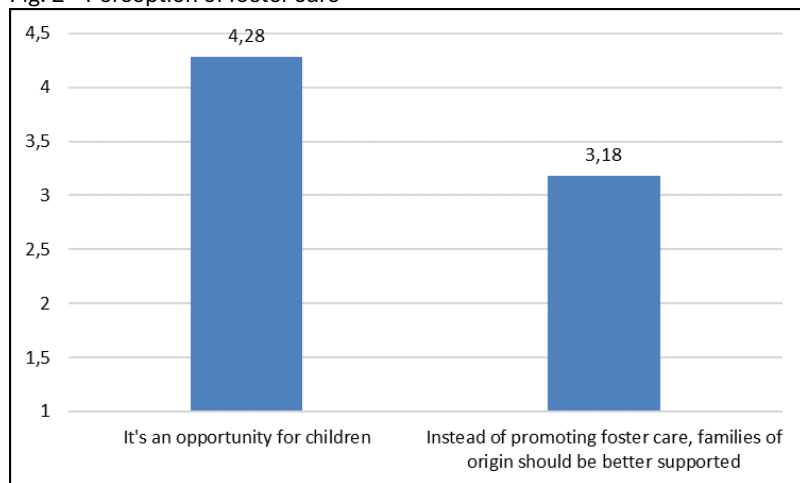

Only a few students have direct knowledge of foster care, either from having met children in foster care (29%) or foster families (33%). Some were part of a foster family (13%) or were in foster care themselves (7%). Unfortunately, most of those with indirect knowledge of foster care (the majority of the sample) gained information primarily from friends (42%) or online (18%). Only a small number obtained information from more reliable sources, such as books (8%) or study materials (14%).

## 2.2. Students' Perceptions of Foster Care

Although the interviewed students have limited direct experience with foster care, when asked whether they consider foster care an opportunity or a risk for children, all respondents shared their opinion. The majority view foster care as an opportunity for children (mean score = 4.28; scale: 1 to 5). However, when asked about the statement, "Instead of promoting foster care, families of origin should be better supported," many agreed, believing it would be more beneficial to support biological families over promoting foster care—without considering that these two actions are not mutually exclusive (mean score = 3.18; scale: 1 to 5) (fig. 2).

Fig. 2 – Perception of foster care

## 2.3. Students' Knowledge of Foster Care Facts

This section first explored whether students were aware that, in Italy, more children are now placed in facilities than in foster care. Only 19% of respondents were aware of this trend—a fact that has received little attention since the shift began in 2019. Unfortunately, this shift reflects a negative trend internationally, sparking debate in countries like the USA and France. More concerning is that

almost 40% of respondents could not say whether it is more desirable for children to grow up in a foster family or in a facility (fig. 3).

Fig. 3 – Importance of family

Approximately 70% of the students interviewed could not express an opinion on the typical duration of foster care, and 54% were unsure whether the headline “80,000 children torn from their family in 10 years” was accurate. In discussions following the questionnaire, students explained that they focused primarily on the number (80,000) and were unsure of its accuracy. However, they overlooked the problematic use of the word “torn,” which inaccurately suggests that children are forcibly removed, rather than receiving assistance from courts and social workers in cases of family hardship.

#### Representations of Foster Care in TV Series and Films

When asked if they could recall films or TV series that address family custody, over 40% of survey participants indicated that they could not remember any titles depicting foster care positively or negatively. This is surprising, given that many American TV series feature at least one unfortunate character who experienced a troubled childhood, often moving from one foster home to another. This data highlights the limited impact or reach of these messages on students’ awareness. Now, let’s examine those who recalled films or TV series relevant to foster care. In total, students identified 81 titles depicting foster care negatively and 77 portraying it positively. Notably, 25% of the titles appear on both lists, as they present both negative and positive aspects or experiences related to foster care. Of the 81 titles identified as portraying family custody negatively, 59 correctly relate to foster care (e.g., *Anne with an E*). However, 10

