# USING *PEREŽIVANIE* IN AUTOBIOGRAPHICAL MEMORY ACTIVITIES WITHIN THE CLASS GROUP

Stefano Costantini  
University of Florence

Within a classroom setting, the relationships and social-emotional experiences that occur between peers are manifold and can be understood as the product of a pattern. Examining the systemic relationship and interdependence between developing individuals and the context of life, Vygotskij observed that in addition to the subjective characteristics of individuals, the objective characteristics of the social environment also determine how an experience is perceived and the trajectory of human development nonetheless. In a Vygotskian perspective, people live the same event very differently from one another and one's *Pereživanie* becomes the way the experience is understood and internalized by the individual in which the emotional and cognitive components are interpreted as a unicum. By proposing autobiographical activities to young students, such as oral or written narratives referring to a significant episode that involved the entire class group (a trip, a particular activity carried out at school, a theatre workshop, an end-of-school-year party, the arrival of a new classmate or a new teacher, etc.) it is possible to bring out the subjective experiences of *Pereživanie* and to use them as an analytical tool between individual and social experiences of the students in order to foster a construction of a positive classroom environment.

School Well-Being, Student-Centered Pedagogy, Activities in a Group Class, *Pereživanie*, Autobiographical Memories.

## INTRODUCTION

Vygotskij's cultural-historical theory distinguishes the necessary *lower* psychological functions understood as spontaneous processes guided exclusively by biological factors from the *higher* psychological functions that are understood as logical memory, abstract thoughts and language, voluntary attention and creative imagination that describe the natural capacities of the

human beings (Vygotskij, 1978, 1987, 1997, 1998, 1999, 2019). In Vygotskij's view, social relationships are the basis for the development of all higher psychological functions and each higher psychological function manifests twice during the process of development; firstly, during social activities in peer interaction through an inter-psychological process and secondly, internally, during individual activities through an intra-psychological process (Vygotskij, Lurija & Leontjev, 1970). The internalized use of tools and signs that leads to the development of higher psychic functions, therefore, occurs through interactions with others (Vygotskij, 1990). During everyday school life a crucial role is played by the linguistic exchanges between adults and children where they communicate and plan together the activity they will be engaged in and through which the adults make their thinking activity visible and comprehensible to the children, leading them to the next step of cognitive and socio-emotional growth. Since it is a common belief that the higher psychological functions are all skills that are learned through practice, there is a tendency to assume the transition between these two processes occurs spontaneously and non-traumatically, rather than considering an inevitable period of 'crisis' (Kellogg & Veresov, 2021). According to Vygotskij, the "qualitative leap" in cognitive abilities happens through an alternation between stable ages during which changes are minimal and the passing of critical ages that allow the transition to a later developmental stage. In this sense, Vygotsky focuses on the individual changes that occur for each child following their unique rhythm of development. What Vygotskij means by 'crisis' is that, in the first place, the situation of social development is one in which internal rather than environmental factors seem to be in control. In the case of an assessment examines exclusively the socio-emotional developmental aspects, what should be of interest is not only the learning capacity but rather the systematic observation of the ways students use and draw on their knowledge and skills influencing their growth steps. If the social and cultural environment is not rigidly predetermined, it can be organized based on the socio-emotional needs that may gradually emerge. Achieving this requires leaving more educational space for each student through a methodology that uses teaching activities to encourage participation and active learning with cooperation processes (e.g. *cooperative learning* and *peer education*). In doing so it becomes possible to provide adequate and appropriate *stimuli*, especially for young students with emotional, affective and relational difficulties. Such an approach would enable teachers to provide specific educational and didactic actions focusing not only on the socio-emotional competencies that children have already achieved, but also on those

that could determine their subsequent growth steps (Minson, Veresov & Hammer, 2022).

### **THE RE-ELABORATION OF LIVED EXPERIENCES (PEREŽIVANIE) AS AN ANALYTICAL UNIT WITHIN THE CLASS GROUP**

The past experience of each student has its own specific weight. In the context of everyday school life, it is often the case that many young students present an attitude that is positively or negatively influenced by past experiences, which may result in good or poor school performances or, more generally, possible fondness or disaffection for the school environment (Karabanova 2010; Mok, 2017). Experience (Pereživanie) is a unit of development comprehending both internal (emotions, consciousness) and external experience (social environment) as integral parts of an irreducible unity, as it integrates the cognitive, emotional and practical dimensions of human life. Such a unity can't be fragmented into separate characteristics of the person and the environment. Instead, it represents a continuously evolving process, capturing the dynamic interplay and two-way interaction between the individual and the surrounding environment (Veresov, 2010). Thus, it is possible to identify Pereživanie as a category for understanding human development, serving as a minimal unit that reflects all the characteristics of the developmental whole, encompassing both social environment and the person. This unit undergoes two distinct types of changes: (a) continuous and quantitative alterations that may be classified as learning and (b) discontinuous and qualitative transformations that are traditionally recognized as development. In individuals, this unity is ideally reflected in consciousness, affectively in emotions and practically in changes to personal action potential. Therefore, when observing a young learner's behavior in a typical school context, what is happening cannot be understood exclusively based on the individual's characteristics but as a developmental continuum (Jóhannsdóttir & Roth, 2014), where previous forms of experience also influence development as a whole (Roth & Jornet, 2014). Within a classroom setting, the relationships and social-emotional experiences that occur between peers are manifold and can be understood as the product of a system. For example, when examining the systemic relationship and interdependence between the members of a class group, in addition to the subjective characteristics of individual students, it is primarily the objective characteristics of the social environment that determine how an experience is perceived and the trajectory of human development (Van der Veer & Valsiner, 1994). The events young learners experience in the classroom, particularly

those ‘that stands out as a lasting memory’, carry an affective dimension that cannot be separated from its cognitive, emotional and practical aspects. These events hold unique significance as they constitute units of *Pereživanie* shaped by, and building upon, previous experiences (Veresov & Fleer, 2016). From this perspective, *Pereživanie* can be understood as a category that retains and preserves the defining characteristics of a context, while also integrating the evolving personal and environmental elements. It effectively represents an analytical unit embodying the intrinsic traits of the person (Jóhannsdóttir & Roth, 2014). The systemic relationship and interdependence among members of a class group, along with the objective characteristics of the social environment, shape the experiences of young students in school. This reality underscores the necessity for teachers to plan and implement specific activities aimed at illuminating these *Pereživanie*. According to Vygotskij’s cultural-historical theory, developmental processes are shaped by evolutionary changes; however, only ‘dramatic’ and ‘contradictory’ moments from the past influence the subject’s life. The extent to which a young student is supported in realizing and harnessing their full potential to achieve a higher level of socio-emotional development depends on their *social developmental context* (Veresov, 2006). For instance, poorly managed ‘dramatic’ and ‘contradictory’ moments may pose a risk to a young student’s socio-emotional development; however they also hold the potential for significant progresses (Ma, Hammer & Veresov 2021). Ultimately, cultivating a new and different self-awareness for each student can reduce the risk of consolidating an attitude of possible disaffection and can help foster a renewed attitude of interest in their peers and the broader school environment.

## **USING PEREŽIVANIE IN AUTOBIOGRAPHICAL MEMORY ACTIVITIES WITHIN THE CLASS GROUP**

Vygotskij defines *Pereživanie* as a ‘refractive prism’ that reflects various aspects of its environment and influences the impact it can have on students within the school context (Germanos & Longarezi, 2019). In these terms, from the standpoint of promoting a student-centred pedagogy that safeguards the student’s uniqueness and well-being at school, it is essential for teachers to provide specific autobiographical storytelling activities. Such activities are particularly beneficial when implemented during the last two years of primary school, a period when meaning-making is evolving and the articulation of narratives with autobiographical content is richer in details and nuances. What remains in the young student’s memory regarding school life are the ‘dramatic’

and ‘contradictory moments’ from the past, both positive and negative. The recollections formed today are reflected through *Pereživanie* and serve two key purposes: first, they act as an indicator of how *Pereživanie* functions as a prism; second, they enable the reconstruction of the ‘dramatic’ and ‘contradictory moments’ of the past that the young students experienced. This dual insight enhances our understanding of the role and influence the environment has on each student’s socio-emotional development. Memory and the self are shaped by specific social interactions and cultural structures, leading to the formation of an autobiographical narrative that define what is appropriate to remember and how to do so. It can thus be assumed that autobiographical memories are partially constructed through social engagement (Fivush & Haden, 2003). Through written rather than oral narration, personal memories emerge with less embarrassment and reduced conditioning of other classmates. This allows for the analysis of the social-emotional aspects that influenced the recalled experience. Using autobiographical storytelling in written to examine school memories can be a valuable tool for fostering expression and narration, as well as depicting the ‘prism of experiences’ (*Pereživanie*) that young learners have encountered in the school context (Hedegaard, 2009). Considering the individual *Pereživanie*, it is possible to implement specific autobiographical activities throughout the school year. These activities aim to identify the socio-emotional experiences that may have shaped young students’ personal beliefs, which can lead to an inaccurate self-perception. This, in turn, affects the development of positive relationships with peers and, more broadly, influences the overall classroom climate (Zaporozhets, 2002). The ‘prism of experiences’ (*Pereživanie*) that emerges for each student effectively captures the subjective world and often highlights elements that can be interpreted in relation to their well-being or discomfort within the school context. Notably, biographical involvement enables the reconstruction of the school lives of students in a class group who have shared the same, or similar, experiences, shedding light on their personal cognitive, affective, value-based, and relational dimensions (Demetrio, 2000). An activity that explores autobiographical elements can be implemented by encouraging young students to create written narratives about a significant episode that involved the entire class group (such as a trip, a memorable lesson or activity, a drama workshop, an end-of-year class party, the arrival of a new classmate or a new teacher, etc.). The goal is to use the insights gained from these experiences as a potential analytical tool to explore the interplay between the individual and the social context experienced by the students (Veresov, 2019). In this dynamic,

promoting an active participation of all members of the class group not only enhances the understanding of different perspectives but also fosters a positive climate. Such an approach allows for a deeper understanding on how each student perceives and internalizes their lived experiences, integrating emotional, cognitive and practical dimensions into a cohesive and unique whole (Michell, 2016).

# BRINGING EDUCATION BACK TO SCHOOL: AN ACTION RESEARCH PROJECT TO STRENGTHEN TEACHER PROFESSIONALISM AND AVOID THE MEDICALISATION OF SCHOOLING

Valerio Ferrero<sup>a</sup>

Anna Granata<sup>b</sup>

<sup>a</sup>University of Turin; <sup>b</sup>University of Milan-Bicocca

Bringing education back to school is both an epistemological and a professional issue. Following a theoretical framework, this paper presents the results of an action research involving primary school teachers, parents and a neuropsychiatrist.

school; education; students' well-being; teacher professionalism; Italy

## INTRODUCTION

The pivotal role of teachers in providing equitable and quality education for all with significant impact on society has long been internationally acknowledged (Mincu, 2015; Sahlberg & Boce, 2010). Teacher professionalism is essential to the strength of school systems, concerning educational policies, institutional practices and daily school life (Tatto, 2021). Therefore, investing in teachers through initial and in-service education, career development and enhanced social and economic recognition is a key issue. This paper explores the challenges of the teaching profession, with a focus on the Italian context.

The Italian school system is facing several structural challenges. Low public spending on education (OECD, 2024) leads to various territorial differences: all-day education is widespread in northern Italy, while in the south it often remains below 10%; many school buildings need maintenance. In addition, the increasing adherence to neoliberal logic exacerbates inequalities between schools and students (Baldacci, 2022). Thus, teachers are losing their social

relevance due to a lack of investment and a public discourse that denounces the inefficiency of education as a great equaliser (Gremigni, 2012).

Bringing education back to school is a matter of strengthening the school system and reaffirming the social role of teachers (Ferrero & Granata, 2024). This paper explores the importance of prioritizing teacher professionalism in planning the inclusion of students with special educational needs, in order to counteract trends of medicalization and the delegation.

## **1. THEORETICAL FRAMEWORK**

Bringing education back to school involves both the relationship between disciplines and the dialogue between professionals. It is essential to refocus on the educational perspective, both epistemologically and professionally.

### **1.1. In Dialogue, but on an equal footing!**

The complexity of educational phenomena makes a single-disciplinary approach inadequate (Morin, 1999). Fragmented knowledge fails to capture the multiple factors influencing students' educational paths, the school culture and organization. Furthermore, interdisciplinary dialogue is authentic only if there are no hierarchical relationships between disciplines (Bertolini, 2005; Granata, 2018).

Education often takes a subordinate role (Moscato, 2012): when it moves into other fields, it can lose its specific insight on the student's growth path. As far as school and special educational needs are concerned, the attention is no longer on the student and their approach to learning, but on what is perceived as a deviation from the idea of norms, on codes and diagnoses (Gambacorti-Passerini, 2016; Gaspari, 2016). As a result, the focus shifts from students' strengths to their difficulties, diminishing the view of the person in favor of aspects like certification, deficits and distance from the norm.

In the school context, education is the key disciplinary lens to understand the various dynamics that arise. Its dual nature, both reflective and practical (Chiosso, 2018), should be more strongly emphasized both at the epistemic level and in dialogue with other disciplines. The educational perspective helps to maintain the connection between instruction and education (Biesta, 2012) ensuring that the school experience is aimed at the holistic growth of the person.

## **1.2. Interprofessional Collaboration for Special Educational Needs**

The ancillarity of education as a disciplinary lens is reflected in the position of the teacher professionalism in the interprofessional dialogue on the inclusion of students with special educational needs. Therefore, it is necessary to affirm the specific professional competence of teachers (Arsena, 2024) in developing pedagogical responses to students' needs. In fact, neuropsychiatrists, psychologists, speech therapists and social workers are considered more entitled to provide operational and planning guidelines for schooling, relegating teachers to a purely executive role, which is detrimental to their professional self and, above all, dangerous for the quality of students' experience.

Medical professionals have a fundamental role in the diagnostic process: the information provided by teachers is certainly useful, but must be supplemented by particular procedures and tools. Likewise, they must respect the competences of teachers, who can respond to the specific needs of each student with pedagogical means (De Anna, 2022). Teachers themselves must defend and strengthen their role as designers of students' educational paths, without ceding this responsibility to others (Martinelli, 2015): otherwise, the danger is to delegate pedagogical planning to professionals who are careful to provide technical and "special" answers and who do not prioritise the collaborative dimension of learning processes and school life.

There is a need to rediscover teaching (Biesta, 2017) in order to design inclusive processes from an educational perspective. If the interprofessional dialogue only marginally considers this point of view, the need for change for the whole context is ignored (Ainscow, 2020). In fact, student empowerment does not take place through their adaptation to the educational offer with individualised teaching methods, but through personalization processes in which the classroom is seen as a learning community to which everyone makes their own contribution (Ianes & Demo, 2023). Ultimately, bringing education back to school means moving away from the logic of the standard and the average student and not delegating pedagogical and didactic decisions to other professionals (Bellantoni & Lombardi, 2020).

## **2. THE RESEARCH DESIGN**

Our research aims to understand how the medicalization of schooling can be avoided by reaffirming teaching professionalism. We want to answer the following research questions:

- what are the consequences of the ancillary educational perspective on schooling?
- how can the inclusion of special educational needs be addressed by purely pedagogical means without medicalization and delegation?
- how can teacher professionalism be brought back into focus?

## **2.1. Methods and Tools**

We used a qualitative approach (Luttrell, 2010). An action research was conducted: the primary school teachers were the main actors; the path with them was triangulated with the voice of parents and a neuropsychiatrist.

Five low structured focus groups (Morgan, 2013) were conducted with the teachers in order to explore their ideas on the research topic and design pedagogical strategies related to special needs. Narrative interviews (Gubrium et al., 2012) were conducted with the parents and the neuropsychiatrist about their perspectives on the theme.

## **2.2. Participants**

9 teachers of three first classes of a primary school in Lombardy (Northern Italy) took part to the research. Furthermore, 2 parents and 1 neuropsychiatrist were involved.

## **2.3. Data Analysis**

The data collected were thematically analysed (Braun & Clarke, 2021). After having familiarized with the participants' dialogic interactions, we code them by drawing out the relevant discursive segments in relation to the research questions; then, themes are constructed and defined to summarize the different codes into a central and organizing concept that is declined in different nuances.

## **3. RESULTS**

Some significant excerpts from the interviews with the parents and the neuropsychiatrist are offered. Instead, data collected from the path with teachers are presented from these thematic strands:

- importance of being a diverse but close-knit team;
- teacher habitus;
- classroom as a space for dialogue;
- beyond the traditional schooling;
- enhancing hidden capabilities.

The names used are pseudonyms.

### **3.1. The Parents**

The first parent interviewed explains exactly how school culture and organisation can negatively affect the students' well-being. Specifically, a school transfer produced problems that have never occurred before and the uncritical categorization of the pupil into the special educational needs category by the teachers.

Vicky is a sociable and lively child. She faced major changes after we moved this year.

In her previous school, teachers appreciated her intelligence and empathy for classmates with disabilities. However, new teachers see her behavior as opposite, noting her refusal to write in cursive and difficulty completing assignments.

They recommended screening for dyslexia, dyscalculia and ADHD; they interpreted her sensitivity to classmates with disabilities as "difficulty in relating to *normal* classmates".

As parents, we feel confused and ignored by the teachers.

Lucia, Vicky's mother

The second parent interviewed also points out how schools can extinguish students' motivation to learn and invoke the category of special educational needs if results are unsatisfactory. Furthermore, in this case, bilingualism is considered not as a resource but as an obstacle to learning.

Pablo is a Spanish-Italian child. He has always preferred solitary play and has a strong interest in science and nature.

Despite his intelligence, he struggles in primary school due to traditional teaching methods and limited outdoor activities. While thriving in his interests, he dislikes group work.

Teachers suspected autism or ADHD and requested a screening, which came back negative. They also suggested exempting Pablo from activities he resists.

Julia, Pablo's mother

### **3.2. The Neuropsychiatrist**

The neuropsychiatrist interviewed points out that teachers too often seek external advice without questioning how they can respond to students' difficulties with their professional skills. This approach leads to an overburdening of healthcare facilities and a medicalization of learning paths.

Teachers must carefully consider whether to refer students to neuropsychiatry.

Many foreign children are screened for potential learning disorders based on teachers' reports. While such diagnoses may sometimes be valid, it's also reasonable to consider that these difficulties might stem from the natural process of learning written Italian, which requires time.

Marco, neuropsychiatrist

### **3.3. The Teachers**

Firstly, teachers emphasise the need to be a cohesive team. The diversity of skills and visions is seen as a value.

We are a team with different ages and skills. We get along well: everyone plays their part and the children benefit too.

Carla

A good climate is not created from one day to the next, you must work at it.... Both among adults and with children.

Marta

Secondly, the focus is on the teacher habitus, especially to deal with those cases where students approach learning with anxiety and fear.

We must communicate that even the teacher can make mistakes.

Mattia

Many children have performance anxiety: you must work on this!

Barbara

Anxiety belongs to the teachers too: certifications also depend on taking away the anxiety of getting all pupils to achieve the same goals.

Carla

Thirdly, the ideas about the classroom are crucial: it is not an aseptic space, but a pedagogical environment that must be designed with regard to relational climate.

We take 10 minutes every morning to tell each other how we feel. It is important to create a peaceful atmosphere.

Anna

We create a class museum with our school memories.

Barbara

We have five minutes (which often become much more than five) in which we tell each other what is on our minds...

Maria Grazia

It becomes clear that the school time, space and organisation must be renewed. When students have difficulties, the solution cannot be to immediately refer to the category of special educational needs: this would entail the risk of labelling and medicalization.

The classes divided by age are very rigid: sometimes more flexibility is needed... Mixing the ages would help many children to learn better.

Anna

We should create a toolbox that everyone can use if they need it and independently.

Giulia

Not all students learn in the same way. Some need more attention and different teaching methods. I need to incorporate different approaches to teaching.

Carla

Finally, teachers emphasise the need to focus not only on knowledge and abilities related to school subjects. Every student has skills and talents that must be fully recognised.

The notebook does not tell all the students' abilities. We strive to find them, but it is difficult to communicate this approach to families.

Anna

We carry out activities that bring out other skills than the typical school ones... Tending a plant, contributing to the local area... The best skills emerge when students work together!

Giulia

#### **4. DISCUSSION**

The results of our study show that the dynamics of delegation and medicalization as well as the devaluation of teacher professionalism are still present in the Italian school system. Regarding the second area, teachers themselves prefer to turn to other professions to respond to challenges that are primarily pedagogical in nature.

In addition to addressing the structural deficits of the school system at a

political level, we must move away from the belief that certain learning styles or intelligences are more valuable than others. Every student possesses unique skills and talents that deserve to be nurtured, even if they are wrongly deemed irrelevant for school. Cultivating students' well-being requires a pedagogy that places them at the centre, without a false understanding of norm or standard.

Thus, it is important not to prematurely label momentary school difficulties as permanent special educational needs. Conversely, we must question the traditional understanding of the educational experience. School times and spaces must be adapted to the needs of students by finding new organisational solutions, in order to create the conditions for better learning for all.

## CONCLUSION

Our paper focused on the Italian school system, but our reflections may also be useful for other contexts with similar characteristics and problems. In fact, improving teacher professionalism is a central theme in the international debate.

Bringing education back to school is an ethical, epistemic and professional issue. Adopting this perspective means putting learners at the centre of teaching, abandoning an adult-oriented logic and understanding personalization as a classroom-based approach, without separate and multi-level paths. By imagining new ways of schooling, students' hidden talents and skills can be valued.

# LISTENING TO SILENT VOICES: AN INVESTIGATION INTO THE STUDENT VOICE APPROACH TO PROMOTE INCLUSIVENESS AND STUDENT WELL-BEING

Federica Festa<sup>a</sup>

Alice Di Leva<sup>a</sup>

<sup>a</sup>University of Turin

Through a literature review, this work aims to investigate how much the student voice is integrated within the teacher training and how this practice has repercussions on the professional practice of teachers and on the well-being of students. Specifically, we aim to investigate how much the student voice is integrated into the academic training curriculum of future teachers and how this practice impacts on teachers' professional practice in an inclusive perspective. Indeed, the literature shows that students involved in student voice practices demonstrate greater involvement and responsibility for the tasks assigned to them, increasing the likelihood of generating meaningful learning. Based on this assumption, the research hypotheses that experiencing student voice in one's own training helps teachers who will go on to work with students with disabilities to internalise the importance and urgency of giving voice to the people usually unheard, and that experiencing engagement and advocacy can help future teachers to replicate this practice in their work.

inclusion; student voice; teacher training; students well-being

## INTRODUCTION

Inclusive education aspires to ensure equitable learning opportunities for all students, regardless of their abilities or backgrounds. However, individuals with disabilities are often excluded from critical educational processes and decisions that shape their experiences. This exclusion reflects a broader pattern of structural and historical ableism that continues to marginalize their voices in educational contexts. The concept of "student voice" challenges these inequities by advocating for the active participation of students in shaping their learning environments. As highlighted by Cook-Sather (2002), neglecting to

include students in the design of educational systems undermines both their agency and the effectiveness of those systems.

Despite the transformative potential of student voice, individuals with disabilities, particularly those with complex communication needs, are frequently absent from these discussions. Batt et al. (2023) underscore the persistent underrepresentation of disabled students in student voice initiatives, a gap that is deeply entwined with epistemic violence. Defined by Spivak (1988), epistemic violence refers to systemic practices that silence or limit the capacity of marginalized groups to speak and be heard. Addressing this exclusion requires a critical reassessment of traditional approaches to education, shifting from a paradigm of doing research “on” students with disabilities to one of doing research “with” them (Boyle, 2012). This shift involves recovering the subjectivity of individuals, restoring their capacity to define their own life paths, and considering their voices authoritative in these processes (Marchisio & Curto, 2019).

This study investigates how participatory methodologies can amplify the voices of students with disabilities, promoting inclusiveness and well-being. Grounded in disability studies, which critique deficit-based models and advocate for approaches rooted in rights, empowerment, and self-determination (UN Convention, 2006), the research emphasizes collaboration, experiential knowledge, and reflexivity as critical tools for addressing entrenched inequalities in education (Cornish et al., 2023).

By bridging the gap between inclusive theory and practice, this research offers insights into the potential of participatory approaches to create more equitable educational environments. Ultimately, it aims to enhance the experiences and well-being of all students, ensuring that their voices are not just heard but actively shape the systems they inhabit.

## **1. STUDENT VOICE AND WELL-BEING**

The concept of Student Voice has evolved significantly, transitioning from tokenistic approaches to practices that position students as active participants in educational reform. Fielding (2004b) outlines this evolution, where students move from being data sources to becoming co-researchers and central actors in shaping their educational environments. This shift aligns with participatory and rights-based approaches, emphasizing power redistribution and student agency.

The integration of Student Voice is closely tied to theories of inclusion and

disability. Disability, as Mitchell and Snyder (2000) observe, has historically served as a trope of human disqualification, forming the “negative space” against which the notion of the ‘normal’ body is constructed. Davis (1995) critiques this construction, advocating for a social model of disability that emphasizes empowerment, self-determination, and equity. Reframing the voices of students with disabilities as central to educational processes challenges ableist structures and promotes inclusive practices.

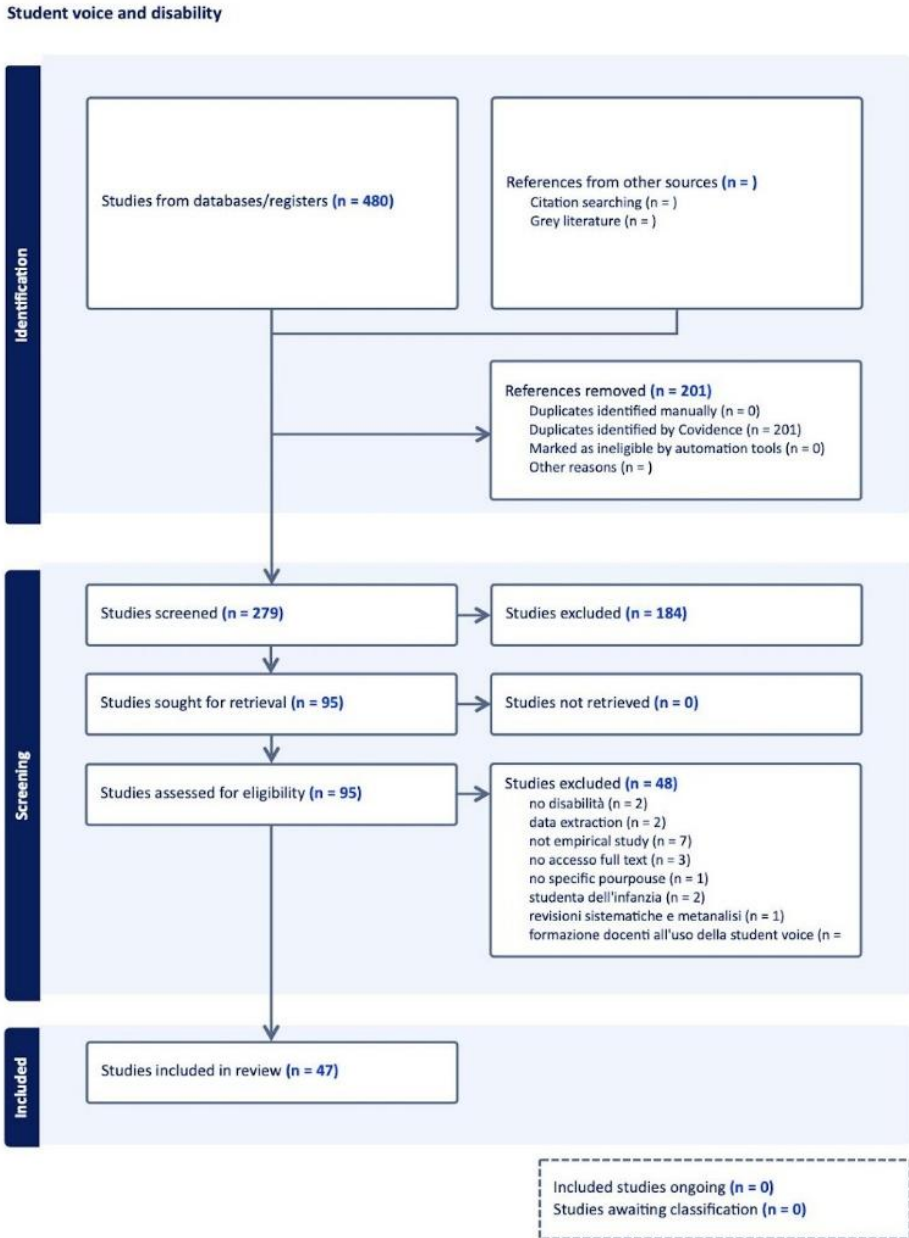

Recent studies highlight the benefits of Student Voice in addressing systemic barriers and fostering equity. Messiou et al. (2020) argue that engaging students as equal partners enhances diversity and aligns practices with inclusive values, linking participation and empowerment to well-being by fostering belonging and self-efficacy. Cook-Sather et al. (2014) report positive impacts on critical thinking, engagement, and agency, while Bovill et al. (2011) and Werder et al. (2012) emphasize its role in fostering leadership, responsibility, and motivation for both students and educators. Halliday et al. (2019) further connect participatory action research (PAR) to well-being, demonstrating how it fosters autonomy, competence, and relatedness—psychological needs identified by Ryan and Deci (2000)—while creating inclusive spaces where all students feel valued and empowered.

However, significant challenges persist in implementing Student Voice inclusively. Findings from this study’s systematic review reveal a predominant reliance on verbal communication methods, which exclude students with complex communicative needs. Only 4% of the studies reviewed utilized non-verbal tools like Talking Mats or visual narratives, underscoring the need for methodologies that accommodate diverse ways of expressing and participating.

## **2. METHODS**

This study employed a systematic review and participatory action research to investigate the use of Student Voice with individuals with disabilities in formal academic settings, exploring how and to what extent their voices are heard and hold transformative power within these contexts. The systematic review was conducted using the PRISMA framework to ensure a rigorous and transparent process of identifying, screening, and synthesizing relevant literature (Moher et al., 2009), and was focused on studies published between 1990 and 2024. The workflow is exemplified in Figure 1, which provides a visual representation of the systematic review process.

Fig. 1. Systematic Review Workflow

The systematic review revealed critical gaps in the literature, notably the underrepresentation of students with complex needs and the predominance of verbal communication methods. These findings informed the design of the participatory action research phase, conducted in secondary schools in Turin. This phase involved focus groups with students, aimed at exploring their perceptions of inclusion, the dynamics of being listened to, and the impact of participatory practices on their well-being. The research is expanding to include teachers, families, and self-representation groups, fostering a multi-stakeholder dialogue to co-construct inclusive strategies for educational practices.

Throughout the study, a strong emphasis was placed on reflexivity and intersubjectivity, addressing ethical complexities such as power imbalances and ensuring that participants' contributions were central to the research process. This combined approach provides both a theoretical and practical understanding of the role of student voice in promoting inclusiveness and well-being, bridging gaps between research and practice.

### **3. RESULTS**

The findings of this study reflect the dual focus of understanding existing methodologies for incorporating Student Voice and exploring its practical application through participatory action research. These results are presented in two parts: the outcomes of the systematic review and the preliminary insights from the focus groups conducted in Turin.

The systematic review revealed persistent gaps in the inclusion of students with intellectual disabilities and complex communicative needs in educational research and practice. Among the studies reviewed, only 4% employed non-verbal or assistive communication methods such as Talking Mats or narrative-based approaches. The overwhelming reliance on verbal communication methods underscores a structural limitation that restricts the participation of students with diverse communicative abilities. Moreover, the review identified a lack of integration between inclusive education theory and practical methodologies designed to empower marginalized student populations.

Building on these insights, the focus groups with secondary school students in Turin provided a practical perspective on the dynamics of inclusion and Student Voice educational settings. Students frequently expressed feelings of exclusion due to limited opportunities to influence decisions affecting their learning environments but also conveyed a strong desire for meaningful dialogue with

educators and peers. Being heard was associated with a sense of belonging and improved well-being. Preliminary findings suggest that inclusive participatory practices can address these concerns, with students reporting greater motivation and connection to their learning communities when their contributions were acknowledged. These results align with broader literature linking Student Voice to enhanced well-being, agency, and engagement (Halliday et al., 2019; Messiou et al., 2020).

#### **4. DISCUSSION AND CONCLUSION**

The findings of this study underscore the transformative potential of Student Voice in fostering inclusiveness and well-being in education. By examining both the theoretical frameworks and practical applications, this research highlights critical gaps in current methodologies and offers insights into how participatory practices can address these challenges. The discussion explores the implications of these findings for inclusive education, and student well-being.

The systematic review revealed a pervasive reliance on verbal communication methods, which excludes students with complex communicative needs from meaningful participation. This structural limitation reflects broader systemic barriers rooted in ableist assumptions about communication and inclusion. As suggested by Mitchell and Snyder (2000), these barriers perpetuate the marginalization of students with disabilities, framing them as deviations from the norm. Addressing these limitations requires a paradigm shift in how inclusiveness is operationalized, particularly in teacher training programs.

The focus groups provided a practical lens to understand how these theoretical challenges manifest in real-world settings. Students reported a lack of opportunities to influence decisions, which they associated with feelings of exclusion and reduced motivation. However, when given the chance to participate meaningfully, students expressed a heightened sense of belonging and agency, reinforcing the link between Student Voice and well-being. These findings echo Halliday et al. (2019), who emphasize the role of participatory practices in fostering psychological competencies such as autonomy and relatedness, which are central to student well-being.

Participation and inclusion are not merely procedural but have profound effects on students' sense of belonging, self-efficacy, and emotional well-being. These findings highlight the importance of fostering environments where Student Voice is a cornerstone of inclusive education, supported by collaboration with families and self-representation groups. By co-constructing strategies that

address diverse needs, schools can move beyond tokenistic inclusion to create frameworks that value and amplify all voices. Future research should explore how participatory practices can be scaled and integrated into broader educational systems, bridging the gap between theory and practice and ensuring education becomes a transformative force that uplifts all students and prioritizes their well-being.

# THE WRITING WORKSHOP AS A STUDENT-CENTRED APPROACH: STRENGTHS AND WEAKNESSES

Charlotte Kohlloffel<sup>a</sup>

<sup>a</sup>University of Turin

The paper examines the *Writing Workshop*, a process-oriented approach to teaching writing, in the context of Italian middle schools. This method, which emerged in the 1970s in the U.S. (Murray, 1972; Calkins, 1983), emphasises writing as a process and focuses on autonomy, student agency and teacher support. In recent years, it has also gained importance in Italy (Poletti-Riz, 2017). The adaptation of the method is analysed, as well as *Writing Workshop's* adherence to an authentic student-centred approach (Starkey, 2019). The main strengths of the method and the challenges of its implementation in the Italian context are analysed based on teachers' opinions on the subject and theoretical consideration. The paper concludes that while the *Writing Workshop* has significant potential, its success depends on thoughtful integration, teacher readiness to implement it, and ongoing research. Further research is recommended to evaluate its long-term effectiveness in Italian schools.

Writing Workshop; student-centred; strengths; weaknesses; Italian middle-school.

## INTRODUCTION

Writing is more than a technical skill, it is a powerful tool for personal expression, communication, and the development of critical thinking (Klein et al., 2014; Alber-Morgan et al., 2007). Traditional approaches to writing instruction have often focused on the final product, neglecting the iterative and reflective nature of the writing process itself (Lo Duca, 2013). Since the 1970s, cognitive process-oriented methods have been developed and refined, particularly in the U.S, which then became popular in other parts of Europe. Among these approaches, the *Writing Workshop*, an explicit and student-centred approach, has become well-known in Italy in the last ten years. This

paper therefore examines the *Writing Workshop* in the Italian context, especially in middle school, and analysis its adaptation as a *traveling library* (Popkewitz, 2005): in fact, the approach is adapted and tailored to a different time and space than it was originally developed. How the different aspects can work together is further analysed; moreover, the paper describes how the method can be reckoned a student-centred approach (Starkey, 2019; Tatal & Yazar, 2022). Furthermore, it provides a critical overview of the strengths and challenges of this approach in Italian middle schools, considering both the theoretical foundations and the practical real-world applications. In this way, this text aims to offer insights to educators who wish to introduce or further develop the *Writing Workshop* in Italian educational contexts.

## **1. THE BACKGROUND OF THE WRITING WORKSHOP**

### **1.1 The Writing Workshop roots**

Since the 1970s, the increasing recognition of cognitivism in teaching in the U.S. has also influenced teaching of writing. Donald Murray's essay "*Teach writing as a process, not product*" (1972) was one of the first suggestions to teach writing in a *workshop* mode: the assumption is to teach "unfinished writing" through a process of discovery of writing practice in which the student is the director of his or her own writing and learning. Students are thus seen as apprentices, experimenting with the written text and words through *trial-and-error*, according to their own time and needs. Emig (1971) explicitly described how the various processes involved in continuous, reiterative writing by twelfth graders take place, distinguishing prewriting, planning, starting, composing aloud, reformulating, stopping and contemplating the final product.

Later, cognitivist researchers detailed the writing processes: Hayes and Flower's (1980) model is the first pioneering contribution. The authors identified the processes of planning, translating and revising, as well as the influence of the task environment and long-term memory on composition. Further on, Bereiter and Scardmalia (1987) distinguished the difference between *knowledge-telling* and *knowledge-transforming*: these two developmental models helped to elaborate an evolutionary concept of writing skills; the ability to look back critically at the writing product – in an iterative process perspective – is, as they define it, a central aspect of good mastery of written composition, as is the ability to consider a communicative goal. To help students manage all the cognitive activities implied in writing, the authors introduce the concept of *procedural facilitators*, cognitive strategies designed to simplify or support the

writing activity by breaking writing into small parts.

Based on these premises, various cognitive methods of writing instruction developed in the United States, ranging from strictly cognitivist approaches, in which the learner uses graphic organisers to reduce cognitive load (SRSD program, Harris, 1982; Harris & Graham, 1992; CSIW, Englert et al. 1991), to process-oriented approaches. Among these approaches, the *Writing Workshop* promoted by Lucy Calkins is the one that emerged from the early of Donald Murray. The method became well known in the American and Anglophone context after Calkins founded a research center called the “Teachers College Reading and Writing Workshop” at the College of British Columbia University in 1981. In her first book *Lessons from a Child* (1983), she describes the application of the *Writing Workshop* in her teaching practice. In *The Art of teaching Writing* (1986), she then attempts to systematise her experiences by suggesting that the *Writing Workshop* should be used in schools from a very young age. In the same years, Nancy Atwell (*In the middle*, 1987) also supports the workshop approach in schools as an effective method for teaching writing skills from primary school onwards. Both link writing instruction to reading, particularly so that students have examples of good texts to model, draw inspiration from, or refer to, which is close to some aspects of the genre-based approach to writing. Both focus on the processes involved in writing, from initial planning, drafting, revising, evaluating, and publishing of the final product. Calkins focused primarily on writing; in later years, she attempted to embed reading instruction in the same *workshop* method (Calkins & Cunningham, 2000), which has always been the weakest link in the *Reading and Writing Workshop*. Scientific research has highlighted the gaps of the method, especially in terms of learning phonology and phonetics and learning vocabulary (Adams et al., 2020; American Institutes for Research, 2021); at the same time, the method seems to have been successful in 4<sup>th</sup> and 5<sup>th</sup> grade, especially for students from disadvantaged backgrounds (Figge & Sass, 2021). Despite the limitations pointed out, her method has become known and famous in the U.S. and beyond, and in recent years has also become increasingly important in Italy.

## **1.2 The Writing Workshop in the Italian context**

In Italy in the sixties, the practice of writing that focused on the process was initially carried out in an informal way. One of the first documented experiences on this subject is the practice of writing in the Barbiana school by Don Milani and his students (Milani & Scuola di Barbiana, 1967). The collective generation of ideas and the processual writing approach were closely linked to having a strong

theme relevant to the students, which they could choose according to the importance of the theme for themselves. It was a means of denouncing injustice and demanding a school connected to real challenges. Later, the GISCEL (Group of Intervention and Study in the Field of Linguistic Education) published their manifesto (1975) in which they argued for a model of linguistic education that was more student-centred and less focused on traditional, meaningless products for written instruction. They also emphasize the importance of allowing learners to experiment with words, in a processual perspective of writing (and speaking). The practice of writing teaching in Italian schools shows an increasing influence of the cognitivist approach, first thanks to the studies by Boscolo (1990) and later by Cisotto (2006; Cisotto & Gruppo RDL, 2015). Nevertheless, the *Writing Workshop* didn't become known under this specific name until 2017, when Poletti-Riz wrote the first book on this method in order to disseminate it. Since then, many other teachers or researchers have adopted this approach (there is even a website that groups teachers together under the name "Italian Writing Teachers"<sup>1</sup>), and other manuals for teachers have been published (Pognante & Ramazzotti, 2022, 2024; Pellacani & Verziaggi, 2023; Poletti Riz & Turrini, 2024). Originally, Poletti-Riz and colleagues suggested using the *Writing Workshop* mainly in middle school, when students should have already developed the basic skills of writing (the graphomotor and linguistic foundations; Vio et al. 2012); only in recent years these authors suggested using it in primary school (Dicati & Vaudagnotto, 2024). After the first publications, the group "Italian writing teachers" proposed to apply the method to learning to read, and it is now also adopted by many school publishers (e.g. Sanoma). We argue here that the reading method is slightly different from the method proposed by Calkins, as it is influenced by or merged with other methods such as reading aloud (*lettura ad alta voce*; Batini, 2022). These traveling libraries (Popkewitz, 2005) may have taken into account the criticisms leveled at Calkins' original method, or that were critical of its adoption, and incorporated it into a classical didactic tradition of writing with monthly essays in the classroom, where the choice of topic is less flexible (Calkins argues for high flexibility and student choice regarding the topic of the written essays, 2014). The proposal to use the method in Italian schools came at an opportune moment when the context would have been able to embed it in daily practice, also thanks to the strong adherence of the method with the curriculum's description of how written instruction should be conducted (process-oriented). The method is thus

---

<sup>1</sup> <https://www.italianwritingteachers.it/>, accessed on 10 December 2024.

embedded in a specific context in which previous traditions of writing instruction and *Writing Workshop* merge to create a somewhat different final product.

## **2. THE STRUCTURE OF THE WRITING WORKSHOP**

The *Writing Workshop* is a structured yet flexible model that adapts to different teaching situations, focusing on the writing process. The methodology is based on three interconnected phases —minilessons, writing and conferencing, and reflection and sharing — each of which serves a specific purpose to foster students’ development as writers. It can be adapted to any genre (Calkins, 1986, 2014). The premise is that the structure described below is repeated at many different stages until a final product is completed, and that the teacher breaks down the various processes involved in writing into parts so that students can focus on one stage at a time (consistent with the procedural facilitations mentioned earlier).

### **2.1 Minilesson**

The *Writing Workshop* begins with a mini-lesson: a short, concentrated lesson lasting about 10–15 minutes. During this time, the teacher introduces a specific writing strategy, concept or skill. Examples include techniques for crafting engaging introductions, strategies for effectively organizing ideas, or the mechanics of punctuation in dialog. The minilesson also builds on students’ prior knowledge to make the new content accessible and meaningful.

The key to this phase is its deliberate brevity and clarity. By focusing on a concrete goal, the mini-lesson should avoid overwhelming students and allows them to immediately apply what they have learned to their own writing. This explicit phase of instruction reflects the principles of effective writing instruction (Slavin, 2019; Graham, 2007; Graham et al. 2016) and emphasizes direct instruction.

### **2.2 Autonomous writing and conferencing**

The writing phase accounts for most of the time in the workshop (if a lesson is dedicated to writing, at least half of it will be in this phase) and is the time when learners apply the taught strategy in the minilesson. They plan, draft, revise, edit and publish their work autonomously. During this time, learners work independently or in small groups, experimenting with ideas and refining their texts. Although they work by themselves (which is why this method is especially recommended for middle school, since students can self-regulate and enjoy

this autonomy), a distinctive feature of the *Writing Workshop* is conferencing, where the teacher circulates between students and gives them individual feedback and scaffolding on strategies. These one-on-one interactions, while students are writing independently, allow teachers to address specific challenges, such as help with planning or restructuring paragraphs, while encouraging students to take risks and think critically about their writing, depending on each student's needs. Conferencing allows students to feel supported in their efforts, but also appropriately motivated to write, according to constructivist Vygotsky's (1990) theory of the zone of proximal development.

### **2.3 Collective reflection and Sharing**

The *Writing Workshop* concludes with a reflection and sharing session in which students present excerpts from their work to classmates or the class and critically reflect on the challenges of the new strategy or key insights that students believe could be useful for this purpose. Sharing also fosters a sense of writing, as students see themselves not only as writers but also as part of a larger creative process. Teachers facilitate these sessions by leading the discussions, asking reflective questions and encouraging constructive feedback.

While the basic structure of the *Writing Workshop* remains consistent, its implementation can vary depending on the needs of the class. For example, some teachers may extend the minilesson to cover particularly complex topics, while others may allow more time for conferencing to support struggling students. This adaptability ensures that the workshop remains relevant and effective in different educational contexts.

## **3. THE WRITING WORKSHOP AS A STUDENT-CENTRED APPROACH**

### **3.1 Student-centred approach: a definition**

Aware of the criticisms levelled at student-centred approaches, particularly the policy implications of these approaches (Schweisfurth, 2013), we further define how student-centred is meant in this paper. As Starkey (2019) states, we can recognise three dimensions of student/learner-centred approaches in education:

- (1) Cognitive dimension: the focus is on improving the performance of individual learners (which can be defined in different ways) but is mainly linked to knowledge and skills.

- (2) Student agency dimension: The focus here is on learner empowerment, where each of them feels involved and is actively engaged in their learning, with intention and self-reflection (Bandura, 1986). This means that students and teachers have equal status in a democratic community and students can decide for themselves what they want to learn (or write, for example).
- (3) Humanistic dimension: Taking into account all the different dimensions of learning, from affective aspects to creativity or contextualisation, is the main aspect of the humanistic dimension (with a culturally appropriate pedagogy). From this perspective, learning also encompasses emotional, social and personal development.

In her analysis, Starkey (2019) emphasises that the second dimension is partially embedded in the third dimension, as a learner who is empowered and able to influence their learning process is part of the consideration of the needs of learners and students as human beings as a whole.

We argue here that aligning the student-centred approach with the democratic principles of GISCEL (see above), an integrated vision of the student-centred approach could be beneficial, where achievement is linked to the competent use of writing for communication purposes. Since we do not yet have experimental results in the Italian context, and we are interested in seeing the effects, we advocate that the *Writing Workshop* is a student-centred approach according to the second and third dimensions (results regarding the effectiveness of the method can be found in the U.S. where there is clear evidence especially for explicit instruction, but they are not transferable to a very different context such as the Italian one; Figge & Sass, 2021; Graham et al. 2017; Slavin et al. 2019).