titles instead concern adoption (e.g., *Candy Candy*), 8 are unrelated to either foster care or adoption (e.g., *Pippi Longstocking*), and 4 depict informal foster care situations (e.g., *Legacies*). The most frequently mentioned negative portrayal is the TV series *Shameless* (an American comedy-drama created by John Wells that aired on Showtime from January 9, 2011, to April 11, 2021). This series follows a highly dysfunctional family with an alcoholic father and children in disarray, depicting foster care as an undesirable alternative despite the dire conditions faced by the children. Unfortunately, when watching such TV series, viewers often misplace their empathy and find themselves wishing for the children to stay in unsuitable situations rather than hoping for a better future for them. Regarding the TV series cited as examples of positive representations of family foster care, only 44 titles were found to be accurate. Notably, many of these positive representations come from cartoons featuring animals or depict informal foster care scenarios (e.g., *Twilight*). There is also considerable confusion between foster care and adoption, leading to the removal of such titles from the count. Additionally, when examining some Italian TV series that positively portray family foster care, we find that they still present incorrect perceptions of the foster care system (e.g., *Blanca*, *Un professore*, *Mare fuori*). For instance, these series depict foster care as a solution arising from a chance encounter between a child in need and an individual or family who decides to become a foster carer based solely on that meeting, rather than through a thoughtful decision involving a selection and training process. This representation suggests a form of “on-demand” foster care. Furthermore, these series often illustrate a lack of collaboration between the foster family and the biological family, portraying the foster family’s fear of letting the children go, which undermines the true essence of foster care. It should also be emphasized that several American films and TV series cited in the survey present a dismal portrayal of family foster care. However, when the protagonist chooses to care for a child by providing foster care, the representation shifts to a very positive one (e.g., TV series: *S.W.A.T.*, *Rookie*, *Truth Be Told*; films: *The Great Gilly Hopkins*, *The Blind Side*). Despite these positive depictions, the general opinion on the American foster care system remains negative. The situation is further complicated by the fact that 76% of those interviewed do not understand the differences between the Italian and American systems. This lack of knowledge raises the risk that they may unconsciously apply their judgments of the American system to the Italian context, leading to lingering suspicion or misconceptions about foster care in Italy. e.g. *S.W.A.T.* (American police procedural action-drama television series) The protagonist chooses to keep the

child because the foster family is composed of kind people, but they only provide rules and not love, appearing primarily motivated by money. Another character frequently shares his experience of having been in 13 foster families. ROOKY (American police procedural television series created by Alexi Hawley for ABC – 2018). In the series Rookie, one of the protagonists is a former foster carer who speaks very negatively about her past. However, when another protagonist takes in a lonely girl as a foster child, the experience turns out to be positive. In *The Blind Side* (2009), directed by John Lee Hancock, the protagonist finds a good foster family after having passed through numerous bad situations. Similarly, in *The Great Gilly Hopkins* (based on the realistic children’s novel by Katherine Paterson), the protagonist, Gilly, also ultimately finds a supportive foster family after experiencing several unfavourable placements.

## **THE NEW PROJECTS**

To promote a correct representation of family foster care and the broader protection of children, we have implemented a five-year curriculum within the initial training of teachers. This program consists of dedicated lessons interconnected in a cohesive design, integrated into courses, laboratories, or indirect internship hours that contribute to the teachers’ training. The training sessions also include explorations of stereotypes and prejudices stemming from social media, TV series, and children’s books. Furthermore, “socio-psycho-pedagogical clinics” have been planned, which are educational activities designed to train mixed teams of future psychologists, social workers, teachers, and educators. These teams will interact in simulated situations to analyse complex cases related to child protection, with guidance from professionals in each of the four fields. This approach allows them to learn collaboration, recognize the boundaries of their respective roles, and connect effectively in a network, particularly for more complex situations. We hope that these pilot initiatives at the University of Turin will expand and help nurture a culture of child protection.