### **3.2 The Writing Workshop: agency and humanist dimensions**

The main aspects that support the *Writing Workshop* as a learner-centred approach are, according to the previous definition, the following:

- **Autonomy and responsibility:** students are responsible for their writing for at least half of the time they spend on writing instruction. At the heart of the *Writing Workshop* is the belief that students should take responsibility for their writing process. In contrast to traditional approaches, where teachers prescribe topics and structures, students in the *Writing Workshop* can choose their own topics and set their own goals. This autonomy fosters a sense of responsibility and investment in

their work and encourages them to engage deeply with the writing process. Research demonstrates the positive effects of student autonomy on motivation (Brooks et al., 2021).

- Personalization: The *Writing Workshop* is inherently adaptable and allows teachers to personalise instruction based on each student's strengths, weaknesses, and interests during conferences. This allows them to provide tailored feedback that addresses specific challenges. This personalisation, as advocated by Tomlinson (2014), ensures that all students, regardless of ability level, can meaningfully participate in the writing process.
- Community of writers: Emphasising collaboration during the final reflection and sharing stage and during the autonomous writing stage (sometimes providing opportunities to talk or write together) encourages the creation of a supportive environment, a sense of democratic community in which students can feel valued and connected. In addition, feedback from classmates allows students to learn from each other's insights and approaches, empowering them and giving them more agency in their interactions with others.
- Emotions and interests: The reflective nature of the workshop during the conference and final reflection, as well as the opportunity to share and collaborate, encourages students to articulate their thoughts and feelings. In addition, the opportunity to make their own choices gives students the chance to act according to their interests. From this point of view, the *Writing Workshop* takes into account that the learner has cognitive, emotional, personal and social needs.

These features of the method contribute to a positive and empowering writing classroom where students are at the centre of the learning process.

#### **4. CRITICAL ANALYSIS OF THE WRITING WORKSHOP**

The above aspects seem very positive on paper, but when put into practice, they can take a different turn. After an in-service training with three teachers from a middle school in Turin, Italy, the *Writing Workshop* was applied in their classrooms. Thanks to collective reflections, participant observation and a focus group, we present here a balance of the strengths and challenges of this approach, especially when applied in a culturally diverse, urban and Italian middle school.

The balance of strengths and weaknesses is thus the result of a review of the

theory-based limitations and the field implications identified in practice. By examining both, educators and researchers can better understand the impact of the approach and refine its implementation.

## **4.1 Strengths of the Writing Workshop**

### *4.1.1 Fostering Autonomy and Metacognitive Thinking*

As has already been emphasised, one of the greatest strengths of the *Writing Workshop* lies in the promotion of autonomy. Students have the freedom to choose their own topics and control their writing process, which promotes their independence and self-regulation. In addition, the *Writing Workshop* encourages critical and metacognitive thinking (Cornoldi et al., 2018) by requiring students to make decisions at each stage of the writing process. For example, during the writing process, students must assess how best to structure their arguments or convey their ideas and whether this is coherent with their originally planned ideas. This iterative decision-making process prompts students to critically evaluate their own work or that of their peers (Guilford, 1967).

### *4.1.2 Motivation in writing*

Autonomy means that learners can be actively involved, which is one of the key components of writing motivation (Hidi & Boscolo, 2006; Piazza & Siebert, 2008). Emphasising choice in the workshop allows students to explore topics that match their interests and experiences (intrinsic motivation, Ryan et al. 2021). In addition, peer feedback can enhance motivation in the form of positive peer feedback, encouragement, and a sense of being able to provide valuable feedback to classmates. During the conferencing, the teacher can also encourage the students so that when they feel supported, they are even more motivated to stick with the task (extrinsic motivation, Ryan et al., 2021).

### *4.1.3 Internalisation of writing processes*

Because the *Writing Workshop* focuses heavily on process-based instruction, from planning to publication, students who are exposed to the method for a long time will eventually become accustomed to the structure and be able to use it confidently. The *Writing Workshop* is indeed a framework that can be applied to different genres (as shown in diverse publications: Pognante & Ramazzotti, 2022, 2024; Poletti Riz & Turrini, 2024).

#### *4.1.4 Personalisation through time, choice and feedback*

Learners proceed at their own pace, without time pressure, and have the opportunity to choose their topic: This moves towards a personalised pedagogical setting (Tomlinson, 2014). In addition, the teacher can provide help, support and feedback tailored to the student's needs to make learning more effective given the limited time allotted to writing in Italian schools (Boscolo & Zuin, 2015; Rossi, 2019).

#### *4.1.5 Work on revision*

The current practice in Italian schools is to work on writing during the essay lessons dedicated to writing practice, but with students working independently, sometimes following direct guidance on planning and drafting. Lessons on revising the text are often omitted (Boscolo & Zuin, 2015). *Writing workshop* allows teachers to use an appropriate moment in their didactics for intentional revision.

## **4.2 Challenges of the Writing Workshop**

### *4.2.1 Transferability of the learned techniques*

As the method is proposed as a framework for all different genres, it is essential for students to apply the method to all types of writing tasks they might consider in the real world so that they are able to transfer their knowledge to all writing tasks. This is particularly important according to the infusion model (Trincherò, 2022), where students need to focus on the specific content of applying a strategy in order to subsequently apply it competently. With this in mind, the choice of topic – which encourages motivation – should be carefully balanced with the more focused writing topics, taking into account the circumstances. Perhaps this is also the reason why the Italian authors who publish manuals to introduce the *Writing Workshop* into daily classroom practice link each manual to a genre (Pognante & Ramazzotti, 2022, 2024; Poletti Riz & Turrini, 2024).

### *4.2.2 Demotivation and lack of autonomy*

For students to be independent, they need to be trained. Because if we change the whole didactics from one day to the next, which could be more linked to direct teacher-led activities, students might feel lost and not enjoy the autonomy. On the contrary, they might even feel frustrated and demotivated. It is therefore suggested to proceed gradually and give students a little more autonomy time each time so that they learn to cope with it. Writing time may also be underutilised if the explicit instruction or strategy is not well explained or illustrated: Learners may feel confused and lost in the task.

#### *4.2.3 Identification of personal needs, providing feedback and teacher preparation*

If students do not gradually learn to deal with the open-ended nature of the method, there is a risk that students who have difficulties with self-regulation or self-confidence, for example, may feel overwhelmed by the freedom to choose their topics or direct their own learning. The feeling of being alone and perhaps lost in the face of writing could lead to students asking lots of questions and seeking help from the teacher, who can easily feel overwhelmed with all the requests. It is therefore crucial that teachers are well prepared to implement the method in the usual didactics that students are used to, that they are culturally and contextually sensitive before putting the method into practice. They also need to be aware of their students' needs, from the socio-emotional support learners need to the challenges each student has in writing. Educators should be prepared to be flexible to learners' needs in order to respond to them effectively.

In Italy, the school system is inclusive, so that students with disabilities can also come into contact with the method. The flexibility of the *Writing Workshop* is crucial for these students. At the same time, students who have great difficulty with writing should be supported through personalised methods where writing can be replaced by oral narration. While the method itself is inclusive, it does not go as far in terms of flexibility: this is the space where classroom practise is challenged by creativity to find tailored and different means of communication to meet the needs of individual students.

#### *4.2.4 Difficult to implement in the "traditional" practice*

In connection with the last weakness, the difficulty of introducing the new method in daily practise is a real challenge. A middle school teacher (female, 43 years old) in a urban school in Turin explains:

One weakness that I notice is that the Writing Workshop has a structure, it is a method, and like all methods it offers involvement in a framework, a framework with its own meaning, which gives value and makes you understand that if you start from there, you arrive there because you follow a whole process, which is in a way a process (...) a bit armoured... So that means that the structure of the week: (...) the hours that are dedicated to reading, the hours that are dedicated to writing.... You have to (...) distort in an important way what your habit is in order to organise the weekly structure of the hours of writing. (...) The risk I have encountered, I mean, the fear I have encountered, is that if I change everything without knowing exactly what I am going to do, I will mess everything up.

As she clearly states, the introduction of the method must be prepared, can be gradual (it is preferable if the students are used to a different kind of approach), but with the knowledge of what the target point is. Without a critical and clear analysis of the teaching context in which we want to introduce the *Writing Workshop*, there is a great risk of being superficial or losing the purpose.

#### *4.2.5 Time consuming*

Compared to traditional didactics, teachers who use the *Writing Workshop* state that it is much more time-consuming. This is indeed related to the nature of the workshop itself: the process-oriented approach requires longer periods of time for planning, drafting, revising and conferencing. In schools with tight schedules, it can be difficult to find enough time for these activities, and without adequate time there is a risk that the workshop will become fragmented, undermining its effectiveness.

## **5. CONCLUSION**

*Writing Workshop*, rooted in process-oriented pedagogy, offers a student-centred approach to writing instruction. It emphasizes learner ownership and iterative improvement, allowing learners to take responsibility for their writing process. However, as with any pedagogical method, its successful implementation requires an attentive awareness and understanding of its strengths and limitations.

In order to assess the actual effectiveness of the method in Italian schools, it is crucial to understand the implementation of the *Writing Workshop* in the Italian context: further research is needed, as the balance between strengths and weaknesses here is based on teachers' impressions and theoretical analysis, – which are very relevant but cannot be the only evaluation criterion. Before advocating the incorporation of process-oriented methods such as the *Writing Workshop* in teacher education and training, it is essential to evaluate their effectiveness at national level (by experimenting several times and listening to the experiences and impressions of numerous teachers). At the same time, teachers who want to experiment with *Writing Workshop* in their classrooms should undergo professional development through reading, confrontation with peers, courses, etc., in order to be prepared for a correct and not a-critical implementation of the method (Murtonen et al., 2024).

As for the strengths of the method, these are anchored in the main features of the method itself, which, when implemented and applied as intended, can truly

promote writing learning and metacognitive writing skills (Cornoldi et al. 2018) throughout the writing process. It can also support students' agency and empowerment and have a positive impact on students' whole school experience. Furthermore, it can effectively promote the democratic language education that the GISCEL group supports and which is highlighted in the national curriculum for language education (MIUR, 2012). Personalising teaching and learning and fostering motivation are key to promoting students' writing proficiency and passion.

The challenges are not negligible: the difficulties in the transferability of the strategies learned and in the implementation of the *Writing Workshop* in Italian classrooms are the main aspects that teachers, book authors and school publishers should pay attention to. Teachers, schools, and curriculum designers should really consider and extend the time devoted to writing exercises: results regarding students' written productions are not encouraging (Prada, 2009, 2020, 2021).

In conclusion, we recommend that teachers who find the *Writing Workshop* nowadays embedded in their textbooks to adopt it critically, and only after having thoroughly studied the principles of the method themselves. Otherwise, the risks mentioned above have a greater chance of becoming a reality in their classrooms. Collaborative networks such as the "Italian Writing Teachers", where educators share good practices and challenges, can further promote the dissemination of the *Writing Workshop* and advocate for research into the method in schools.

# THE CHILDREN OF MIXED COUPLES IN THE POSTDIGITAL AGE: WHEN DIGITAL AND INTERCULTURAL COMPETENCES COME TOGETHER

Stefano Pasta<sup>a</sup>

Michele Marangi<sup>a</sup>

<sup>a</sup>Catholic University of the Sacred Heart

Starting with the concept of “Digital Educational Poverty”, the study focuses on digital competences and differences based on socioeconomic factors using the Depend tool (Digital Educational Poverty in Educative Networking and Development). This tool was tested in the Digital Connections project (2021-2024), involving 6.598 second-year middle school students. The concept of digital educational poverty stems from the hybridization of two perspectives in defining digital competence: the “Rights” perspective and that of “New literacies”, which focuses on the dynamism and transdisciplinarity of competencies. Through the survey of the Digital Competence Score submitted in 2022-23, it emerges that the results of children of mixed couples (6.20% of the total) surpass those of children with both parents born abroad (11.65%) and those with both parents born in Italy (82.15%). Using the concepts of “cultural capital” and “intercultural capital,” the article theorizes that these better results can be explained by the fact that both digital competences and intercultural competences are characterized by dynamism, contextualization, and a collective component.

Digital Divide; Digital Educational Poverty; Digital Competences; Depend; Intercultural Competences.

## FROM ‘DIGITAL DIVIDE’ TO ‘DIGITAL EDUCATIONAL POVERTY’

This article ranks among the studies on combating digital educational poverty, a construct that was introduced in 2021 by the Research Centre on Media, Innovation and Technology Education (Cremi) of the Catholic University, together with Save the Children (Marangi, Pasta and Rivoltella, 2022). The

purpose of the Index of Educational Poverty (IEP) was to broaden the measurement of inequality from the, albeit important, economic poverty to the ‘educational opportunities’ offered by a territory. In a similar way – but not measured on a territorial basis – “Digital Educational Poverty” refers to the lack of acquisition of digital skills, understood as new alphabets (Rivoltella, 2020) necessary to analyse the production and fruition of the various digital contents by the “spectators” (Pasta, 2021) and, therefore, to access the opportunities offered by the social web. Citing Save the Children’s definition (2021, p. 15), “digital educational poverty thus refers to the deprivation of opportunities to learn, but also to experience, develop and allow skills, talents and aspirations to flourish freely, through the responsible, critical and creative use of digital tools”<sup>1</sup>. It should be pointed out that such an approach does not, with a utopian and cyber-enthusiastic outlook, equate the Internet only with positive aspects, but associates it, consistently with classical media-educational frameworks, with an ‘extension of reality’ and thus of possible opportunities (Pasta, 2018). Countering digital educational poverty means promoting literacy skills, of functional languages to manage communication and access to information, and the cultural capital of the subjects, i.e. their reference encyclopaedia, their ability to understand and elaborate the meanings of their culture understood as a whole way of life in the postdigital society. With the latter term, we indicate the urgency of thinking about existence and relationships after the digital has redefined them: the construct of Postdigital (Jandrić, MacKenzie and Knox, 2023) indicates a critical evaluation of the premises embedded in the cultural understanding of the digital, with reference, for example, to the deep socio-technical relationships that have significant consequences for forms of learning in contemporary times.

The measurability of digital educational poverty has been discussed elsewhere (Pasta, Marangi, Rivoltella, 2021). The concept is the outcome of the hybridisation of two perspectives with which digital competence can be declined: that of “Rights” and that of “New Literacies”. The first is inspired by the European *Digital Competence Framework for Citizens (DigComp) 2.1* and by the integrations of 2.2, to which more than half of the educational systems (including Italy) refer in their attempts to define digital competences, albeit within a European framework of high heterogeneity (Pasta, 2023). The second perspective, that of the New Literacies, is more attentive to the dynamism and transdisciplinarity of competences (Buckingham, 2020) and to the concept of

---

<sup>1</sup> Translation by the authors.

Dynamic Literacies (Potter and McDougall, 2017), underlining how a segmented approach betrays the “citizenship vocation” of digital competence (Pasta, 2021).

A significant non-coincidence between educational poverty and digital educational poverty has already been noted (Marangi, Pasta and Rivoltella, 2023). Here, we briefly report the results of a survey of 6,598 pupils in 410 classes in 99 lower secondary schools in 17 Italian regions as part of the Digital Connections project (2021-2024)<sup>2</sup>, focusing on the data of the children of mixed couples, in order to reflect on possible overlaps and commonalities between digital competences and intercultural competences.

## **2. USING THE DEPEND TOOL TO EVALUATE DIGITAL EDUCATIONAL POVERTY IN LOWER SECONDARY SCHOOLS**

In 2022-23, 6,598 seventh grade students were given the Depend (Digital Educational Poverty in Educational Networking and Development) tool<sup>3</sup>, created in Digital Connections by Cremit researchers Michele Marangi and Stefano Pasta.

Next to a questionnaire part on the socio-cultural characteristics of the respondents (children between 12 and 14 years old), Depend consists of a 30-question test that, in twelfths, detects the Digital Competence Score (DCS) (Marangi, Pasta and Rivoltella, 2022). The DCS is calculated on 12 indicators related to the four dimensions of learning based on the digital educational poverty framework proposed by Cremit and Save the Children in 2021: (I) learning to understand (technical knowledge of digital formats and environments; knowledge of publishing and copyright rules; ability to filter data and contextualise information in digital content), (II) learning to be (knowing how to recognise and activate digital creativity; possessing and using narrative skills; to know strategies for protecting one’s digital identity), (III) learning for living together (knowledge of netiquette and awareness of cyberstupidity; competence in the logic of algorithmic functioning; recognition of the collaborative dimension of digital knowledge), (IV) learning for an autonomous and active life (use of digital in a perspective of conscious and active citizenship; the ability to share content; the ability to verify and situate information).

---

<sup>2</sup> It is a project implemented by Save the Children, Cremit and the Cooperative Edi Onlus, with the aim of combating digital educational poverty, working with girls and boys between the ages of 12 and 14.

<sup>3</sup> The tool is available at the link [www.cremit.it/depend/](http://www.cremit.it/depend/).

It should be pointed out that the sample of respondents is made up of schools whose headmasters responded to the call circulated by Save the Children together with the Italian Ministry of Education, with a particular focus on areas characterised by significant indices of educational poverty. The Depend tool was submitted both to the children of the classes participating in the project and to the control classes of the same schools; it was submitted before starting the two-year course, so participation in Digital Connections does not influence the outcome of the sample.

Some trends that emerged in the survey with the 6,598 minors are summarised below. A first variant to be considered is gender: against a sample that has a mean of 7.267 and a median of 7.542 out of a maximum of 12 (standard deviation 1.870), the results are better for female respondents (7.526) than for male respondents (7.019); this is in line with the self-reported grade in Italian in the last evaluation form, while there are no differences in mathematics. The number of books that boys claim to have at home and the level of education of both parents confirm how cultural capital is often linked to the results their children achieve, indicating that digital competence is also one of the objectives that democratic and innovative schools must strive for in order not to reiterate the preservation of initial cultural disadvantages, yielding to the social determinism of cultural inheritance and not resigning themselves to an inequality that is handed down. On the other hand, neither the geographical area nor the size of the municipality in which one lives emerge as particularly significant variants; this trend is in line with the most recent research on digital access, as, in the Italian context, emerges in the Cif Report 2024 (Pasta, 2024). Of particular interest for the discussion on overcoming the digital divide are the data collected by Depend, which show that the indicators classically used for digital access do not significantly influence the distribution of the four digital competence percentiles. There is no correlation, for example, between higher values of the Digital Competence Score and the presence or absence of high-speed internet, or the ownership of smartphones, tablets, and PCs (Tab. 1, 2, 3, 4). This is not meant to diminish the need for an adequate digital infrastructure, which is central to the classic concept of the digital divide: ensuring accessibility to performance technologies and adequate connective infrastructures remains a necessary condition, but no longer sufficient; the variants that impact on digital competence are also others, precisely included in the concept of digital educational poverty.

Tab. 1. Availability of a high-speed connection across the 4 groups, from low DCS (group 1) to high DCS (group 4).

	No	Yes	I don't know
Gr. 1	11.8%	71.4%	16.8%
Gr. 2	9.5%	76%	14.5%
Gr. 3	9%	77.9%	13.1%
Gr. 4	9.6%	80.1%	10.1%
Tot.	10%	76.4%	13.6%

Tab. 2. Availability of smartphones at home across the 4 groups.

	None	1	2	3	+3

Tot.	7.6%	34.6%	34.6%	15.7%	11.3%

### 3. CHILDREN OF MIXED COUPLES: A 'POSTDIGITAL INTERCULTURE' PERSPECTIVE

The data on migrant family background does not hold any surprising results if we focus on the place of birth of the minors themselves: for foreign-born minors the results are much lower, also due to the difficulties in understanding<sup>4</sup>. It should be pointed out that, even though we are talking about schools in areas with a high presence of pupils with a migrant background, foreign-born pupils account for only 3.76% of the sample: among them, 2% went through the entire primary school cycle, 1.15% only a few years and 0.61% none at all. The figure of 3.76% is in line with the national figure on pupils with non-Italian citizenship at secondary school, which in the 2021-22 school year was 11.2%, of which only 33.1% (i.e. 3.7% of total pupils) were not born in Italy (Ministry of Education, 2023). It should be remembered that the percentage of pupils 'with non-Italian citizenship' – this is the terminology used by the Ministry of Education – is much higher, as a result of an anachronistic Italian citizenship law (Ambrosini, 2020) that often leads to minors born and raised in that country being called foreigners. In 2022, out of the 865,388 students with non-Italian citizenship surveyed by the Ministry of Education, there were 16,000 new arrivals (NaI)<sup>5</sup>, a number more than halved compared to ten years earlier, of which 14,000 in the two secondary schools (from 6th to 13th grade).

In the same sample of Digital Connections, on the other hand, the number of children of mixed couples<sup>6</sup> is almost double in percentage terms (6.20%) compared to those born abroad, next to the children of parents both born in Italy (82.15%), or both born abroad (11.65%) and 398 of mixed couples (6.20%)<sup>7</sup>, a figure that provides a snapshot of the anthropological change underway: according to ISTAT (2022), 14.6% of marriages celebrated in Italy in 2020 concerned couples with at least one parent of non-Italian nationality. Assuming this tripartition – children born in Italy, children born abroad, children of mixed couples – there is a figure to be discussed: among the children of those born in Italy, the DCS is 7.36; among the children of those born abroad, it is 6.74; among the children of mixed couples, the highest value of 7.44 is recorded.

A focus on the socio-economic description, media consumption and skills of these children of mixed couples is to be found elsewhere (Marangi and Pasta,

---

<sup>4</sup> 49.2% of those born abroad are placed in the lower DCS percentile, compared to 24.4% of those born in Italy.

<sup>5</sup> Students newly arrived in Italy who are unable to use Italian L2 as a language of communication or students who have been enrolled in school for less than two years.

<sup>6</sup> In this case, children with one parent born in Italy and the other abroad are counted.

<sup>7</sup> Minors who do not declare where one or both parents were born have been excluded from the count. In the article, the percentages therefore refer to the sample of valid responses.

2023), but the data can be re-read within the research space that goes by the name of 'Postdigital Intercultures' (Pasta and Zoletto, 2023).

We will now try to explain this excellence in the 'digital competences' of the children of mixed couples in the light of the link with 'intercultural competences' (Reggio and Santerini, 2014).

The theoretical reference of the proposed interpretation combines Pierre Bourdieu's (1986) concept of 'cultural capital' with Andreas Pöllmann's (2013) more recent concept of 'intercultural capital'. As for the former, reference is made to its *embedded* state (the others are the institutionalised and objectified one), i.e. the set of experiences, modes of relationships, patterns of understanding, skills of knowing how to do, which the individual can develop even outside the institutional contexts and canons of education. This form of capital is accumulated over the course of life through the process of socialisation that takes place to a large extent unconsciously, ending up creating the cultural distinctions that one feels are natural. Intercultural capital' (Pöllmann, 2013) refers to the set of relational and communicative skills, of codes and signs belonging to different languages, of the capacity for empathy and decentralisation in the relationship with the other. From a psychopedagogical perspective, Anna Granata has applied this framework to the children of immigrants, the so-called "second generations" (2011), and to children who experience international mobility by living their fourth year of high school abroad (2015): in both studies, the thesis that growing up among several cultures is a resource before being a problem clearly emerges. This model can also be applied to the children of mixed couples, who can therefore be considered – in addition to being highly digitally competent as shown by the data – particularly competent from an intercultural point of view. Indeed, young 'intercultural equilibrists' (Granata, 2011) grow up in a context of daily multiculturalism experimenting with how to manage their own internal conflicts and how to find a synthesis between shared values and personal projects with a dynamic process very similar to the *Dynamic Literacies* that Potter and McDougall (2017) talk about with regard to third learning spaces. In this way, intercultural competence is based on two dimensions, understanding and freedom. The former, in its meaning of 'containing within oneself', involves the ability to translate (not only linguistically, but also of attitudes and meanings), to compare different cultural backgrounds, to empathise (with parents, native peers or those with histories similar to one's own) and to remember one's roots and past experiences. On the other hand, freedom, in its meaning of 'free to' experience a bond, involves the ability to express oneself (to tell one's story), to

have an opinion, to diverge (to be able to look with a critical eye) and to be ironic. The dynamism of (digital and intercultural) competences is thus a first point that may explain why the most interculturally competent children on paper are also those with the highest Digital Competence Score.

A second element is the particular relevance of the contextualisation of competence, both in the valorisation of plurality, which must also address tensions and not remain only on a value and abstract level (Santerini, 2003), and in media literacy interventions, which must aim at developing media competences considering the variables that from time to time intervene to co-determine situations and striving not to apply linear and deterministic models of competence development (Rega and McDougall, 2023). In blended families, interculturalism becomes a daily experience, experiencing interaction with people from cultures other than one's own on an ongoing basis (Alred, Byram and Flaming, 2002): the focus shifts from identities to lived experiences. Similarly, the fight against digital educational poverty underpinning Digital Connections measures the ability to analyse by resorting to iconic supports referring to media consumption widespread among students, such as a screenshot from TikTok (Pasta and Marangi, 2023).

Finally, a third element that links intercultural competence with digital competence is the collective component in the experience. Flye Sainte Marie and Tisserant (1997) write of “collective intercultural competence”, i.e. the possibility of transforming individual knowledge into collective feeling, into cultural and intercultural capital. Granata (2015) identifies as a fundamental condition for an intercultural experience to turn into true intercultural competence the fact that those who have lived it can share it with others: sharing means stopping to think, but also perceiving that one's own experience has elements in common with the experience of others. We thus understand another reason why young “balance” learners who are used to practising intercultural competence in a collective way perform well, since the tool used for the Digital Competence Score contextualises the media competence in the community, as – and this is seen in the design of Digital Connections (Pasta and Marangi, 2023) – analysis and production skills in the perspective of Onlife Citizenship Dynamics, contextualisation and the collective component are, therefore, the three elements that in the presented view unite digital and intercultural competences, helping to understand the shift from the static measurement of the digital divide to the – more dynamic, situated and also collective – detection of digital educational poverty.

# THE CONTRIBUTION OF COMPLEXITY EPISTEMOLOGY TO A CRITICAL ANALYSIS OF THE “CHILD AT THE CENTER” PEDAGOGICAL IMPERATIVE

Letizia Rota<sup>a</sup>

<sup>a</sup>University of Verona

The XX-century recognition of children’s rights has changed their role from the socio-cultural margins to a more central position. The concept of “child at the center” has become increasingly present in pedagogical discourses and policies, also as a key principle of the European Quality Framework for Early Childhood Education and Care (European Commission, 2014). This study epistemologically explores the pedagogical foundation of the “child-centered” approach in order to preserve its meaning. Who is the child placed at the center? What does their centrality mean in nursery schools? Morin’s epistemology of complexity provides some key tools to redefine this centrality, addressing the tension between identity, multiplicity, diversity, and unity. At the center there is not the idealized but the real child, with their unique complexity, shaped by diverse needs and interests forming their identity. In nursery schools, the real child encounters other real children, each with their own diverse needs and interests. Educational design becomes a key tool to help every child perceive themselves and others as complex individuals with multiple needs. This reciprocal recognition fosters new ideas of collectivity and multiple citizenship (Ceruti, 2018) to be promoted both at a local level and through global policies.

child-centred; nursery schools; complexity epistemology; educational design

## INTRODUCTION

The centrality of the child is increasingly prominent in pedagogical discourse and the development of educational policies and services. The European Quality Framework for Early Childhood and Care identifies ‘child centrality’ as a guiding principle for pedagogical reflections. This concept embodies the dual

vision of childhood and adolescence outlined in the Convention on the Rights of the Child: children are both citizens, with distinct perspectives and interpretations of the world, and individuals requiring protection for whom adults are responsible (Lamarque, 2016). This duality generates contradictions in the interpretation of child centrality. The pedagogical principle of ‘child at the center’ risks losing its core meaning when decontextualized, as it may be reduced to an idealized, detached view of childhood that neglects educational perspectives on children’s roles and positions in a pluralistic society (Biesta, 2022). Malaguzzi (1975) wrote: “Children are certainly the primary reference point, but outdated and idealized child-centeredness should be avoided” (Cagliari, 2016, p. 228). It is, therefore, significant to examine this principle from an epistemological perspective to prevent the concept of ‘child at the center’ from losing its meaning. Who is the child placed at the center? What implications arise from their centrality within an educational service? This paper examines how Edgar Morin’s complexity paradigm offers valuable tools to redefine child centrality in early childhood education. It is organized into three sections: the first outlines the historical trajectory that placed childhood at the center of socio-cultural discourse; the second investigates the foundation of child centrality through a complex epistemological perspective; and the third explores its educational implications within early childhood contexts.

## **1. BETWEEN MARGINALITY AND CENTRALITY: KEY MILESTONES IN A HISTORICAL AND PEDAGOGICAL PATH**

In the 20th century, the recognition of childhood and its rights prompted a major shift in educational and pedagogical policies. The social condition of childhood, once marked by exploitation and violence, was transformed by the gradual recognition of rights, protection, and opportunities (Macinai, 2013). Ellen Key’s ‘The Century of the Child’ initiated discourse on adult-child relationships, while Eglantyne Jebb, in 1923, laid the foundations of the Geneva Declaration, the first step in recognizing children’s rights (Dal Toso, 2017). Janusz Korczak advocated for children as rights-holders, a key idea in the New York Convention (Macinai, 2013). Montessori, reflecting on adult-child relationships, valued children’s resources, placing them at the center:

What sparked the most discussion was the reversal between adult and child: the teacher without a podium, without authority, and almost without instruction, and the child placed at the center of activity, learning independently, free to choose their tasks and movements.  
(Montessori, 2017, p. 148).

Goldschmied values children's perspectives by centering them in reflections and challenging adult viewpoints (Goldschmied & Jackson, 1997). Malaguzzi emphasizes the child's role within a network linking home and daycare experiences to the broader city context, while questioning child-centered policies (Edwards et al., 2010). This awareness redefined early childhood contexts as daily life environments for children rather than services for families. Tracing the evolution of child centrality offers insights into its establishment as a core principle of the European Quality Framework for Early Childhood Education and Care (European Commission, 2014).

## **2. IDENTITIES AND POSITIONINGS**

Exploring pedagogical experiences that affirm the child's rights and central role is just a starting point. It is essential to question the lens through which we see the child: Who is the child at the center? What does placing the child at the center mean in nursery school? Examining the centrality of the child through the epistemology of complexity prompts reflections on the challenges of the contemporary.

### **2.1. Complex thought**

The concept of "child centrality" frequently appears in pedagogical discussions on policies and services for children, yet it risks losing its significance when decontextualized, particularly when an idealized, imagined child is placed at the center of reflection and practice. The child who lives within families, services, and cities is not ideal but real. If the ideal child reflects adult stereotypes and expectations (Luciano, 2017), being unobtrusive, compliant, and engaged, the real child acts based on their own needs and interests. They might be tired from a sleepless night, curious about their surroundings, or melancholic. The experiences of a real child are inherently non-linear, as is reality itself. In the epistemology of complexity, reality is understood as intertwined and multidimensional, concepts clarified by the etymology of the term itself.

Complexity, ultimately, derives from the Latin 'plectere' (to weave) and 'plexus' (woven), combined with the preposition 'cum' (with), meaning "woven together." Thus, the etymology highlights notions of multiplicity as well as unity.

(Ceruti, 2018, p. 98).

This perspective sets the stage for the second point of this contribution, where the complex epistemological approach delves into the foundation of the child's

centrality. A real child, like any person, cannot be understood apart from their complexity, with its intertwined elements, diverse interests, and varying needs that collectively form the whole, contributing to the person's identity.

The human unity embodies the principles of its multiple diversities. Understanding humanity means grasping its unity within diversity and its diversity within unity  
(Morin, 2001, p. 56).

Complexity is the work that sustains the cohesion of what is intertwined, preserving the ongoing tension between unity, identity, multiplicity, and diversity, a tension that is neither diminished nor resolved, but rather acknowledged and valued. Edgar Morin, theorist of complex thought, advocates for a reform in thinking that enables the comprehension of human existence in all its interconnected dimensions: physical, biological, psychological, social, and political. This reform aligns with the complexity paradigm. The European Quality Framework reflects this notion of human multidimensionality in its key principle: "Child-centred pedagogy including the interest of the child."

A child-centred approach is one which builds on children's needs, interests, and experiences. These include cognitive, social, emotional and physical needs. A child centred approach is one that uses a pedagogy which promotes children's holistic development and enables adults to guide and support their development.  
(European Commission, 2014, p. 65)

This view requires recognizing the whole—the child—and its parts, dimensions, and interconnections. Morin emphasizes the need to develop a form of thinking that overcomes disjunctive reasoning, which fails to perceive connections. Inspired by Montaigne's reflection that "a well-made head is better than a well-filled one," he advocates teaching thinking that organizes and imparts meaning to knowledge rather than merely accumulating fragmented facts (Morin, 2001). An approach that grasps complexity is vital for achieving 'pertinent knowledge,' which situates information within its context and the larger whole (Morin, 2001). Complex thinking addresses contemporary challenges (Morin, 2000) arising from fragmented and decontextualized knowledge and the failure to recognize connections.

## **2.2 Some challenges**

One of the key challenges Morin identifies is the "cultural challenge," rooted in the divide between scientific and humanistic cultures. This separation obstructs

a holistic understanding of humanity, which encompasses chemistry, physics, and biology, as well as social relations, ideas, and emotions. Humans are both biological and cultural beings. Grasping complexity requires dialogue between the sciences and humanities, addressing physiological diversities within the unity of the human being. Applying this principle to understanding children in real contexts requires contextualizing their behaviors and recognizing them as individuals in dynamic development. Their actions reflect not only their psycho-developmental maturity, as outlined in scientific studies, but also their history, ideas, and interests, expressed in ways congenial to their age (Arace, 2018). Interpreting their behaviors through a developmental lens and situating their actions within their age, history, and experiences allows us to grasp their complexity rather than diminish it. Morin also identifies the “sociological challenge,” addressing the relationship between knowledge and society. As knowledge grows, it often leads to fragmented or conflicting perspectives due to the dominance of technical languages. Mastering and integrating information fosters the development of ‘pertinent knowledge,’ a concept Morin defined through specific principles. This knowledge arises from the ability to situate information within its context and the whole, uncovering connections. Developing ‘pertinent knowledge’ about children requires acknowledging their multiple, interconnected experiences—cognitive, social, emotional, and sensory-motor—as elements that collectively shape their identity. It is not possible to center the child while prioritizing select dimensions, characteristics, or potentials and denying others. Viewing complexity as a dynamic tension between unity, identity, multiplicity, and diversity can guide our reflections. A real child experiences multidimensionality, where diverse needs and interests intertwine, shaping a unified identity. Acknowledging the child’s varied experiences allows them to embrace their multiplicity, validating even challenging aspects within the same cognitive-body unit and enabling them to fully experience their identity. Morin’s concept of ‘pertinent knowledge’ allows children to develop a mode of thinking that integrates and contextualizes diverse information about themselves. Fragmenting experiences and elements without recognizing their interconnections isolates unacknowledged aspects. Anger or physical fatigue, for instance, are integral to a child’s identity and cannot be overlooked in an educational context that claims to center the child. Recognizing a person as a multifaceted identity and acknowledging aspects like anger and joy fosters an experience of diversity within unity, cultivating a sense of being both partial and whole. As Morin states, “democracy needs diversity and antagonism” (2001, p. 114), and recognizing every dimension of a person,

physical, cognitive, and emotional, while accepting their contrasts enables a localized experience of democracy. The child's centrality in nursery schools requires deeper contextualization: the child is not alone but shares the space with many others. To fully grasp this complexity, we must revisit the initial question through the lens of complex epistemology: What does child centrality mean in a nursery school? No longer is it an idealized, imagined child at the center but a real child, with their complexity and interwoven needs and interests shaping their identity: a real child meeting other real children, each with their own complexity. At the center are multiple and diverse children's identities.

### **3. MULTIPLE AND DIVERSE CHILDREN'S IDENTITIES**

The child's centrality, examined through a complex epistemological lens, carries significant educational implications for early childhood contexts. In these settings, educational professionalism and training are crucial. If educators embrace contemporary challenges, as discussed in the second part of this paper, they can foster 'pertinent knowledge' in children, allowing them to recognize themselves as multifaceted, complex identities. Helping each child see themselves as a multiple and complex reality, while also recognizing the complexity of others, fosters reciprocal recognition, nurturing a sense of community (Ceruti, 2018). Such a sense of community itself fosters experiences of plural citizenship, which are key for cultivating a democratic sentiment. Educational design, focused on expanding each child's environment and creating experiential contexts (Guerra, 2023) that embrace and intertwine the needs and interests of each child's identity, enables the experience of democracy on a 'global' level within the classroom context. The adult's relational and intentional mediation is a key tool within the dynamics connecting the various microsystems, where the child is simultaneously at the center and surrounded by these interconnected systems, as outlined in the ecological perspective (Bronfenbrenner, 1986). When educational planning embraces the diverse identities of children, they can see themselves as integral parts of the classroom unit, recognizing themselves as part of their interconnections, not through an inclusion/exclusion dynamic but as interwoven components of the whole. This idea of being 'interwoven together', rooted in the etymology of the word complexity, highlights the 'relationships between the parts and the whole,' which Morin defines as 'global' (2001, p. 36), characterized by mutual interdependence. The local shapes the global: a child's interest in bell towers, facilitated by educational design, can inspire citywide exploration. The global shapes the local: a dish on the nursery school menu may

evoke varied emotions in children, creating opportunities to share narratives. Recognizing the interplay between the local and the global, along with the diverse needs and interests of multiple child identities, fosters a sense of collective belonging, enabling children to see themselves as parts of a complex whole where their actions drive meaningful change. This perspective addresses the ‘civic challenge’ (Morin, 2000), advocating for a broader sense of responsibility that connects the local and the global. Centering not a single child but diverse children’s identities not only informs local practices within nursery schools but also expands reflections to a global scale. In doing so, it cultivates a sense of Earth citizenship, which Morin considers essential for individuals to see themselves as active participants in their environment, whether in the classroom, the nursery school, the city, or the Earth itself (Morin, 2001).

# EQUITY, JUSTICE, INCLUSION AT SCHOOLS

Giorgia Ruzzante<sup>a</sup>

<sup>a</sup>Libera Università di Bolzano, Italy

Education is a human right and a social right and guarantees the possibility of access to other rights as it allows the full exercise of citizenship. The right to education is defined as a human right by various norms of international law, such as the Universal Declaration of Human Rights of 1948, the Covenant on Economic, Social and Cultural Rights of 1966, the European Convention on Human Rights, the Charter of Fundamental Rights of the European Union, which defines this right as right to education, and the 1989 UN Convention on the Rights of the Child, which uses the same term: right to education. OECD Report *Equity and Quality in Education: Supporting Disadvantaged Students and Schools* (2012), underline that the best education systems are those that combine equity with quality.

The terms equity, justice, and inclusion in reference to our school system are closely interconnected and represent the fundamental principles upon which a school aiming to ensure the right to education and the appreciation of individual differences is based. These concepts, moreover, evolve and change in response to ongoing societal transformations and different conceptions of the right to education. Sustainable Development Goal 4 of the United Nations 2030 Agenda is dedicated to quality education and aims to ensure that everyone has access to inclusive, equitable, and quality education, promoting lifelong learning opportunities for all, leaving no one behind. This goal contributes to the building of a more just society. In fact, inclusive education is the tool through which this right to quality education is concretely realized, to then make it effective in teaching practice.

The principle of equity was recalled by the Nobel Prize winner Amartya Sen (2010) and the philosopher Martha Nussbaum (2007), who understand equity as an act of justice.

The fundamental thesis of Nussbaum's approach to social justice is that "respect for human dignity requires that citizens achieve a high level of capability in all specified spheres" (2012, p. 41). Education plays a crucial role

in ensuring the formation of citizens by promoting conditions that guarantee opportunities for everyone. Schools, therefore, serve as the context in which the foundations of an equitable, just, and inclusive society can be built.

According to Benadusi et al. (2008), equity is a distributive arrangement of goods that foresees equalities and inequalities deemed legitimate in light of one or more theories of justice.

The connection between these three principles can be highlighted as follows:

- Equity: Ensuring that every student has what they need to learn.
- Justice: Ensuring that all students are treated fairly and with respect.
- Inclusion: Integrating all students into the school community without discrimination.

Rawls (2002) understands “justice as equity”. Justice and equity are terms that combine well with inclusive ones: guaranteeing equity in fact means giving everyone what they need, considering the fact that the starting point is not the same for everyone.

These conceptual references can already be found within Italian Constitution and should guide educational policies and practices towards building a school system that aims to promote the educational success of all students. The inclusiveness of our school system can already be found within the Constitution (Matucci, 2020), where it refers to substantive equality and not merely formal equality—meaning the actual possibility of being placed on an equal footing with others, regardless of one’s starting point. In fact, the legislation aims to achieve equity in practice (Ferrero, 2023). Access is only the first step: it is essential to ensure the acquisition of skills that are both applicable in the labor market and necessary for the active exercise of citizenship within democratic societies. The shift from cultures to inclusive practices (Booth & Ainscow, 2014) is not linear, and there are various factors that hinder its implementation. The right to school inclusion has yet to be fully fulfilled, as it is protected in legislation but is not always concretely implemented, given that the issue of the lack of resources due to the economic crisis undermines the social right to education (Matucci, 2019). The right is not alone sufficient to guarantee a positive school experience, in which the student can experience well-being and inclusion, being able to develop both the relational and learning levels. Pedagogy, in fact, in a complementary manner to law, also investigates the pedagogical conditions that allow one to feel good at school, paying attention to developing the talents of students to the maximum and achieving educational success. It is no longer satisfied with just everyone’s right to access school, but

it would like a quality and inclusive school, capable of guaranteeing individualisation and personalization (Baldacci, 2005) of learning paths and a school “student’s size” (Baldacci, 2008), and Matucci (2016) noted in the school of today a progressive trend towards the recognition of this right.

Equity does not mean treating everyone the same, but recognizing the differences among students and providing each one with the resources and support needed to achieve their educational goals. It is indeed important to provide greater opportunities to those who have fewer and to allow the achievement of skills in many different ways, as outlined pedagogically in the UDL (Universal Design for Learning) approach (Montanari&Ruzzante, 2021). The UDL Guidelines (CAST, 2024) explains that the plurality of teaching methodologies and mediators in teaching is more sensitive to differences.

Our school system seems to perpetuate inequalities rather than seeking strategies to overcome them, by valuing differences as a resource for learning rather than as an obstacle.

How can schools promote equity? How can the concept of equity and the quality of the education system find a common ground?

Within the school context, ensuring equity means removing barriers and enhancing facilitators to ensure that all students can participate in school activities and the social life of the class, with appropriate adjustments.

What role do selection and meritocracy play within our educational landscape?

One of the key moments for equity in the Italian school system was the establishment of the unified middle school. This historical milestone transformed the country’s educational system, making it more inclusive, equitable, and democratic. This change was formalized by Law No. 1859 of December 31, 1962, which introduced the unified, mandatory, and free middle school. It marked a shift from a class-based school system rooted in social inequalities, fostering the democratization of education and a reduction of disparities.

Our country has also adopted a comprehensive system for secondary education (Benadusi & Giancola, 2014), allowing access to university with any diploma.

Today, issues related to equity that are worth exploring include the inclusion of foreign students and school dropout, which primarily occurs in the 14-16 age group. Dropout is, in fact, one of the most significant problems from an equity perspective in education.

# WELLBEING AT SCHOOL: BETWEEN DIFFERENT LANGUAGES AND FAMILY CULTURES

Silvia Sordella  
University of Turin

This study examines the role of linguistic and cultural mediation in parent-teacher meetings with migrant families, focusing on how it promotes a Moroccan mother's agency in discussing her daughter's progress. In addition to translating linguistic and emotional aspects, mediation enables parents to express their perspectives, fostering mutual understanding and supporting more inclusive, equitable educational environments.

Plurilingualism, Identity, Parental involvement, Migration

## INTRODUCTION

To ensure the rights of children and young people to be fulfilled as individuals and actively involved in their societies, school well-being is a central concern (Anderson and Graham, 2015). Collaboration between teachers and parents is an important factor in promoting a positive sense of self and academic achievement. On the other hand, various difficulties have been identified in the school involvement of parents with a migrant background, partly linked to cultural factors and partly linked to linguistic factors.

In this contribution we will consider the possible obstacles for foreign parents to play an active role in family-school meeting. Some conversational dynamics will be examined where linguistic and cultural mediation strategies stimulate the active role of a Moroccan mother in understanding an emotional situation of her daughter's difficulties.

## **2. TO BE WELL AT SCHOOL IN CONTEXTS OF LINGUISTIC AND CULTURAL DIVERSITY**

### **2.1. Linguistic discomfort of foreign students**

The school plays a crucial role in shaping a more democratic, cohesive, and inclusive society by facilitating access to knowledge for all students and providing tools for critical analysis of current events (Ferrero and Granata, 2023). The Italian education system's structural presence of foreign students is a source of diversity that is added to the wide range of factors that shape the educational landscape. According to the latest official data (Italian Ministry of Education and Merit, 2024), non-Italian citizens make up nearly 11.2% of the student population, with 64.5% of them coming from migrant backgrounds but having been born and raised in Italy.

In addition to the diversity of family cultural heritage, linguistic diversity can have positive implications for cognitive development (Bialystok, 2021) and the construction of an integrated identity. However, the widespread adoption of multilingual education is still far from reality (Sordella, 2015). Consequently, students' native language and culture can be perceived as obstacles to learning. Cultural difficulties may stem from differences in school organization, learning content, participation methods, and parental expectations, which may not align with their previous experiences. Linguistic challenges include both the comprehension of written and oral communication from teachers, and the ability to communicate with them. Limited proficiency in the second language can also hinder parental involvement in overseeing their children's homework and studies.

The perceived gap between students' linguistic knowledge, along with the symbolic values attached to the family's language, and the school's linguistic model can generate a sense of linguistic discomfort (Iannaccaro, 2019). This sense of inadequacy can lead to the devaluation of the family context, often seen as a disadvantage in achieving academic success, with potential implications for identity formation (Van Gorp and Verheyen, 2024). The devaluation of a family's linguistic heritage compounds challenges in parenting, especially within a sociocultural framework where immigrant families often struggle to navigate the educational system.