# RESIDENTIAL FOSTER CARE HOMES AS TOOLS FOR SOCIAL EQUITY AND EMPOWERMENT. A STUDY ABOUT FOSTER CARE IN A REGION OF NORTHERN ITALY

## C. SCIVOLETTO

Stefania Fucci<sup>a</sup>

Matteo Davide Allodi<sup>a</sup>

Irene Valotti<sup>a</sup>

<sup>a</sup>University of Parma

The proposal arises from some results of a study conducted in Emilia-Romagna, a region in Northern Italy, starting from the hypothesis that residential foster care homes (RFCH) have the capacity to generate interactions and social relationships between those who, at different levels, are involved in it functioning (parents, professionals, educational services, social services, health services, associations, volunteers). This contribution shows only the main results from the quantitative data—specifically, the results from an online questionnaire filled out by a sample of managers of RFCH in the Emilia-Romagna territory. The self-representations that the respondent sample highlighted allow us to identify their ability to generate and nourish fair relationships, thanks to trust-type bonds (both interpersonal and systemic), towards the empowerment of the children and their social participation. The contribution aims to offer some general reflections on the issue of children in foster care (Act. N. 184/1983) and the role of RFCH as a resource for the growth and education of children, as generators of both social equity and empowerment dynamics for the families and the local communities.

foster care; residential foster care home; children's empowerment; children protection

## **INTRODUCTION**

The Italian childcare system and the related social work methodologies can be usefully analysed through a multidimensional approach involving different sectors of the social sciences (Greco and Iafrate, 2001; Greco and Maniglio, 2009). Moreover, in Italy, the social representation of foster care as a set of cognitive and evaluative constructs, as well as that of social work, has changed compared to a few decades ago (Scivoletto, 2013), when the need to open up to the worlds of host families or the private social sector was dictated by ethical and cultural issues as a consequence of the critique of total institutions that culminated in the approval of Law 180/1978, also known as the Basaglia Law (Basaglia, 1967; Goffman, 2001). One of the main challenges in the current welfare system programme is therefore to build a social system supported by an integrated development of economic and social welfare systems, setting measures able to combat poverty and social exclusion towards social equity and the empowerment of foster children (Freire, 1971; Sandel, 2010; Kincheloe, 2011).

The purpose of this paper is to offer some reflections on the issue of hetero-familial foster care and on the role of residential services as a resource not only for the growth and education of children placed outside their families of origin, but also as generators of a broader social wellbeing and civic culture. These reflections are the result of a survey carried out in Emilia-Romagna in 2023 as part of a broader research on the children's foster care system.

### **1. RESIDENTIAL FOSTER CARE HOMES AS PRODUCERS OF A BROADER SOCIAL WELLBEING: THE ROLE OF SOCIAL CAPITAL**

The starting hypothesis of this research is that residential foster care homes (RFCH) have the capacity to affect not only internal relationships, but also the local fabric in which they are embedded, generating interactions and social relations among people who do not directly use the services that these residential services make available to their users and internal members.

We therefore decided to investigate the representations that the RFCH have of themselves in terms of subjectivity, the relationships they create, and the methods they use to enrich the social fabric of a territory and to transmit the culture of which they are custodians.

Thus, the question of social capital, which is built up over time in continuous and relatively stable social relationships, becomes a central issue. Social capital, according to Putnam, is a “set of those elements of social

organization—such as trust, shared norms, social networks—that can improve the efficiency of the society as a whole, to the extent that they facilitate the coordinated action of individuals” (Putnam, 1993, p. 169). In particular, this author reminds us that social capital takes on both an individual and a collective character, with a private and a public face, as individuals form relationships from which they themselves benefit, and that “it can also have externalities that spill over into the wider community” so that “not all the costs and benefits of social ties go to the person who formed the relationship” (Putnam, 2004, p. 16). In this sense, for Hanifan (1916, p. 30), social capital coincides with “goodwill, friendship, solidarity, social relations between individuals and families that form a social unit”.

The importance of reviewing the role of children’s residential services in the light of current needs leads us to consider that the more residential services manage to connect social capital of the bonding type—that is, the social capital that is the result of relationships built within a relational system and that generates solidarity in homogeneous groups—with the capacity to generate social capital of the bridging type—that is, that which goes beyond homogeneous groups and which, as Lin (2002, p. 20) argues, acts as a “sociological lubricant” that allows one to “look outwards” and “build bridges”— the less their intervention is institutionalised in education and welcoming action.

## **2. THE RESEARCH: OBJECTIVES AND METHODS**

From the beginning of this work, we asked ourselves what was the relationship between the social potential of pro-social families and the socio-educational potential expressed in the mission of welcoming children and families in difficulty—in other words, what was their capacity to produce wellbeing both towards and in society and internally, in the care and social work pathways, according to their specific family identity.

Based on the research question and initial hypotheses, this quantitative pilot research involved the adoption of an online questionnaire to explore the role of RFCH within the welcoming system and the territory. The questionnaire, which consisted of 36 questions, was structured with a first general section aimed at reconstructing a picture of the RCFH by asking about the year of establishment, territorial location, belonging to a network of associations, and the number of active volunteers. A second section was devoted to identifying their social strength—i.e. the degree of awareness and representativeness that each RFCH believed it had within its own social fabric and its subjective insight in terms of

participation, recognition and relationships with citizens, key socialization agencies and institutional agencies in the local community. Finally, the concrete way in which each subject acted within its territory was explored.

The questionnaire was sent to a sample of RFCH in the Emilia-Romagna region and was filled in by the managers or contact persons.

### 3. SOME RESULTS OF THE SURVEY

A total of 89 RFCH in the region responded to the survey, broken down by province as follows: just under a quarter (21) were in the province of Forlì-Cesena, 16 in the area of the regional capital, 13 in the province of Modena, and 12 in the province of Parma. Piacenza, Rimini and Ferrara were the least represented provinces (Fig. 1).

Fig. 1. Distribution of the RFCH sample by province

Most of the responding RFCH (36) were established between 2011 and 2022, 31 between 2001 and 2010, and the remaining 22 in the last century. More than half reported having between one and five active volunteers, a fifth between six and ten.

Starting from the perception of subjective social potential and the concrete ways in which RFCH act in this area, we can see first of all that more than 60 per cent of residential structures (55) claim to participate directly and actively in the social and cultural life of their municipality. Participation mainly takes the form of adherence to and active participation in social and cultural initiatives organised in the area, along with networking in collaboration with other institutions, but also participation in institutional working groups (at the district level, “Piano di zona”). Despite the reported high level of participation, around a third (28) of respondents felt that the work of their residential structure was little recognised or not recognised at all by their local authority.

Fig. 2. How do you consider your RFCH to be an asset to the territory?