### **1.2. Foreign families participating in their children's schooling**

Effective communication and collaboration between home and school are crucial for supporting children's development as learners and active

participants in both formal and informal educational settings (Gonzalez, Moll, and Amanti, 2006). Numerous studies have highlighted the important role of families in students' academic achievement (Jeynes, 2005; Fan & Chen, 2001), especially in contexts with a disadvantaged cultural and socioeconomic background. Parental involvement, as identified in several meta-analyses (Jeynes 2024), includes factors such as teacher partnerships, homework monitoring, participation in school events, and engagement with community resources. Focusing on parent-teacher communication, academic expectations, and attendance at institutional meetings, Jeynes (2024) emphasizes the relational dynamics underlying these aspects of involvement. Many immigrant parents view their primary responsibility as providing emotional, physical, and financial support, and they expect teachers to be responsible for their children's learning.

Differences in expectations create mutual miscommunication which adversely affects children's learning. Immigrant parents have rich resources to offer, but because of language barriers, lack of information on the school system available for parents, and inadequate preparation of teachers working with immigrant parents, these resources are often under-utilized. (Antony-Newman, 2019: 373)

Communication barriers between immigrant parents and teachers often go beyond language, arising from differing views on childhood, education, and the role of schools (Antony-Newman, 2019, p. 368). In Italy, these issues are similarly evident, though collaborative projects between schools and universities have proposed strategies to enhance the involvement of immigrant families in the educational process (Cognigni, 2020; Carbonara and Scibetta, 2020; Andorno and Sordella, 2022; Sordella, 2022, 2024).

### **1.3. Mediating a dialogue to rebalance the agency of parents and teachers.**

When institutional power is unbalanced, the agency of others can be acknowledged or not in the conversation (Bazzanella, 2009). This means that building a collaborative relationship is challenging when one assumes that the other party either cannot or does not want to play an active role in achieving the shared goal. The theoretical and methodological construct of agency, defined as "the socioculturally mediated capacity to act" (Ahern, 2001:112), allows for the examination of mutual expectations in school-family collaboration. According to this anthropological approach to language, meanings are co-constructed by participants through specific social interactions.

In the context of school-family collaboration, where linguistic and cultural disadvantages may limit participants' agency, the mediator plays a crucial role in promoting and enhancing the resources of immigrant parents.

As Baraldi and Gavioli (2024) highlight, mediation is not limited to translating across languages to facilitate understanding, but also includes non-translation interventions within monolingual exchanges. In the main conversational thread, the mediator can indirectly involve the non-native participants by directing the conversation toward topics where they are empowered to contribute; in lateral conversations in foreign language, the mediator can enhance details, simplify language, and encourage migrants to share narratives about their world.

Far from simply reproducing text in another language, renditions are contextualised in communication considering participation opportunities, multiple perspectives and explicitation of assumptions (Baraldi and Gavioli, 2024, 165).

Traditionally used to resolve conflicts arising from cultural and linguistic differences, mediation can also promote collaboration in intercultural contexts. According to Davitti (2013), mediation helps prevent misunderstandings, bridging cultural gaps and fostering cooperation between parents and teachers.

### **3. PROMOTING PARENTAL AGENCY IN A HOME-SCHOOL INTERVIEW**

#### **3.1. The research context**

This study examines how mediation promotes agency in a parent-teacher meeting as part of a larger ethnolinguistic study conducted in the Aurora district of Turin (Sordella, 2024).

In this multilingual conversation, a university student mediates, enabling the mother's active participation with the teachers. The meeting, held after school, includes the mother, daughter, and mediator, a Moroccan student, who introduces herself and explains her role. This session was convened to address the child's discomfort due to changeover of Italian L2 and the reduction of her attendance in the language lab, as she has become more autonomous compared to her peers.

#### **3.2. The interplay between quantitative and qualitative data**

Both quantitative and qualitative analyses were used to identify areas of parental involvement in the interview. The length and frequency of exchanges between participants were measured after transcribing the interview. Table 1

presents the average length of exchanges longer than 40 words, along with the participants and conversational moves.

Tab. 1. turns exceeding 40 words in school-meeting.

Speaker	Addressee	Convesational move	No. words of exchange	Mean lenght
teacher 1	child	request to do something	87	60
	child	motivation to do something	83	
	mother	narrative	74	
	mediator	narrative	55	
	child	narrative	55	
	child	request to do something	44	
	child	request to do something	42	
	mediator	narrative	41	
teacher 2	child	motivation to do something	85	57
	mediator	narrative	63	
	child	narrative	56	
	mother	narrative	56	
	child	request to do something	50	
	mother	narrative	46	
	mediator	request to do something	43	
teacher 3	all	self-narrative	85	55
	mother	motivation to do something	56	
	child	narrative	51	
	child	request to do something	44	
	child	narrative	41	
teacher L2	mother	narrative	159	159
child	teacher 3	reading	58	52
	teacher 3	request to do something	45	
mother	mediator	self-narrative	40	40

	teachers	report of rendering/rendering	49	
	mother	rendering	49	
	teachers	rendering	44	
	teachers	report of rendering/rendering	42	

Graph. 1. Frequency of exchanges in school meeting.

Teachers tend to speak more, primarily in narrative forms, to explain the student's progress and emotional difficulties. The girl also speaks at length, especially when sharing a message from her L2 teacher and discussing a homework assignment. The mediator translates and explains, with shifts in length comparable to those of the teachers. Notably, both teachers and the mediator share personal anecdotes about being bilingual, while the mother

uses this mode to connect her own anxieties about learning at CPIA<sup>1</sup>. with her daughter's fear of making mistakes. In terms of the frequency of conversational exchanges, Graph 1 shows the mediator interacts most frequently with the mother, followed by the mother's responses to the mediator.

On the level of qualitative analysis, the following conversation extracts illustrate key moments of mediation that promote the mother's.

Excerpt 1

- 1 INS 1: bene Basma, cosa diciamo alla mamma? >  
CHI (MOT)  
okay Basma, what do we say to your mom?
- 2 CHI: boh... > INS 1  
I don't know...
- 3 INS 1: come boh? > CHI  
what do you mean by 'I don't know'?
- 4 INS 2: come stai andando in questo periodo a scuola?  
> CHI  
how are you doing at school these days?
- 5 CHI: bene? > INS 1  
good?
- 6 INS 1: be:ne! mo::lto bene. > CHI  
very good!really good!
- 7 INS 2: cosa vuol dire questo bene? proviamo a riempirlo un po'.  
>CHI (MED)  
what does 'good' mean? Let's explore it a bit.  
visto che è un po' difficile, magari sfruttiamo anche...  
given that it's a little challenging, maybe we could also make use  
of...
- 8 MED: sì sì. io sono qui apposta. > INS 2  
yes, yes. I'm here for that.

The child starts crying, possibly due to decision regarding her reduced attendance in the L2 Italian lab. To ease the tension, the teachers reassure the mother, highlighting the child's academic progress through narrating school episodes and using the math notebook as a visual aid.

In the second excerpt, we can see how the mother's role in the conversation becomes more active, initially as the recipient of information about her daughter, and later as a co-participant in a parallel exchange with the mediator, which is subsequently incorporated into the main conversation.

---

<sup>1</sup> Provincial Centers for Adult Education.

In turn 4, the mediator shifts the focus from the school environment to the child's emotional state at home. The mother interprets the crying of daughter as linked to attachment behaviors, a view confirmed by the teachers, who acknowledge her perspective, reinforcing her agency in the conversation.

Excerpt 2

1 T 1: e stai riuscendo veramente tanto!

>

CHI

you're really doing so well! Not just in Italian, but in all subjects.

e non solo in italiano, ma in tutte le materie, mamma.

>

MOT

and not only in Italian, but in all subjects, Mom.

perché quando le riesce meglio a comprendere, a capire,

because when he can understand it better, to understand it,

poi riesce anche meglio, per esempio in matematica.

then he can even better, for example in mathematics.

vai a prendere il quaderno di matematica che facciamo vedere

>

CHI

get the math notebook that we show mom

quel problema che hai fatto da sola! la prima a risolvere,

that problem you did yourself.

vero Basma?

is it true, Basma?

2 CHI: sì. > INS 1

yes.

3 T 2: la prima a consegnare. e giusto! e con la sua strategia!

> MOT

the first to submit. and correct!

4 MED: does she cry at home because of school? (arabic)

> MOT

5 MOT: a little. It's like when a teacher is about to leave. (arabic)

> MOT

6 MED: yes, exactly. They told her she finished the course. (arabic)

> MOT

7 MOT: she gets attached. When guests come to our house, she gets

attached and doesn't want them to leave. (arabic)

>

MED

8 MED: ha detto che si è affezionata molto alla maestra, e anche a casa

> ALL

she said that she was very fond of the teacher, and even at home

quando va qualcuno a visitarli, a trovarli, lei si affeziona tanto

when someone goes to visit them, to see them, she's getting too

fond

- e non vuole più che vadano via.  
and does not want them to go away anymore.
- 9 T2 è una bambina che si affeziona molto. > MOT  
she has a strong sense of affection.
- 10 T1 che fa fatica all'inizio, fa fatica all'inizio e poi invece quando  
> MOT  
si abitua si affeziona tanto.  
who struggles at first, struggles at the beginning and then when  
he gets used to it he becomes very fond.

After the mediator report of rendering the mother's perspective to the teachers in turn 8, the teachers then address the mother directly, validating her description of the child, both at home and at school.

In the analysis of the school-family interview, agency is not located in individual linguistic elements, but rather in how turn-taking is managed across various dialogical sequences. Agency emerges in the way conversational roles are allocated to participants, highlighting how different actors are called upon within the evolving narrative of the interaction.

# ADOLESCENTS, WELL-BEING AND MEDIA PRACTICES: ANALYSIS OF STUDENTS' EXPERIENCES IN THE METROPOLITAN CITY OF BOLOGNA.

Paolo Bonafede<sup>a</sup>

Alessandro Soriani<sup>b</sup>

Elena Pacetti<sup>b</sup>

<sup>a</sup>University of Trento – Department of Humanities; <sup>b</sup>University of Bologna – Department of Education Studies

This article explores the evolving dynamics of adolescents' digital media practices and their implications for socialization, identity, and well-being. The research, conducted over two years with students aged 14-19 in Bologna, employed a mixed-method approach to examine media habits before and after the pandemic. Findings reveal increased screen time, shifts in communication toward more functional interactions, the challenges of fragmented identity across platforms and the pivotal role of group chats in peer dynamics, often amplifying misunderstandings and exclusion.

Adolescents, Well-Being, Media practices, Socialisation, Digital technologies.

## 1. THE NECESSITY OF A PERMANENT OBSERVATORY

Social media have long been considered both a strong driver of peer-to-peer social interactions (Caronia, 2002; Turkle, 2012) and an important ground for the establishment of participatory cultures and self-expression (Ito, Jenkins & boyd, 2016). Particularly in the last decade, the infosphere has undergone a development that, although expected, has surprised in terms of its speed and in terms of how profoundly it has changed young people's online practices (Floridi, 2017).

Understanding adolescents' media practices requires a continuous and dynamic investigation. This necessity arises from the constant remodulation of cultural contexts, technological advancements, and the evolving generational

attitudes toward media. Adolescent behaviours online do not exist in isolation but are interwoven with their cultural and social environments, making longitudinal and comparative research essential to capture these shifting paradigms.

## **2. THE RESEARCH**

### **2.1. Objectives and research questions**

Has this transversal, constant and pervasive change affected the way young people negotiate their role in the peer group? The two-year research hereby presented (2020-21; 2021-22) involved students aged 14 to 19 from 9 secondary schools in the territory of the Metropolitan City of Bologna, with the aim of exploring this general question in order to offer a detailed descriptive and interpretative picture of the issue.

### **2.2. Timeline of the research**

The first year was guided by two specific research questions (what are the media practices of today's adolescents? In what terms do their practices have an impact on their way of socialising and negotiating their identity?), was articulated into a quantitative study dedicated to gathering – through an online questionnaire (88 classes involved, 1658 respondents) – the general situation of the students and into a qualitative study – structured as a series of online focus groups (5, one for each year, for a total of 49 participants) – aimed at gaining an in-depth understanding of the results of the quantitative phase. A picture emerged in which technologies and social media assume a fundamentally important role in adolescents' relationships and identity formation (Pacetti, Soriani, Bonafede, 2023). Media practices represent a fundamental junction in the way adolescents behave, interact, act with their peers and socialise with reference figures (adults, peers and influencers). Very few use social media 'actively' (in the sense of being content creators), but they perceive their peers doing so positively and with admiration. Moreover, the lockdown profoundly changed their media practices: digital tools were the only means of communication and were used much longer than normal.

The contribution aims to present some results of the second year (s.y. 2021-22), of the research focusing on:

- students' media practices and modes of interaction through technology among adolescents;

- dynamics of inclusion and exclusion in peer groups in informal contexts connected to school or educational contexts (e.g. class chat);
- research into subjective well-being from forms of socialisation among adolescents through technology.

The stages of the research, conducted according to a mixed method (Creswell, 2015), were twofold:

- a quantitative study dedicated to collecting – through an online questionnaire (1286 respondents) – the general situation of the students;
- a qualitative study – structured as a series of online focus groups (54 participants) – aimed at deepening the results of the quantitative phase.

### **2.3. Methodology**

The hereby presented research can be considered as an explanatory study conducted by following a phenomenological research approach.

Seeing the complexity of the phenomenon addressed the researchers opted to adopt a mixed method approach (Creswell, 2015) by following an explanatory-sequential strategy of inquiry (Trinchero, Robasto, 2019). The phases of the research consisted in two main moments: in a first moment, a quantitative study devoted to collect – by the mean of an online survey – the general situation from the students and, in a second moment, a qualitative study – structured as a series of online focus groups – aimed to deeply understand the results of the quantitative phase.

Questionnaire:

- Media practices: after the pandemic, how much has changed in terms of:
  - Performance;
  - Behaviour;
  - Relationships;
  - skills and hours of technology use;
  - most used device;
  - night management;
  - changes in use;
- Role models: examples of influencers used to assess the link between teenagers and social icons;
- Class chat: emotions, exclusion, acceptance

Focus groups:

- Peer communication before and after the pandemic;
- School and technology, before and after the pandemic: uses and perceptions of attention;
- Notification management and sleep;
- Social media and comparison of body exposure;
- Interactions with people known online;
- Group chats: what emotion is associated and presence of exclusion dynamics.

The research was conducted in 7 upper secondary school located in the area of the Metropolitan City of Bologna and involved a total of 1287 students (first year – 202, second year – 285, third year – 295, fourth year – 244, fifth year – 261; males – 721, females – 520, non-binary – 24, did not want to answer – 22).

### **3. THE RESULTS**

The results from the student questionnaires will be presented and discussed here. In particular, we will focus on a part of the data collected, relating to the change in media practices following what happened during the quarantine for Covid-19 and how students perceive the class chat in terms of online well-being.

#### **3.1. How have media practices changed since the pandemic?**

Figure 1 depicts an aggregate of the responses to the series of items gathered under the question ‘What has changed after COVID’s pandemic?’. The students had to respond with a Likert scale where 1 represents the lowest value of change (‘Nothing has changed’) and 5 the highest (‘A lot has changed’). It can be seen that the values are all at the top end of the scale (3 and above), and in particular that the items that seem to have changed the most are the ‘Level of relationship with peers’ (3,52) and ‘Level of Digital Competence’ (3,98). This can be interpreted as the fact that during the quarantine the students had much more time to spend on digital devices, learning to use them with more familiarity, in a constant and continuous exchange with their peers.

FIGURE 1. What has changed after COVID. Likert: 1 (nothing has changed) – 5 (a lot has changed).

Figure 2 show an account of the hours students spend in front of devices during daytime and evening hours in relation to before and after the pandemic. What emerges is a picture where the number of hours spent on devices during daytime hours has increased (Likert = 3,84) while it remains almost stable in the evening hours (Likert = 3,01). The most frequently used digital devices are smartphones (both during daytime – 1072, and evening hours – 844) and television (especially in the evening hours – 184).

FIGURE 2. Hours spent on digital devices during daily and evening hours. Likert: 1 (less than before) – 5 (more than before)

In Figure 3, the answers to the question ‘How have you changed the way you use technology after Covid’ are aggregated. The aspects of daily life which have been most influenced and which see a greater use of technology after the pandemic than before are: ‘to pursue hobbies and other commitments’ (3,36); ‘to watch things (videos, TV series, etc.)’ (3,47); ‘to inform myself’ (3,53); ‘to keep in touch with my friends’ (3,55); ‘to listen to things’ (3,69); and with the higher Likert score (3,72) ‘to study’.

Figure 3. How have you changed the way you use technology after COVID. Likert: 1 (much less than before) – 5 (much more than before).

Despite the fact that the values are all between 3 and 4 (and thus relate to a slight increase), it is interesting to note that the highest value is precisely that of the use of technological devices for studying. This element was then taken up again in the focus groups, from which emerged the use of messaging services

(chat and e-mail) and VoIP calls as channels used more frequently than before to get in touch with teachers, but above all as tools aimed at building a network of mutual support among peers. In this sense, class chat plays the role of the nerve centre of most exchanges.

In fact, in the graph below (Figure 4), it is possible to observe how one of the major uses of these chats is precisely to seek support from peers for school-related reasons.

Figure 4. The class group-chat, for you, is a source of... Likert: 1 (nothing) – 5 (a lot)

However, it is important to note that the highest values are linked, in addition to the request for support in school matters (Likert = 2,17), above all to relational situations: conflicts and discussions (2,17) and moments of fun (2,1). Even if the values are shifted towards relatively low values on the Likert scale, the importance of these instruments (both in their more scholastic and more informal uses) in delineating the social climate of the classroom can be noted (Soriani, 2018).

### 3.2. Presentation of the qualitative data

Two thematic areas emerged from the conversations as the main findings:

#### 3.2.1. Digital Media and Communication Among Adolescents Before and After the Pandemic

The pandemic brought significant changes to adolescents' use of digital media, transforming how they spend their time, communicate, and engage with others. One of the most striking trends was the increase in screen time. Younger students shared how their digital habits intensified, both for school and leisure.

A ninth-grader remarked: “I’ve gone from maybe having an hour of computer time a day, now I spend eight hours, both for school and recreational purposes.” Similarly, a tenth-grader reflected on how boredom at home often pushed them toward their phone: “When I’m at home, I struggle much more to find something to do, so for me, it’s inevitable after a while to pick up the phone and spend a lot of hours on it.” Meanwhile, older students highlighted extreme cases of digital immersion during online schooling, with one twelfth-grader admitting: “Some days I even reached like 16, 17 hours a day because TikTok takes up time.”

Communication habits also shifted during this period. Many adolescents observed that interactions became more functional and less personal, with group chats and messaging apps replacing face-to-face conversations. A ninth-grader captured this sentiment, saying: “Once we used to organize ourselves by word of mouth... now we do everything through WhatsApp, and even when we meet, we don’t have much to say.” Others mentioned how the written format often led to misunderstandings or conflicts, as it lacked the emotional nuance of in-person exchanges.

While web conferencing tools proved invaluable for maintaining education and social connections, they elicited mixed feelings. Younger students appreciated their convenience for group work, with one tenth-grader noting: “It’s easier if someone has different schedules; you log in at a certain time because you don’t want to move, and you’re set.” However, these platforms also took on unconventional roles, as one twelfth-grader shared how they were used for watching movies with quarantined friends: “We said, okay, let’s watch a movie together, so we watched it on Google Meet.” Such examples illustrate how adolescents adapted to the tools at hand, blurring the lines between productivity and leisure.

Another notable shift was the fragmentation of communication across multiple platforms. Adolescents frequently described moving between apps like social media and WhatsApp while interacting with the same person. A thirteenth-grader explained: “I see this funny thing, I think of you and send it to you, then you reply on social media. Then I switch to communicating with you on WhatsApp. I communicate with the same person on three platforms in parallel”. This reflects the dispersed nature of digital interactions and aligns with Rivoltella’s concept of fragmented identity representation in digital alphabets (2020), where the self is expressed differently across platforms.

### *3.2.2. Well-being and Group Chat Dynamics*

The dynamics of digital communication were also closely tied to adolescents’

emotional well-being, with group chats playing a pivotal role. Many participants highlighted how group interactions, though efficient, often led to misunderstandings and heightened tensions. A ninth-grader commented: “On WhatsApp, it’s not like talking face-to-face... I never know the real reason behind a message or what’s behind the person writing it.” This lack of emotional context frequently resulted in conflicts, as a tenth-grader explained: “In group chats, there are sometimes big controversies over pointless things. You write a message that gets misinterpreted, and suddenly you’re in a storm of messages.” Such experiences underline the challenges of managing relationships in digital spaces where tone and intent are easily lost.

Exclusion, both intentional and unintentional, emerged as another theme. Some participants recounted instances of being left out of group chats during lower secondary school, which left lasting emotional scars. One ninth-grader admitted: “In lower secondary school, I was excluded, but I also excluded others... there was always that classmate I didn’t want in the group.” Others described self-exclusion due to the overwhelming nature of constant digital interaction. A tenth-grader shared: “I can’t dedicate the whole day to these people and contact them—so I exclude myself or feel excluded.” This reflects the pressures of digital connectivity and the pervasive fear of missing out (FOMO).

For many, these dynamics were compounded by the rigidity of group chats, where leaving a chat was not always an option. A ninth-grader lamented: “If you try to leave a chat, they put you back in... I left a chat twice, and they kept putting me back in.” Such experiences highlight how digital environments can feel inescapable, further intensifying adolescents’ emotional strain.

Despite these challenges, participants also recognized the potential for online tools to foster connection and productivity when used thoughtfully. These insights serve as a foundation for developing strategies to support adolescents in navigating their increasingly digital lives.

#### **4. CONCLUSIONS**

This quantitative and qualitative analysis underscores the complexities of adolescents’ digital lives, highlighting both opportunities for connection and risks to emotional well-being. Addressing these challenges requires a comprehensive, multi-stakeholder approach to digital education and well-being. The overall findings emphasize the need for a balanced approach to digital engagement—one that maximizes its benefits while addressing the

complexities of communication and well-being in virtual spaces.

Reflecting on digital well-being today means addressing the pervasive presence of technology in the lives of adolescents, while promoting a deeper awareness of its implications on intimacy, relationships and emotional health. Educational efforts must prioritise the cultivation of social skills and digital empathy, equipping young people with the ability to navigate online interactions with care and understanding and to develop parallel skills in everyday in presence-life. In this sense, the concept of citizenship – broad and inclusive – should transcend specific digital connotations, integrating ethical, social and participatory skills essential for online and offline life. By incorporating these values into education, we can empower future generations to thrive in an interconnected and ever-changing digital society.

#### **Acknowledgements**

The layout of the contribution was entirely shared by the three authors. Specifically, Elena Pacetti signed paragraphs 1, 4; Alessandro Soriani signed paragraphs 2.1, 2.3, 3.1; Paolo Bonafede signed paragraphs 2.2, 3.2.

# PHILOSOPHY FOR CHILDREN, CHARACTER SKILLS AND WELL-BEING IN THE CLASSROOM

Nicolò Valenzano<sup>a</sup>

Federico Zamengo<sup>b</sup>

<sup>a</sup>University of Turin; <sup>b</sup>University of Turin

The paper explores the relationship between well-being, character skills, and learning, highlighting the importance of social-emotional skills in educational processes. After providing an overview of the benefits and critiques of the concept of educational well-being, the analysis focuses on character skills, non-cognitive qualities such as resilience and cooperation, which are crucial for personal and academic success. The Philosophy for Children method is shown to be an effective approach to integrating learning and well-being that promotes complex thinking, agency, and positive relationships, crucial for student growth and classroom harmony.