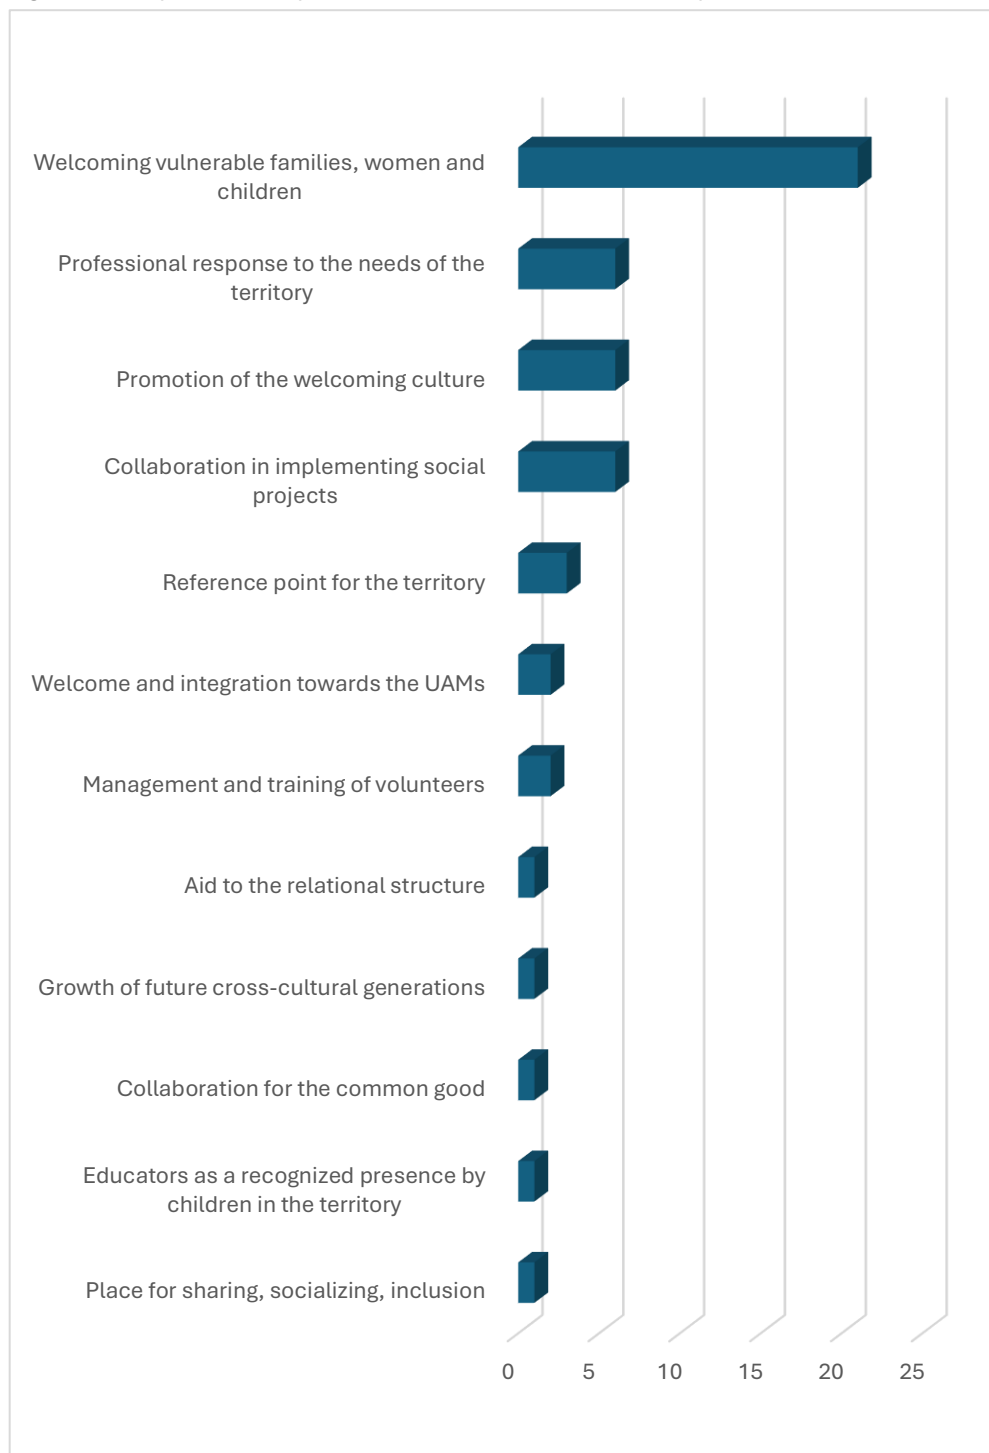

Fig. 3. How do you consider the territory to be an asset for your RFCH?

Fig. 4. Activities in which citizens are expected to support the RFCH

Almost all the RFCH that replied to the questionnaire (82 out of 89) considered themselves to be a resource for their local community, particularly in terms of welcoming vulnerable families, women and children, promoting a culture of welcome, cooperating in the implementation of social projects, and/or seeing themselves as a professional response to the needs of the territory (Fig. 2).

Similarly, more than 80 per cent of the respondents (73) affirmed that the territory is itself a resource for their residential structure, as it is fundamental in providing tools for integration and social inclusion, opportunities for socialisation, and job opportunities for young people leaving the RFCH (Fig. 3).