Philosophy for Children; Character skills; Social skills

## INTRODUCTION: WELL-BEING IN EDUCATIONAL PROCESSES

Defining well-being in the context of educational processes is challenging both conceptually and operationally. The concept of student well-being includes different categories such as ‘emotional competence’, ‘emotional intelligence’, ‘positive mental health’ or ‘emotional well-being’. This variety of interpretations also leads to a range of operational terms such as social and communication skills, resilience, determination, motivation, self-confidence, self-esteem and self-efficacy (McLaughlin, 2008, 353-354). The growing recognition of these components demonstrates how the field of education is increasingly understanding the interconnections between emotional states and academic success.

Furthermore, the concept of well-being in schools can give rise to different views. Proponents of well-being in education argue that it can permeate all aspects of school life and learning, serving as an indicator of the quality of school life and contributing to students’ physical and psychological health and

development, thereby improving learning outcomes (Hascher, 2012; OECD, 2019). Conversely, critics have raised concerns that well-being programs in schools could move towards therapeutic education, and shift teachers' focus from promoting critical knowledge to solely promoting students' emotional well-being (Biesta, 2017; Hayes, 2009; Füredi, 2004; Ecclestone, 2011; Ecclestone and Hayes, 2009). Such debates highlight the need to find a balance between cognitive and emotional development, ensuring that educational interventions remain holistic.

Despite the ongoing debate about the definition and focus of well-being in education (Thomas et al., 2016; Amerijckx and Humblet, 2014), there is some consensus on key factors such as agency, autonomy, respect, sense of community, happiness, esteem and positive relationships (Cassidy, 2017). Non-cognitive skills or soft skills are often highlighted as crucial components of well-being that influence student learning experiences and outcomes. Integrating these elements into curricula may not only enhance academic performance but also foster a generation capable of navigating the complexities of modern society.

In essence, well-being in educational processes is a complex and multi-layered concept that is interwoven with students' emotional, social and cognitive development and influences their entire learning journey. Acknowledging this interwoven nature allows educators to design interventions that address the diverse needs of students.

## **WELL-BEING AND CHARACTER SKILLS**

The contradiction between well-being and learning becomes apparent when analysed in depth, as well-being can be seen as a result of positive educational relationships and activities that develop resilience and agency in students (Eaude, 2009:185). It is worth thinking about character skills (Heckman and Kautz, 2017; Chiosso, Poggi, Vittadini, 2021) or soft skills, also known as socio-emotional skills. There are different conceptualizations of this construct that do not always agree (Pattaro, 2016; Patera, 2019). In general, these skills encompass a dynamic combination of cognitive and meta-cognitive skills, interpersonal, intellectual, and practical skills, and ethical values that enable individuals to adapt and behave positively to deal effectively with everyday and professional challenges (Haselberger et al., 2012). Recognizing the diversity of these constructs underscores their universal applicability across educational contexts.

The emphasis on these aspects highlights dimensions that are not strictly categorized as ‘cognitive’ but play a crucial role in academic learning and personal development. Often referred to as Social and Emotional Skills (SES), there is ongoing debate in the literature as to whether these are competences or skills. Despite the analytical distinctions, the terms are often used interchangeably in relation to SES (Maccarini, 2021). This interchangeable use, while occasionally confusing, points to the fundamental overlap in their goals and applications. Although nominally distinct, many studies suggest that terms such as soft skills, non-cognitive skills, life skills, socio-emotional skills, and transversal skills refer to the same conceptual space (Heckman and Kautz, 2013). These constructs are distinct from cognitive skills, are beneficial for learning and achievement, are considered stable attributes once acquired, and are responsive to educational interventions. They include personality traits such as perseverance, open-mindedness and teamwork. Such traits, when nurtured effectively, form the bedrock for success both inside and outside the classroom. Taking into account the Big Five personality traits, cultivating character virtues generally increases students’ well-being (Heckman and Kautz, 2017; Caprara, Barbaranelli, and Borgogni, 2008). Positive emotionality and sociability contribute to satisfying relationships, a sense of belonging and general happiness. Traits such as politeness, empathy, altruism and cooperativeness promote positive interpersonal relationships. Thoroughness and perseverance encourage a proactive approach to commitments, promote self-efficacy and prepare children for adulthood. Emotional stability, emotion control and impulse control create a supportive environment in the classroom. Open-mindedness, creativity and appreciation for diversity foster positive relationships and the development of resilient personalities. Educational policies should therefore emphasize these traits to prepare students for complex interpersonal and professional dynamics.

It is crucial to develop educational strategies that explicitly integrate well-being and learning in a positive cycle. Such strategies ensure that the mutual reinforcement of these elements can create environments where students thrive holistically.

## **PHILOSOPHY FOR CHILDREN AND CHARACTER SKILLS**

Among the various approaches that promote the intertwining of well-being and learning, it seems interesting to focus on the role of Philosophy for Children (p4c) (Limpan, Sharp, and Oscanyan, 1980; Lipman, 2004). According to

Lipman, p4c aims to develop complex thinking: cognitive, creative and caring. It is a hypothesis that does not separate the cognitive dimension from the non-cognitive and, what we want to support here, is not in opposition to learning and well-being, but rather integrates them as a goal of the whole educational process. This integrative approach aligns with broader educational goals that value the interplay between intellectual rigor and emotional depth.

Recent research carried out in a high school has shown a correlation between p4c and the improvement of social skills, at least in relation to certain dimensions such as the ability to disagree, express one's doubts, accept remarks and express one's difficulties (Zamengo, 2022). This has made it possible to hypothesize a clearer link between p4c and the aspects that seem to be most strongly associated with respect for others and tolerance of disagreement. Lipman's instrument therefore seems to fit well within the Global Competence perspective (Schleicher, 2017): attention to understanding one's own point of view and the point of view of others, tolerance of disagreement, and the ability to form 'reasoned' opinions about situations are all aspects that p4c insists support the promotion of respectful and democratic attitudes in students. By fostering these attitudes, p4c prepares students to engage constructively with diverse perspectives in a globalized world.

To the extent that p4c succeeds in developing social skills, it can be seen as a pedagogical practice that is able to support students' well-being and is clearly understood from a relational rather than an individual perspective. This relational dimension underscores the collective nature of learning and its impact on community well-being.

Philosophy for Children is a teaching practice that supports the acquisition of character skills and structures the learning context as a place of positive relationships to promote students' agency and well-being. In other words, it creates a pedagogical context based on serenity among participants and fosters interaction among peers and with the teacher/facilitator. It allows students to feel part of a (research) community, thus drawing attention to a dimension that is not only individual in the notion of well-being, but rather understood as a feature of contexts and relationships (Cassidy et al., 2024). This community-focused approach reflects the broader social role of education in nurturing responsible and empathetic citizens.

Precisely because it promotes the ability to think together, p4c accustoms children to being challenged in their thinking and to facing challenges with a positive attitude: In this way, it contributes to the development of resilience. Due

to its structure and didactic principles, p4c also creates a sense of agency. In the research community, students steer the direction of inquiry from the formulation of the initial questions and thus determine the subsequent dialog about their interests, concerns or “questions”. In p4c encounters, students engage in ‘social, cognitive and emotional’ relationships that are relevant to their world and develop the habit of seeking and finding meaning, which is central to a person’s identity, relationships and well-being (Kizel, 2017: 87). This habit of inquiry not only reinforces cognitive skills but also contributes to lifelong personal and social development.

## **CONCLUSIONS**

Although the issue of student well-being in the classroom presents some conceptual difficulties, it is a fundamental element in the development of the younger generation. Based on this conviction in mind, more attention should be paid to character skills in educational pathways. This does not mean that specific training should replace curricula; instead, we propose that the focus in school education should be on character education and, in particular, on social skills. Through the teaching of subject content, it is possible to cultivate attitudes and mindsets that shape a person’s character and thus promote their well-being. By embedding these principles into everyday classroom practices, schools can become transformative spaces where cognitive and emotional growth are seamlessly integrated. The p4c experience presented here is a methodological proposal based on two easily implementable elements: the creation of a dialogical environment and the attitude of a teacher who is attentive to promoting the overall development of students. These elements highlight how simple yet intentional practices can profoundly influence students’ trajectories.

# DESIGN OF SCHOOL CONTEXTS AND AN INCLUSIVE CURRICULUM ACCORDING TO THE UNIVERSAL DESIGN FOR LEARNING APPROACH: RESULTS OF THE EXPLORATORY PHASE

Maria Antonietta Augenti<sup>a</sup>

<sup>a</sup>Università degli Studi di Bologna

The exploratory phase of the action research project was conducted with the participation of 30 primary school teachers and 185 children across nine classes in the cities of Reggio Emilia and Bologna. The research employs focus groups and thematic analysis to identify critical issues in educational and instructional planning, space and time management, curriculum use, and inclusive practices. Teachers have reported difficulties in addressing the heterogeneity of the classroom environment, citing rigid learning environments and a lack of cohesive planning for students with disabilities as key challenges. Despite the embrace of inclusive values, challenges persist in the effective translation of these principles into teaching practices. The findings emphasise the necessity for continuous professional development, equipping teachers with theoretical and practical skills to foster flexible, dynamic, and participatory learning environments. Furthermore, the study highlights the importance of rethinking structural and organisational frameworks within schools to promote inclusion. The UDL approach emerges as a pivotal strategy for designing proactive and flexible curriculum that address individual variability from the outset. This research underscores the necessity of innovative pedagogical models to advance inclusive education and improve responsiveness to the diverse needs of contemporary classrooms.

inclusive education, diversity, universal design for learning

## **INTRODUCTION**

Our society is increasingly pluralistic, complex, and characterized by diversity. Heterogeneity is an inherent quality of any social group and has always existed. However, social changes stemming from rights-based movements have transformed how diversity is conceptualized and made visible, identifying it as a fundamental component of both society and education. Diversity in school settings arises from socioeconomic, cultural, linguistic, familial, or individual differences, including skills and needs. The international debate on education upholds the right of all children to quality education, where everyone can develop their potential and achieve the skills necessary to become active citizens in society. Today, schools face various challenges both in terms of pedagogical models and the methodologies and teaching practices to address the diversity of students' needs, interests, learning profiles, and functioning with the perspective of inclusive education (UNESCO, 2009; EASNIE, 2016). IE is a foundational theoretical model guiding global educational policies, supported by key international organizations (Cottini, 2017). The European Council and the European Commission have issued a series of recommendations aimed at promoting actions to improve education for all and enhance teachers' skills, acknowledging them as essential elements in the implementation of inclusive educational practices. This perspective still encounters challenges in its implementation, particularly in teachers' ability to design and apply educational and didactic practices that effectively address classroom heterogeneity. The following section will present data from the exploratory phase of an action research study, offering insights into these critical issues and potential pathways for improvement.

## **1. THE ACTION RESEARCH**

### **1.1. Exploratory phase objectives**

The Action Research (Balduzzi & Lazzari, 2018; Pastori, 2017; Canevaro, 2004) presented was conducted between May 2023 and September 2023, following a mixed methods approach (Trincherò & Robasto, 2019). It involved 30 primary school teachers and 185 children across 9 classes and 7 primary school, in the cities of Reggio Emilia and Bologna. The aim of this research was to experiment an inclusive curriculum, following the Universal Design for Learning (UDL) approach (CAST, 2011; 2018). The research, divided into four phases, incorporated alternating reflective and training sessions, which structured the entire process. In the initial exploratory phase, four focus groups were conducted, two for each school district, involving all teachers from the

participating sites. The objective was to identify emerging practices related to inclusive education. Specifically, this phase investigated: motivations for participating in the research, needs, challenges, and resources present in these school settings; attitudes and beliefs regarding the concept of inclusion; and the instructional methods and curriculum approaches used within the school districts.

## **1.2. The methodology**

The choice of focus groups in the Research-Action methodology was a crucial tool to give voice to teachers and encourage meaningful interaction. This approach clarified perspectives, fostered shared understandings, and revealed group dynamics. The opinions, feelings, and interpretations of the participants in the research clarified individual perspectives and allowed for comparison with others, leading to the definition and articulation of subjective meanings and ultimately fostering new shared realms of mutual understanding (Cataldi, 2009). Specifically, when the focus group coincides with the research group involved in the intervention, it becomes a valuable perspective for observing dynamics and relationships. The facilitated access to these behavioural norms provides valuable insights into the processes through which participants formulate interpretations, opinions, and conclusions (Albanesi, 2012). Two focus groups were conducted for each school district. The topics were introduced using prompt questions related to the themes being investigated:

- Reasons for participating in the research
- Attitudes and Beliefs Regarding the Concept of Inclusion
- Teaching Methods and School Curriculum

The data were analysed using thematic analysis (Braun & Clarke, 2022) with an inductive, “bottom-up” approach (Frith & Gleeson, 2004) and a realist method (Widdicombe & Wooffitt, 1995). The process involved transcription, data familiarization, initial coding, and themes identification. Codes were iteratively reviewed and grouped into broader categories. Recurrence analysis refined the themes, ensuring accurate representation of participants’ perspectives.

## **2. THE RESULTS OF EXPLORATORY PHASE**

The following section will present the themes and sub-themes that emerged during the exploratory phase, outlining the barriers faced by teachers in school contexts.

Tab. 1. Themes and sub-themes from the focus groups

The Educational and Instructional Context	Cluster No. 1: Educational and Instructional Design Cluster No. 2: Spaces Cluster No. 3: Time Cluster No. 4: Curriculum
Inclusion	Cluster No. 1: The culture of Inclusion Cluster No. 2: Participation of Students with Disabilities in School Life Cluster No. 3: Relational Dynamics Cluster No. 4: Co-Teaching

## 2.1. The Educational and Instructional Context

Teachers involved in the research highlight difficulties in designing and implementing educational and instructional plans (Cluster No. 1) that considers all the difficulties and needs within the classroom. Today's classrooms, including those in this research, show the complexity of contemporary schools. There are many students who require an Individualized Educational Planning (IEP), a Personalised Educational Plan (Law 170/2010; Ministerial Directive of 27 December 2012; Ministerial Circular No. 8 of 6 March 2013), such as those with Specific Learning Disorders, Special Educational Needs and non-Italian-speaking children. Teachers report the difficulty of implementing inclusive teaching that effectively considers the students' different abilities and skills. The organisational and didactic practices, as well as the educational planning implemented by teachers, do not appear effectively address the heterogeneity of classes. The analysis shows that teachers use only five educational and didactic methodologies, underlining the difficulty of addressing the educational needs present and the need for a reorganisation of contexts and shared planning. The second sub-theme is the use and availability of school space. Space represents the physical and material container where teaching activities take place. The way in which a learning environment is organised, using furniture and teaching materials, makes the school's educational project immediately evident (Weyland & Attia, 2015), reveals the teacher's pedagogical choices, conditions the teaching action and affects the relationship between teachers and students. Teachers report that school spaces are not very modulable and do not allow differentiation according to didactics and various educational activities. The third sub-theme concerns time management within the school context (Cluster No. 3). Many teachers report complexity in the management of

full time at school, expressing difficulties both in class organisation and in the inclusion of pupils with disabilities. The organisation of the school timetable in a rigid logic linked to structuring the disciplines separately generates disorientation and cognitive overload in students. The fourth sub-theme relates to the use of the curriculum in the design and assessment dimension (Cluster No. 4). The curriculum is perceived by teachers as a bureaucratic tool rather than an educational and didactic planning tool. Teachers state that they do not use the school curriculum in their educational planning, perceiving it as a bureaucratic tool and disconnected from their planning practice. Furthermore, the difficulty for teachers to implement formative assessment, officially introduced by Ministerial Order No. 172 of 4 December 2020, in primary schools emerges as a critical issue. In this document, the periodic and final assessment of pupils' learning in primary school classes is made explicit, emphasising its formative nature. The new mode of assessment, introduced by this law, is still difficult for teachers to acquire and apply. The main challenge is related to an assessment culture still anchored to a summative model. The problem is therefore the lack of coherence between instructional design and assessment.

## **2.2. The culture of inclusion**

The second theme emerging from the thematic analysis of the focus groups concerns the culture of inclusion. The culture of inclusion expressed by teachers does not only refer to pupils with disabilities, but as the ability to respond to the different educational needs of students, ensuring that everyone could actively and fully participate in school activities. Inclusion is seen through the lens *pedagogy of encounter*, where encountering the other and sharing gives meaning and significance in a community, such as a school. Teachers' attitudes play a key role in inclusive practices (Davis & Layton, 2011; Taylor & Ringlaben, 2012). Nationally (Canevaro, D'Alonzo, Ianes & Caldin, 2011) and internationally (Forlin, 2011) research highlights how teachers' attitudes and beliefs influence inclusive processes. However, this attitude is coupled with a recognition of the difficulties in translating these practices into action. Teachers report the difficulty of implementing effective inclusive education (Cluster no. 1) that considers all the difficulties and needs within the classroom. Although teachers adhere to and share the values and assumptions of inclusive education, the difficulty is in translating these principles into effective teaching actions. Often, teachers only use bureaucratic devices such as IEP and Personalised Educational Plan, without any real change about educational and didactic curriculum. This difficulty is also highlighted by the second sub-theme,

the participation of pupils with disabilities in school life (Cluster No. 2). The activities are planned for the class without considering the characteristics and cognitive potential of the disabled pupil and then these are adapted by support teacher into individual and parallel pathways. The third sub-theme concerns the presence and management of complex relational dynamics between children and challenging behaviour in the classroom (Cluster No. 3). Several teachers report widespread discomfort in pupils' behaviour, attention difficulties, motivation to learn, challenging and difficult to manage behaviour. The final sub-theme relates to the use of co-teaching (cluster No. 4), understood as a collaborative dimension of teachers' planning and teaching practices. Co-teaching is a practice in which two or more teachers, one of curricular subjects and one of support subjects, work together in co-planning, co-teaching and co-assessing a heterogeneous group of pupils within the same classroom and school setting, using different approaches (Friend & Cook, 2007). It is a crucial dimension for promoting inclusion processes in educational contexts. The teachers' experiences show a variety of situations within classes. In some of them (4), only partial recognition of the value of co-planning and co-teaching in the classroom emerges. The teachers emphasised the presence of attitudes that hinder the full promotion of a collaborative approach. There is a tendency to consider the support teacher not as an equal figure in the classroom, but rather as a figure to whom responsibility for the child with disabilities is exclusively delegated, thus limiting the potential of co-teaching and its function in promoting inclusive processes.

## **THE CONCLUSION**

The findings of the exploratory phase of the research show that the challenges faced by teachers in educational and school settings are closely associated with the growing complexity of contemporary classrooms. In an environment characterised by diversity, there is a clear need for a rethinking of teaching and organisational practices to ensure effective responsiveness to the needs of students. The critical challenges observed in didactic and educational planning, space and time management, classroom organization, the inclusion of students with disabilities and the use of the curriculum underscore the urgent need for continuous professional development. Such training must focus on fostering both theoretical knowledge and practical skills from an inclusive perspective. It is essential that initial and ongoing training equips teachers to effectively address the complexities of managing diversity while creating flexible, dynamic, and participatory learning environments. There is a need for a structural and

methodological reorganisation of educational contexts through a didactic approach based on the valorisation of differences, the promotion of a positive classroom climate and inclusion as a cardinal principle of educational action. The school, as a place based on the principle of education and inclusion, following the approach of inclusive education, must therefore consider a change of a structural and organisational nature to respond to the variability of today's classrooms. In this perspective, where diversity is seen as the uniqueness and originality of each person, one of the international guidelines that emphasises individual variability is that of Universal Design for Learning (UDL), (CAST, 2011; 2018). The objective of this approach is to design a flexible and proactive curriculum, intentionally and systematically designed (Meyer, Rose and Gordon, 2014), by all the teachers. This is done from the outset, with the aim of avoiding subsequent adaptations and changes. In addition, the approach considers the differences between pupils, including those with disabilities, in the various components that constitute the curriculum: objectives, methods, materials and evaluation. Faced with the challenge of inclusive education as the key to quality education, it is necessary to adopt and experiment with new approaches, such as UDL, which serve as inspiration for the teaching-learning process, but also provide the resources for its implementation.

# COGNITIVE DISABILITIES AND PERSONALISED LEARNING: THE CASE STUDY OF THE AGENZIA FORMATIVA OF THE PROVINCE OF VARESE

Francesca Brognoli<sup>a</sup>

Alessandro Curti<sup>a</sup>

Daniela Martarelli<sup>a</sup>

<sup>a</sup>Agenzia Formativa della Provincia di Varese, Luino

The contribution aims to present and examine the pedagogical-educational approaches and experiential learning processes implemented at the Agenzia Formativa in Luino, offering an example of vocational training that is primarily educational. Personalised educational strategies for students with disabilities are crucial to creating an inclusive school environment and reducing dropout risks, particularly for vulnerable students, both cognitively and socio-culturally. The professional courses for students with disabilities, launched in 2018/2019, aim to prepare them for full societal integration through collaboration with local institutions. Students, with varying degrees of cognitive disabilities and from challenging socio-cultural backgrounds, require environments that respect their individual strengths and difficulties, ensuring equal opportunities. The educational experience includes internships, initially in protected environments and later in companies, to develop skills such as responsibility, respect for rules, and relational abilities. This educational approach values each student's uniqueness, fostering active inclusion and promoting autonomy in social and professional life. The experience is explored through case analysis, focusing on teaching strategies, tools, and methods with both didactic and psycho-pedagogical goals.

cognitive disabilities; personalised learning; Vocational Education and Training (VET); learning strategies; inclusive education

## INTRODUCTION

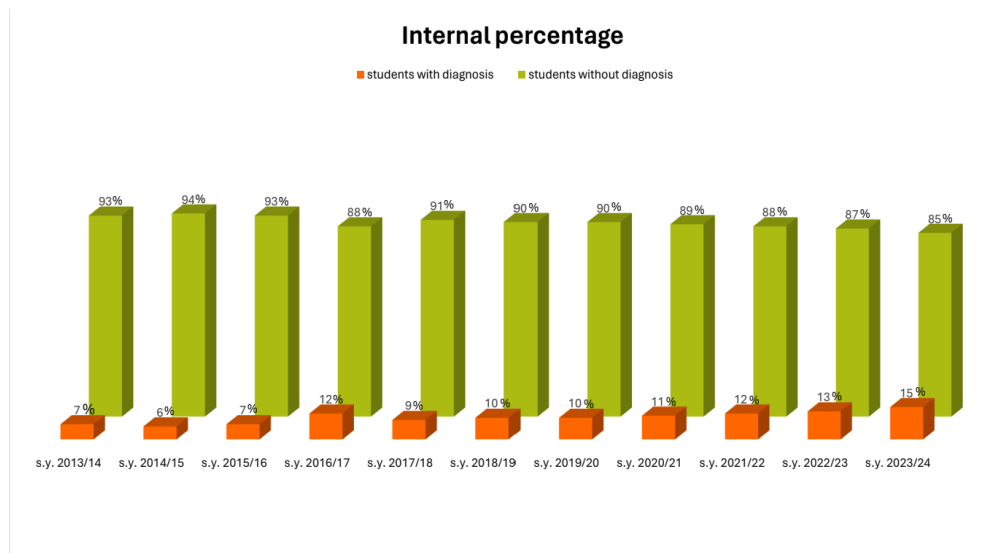

Since the 2018/2019 academic year, the Agenzia Formativa of the Province of Varese, has implemented two vocational training courses for disabled students (PPD) at its branch in Luino. These courses aim to nurture individuals capable of contributing to society as active citizens through personalised learning, which values each individual's uniqueness, and by fostering engagement with local institutions. Integration occurs gradually, with continuous support from the school. Students enrolled in personalised learning paths typically present varying degrees of cognitive disabilities, ranging from mild to moderate. Most of these students come from challenging socio-cultural backgrounds and, therefore, have a heightened need for inclusive environments that can offer equal opportunities, considering their individual inclinations, difficulties, and strengths (Wehman et al., 2018). The school provides learning spaces and pathways based on the principle of equal rights, ensuring personalisation that enhances the uniqueness of each student. The purpose of curriculum for disabled students is not to segregate or emphasise differences, but rather to welcome vulnerable individuals into a safe and supportive environment, enabling them to gradually open up to the world as human beings and engage with society (Beyer et al., 2010). As they become aware of their own limitations and rights, they can take an active role in the social, economic, and political spheres of the country (Honey et al., 2014), ultimately achieving personal fulfilment (Dewey, 2012). The decision to introduce personalised paths for students with disabilities (PPD) stems from the national context, where the percentage of students with functional diagnoses at our centre stands at 15%. In the academic year 2018/19, the first annual PPD programme was launched in the field of catering, and subsequently, a pathway in the agricultural sector was introduced. Adequate training for work and adult life is required, especially in a challenging context that involves both age-related and student-specific difficulties, as well as limited resources allocated to them (107 hours of annual individualised support in standard courses).