In terms of participation in planning between RFCH and institutions, just over half of the respondents (49) declared that their residential structure actively participates in formal and informal working groups for planning activities in the local community, referring in particular to co-planning working groups in the third sector (such as the coordination of volunteers or working groups for participatory planning at the district level), “Piani di Zona”, and working groups on welcome and poverty. Despite this activism, around two thirds of respondents (57) felt that they did not have a concrete and active influence on decisions affecting their area.

On the other hand, if we look at the activities in which the RFCH perceive citizens’ willingness to support them, almost two thirds of respondents said that this support would take the form of voluntary activities or occasional forms of solidarity (markets, ad hoc fundraising, donations), or forms of collaboration on projects or participation in events organised by the RFCH themselves (Fig. 4).

The RFCH were also asked to indicate the degree of co-operation (none, bad, good, excellent) with certain subjects and institutions in the area (municipal administration, schools, social services, health services, extracurricular educational services, sports associations, cultural associations, parishes, businesses and citizens) and to give a judgement on these relationships (negative, rather negative, neither positive nor negative, rather positive, positive). These are all indicators of movement towards society.

The picture that emerges is one of good or very good relations, considered positive or more than positive, with almost all institutional and non-institutional actors in the area. In particular, more than three quarters of responding residential structures reported good or very good co-operation with social and health services, educational institutions and sports associations. Such relationships are also those that tend to be perceived as good or very good. Co-operation and relations with the local authority, cultural associations, parishes

and citizens also appear to be positive, while co-operation with local businesses is rated as poor or non-existent by just under two-thirds of RFCH, most of them rating this relationship as neither positive nor negative.

#### **4. CONCLUSION**

In conclusion, we can say that the self-representations of the RFCH that participated in the research highlighted their ability to create relationships and bonds not only with the children or families that make up the residential structure, but also with and for the territory in which they are located, thanks to the trust-type bonds (both interpersonal and systemic) that they weave and nurture daily. They have a high level of bridging social capital, which in many cases allows the residential structure to become a point of reference for citizens, as well as a significant actor and stakeholder in its local community, thanks to its close contact with institutional services.

# **ADOPTION AND FOSTER CARE: ANALYSIS, REFLECTIONS AND BEST PRACTICE ON EQUALITY AND SOCIAL JUSTICE AT SCHOOL AND IN THE EDUCATIONAL SYSTEM**

Alessia Tabacchi<sup>a</sup>

Anna Guerrieri<sup>b</sup>

Caterina Balenzano<sup>c</sup>

Monya Ferritti<sup>d</sup>

<sup>a</sup>Università Cattolica del Sacro Cuore; <sup>b</sup>CARE; <sup>c</sup>Università degli Studi di Bari Aldo Moro; <sup>d</sup>Inapp Roma;

## **1. ADOPTION AND FOSTER CARE: ANALYSIS ON PAST ADVERSE EXPERIENCES AND CONSEQUENCES ON GROWTH PATHWAYS**

Adoption and foster care provide children with a family environment and a positive context in which to recover from early disadvantages. However, while numerous studies have examined the behavioural and emotional adjustment of children in foster care and adoption, little is known about their educational needs and pathways (Stother et al., 2019). Although some studies have not found significant differences in academic achievement between adoptees and non-adoptees (Dalen and Theie, 2019), most research has highlighted the potential vulnerability of these children in terms of learning, academic achievement and literacy (Sempowicz et al., 2018; Anderman et al., 2021). In particular, the literature has highlighted how children from different ethnic backgrounds and late adoptees, both domestic and international, often have language deficits, learning difficulties and poorer academic outcomes (Helder et al., 2016; Rygvold and Theie, 2016).

Similarly, the literature highlights that students in foster care often experience lower academic achievement and higher classroom behaviour problems compared to their non-fostered peers, which may further contribute to classroom failure (Luke and O'Higgins, 2018; McGuire et al., 2021). However, while many studies have focused on the factors related to the backgrounds of adoptive and foster children that are associated with this gap in learning skills and school performance (e.g. Rutter et al., 2010, Anderman et al., 2018), scholars should better explore the protective factors of the family and social

context and the resources that need to be activated to facilitate school engagement, self-efficacy, academic skills and success of these targeted students (Knapp et al., 2013; Goldberg et al., 2021). This means identifying modifiable environmental factors – such as parental attitudes, social support or teaching strategies – that positively support their academic trajectories.

## **2. STIGMA AND PREJUDICE**

The scientific literature highlights the frequent experiences of discrimination and microaggressions faced by children in foster care and adoption (Sue et al., 2007; Garber and Grotevant, 2015; Baden, 2016; Ferritti and Guerrieri, 2019). These negative experiences can lead to marginalization (Migliarini et al., 2019), educational failures (Ferritti et al., 2020a, 2021; Ferritti, 2023), and social exclusion (Morgan and Langrehr, 2019).

To address these issues, it is essential to explore elements that can stimulate a process of analysis and deconstruction of existing realities. This involves creating new narratives and cultural perspectives that challenge the status quo and promote inclusivity. By doing so, we can begin to dismantle the systemic barriers that perpetuate discrimination and marginalization.

One approach is to implement educational programs that raise awareness about the unique challenges faced by children in foster care and adoption. These programs can provide training for educators, caregivers, and peers to recognize and face microaggressions and discrimination. Additionally, fostering a supportive and inclusive environment in schools and communities can help mitigate the negative impacts of these experiences.

Another important element is the promotion of positive representation in media and literature of these life experiences to help change public perceptions and reduce stigma. This can empower these children by providing them with role models and narratives that reflect their own experiences.

## **3. AN OVERVIEW OF THE ITALIAN SITUATION**

In 2012, following the constant work of family associations and the Coordinamento CARE, the Italian Ministry of Education set up a working group to study the problems regarding the school inclusion of students with an adoptive background and in temporary foster care. In 2013, the Coordinamento CARE itself organized a help desk for Italian families, to identify clear specific needs, and it signed a memorandum of understanding with the Ministry of Education to work on the problem. A special Joint Working Group was

established, leading to the publication of the *Guidelines for the right to education of adopted students* (2014) and of the *Guidelines for the right to education of students outside of their original families* (students in the foster care system) (2017). To verify the impact of the Guidelines 2014, in 2019 the Coordinamento CARE promoted a national research, addressed to teachers of schools of all levels and to adoptive parents (Ferritti et al. 2020a, 2020b). The data collected by the research raised alarm since just over half of the responding teachers (1801 in total) knew the Guidelines and only 21.1% had received specific training on the topic. Through the continuous work of the Coordinamento CARE, the Commissione Adozioni Internazionali, in 2021, signed a memorandum of understanding with the Ministry of Education, which made possible to review the Guidelines 2014 with the aim, above all, of triggering a new and organic training process in the country. The new document was transmitted to schools in 2023.

#### **4. CONCLUSIONS**

Talk about Equality and Social Justice in the Educational System for children with a history of adoption and foster care leads to consider how political, educational, and cultural measures should be offered to guarantee full opportunity and to contrast inequality and stigma.

At the political level, the *Guidelines for the right to education* (2014/2023; 2017) represent a decisive step, unique in Europe, however, their application is not yet widespread in Italy. It is important to establish a dialogue between school, educational services, and families to build a synergistic and integrated system. It is therefore a priority to delineate common projects and educational alliances among the actors involved (Pati, 2019; Tabacchi, 2021), which provide children the possibility of overcoming some conditions of disadvantage or prejudice resulting from educational poverty.

In this perspective, there are still many questions which need to be addressed by interdisciplinary studies, to examine opportunities and possibilities for promoting resilience in children in adoption or foster care. It is worth delving into what are the conditions that today favour full inclusion and equity in children's processes of growth and education; what proposals can be made to plan actions and interventions that meets their educational needs; what training to provide for teachers, educators, parents to counter stereotypes and bias discourses in formal, non-formal, and informal education science fields (Schools, Services, public consensus). The hope is that interdisciplinary

research can increase knowledge about adoption and foster care, and help to spread a correct culture on the subject-matter.