Furthermore, a suitable learning environment is essential to support students with mild disabilities, who are unlikely to benefit from the provisions of Law 68/99 (Camera dei deputati e Senato della Repubblica, 1999). The type of courses has been established based on three criteria:

- A high percentage of students with mild disabilities, therefore potentially able to find employment opportunities;

- Employment prospects in a territory, that of Alto Verbano, known for tourism and landscape conservation;
- Catering and Agriculture as sectors that can offer employment with simple tasks.

Figure. 1. Internal percentage of students with diagnosis in Luino

## 1. PEDAGOGICAL PARADIGM

The topic of educational strategies associated with the personalisation of learning needs to be addressed from a psycho-pedagogical and social perspective. These strategies are intended as learning tools and methods that:

- foster an inclusive environment (Patrick et. al, 2013) in upper secondary schools;
- potentially limit school drop-out and exclusion of the most vulnerable students, particularly those facing intellectual challenges and social or economic instability.

Schools must guarantee the possibility of personal fulfilment for all students, through a systemic approach aimed at personalising learning, especially for students with disabilities. From a systemic perspective, it is not only the school system that contributes to building the student's life plan, but also the extensive network of relationships outside the school. This includes the student's socio-economic and cultural environment, which is shaped by their family and the

social networks they interact with (Caponera e Losito, 2016; lanes, 2005). Family dynamics often take on even destructive forms when families are left to face situations laden with hardship and emotional strain on their own. For this reason, the methodology adopted in this study actively involves parents as much as possible in their children's educational journey, through the shared decision-making of choices, goals, and interventions. This methodology also extends to the network of local services, which may be involved in cases of social distress. The practical application of this theoretical paradigm is organised into two broad areas: traditional subjects and vocational subjects, alongside practical workshops. The theoretical framework is delivered through traditional (core) and vocational lessons, with a simplified curriculum adapted to the specific class group, or even to the individual student. The learning of theoretical concepts is reinforced through their application in workshops, often with the presence of both the subject teacher and the workshop instructor. Particular attention is given to internship experiences, which initially take place in a controlled environment within the school, involving activities aimed at the public. Only at a later stage students are assigned to external training placements. The goal is to encourage independent work experience and the development of cross-cutting competencies, such as adherence to rules, responsibility for assigned tasks and roles, empowerment, and improvement of relational and communication skills. This skill set has notable long-term potential for fostering independence and employability (Southward and Kyzar, 2017). The individualised path for disabled students (PPD) arose from the need to offer an educational path for students who do not find an appropriate learning space within the traditional system but possess skills and competencies that can be cultivated and utilised in their life project. This represents a training gap for a category of individuals who face challenges but are not sufficiently impaired to qualify for social support once they complete their schooling. The aim is to finalise their learning (professional and social integration) by maximising each student's individual characteristics so that they can achieve a sufficient level of autonomy

## **2. CASE STUDY: EVALUATION AND STUDENT PROGRESS**

This preliminary study is based on the analysis of 28 cases, offering an initial exploration of the impact of personalised learning pathways for students with cognitive disabilities. While the findings provide valuable insights, they also highlight the need for further research to substantiate these observations and refine the methodologies employed. Within the professional training courses,

the evaluation of each individual student has been conducted through both direct and indirect observation of a set of competencies, aiming to integrate the educational and professional spheres. In the early stages, each competency was assessed using a three-level evaluation scale. Subsequently, to achieve more precise observation, a four-level scale was introduced:

- Inadequate level (1)
- Slightly adequate level (2)
- Fairly adequate level (3)
- Adequate level (4)

Based on these criteria, the systematic evaluation of each student enables teachers to collaborate effectively during both the preliminary observation phases and the subsequent stages of drafting assessments. Continuous exchange among the team is crucial for monitoring the progress of individual students. An analysis of the collected data revealed that students' educational and personal development is not always consistent. Periods of growth may be interspersed with phases of decline, which are particularly evident in areas such as work execution, attention and concentration, adherence to rules, and interpersonal skills. The underlying causes of these fluctuations are varied and may include familial changes, internal family conflicts, significant economic hardships, protective interventions requiring separation from the family of origin, or prolonged absences from school, each of which significantly impacts academic performance. Improvements are often attributed to additional external support provided by institutions, such as home-based educators, or to prior experience in a relevant field, for example, working alongside parents in an established family business. Class dynamics also play a critical role in fostering students' well-being. The ability to form meaningful, empathetic, and stable relationships is frequently hindered by personal challenges, making it difficult for students to manage relationships and emotions effectively. However, the opportunity to experience a classroom environment with a small group of peers (currently capped at nine) allows students to better navigate social interactions and feel more engaged in the educational dialogue. By the third year, most students demonstrate the ability to meet the majority of the expected objectives across all evaluation areas. This progress can be attributed to significant personal maturation and the motivation derived from participation in internships, which expose students to the broader world, enabling them to become "active" citizens capable of contributing meaningfully (Mason & Arcaini, 2010; Olivari et al., 2016).

### 3. CASE STUDY: STUDENT 3 AND STUDENT 6

Among the students' part of the study analysis, two cases (student 3 and 6) who completed the catering course in the 2022-2023 academic year are here examined, with key trends highlighted:

- Student 6 exemplifies the typical trajectory of improvement observed throughout the programme, with all skills showing measurable progress over the three years. This student, who has mild intellectual disabilities (IQ = 61), demonstrated a strong start in the first year, across most competencies. However, areas of relative difficulty included logical-mathematical reasoning, work pace, work endurance, and attention. Over the subsequent years, this student made significant gains, ultimately achieving levels of performance consistent with his cognitive potential.
- In contrast, student 3 experienced a decrease in performance during the second year, a trend that was not uncommon among participants in the study. This student, who has a moderate intellectual disability (IQ = 44), exhibited a temporary decrease in performance across several competencies, followed by gradual improvement. The decline can be attributed to several factors: the dynamics within the student's peer group, the increased demands of the second-year curriculum, which required greater autonomy and self-management, and the emotional and relational challenges typical of adolescence. Specifically, this student faced personal difficulties within the family during this period, which likely contributed to the dip in performance. Despite these challenges, the student ultimately achieved more stable and adequate competency levels by the end of the course.

These cases highlight the complex interplay of cognitive abilities, personal circumstances, and the demands of the educational context in shaping student progress over time.

Figure 2. Student 6: skills development.

Figure 3. Student 3: skills development.

## CONCLUSION

The study acknowledges the importance of developing study paths that can promote the aforementioned competencies, corroborating the topic of school inclusion and students with disability can be conceived as an active part and not as recipients of the service. The analysis of the teaching methodology and the progression of competencies assessed during the initial years of the PPD course trials in Luino indicates that students have achieved educational success and are well-prepared to advance towards integration into the workforce and society. The limitations found in this research, which is based on experimentation that did not have quantitative research as its purpose and whose data – consequently – were analysed afterward, are as follows. The tools used for learning assessment were constructed within the Training Agency and were not intended to be usable externally. However, to present an exportable path, it is necessary for evaluation criteria to be more objective, although this raises the perennial dilemma of integrating quantitative data collection with qualitative ones. It is fairly evident that a personalised path cannot be universalised and that the evaluation of achieved competencies cannot ignore the Individualised Education Plan (PEI, Progetto Educativo Individualizzato) developed for each student. However, it is important, even through the presented experience, to design and build more objective and readable tools also beyond the Vocational Training Institution in Luino. This step, besides being important for the project's improvement, would also enable the programme to be expanded and tested for its effectiveness in other socio-economic contexts, potentially through integration and comparison with similar experiences across Italy. To achieve this, it would be necessary to establish a network, at least on a regional level but ideally on a national scale, in order to present data to the policymakers and guide legislative decisions in a more informed direction. In this regard, the role of the Agenzia Formativa is crucial, as it seeks to explore the possibility of building partnerships with academic institutions. This collaboration could reinforce the methodology developed in Luino and foster a dialogue between academic pedagogy and territorial pedagogy (Baldacci, 2024). By bridging the gap between theoretical approaches in academia and the practical, contextualised learning strategies in vocational training, such collaboration has the potential to refine and expand the pedagogical paradigm, ensuring that it becomes more adaptable, evidence-based, and widely applicable.

# THE INDIVIDUALIZED STRATEGY FOR AN INCLUSIVE SCHOOL

Silvia Fioretti

Università di Urbino Carlo Bo

Individualization is a strategy that aims to enable each pupil to learn and train under the best possible conditions. It enables optimum learning and training because it pays attention to the *individual and social differences* that each pupil manifests by attempting to overcome them. Indeed, each student comes to school with individual differences that may consist, for example, in the possession of different forms of cognitive ‘skills’ or different motivational attitudes towards the learning task. These differences, whether they take the form of different family environments or different socio-cultural backgrounds, often fuel the difficulties that the student must face to fit successfully into the educational system. Thus individualization, in its concrete implementation, is embodied in the adaptation of the teaching proposal to the characteristics of the pupil. The project hypothesis intends to make use of the more formalized model of individualized strategies, theorized by Bloom, known as Mastery Learning. The fundamental assumption of Mastery Learning holds that most learners can achieve full mastery of basic objectives in the presence of adequate teaching quality. This is possible irrespective of a learner’s ‘aptitude’ for a certain subject, as this aptitude can only predict the time required to reach a certain level of learning. This model will be integrated and revisited in the light of studies relating to the psycho-pedagogical and motivational sphere to ensure that pupils achieve the basic and essential objectives, presenting operational solutions that adapt teaching to the individual characteristics of the students.

Individualized Strategy, Individual Differences, Mastery Learning

## INTRODUCTION

The educational debate has dealt, in recent decades, with a topic of great relevance to educational action that of the individualization of teaching and learning processes. Individualized educational guidance constitutes, in fact, one of the most adequate responses to the demands for real equality of

educational opportunities. Mass schooling has resulted in the access to schooling of pupils from broad segments of the population that were previously excluded and has motivated the search for new strategies for education. Under traditional paradigms of schooling, the existence of social and/or merit 'filters' conditioned students' access to and retention in school. Such filters made it possible to moderate the dispersion of pupils' characteristics, and educational communication could be organized according to a 'typical' pupil, whose individual characteristics matched the average values of the population admitted to schooling. Now when mass schooling occurred, the educational and training task emerged in all its complexity, as the different characteristics of the school population were found to reproduce the same dispersion found in the totality of the population. In practice, the development of schooling, at the time when the possibility of schooling as a right for all was recognized, could no longer be based on traditional conditions built on social 'filter' or merit. Under the traditional conditions each pupil bore the burden of adapting to the learning proposition, but as conditions changed, new propositions became necessary, capable of differentiating instruction in relation to the diversity of individual pupils.

## **1. THE INDIVIDUALIZED STRATEGY AND THE DEMOCRATIC SCHOOL**

The democratic school only makes sense if it moves on a ground of transformation and change, wants to take note of everyone's differences and refer to them as the basis of the educational program. The democratic school is a service structure for all social groups; it intends to counter the negative effects of cultural 'deprivation'. It is about reversing the traditional attitude, that is, not forcing all pupils to conform to a single, predetermined program. A technically viable way of counteracting these limitations is to offer everyone experiences and means of growth that allow them, at the same time, to use their current cultural codes and models, to expand them in the direction of different codes and models in which they can find possibilities and advantages of integration. The problem of the relationship between personal and social culture is even more complicated because, in addition to differences related to, for example, backgrounds, it is necessary to consider the originality and particularities of everyone's development. Beyond alleged genetic determinations it is probably an interactive result between these and original and unrepeatable biographical events. Students, then, are not only different, but they are also "immeasurable" (Hawkins, 1979, p. 261) in their differences. The immeasurable differences do not undermine the acquisition of common cultural forms, understood as skills,

meanings, cognitive tools. In fact, “individual development can bridge individual differences, but only through an appropriate diversity of learning styles and strategies” (Hawkins, 1979, p. 264).

Traditional schooling, characterized by a uniform proposal of educational opportunities, targets individuals hypothetically believed to possess the necessary wealth of experience, prerequisites, skills and cultural acquisitions. By pretending to disregard the initial inequalities among pupils, that is, by treating all as equals, traditional educational practice results, in the case of the absence of some necessary element, in an inevitable progressive accumulation of that disadvantage which, instead, schools should help to eliminate. Thus, traditional practice itself attributes the responsibility for failure to the individual characteristics of the pupil. This attribution finds its origin in the school’s unwillingness to consider the diverse cultural and social conditions of the pupils. In this way, failure is bound to become implicitly and largely taken for granted at the outset. The concept of school failure can be seen as the obvious consequence of learning difficulties, as the expression of a lack of knowledge and competence. In this sense, failure is seen to be represented in the distributions of academic achievement that, accomplished within the school context, sort students according to their mastery of some practice, material or theoretical. In school, evaluative judgment ratifies in a ranking the assumed position of the student, and school failure cannot simply be equated with a lack of culture, knowledge or competence.

Profit distributions, it should be pointed out, are the object of social and institutional representations (Allal, Cardinet, Perrenoud, 1989). Indeed, the deficiency is related to forms and norms designed to detect school excellence, to programs, to evaluation procedures. Therefore, assessment does not create the inequalities even if, by showing them in evidence, it justifies and legitimizes them. To impute the causes of academic failure to causes pertinent to the student or the student’s family, poor aptitudes demonstrated by a student that persist despite egalitarian treatment are called into question. This justification is based on a twofold element of interpretation: one based on aptitude endowment, the other based on ‘indifferent to differences’ school treatment.

For the first element of interpretation, it is important to note that the social status of the family is an important element in determining students’ academic success. It is argued that due to a different genetic, social or cultural heritage some people lack certain things to succeed in school, for example: insufficient IQ, too poor cultural heritage, slow development, rudimentary or restricted

language, low motivation and rejection of schooling. These deficiencies would explain school failure.

For the second element of interpretation, constitutive differences (biological, psychological, economic, social, cultural) are transformed into diversity of learning and cognitive success precisely because the school system stands as 'indifferent to differences.' In fact, what might appear to be a demand for educational equality: an egalitarian treatment 'indifferent to differences' transforms initial diversity in the face of the cultural system into inequality of learning and school success. It is enough to ignore the differences among students to observe how the same teaching:

- enhances the success of those with rich cultural and linguistic capital, information, learning levels, aptitudes, and interests to succeed.
- causes, in mirror form, the failure of those who lack these resources and convince themselves that they are incapable of learning, that their failure is a sign of their personal inadequacy rather than a sign of the school's inadequacy.

Equity has been a key justification for federal involvement in K-12 education. Since the civil rights movement and the Great Society program of the Sixties, federal education programs have played an instrumental role in promoting equal educational opportunities for all students.

## **2. DIFFERENTIATION AND ADAPTATION IN MASTERY LEARNING**

Mastery Learning provides an appropriate training proposal for everyone, according to everyone's ability, by differentiating the teaching proposal. So, it aims to ensure the principle of equality of educational opportunities by guaranteeing basic skills. The idea of individualization, understood as the need for differentiation, represents a kind of rule for all those who find it contradictory to teach the same thing, at the same time, in the same way, to different pupils. Individualization as differentiation means, therefore, making sure that each student is, as frequently as possible, in a learning situation that is beneficial to him or her.

Individualizing also means striving to ensure that qualitative differences are respected and quantitative inequalities that distinguish students are mitigated. "Aptitudes exhibit differences in quantity and quality. Two individuals may differ in that one is a draftsman and the other a poet, or because one is a better draftsman or poet than the other" (Claparède, 1997, p. 34). Qualitative reference to diversity refers to those characters that distinguish one subject

from another, bring out personal identity, highlight not only the presence of potentialities, endowments, subjective skills but also the peculiarities that in each person these present, the way they are expressed and are used. Despite the debate that has developed on the problem of educational equality (Baldacci, 1993; 2002) the dominant model of school organization has not changed. Students are grouped according to their age into classes considered homogeneous; in fact, they are believed to have the opportunity to assimilate the same program at the same time. How to explain the persistence of a pedagogical and educational approach that continues to be 'indifferent to obvious differences'? Does there remain, perhaps, a common conception, extremely widespread among teachers, that leads to accepting students' academic failure as an inevitable consequence of the different distribution of aptitudes? The problem emerges most clearly in the school systems of democratic societies, where the right to education should be respected, where the provision of equal educational opportunities to all citizens should be guaranteed. In these systems there are still phenomena of school dropout (Frabboni, Baldacci, 2004) both explicit and implicit. In essence, there continues to be a rupture between democratic principles and the real effectiveness of schools, a dissimilarity between the equality of educational, scholastic and training offers directed to the most adequate development of human resources and the factual situations. About the complex relationship between equality of educational opportunities and respect for individual differences-both in their qualitative meaning of diversity and quantitative meaning of inequalities-the challenge of individualization, understood as differentiation, seeks to make unified, general and common educational objectives-equal for the entire school population-with the cultural and individual differences that characterize students coexist in schools. By treating students as "equal in rights and duties," qualitative differences and quantitative differences – of culture, personality, acquired skills – are transformed into inequalities in school learning (Scuola di Barbiana, 1967).

It is important not to consider school failure as the simple consequence of learning difficulties, as the expression of a lack of knowledge and competence. This failure is always a classification linked to rules of school success, to programs, to levels of need, to assessment procedures. Above all, it is important to emphasize that distributions of school achievement reflect the reality of gaps, but do not cause them. In this sense it is crucial to remember with Bloom "...under favorable conditions there can be equality of learning; this, however, does not require assumptions about equality among men, but rather evidence

of equality in learning” (Bloom, 1979).

We attempted to see how the causes of school failure were sought in the student and his or her family. The analysis identified a possible cause in the action of a ‘deterministic nexus’ that is established between a student’s demonstrated personal aptitudes and attainable learning levels, and a further cause due to the uniformity of educational treatment. The search for causes takes a decisive step when it is realized that differences and inequalities -- biological, psychological, economic, social, cultural -- do not turn into inequalities in learning and educational achievement that to a particular degree of the educational system, which corresponds to the way these differences are treated. That is, cultural inequalities among students belonging to different social classes are imputed to the undifferentiation of content, methods, techniques and criteria for judgment. The possibility of intervening with an educational proposal in favor of the differentiation of precisely the content, methods, techniques and assessment methods is considered. In this way, the focus is no longer on the learner and his or her differences, whether qualitative or quantitative, but on the characteristics of teaching. If the goal is to provide everyone with opportunities to learn whatever their social backgrounds and cultural resources, there is a need for rational instructional action geared toward explicitly defined mastery through individualized adaptations based on criterial and formative assessment. To individualize teaching is to ensure that each student is, as frequently as possible, in a learning situation that is beneficial to him or her. To individualize is to strive, through differentiating learning conditions, for initial school differences to be smoothed out. “When favorable learning conditions are provided, the ability to learn, the rate of acquisition, and the motivation to continue become very similar, for most students” (Bloom, 1979, p. 28).

# PARTICIPATION OF STUDENTS WITH DISABILITIES IN EDUCATION, TRAINING AND LABOUR SYSTEMS: AN ISSUE OF EQUAL OPPORTUNITIES

Ivana Guzzo  
INAPP

Although international legislation supporting the inclusion of people with disabilities in education, training and labour systems strongly calls on member States to put in place *ad hoc* national policies, the opportunities for young people with disabilities to develop skills that can be used in the labour market still seem very low, considering their early school leaving, their difficulty in accessing to vocational and educational training pathways, the problems still related to the skills certification system, the lack of specific professional figures (guidance counsellor, job tutor) for the construction of Individual Transition Plans and the absence of a territorial network of guidance and job support services for young people with disabilities. Further steps should be taken to mainstream the disability perspective in all European policies and to develop an ambitious second phase of the Strategy for the Rights of Persons with Disabilities.

Inclusive Education; Disability Gap; Equality; Individual Transition Plan

## INTRODUCTION

The rights of persons with disabilities have been enshrined in the European Treaties since 1997. Combating inequalities and discrimination based on sex, racial or ethnic origin, religion or belief, disability, age or sexual orientation is enshrined in European law<sup>1</sup>. Article 19 of the Treaty on the Functioning of the European Union, in fact, stipulates that:

---

<sup>1</sup> Consolidated versions of the Treaty on European Union and the Treaty on the Functioning of the European Union (OJ C 202, 7.6.2016, p. 53).

in defining and implementing its policies and activities, the Union shall aim to combat discrimination based on sex, racial or ethnic origin, religion or belief, disability, age or sexual orientation’.

Moreover, equality strategies and inclusion policy frameworks are included in the 2020–2025 European Gender Equality Strategy, the 2020–2025 European Anti-racism Action Plan and the 2021–2027 Action Plan on integration and inclusion, focusing on groups at risk of discrimination, such as Roma people, LGBTIQ+<sup>2</sup>, people with disabilities and Jewish people. Nevertheless, most recent data at European level show that persons with disabilities still face considerable barriers to be involved in education, training and labour systems and have a higher risk of poverty and social exclusion.

## 1. EUROPEAN AND INTERNATIONAL CONTEXT

In 1996, when the Treaty on European Union was revised, the European Parliament, with the Resolution on the rights of disabled people called on the Member States to include a clause on non-discrimination on grounds of disability, to enact a new legal basis for social programmes, to introduce non-discrimination measures and to treat the rights of disabled people as a civil rights issue.<sup>3</sup> In 1997, the inclusion of disability in the Treaty of Amsterdam (Article 13) gave the European Union a new competence enabling it to combat discrimination against disabled people.

The Charter of Fundamental Rights of the European Union (Article 26) adopted in 2000, is dedicated to the professional and social integration of persons with disabilities:

All disabled persons, whatever the origin and nature of their disablement, must be entitled to additional concrete measures aimed at improving their social and professional integration. These measures must concern, according to the capacities of the beneficiaries, vocational training, ergonomics, accessibility, mobility’.

Having come into effect in 2009, the Treaty of Lisbon attributed the same legal value to the Charter as the Treaties.

The United Nations Convention on the Rights of Persons with Disabilities (UNCRPD) adopted in 2006, was the first international legally binding instrument to set minimum standards for the rights of persons with disabilities

---

<sup>2</sup> LGBTIQ+: lesbian, gay, bisexual, transgender, intersex, queer and other sexual identities.