# BEING WELL AT SCHOOL: EQUITY BETWEEN WELL-BEING AND STUDENT-CENTRED PEDAGOGY

Anna Granata<sup>a</sup>

Valerio Ferrero<sup>b</sup>

<sup>a</sup>University of Milan-Bicocca; <sup>b</sup>University of Turin

## INTRODUCTION

The need to pursue equity in education in order to achieve an ever-higher degree of social justice is internationally shared (OECD, 2012; UN, 2015; UNICEF, 2021), but the different definitions that can be given to these terms lead to various interpretations and different educational projects. We intend to focus on equity visions that value children's school well-being (Fullan & Gallagher, 2020) and promote student-centred pedagogies (Berg & Gleason, 2018).

The topic is becoming increasingly central (OECD, 2023): we must pay attention not only to students' academic performance, but also to their unique ways of approaching learning (Spratt, 2017). In this sense, promoting pedagogical methods and organisational strategies that create a positive school climate is crucial. Therefore, education is an essential disciplinary lens to abandon an adult-centred logic and cultivate approaches based on student needs.

## 1. EQUITY AND WELL-BEING: AN ESSENTIAL LINK

Shaping a school that recognises and values students' strengths means ensuring that each person develops their potential through appropriate educational opportunities that aim not only at achieving certain academic standards, but especially supporting personal growth (Clement, 2010). Establishing a positive school climate is an indispensable aspect of making this vision of equity a reality, both at the level of teachers' professional action in the classroom (Ahghar, 2016; Cohen et al., 2009) and at the level of educational policies formulated by individual schools, also with reference to different models of leadership and governance (Allen et al., 2015; Pepper & Hamilton Thomas, 2002).

In this context, equity represents the horizon of meaning for pedagogical action and school organisation (Ferrero, 2023): it is about considering the different

variables that can affect learning pathways, not having an “average student” in mind, but being open to diverse stories and voices (Granata, 2016). Ultimately, acting from an equity perspective means focusing on school well-being, by nurturing the educational relationship, adopting approaches and methods that promote motivation and joy for learning and implementing organisational strategies based on students’ needs, with school leaders playing a pivotal role (Smith et al., 2020).

## **2. STUDENT-CENTRED PEDAGOGY: A KEY ROLE FOR EQUITY**

Adopting a student-centred pedagogy proves crucial to guarantee students’ excellent school paths in terms of well-being (Bremner et al., 2022), with significant repercussions on learning (Armbruster et al., 2009). It is a matter of considering children’s interests, their cognitive styles and their rhythms from a personalized perspective (Mincu, 2013), not giving in to the temptation of a one-size-fits-all but recognising and valuing everyone’s skills and talents.

Cultivating equity understood as the promotion of children’s school well-being through the student-centred pedagogy approach can be done on several fronts (Anderson et al., 2022). The actions concern aspects related to both pedagogical practice and organisational culture (e.g., school time and space, assessment, inclusive processes that do not create segregation dynamics or lead to compensatory pedagogy, overcoming gender stereotypes, valuing different styles of intelligence and linguistic diversity).

## **CONCLUSION**

We intertwined the constructs of equity, well-being and student-centred pedagogy through the disciplinary lens of education from a theoretical perspective. Our exploration is not self-contained, but is intended to stimulate interdisciplinary reflection. In fact, it introduces the papers presented at the Third International Conference of the journal *Scuola Democratica* “Education and/or Social Justice” (4-6 June 2024, University of Cagliari, Italy) in the panel with the same title as our paper.

Ultimately, the attempt is to answer these questions, which are not meant to be exhaustive:

- how can the construct of equity be conceptualised with reference to school well-being and student-centred pedagogy?
- what dynamics make the possibilities of school well-being unequal?

- what role do school times and spaces play in enhancing the uniqueness of each student and promoting their well-being?
- which assessment practices cultivate students' well-being in terms of reducing anxiety and supporting learning processes?
- how to plan inclusion without creating dynamics of segregation or exclusion?
- how to value diversity in all its forms (linguistic, cultural, learning styles...), without giving in to the risk of a culturalist or differential pedagogy?