<sup>3</sup> Official Journal C 020 20/01/1997 P. 0389.

and the first human rights convention to which the Europe became a party. The right to work and employment is a fundamental right enshrined in Article 27 of the Convention. By ratifying the UNCRPD in 2010, the European Union associated itself with the efforts agreed at the international level to guarantee the fundamental rights of disabled people.

The European Disability Strategy 2010-2020 enables persons with disabilities to enjoy their rights in full and to participate in society and the economy on an equal footing with others. It draws on the UNCRPD and complements the Europe 2020 Strategy and the Charter of Fundamental Rights of the European Union. The areas covered in the Action plan are eight: accessibility, participation, equality, employment, education, social protection and inclusion, and health and external action.

In March 2021, the European Commission adopted the Strategy for the Rights of Persons with Disabilities 2021-2030. The Strategy builds on the results of the previous European Disability Strategy 2010-2020, which paved the way to allow persons with disabilities to enjoy their rights and participate fully in society and economy.

### **1.1. The European Pillar of Social Rights**

The European social dimension is an important part of the broader debate on the 'Future of Europe'. In this context, the European Pillar of Social Rights aims to build a more inclusive and fairer European Union. The European Pillar of Social Rights, a flagship social initiative jointly launched by the European institutions and the member States in November 2017, provides further impetus to the active social and labour market inclusion of persons with disabilities through its Principle 17, expressly dedicated to such persons:

People with disabilities have the right to income support that ensures living in dignity, services that enable them to participate in the labour market and in society, and a work environment adapted to their needs.

## **2. EDUCATION GAP OF PEOPLE WITH DISABILITY**

Strengthening inclusive education is highlighted as a priority dimension in many European strategic documents, as 'education and training is the foundation for successful participation in society and one of the most powerful tools for building more inclusive societies'.

Improving quality and equity in education is a strategic priority of the European Education Area (EEA), which determines the need to address the diversity of

learners and enhance access to quality and inclusive education and training for all. One of the most important initiatives under the EEA is the Council Recommendation on pathways to school success, which aims to ensure better educational outcomes for all learners, regardless of background or situation, by improving performance in basic skills and reducing the rate of early leaving from education and training (ELET)<sup>4</sup>.

In the Strategic framework for European cooperation in education and training towards the European Education Area and beyond (2021-2030), one of the five strategic priorities of the EEA, the priority 1, aims to improving quality, equity, inclusion and success for all in education and training. In 2023 the European Commission created an expert group focused on developing evidence-based policies to support learning environments and well-being in schools and build positive learning environments for all learners.

Nevertheless, early leaving from education and training although reduced in the last decade, remains a challenge, first for students with disability/SEN<sup>5</sup>. The disadvantage for young persons with disabilities in comparison with young persons without disabilities can be measured by the difference in the respective proportions of early school leavers.

According to the European Survey on Income and Living Conditions, at European 27 level in 2020, about 22.9% of young disabled aged 18-24 were early school leavers in comparison with 9.3% for non-disabled young persons (EU-SILC, 2020), while the European total average was 10.3%. The EU-SILC analysis shows also that the high rates of early school leavers among young disabled persons indicate problems relating to accessibility and an absence of adapted programmes. Physical and architectural barriers might present important obstacles, in addition to methods and instruments that do not meet the abilities of young disabled persons.

---

<sup>4</sup> The Council Recommendation of 28 November 2022 on Pathways to School Success replacing the Council Recommendation of 28 June 2011 on policies to reduce early school leaving (2022/C 469/01).

<sup>5</sup> According to Eurydice data the most common grounds leading to discrimination cases in the school are special educational needs/disability and ethnic background, followed by gender, nationality, sex, religious affiliation, socioeconomic background and sexual orientation.

Figure 1. ESL rate for persons with and without disability (EU 27, % 18-24 age). Source: EU-SILC 2020

In 2022, all European countries registered a great difference in the ESL rate of people with disability, in comparison to those without disability. Also Italy, registered 29,5% of young students with disability who leave education system early, vs 11,5% of those without disability (EU-LFS, 2022). Specific top-level legislation, strategies and action plans dedicated to the inclusion and support to students with special educational needs or disabilities have been registered in most European countries. Most of these policy frameworks establish the right of such students to education in mainstream settings and promote the development of inclusive teaching environments.

Nevertheless, data show that there is still a need to identify political measures which can boost educational success for all learners.

Data from the European Agency for Special Needs and Inclusive Education (EASIE)<sup>6</sup> show the share of students with disability or with an official decision of special educational needs (SEN) who are out of any form of recognised education (that means students who should, by law, be in some form of recognised education but who are out of any recognised form of education) are still enormous. Those students who are not in inclusive settings are in separate classes in mainstream schools, fully separate special schools, other recognised forms of education maintained by health or social services, or are out-of-education.

According to EASIE data 2021, the enrolment rate in inclusive education for students with disability show differences both between ISCED levels and in the

---

<sup>6</sup> European Agency for Special Needs and Inclusive Education, 2024. European Agency Statistics on Inclusive Education: 2020/2021 School Year Dataset Cross-Country Report.

proportion of boys and girls enrolled in the education systems.<sup>7</sup>

In 2021, the enrolment rate in inclusive education for students with disability or SEN ranges, at primary level, from 0,27% in Luxembourg to 6,69% in Lithuania for girls and from 0,76% in Luxembourg to 16,12% in Scotland for boys, with a total average of 2,81% for boys and 1,29% for girls, referring to 25 countries. At lower secondary level (ISCED 2) the share of all students with disability enrolled in inclusive education ranges from 36,42% in Scotland to 0,36% in Luxembourg, with a total average of 2,18%, referring to 24 countries. At upper secondary level (ISCED 3) the share of students with disability enrolled in inclusive education ranges from 33,44% in Scotland (UK) to 0,14% in Luxembourg, with a total average of 2,18%.

## 2.2. Neet with disability

In 2020, about 51,8% of young people with severe disabilities, aged 16-29, were neither in employment nor in education and training, in comparison with 24.6% of persons with moderate disabilities and 12.6% of persons without disabilities in the same age group<sup>8</sup>.

Figure 2. Percentage of Neet with and without disability by degree of limitation (EU 27 16-29 age). Source: EU-SILC 2020.

<sup>7</sup> An inclusive setting refers to education systems where the students with disability or SEN follows education in mainstream classes/groups alongside their peers for the largest part of the school week, 80% or more.

<sup>8</sup> The new Europe 2030 Strategy redefined a certain number of indicators (e.g., low work intensity, material deprivation and consequently people at risk of poverty and social exclusion). Data according to the new definitions, adopted by Europe 2030, were not available at the time of elaborating this paper.

### **2.3 Tertiary education**

Referring to the involvement of people with disability in tertiary education, according to the EU-SILC 2020, the percentage of persons aged 30-34 who had completed a tertiary or equivalent education was 33.5% for those with disabilities and 45.3% for persons without disabilities, while the rate for all persons aged 30-34 was 44.1% and the target for Europe 2020 was 40 %.

To ensure a truly inclusive education and equal opportunities for all learners in all levels and types of education and training, in line with the article 24 of the UN Convention on the Rights of Persons with Disabilities (CRPD), all other actions towards broader inclusion are to be encouraged, such as supporting access to inclusive quality education for persons with disabilities, persons with specific learning needs, learners with migrant background and other vulnerable groups, supporting the re-entering in education in a lifelong learning perspective and providing opportunities to enter the labour market through different education and training pathways.

### **3. DISABILITY EMPLOYMENT GAP**

The right to work and employment is a fundamental right enshrined in Article 27 of the United Nations Convention on the Rights of Persons with Disabilities (UNCRPD).

A dedicated flagship initiative, the ‘Disability Employment Package’ is included in the new European Strategy for the Rights of Persons with Disabilities 2021–2030.

Nevertheless, employment rates are notably lower among persons with disabilities in every member State. In 2022, the unemployment rate of persons with disabilities, aged 20-64, was 17.1 %, compared to 10,2% of persons without disabilities, at european level. Moreover, women with disabilities, young disabled persons and persons with high support needs are more likely to be discriminated against and excluded from the labour market.

Figure 3. Unemployment rate of persons with and without disability (EU, % 20-64 age). Source: European Commission data 2020

Data presented in the 2022 by European Commission, based on microdata 2020, finds that 51.3% of persons with disabilities are employed, compared to 75.6% of those without disabilities.

Figure 4. Percentage of employed with and without disability (EU 20-64 age) Source: European Commission data 2020

The gap between the employment of persons with disabilities and the employment of persons without disabilities is known as the disability employment gap. The disability employment gap was added as headline indicator to the European Pillar of Social Rights social scoreboard in 2021.<sup>9</sup> This indicator shows that persons with disabilities are persistently disadvantaged in

<sup>9</sup> Principles 3 and 17.

the labour market compared with persons without disabilities.

In 2022, the disability employment gap for male and female, with some or severe level of activity limitations, in European Union ranged from 8,5% in Luxemburg to 36% in Croatia, with an EU27 average of 21,4% (EU-SILC, 2022). From 2014 to 2022, in 11 member states the disability employment gap has increased and in 4 countries the increment was more than 3,5%. The highest increment has been noted in Cyprus (+7,7%).

## CONCLUSIONS

To ensure truly inclusive education and labour systems, national policies should be dissociated from social, economic and cultural status, or from other personal circumstances. To be inclusive, education, training and labour systems need to develop diversity sensitivity in the learning and working processes, as well as in education, training and labour institutions, so to challenge and dissolve cultural paradigms and diversity stereotypes

### Acknowledgements

I would like to thank my colleague, Dr. Francesco Manente, for his useful assistance in the elaboration of statistical data.

# RETHINKING EDUCATION: A THREE-DIMENSIONAL APPROACH IN THE CONTEXT OF CONTEMPORARY CHALLENGES

Patrizia Lotti<sup>a</sup>

<sup>a</sup>EIDUNED Escuela Internacional de Doctorado Universidad Nacional Educación a Distancia

The essay explores the evolution of the educational system, starting from the crisis of the traditional model based on the principles of sequentiality and hierarchization. It analyses the development of the pedagogical triangle concept, highlighting the relationships between teacher, student and content, and its transformation into a tetrahedron with the addition of the community/territory in the context of Service Learning (SL). SL emerges as an innovative response to contemporary educational challenges, integrating theoretical learning and practical service to the community, and evolving through the impact of new technologies on the educational process. In conclusion, it emphasizes the importance of shared reflection on teachers' professional identity to develop an ethical and conscious educational practice, capable of addressing the challenges of contemporary society and forming an active and responsible citizenship.

Service Learning; Educational innovation; professional identity

## INTRODUCTION: THE CRISIS OF THE TRADITIONAL EDUCATIONAL SYSTEM

The idea of education that, based on Rousseau's concept of "social contract," not only allows the acquisition of knowledge but also contributes to the formation of free, equal citizens actively participating in democratic life, has led to the creation of public and universal national educational systems currently criticized from various points of view. As Juan Carlos Tedesco (1995) also recalls, what is today considered the traditional educational system was forged at the end of the 19th century as a response to the political and social needs of building democracy and nation-states, based on two fundamental principles:

- Sequentiality, as the educational process is structured in successive degrees of knowledge, closely linked both to the psychological evolution of subjects and to their possible social ladder.

- Hierarchization, defined through the distribution of roles based on age and level of knowledge acquired.

If the discussion continued in subsequent centuries between supporters of state education and supporters of private education, between secularism and religious teaching, universality and elitism, these two principles were never questioned. From the beginning, this did not happen on the part of those who proposed an education more based on sciences and oriented towards practical utility, such as Spencer (1919), who indeed suggested that education should be intellectual, moral and physical, progressing (sequentially) from simple knowledge and concepts towards complex ones. Or on the part of those who, like Durkheim (1922), defined education as a process of cultural transmission, in which young people are adapted to the physical and social environment based on prevailing values in society, so as to prepare them for differentiated roles (hierarchically) based on specific skills and functions they can perform.

## **1. EVOLUTION OF THE PEDAGOGICAL OR DIDACTIC TRIANGLE**

The principles of sequentiality and hierarchisation also permeated the reflections on lesson planning in the five steps – preparation, presentation, association, generalisation, application – that enable the realisation of ‘a map in which the eye can orientate itself’, linking multilateral development of intents and moral formation through the integration of ‘educational instruction’. Integrating ethics and psychology with the principles of philosophy, J.F. Herbart highlights the centrality of the relationship between teacher, student and content, emphasising the central role of the teacher in the transmission of knowledge to the student through the intermediate objective of ‘versatile interest’, the fulcrum of the dynamic relationship between student and content (Herbart, 2020). Emphasising the relationship between the teacher and the student, mediated by the disciplinary content, in a process that aims not only at the transmission of knowledge, but also at the character formation and moralisation of learners, it certainly anticipates the concepts formalised in the following century in the pedagogical triangle (Houssaye, 1988).

Fig. 1. Pedagogical triangle

This conceptualization with content at the vertex, as proposed by Houssaye (1988), confirms the importance of the teacher, who has passed from the role of transmitter to that of mediator, and makes the importance of knowledge predominant in the three postures of education

- Teaching, relationship between teacher and knowledge, with the student on the margin;
- Learning, relationship between student and knowledge, with the teacher on the margin;
- Training, relationship between teacher and student, with knowledge in the background.

In the reasoning on the pedagogical triangle, changes between the three vertices depend on the different emphasis placed on the psychological needs of the student and the needs for personalization of learning, up to including attention to the social context and the relational dynamics within the classroom to see the educational process as an activity co-constructed between teacher, student and community and to emphasise the importance of 'didactic transposition' as academic knowledge that is made accessible by the teacher (Develay, 1992). The focus on the process of adapting scientific knowledge (*savoir savant*) into teacher knowledge leads Chevallard (1985) to overturn the triangle, placing the relationship between teacher and student at the top, to highlight how the epistemological conceptions of the former influence the teaching-learning process.

If the sequentiality and hierarchization of the educational process are cornerstones of the traditional educational system, the relationships between teacher, student and content emphasize the communication present in pedagogy and didactics, while using a triangular scheme different from the diagrams generally used to represent any communicative process. On the other hand, as Lacotte (1994) concludes, depending on the context, the teacher produces different types of didactic communication, being able to foresee both unidirectional situations starting from the knowledge to be transmitted, and interaction situations, but on conceptualisations of two contents – to be taught or to be learned – and referring to different realities and meanings, or of true mediation for the co-construction of the meaning of the content.

## **2. CRISIS AND INNOVATION**

### **2.1. The breaking of traditional educational system**

As mentioned at the beginning, sequentiality and hierarchization are now obsolete, no longer able to respond to the new needs of contemporary society, and the crisis of traditional educational institutions has been felt for several decades. It is enough to remember how Hannah Arendt (1958) highlighted the crisis of authority of the teacher, due to a loss of stability in knowledge and in the sense of responsibility for the world in which new generations are brought, which leads to the rejection of hierarchies and distinctions for a progressive homogenization of educational projects.

The last fifty years have led to a simultaneous increase in difficulties in the functioning of institutions responsible for social cohesion, the relationship between economy and society, and the formation of individual and collective identities (Fitoussi and Rosanvallon, 1996). Moreover, economic globalization has led to the collapse of forms of national cohesion and the institution of delegations to local communities has increased the crisis of legitimacy of the State, favoring the tribalization of society (Castells, 1997).

With the loss of the constitutive value of knowledge, which also meant certainty and trust in the institutions that transmitted it, the reflexive nature of knowledge has been affirmed through its application and the continuous reformulation of knowledge itself in light of new information, which has led to the need to reformulate the articulation of education and knowledge with the formation of the citizen (Giddens, 1994).

In this reality, however, it is possible to build knowledge in relation to the community. As Tedesco (2000, 2004) recalls, the need for each individual to

acquire cognitive skills for active citizenship and develop the ability to build a complex identity without a dominant gaze, leads to an idea of an educational institution whose autonomy necessary for knowledge as reflection linked to practice is also a stimulus for bonds and not for isolation.

This is why SL speaks of a virtuous circle or double gift. A virtuous circle in which through learning there is an improvement of the service carried out with the community and through the service an improvement of the complete training that feeds new learning and so on to infinity. On the other hand, as Puig recalls with this paradigm shift for the common good, if the culture of giving is important, it is necessary to provide for its learning in the educational process, so that the first gift of established knowledge from adults to young people is followed by their gift of activity with the community motivated by the value of disinterested offering.

## **2.2. Service Learning: an innovative pedagogical model**

Service Learning emerges as a response to contemporary educational challenges, combining theoretical learning with practical service to the community and allowing individual protagonists to acquire skills for active citizenship and develop a complex identity. In this perspective, learning is no longer a unidirectional process, in which the teacher transmits knowledge to students, but a process of co-construction of knowledge that actively involves students in service to the community.

SL as a methodology creates a “virtuous circle” that implies continuous improvement of both the service provided to the community and academic learning (Tapia, 2012). In other words, through service, students not only contribute to the common good but also improve their training, fueling a self-reinforcing learning cycle.

In this context, the culture of giving becomes fundamental in the educational process, as it allows students to transform from simple recipients of knowledge to donors of actions and skills for the good of the community/territory (Puig-Rovira, 2021).

To the relationships between teacher, student and knowledge, SL adds that with the community/territory. Indeed, as highlighted by UNESCO (2021), SL allows breaking down the “walls” between the classroom and the community,... proposing a broader vision of education, which goes beyond the physical and theoretical boundaries of the classroom. Thus, the process expands, including the community and territory, in a constant interaction that enriches the

formative experience.

If on one hand it breaks the principles of sequentiality and hierarchization through reference to the “virtuous circle,” on the other hand it makes the pedagogical triangle insufficient, introducing the relational dimension with the community with which all three vertices – teacher, student, content – relate. Hence the need to move from a two-dimensional representation to a three-dimensional one that allows considering the three relational dimensions with the content of the teacher, student and community/territory: the “tetrahedron.” In this model, each vertex is in relation to the others, and knowledge is no longer an isolated product, but the result of a dynamic process that involves different actors – teacher, student, community/territory – inside and outside the classroom. Each of the triangular faces of the tetrahedron represents a relational perspective with knowledge: one takes up the pedagogical triangle and represents disciplinary learning, the student-content-community one represents social learning related to the intervention carried out, the teacher-student-community one represents critical thinking learning due and the teacher-content-community one represents learning derived from interdisciplinary and inter-institutional collaboration.

The introduction of this new figure allows conceiving education as a complex process, where the social and community dimension is an integral part of the learning experience (Lotti et al. 2023).

Fig. 1. SL Tetrahedron

### 2.3. The role of technology: towards the double tetrahedron

The transition from triangle to tetrahedron was also made in reflections on mathematics didactics starting from David Tall (1986) to suggest the role of

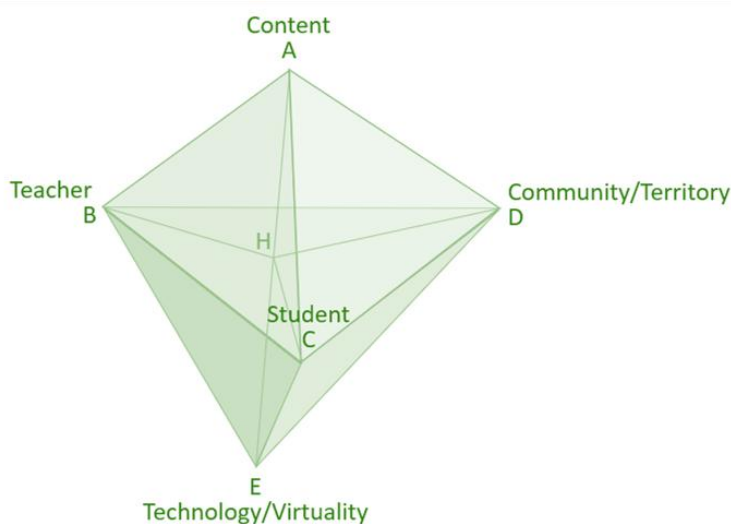

computers in the learning process, and on this basis the vertex related to technology has been updated over time, up to taking into consideration the relational dynamics with virtual reality and artificial intelligence always in relation to mathematics learning (Dasari et al., 2024).

In recent years, the integration of technology in education has added a new dimension to Service Learning. The use of digital technologies, particularly during the Covid-19 pandemic, has spread new forms of Service Learning, such as Virtual Service Learning, which combines distance learning with community service (Ruiz-Corbella & García-Gutiérrez, 2022).

Technology is not seen as a substitute for direct interaction with the community, but as a tool that enhances and enriches the learning experience, expanding the possibilities of interaction and social engagement, giving rise to three different models of real-virtual interaction and learning-service, up to the extreme case of the completely distance path (Waldner et al. 2012).

Fig. 3. Double Tetrahedron

The possibility of also considering the dimension of interactions through technology therefore leads to considering the combination of two tetrahedra, overlapping on the teacher-student-community face related to critical thinking learning. The new combination allows the conceptualization of a renewed and more complex didactic triangle, which allows reflection also on the complexity of the ethical and pedagogical challenges of teaching in relation to the pressure of different relationships inside and outside the classroom both in relation to

content and technological interaction, opening the need for a shared reflection on the ethical professionalism of teacher identity.

### **CONCLUSIONS: TOWARDS A REDEFINITION OF EDUCATIONAL PRACTICE**

SL, with its ability to combine theoretical learning with practical engagement in the community, represents a response to the educational challenges of our time. This approach allows developing a new conception of the teacher as a facilitator of the learning process, which extends beyond the walls of the classroom and is rooted in the territory and community.

The tetrahedron model, which integrates teacher, learner, content and community, offers a three-dimensional vision of education that responds to the needs of an increasingly complex and interconnected society. The breaking of the cardinal principles of sequentiality and hierarchization is determined both by historical-social changes and technological evolution. SL on the philosophical level looks at the educational process both in relation to the relational dimension with the community and territory and to that with technologies, allowing the complex overall vision that the double tetrahedron graphically synthesizes.

In this new educational context, it is essential that teachers continuously reflect on their professional identity, considering not only the relational dimension with students and contents, but also those with the community-territory in relation to both interdisciplinary and inter-institutional collaboration and critical thinking learning as well as social learning, without forgetting the enhancement due to interaction with technology and virtuality. Only through this shared reflection will it be possible to develop an ethical and professionally aware educational practice, able to respond to the challenges of the contemporary world and build active and responsible citizenship.

# BRIDGING THEORY AND PRACTICE: THE ROLE OF TRAINING OF TRAINERS IN PROMOTING INCLUSIVE EDUCATION

Alessandro Monchietto<sup>a</sup>

Cecilia Marchisio<sup>a</sup>

<sup>a</sup>Department of Philosophy and Education, University of Turin

The CUAP training course *Expert in Inclusive Educational Processes*, developed by the University of Turin to respond to the increasing demand for qualified university teachers to support the growing number of students enrolled in *Specialisation Course for Support Activities (CdS)*, is a key initiative to promote inclusive education. Drawing on the principles of Disability Studies in Education (DSE), the CUAP course reconceptualises inclusion by viewing diversity as a core strength rather than a challenge to be overcome. Participants develop broad skills, including cultural awareness, organisational agility, relational skills and strategic thinking, which are essential for implementing inclusion strategies. Initial evaluations show that the course is successfully transforming participants' understanding of inclusion and creating a cascading effect where trainers inspire future educators to incorporate inclusive principles into their practise. This initiative is an example of how targeted professional development can bring about sustainable and meaningful change that meets both national priorities and international standards for equal opportunities in education.

expert; inclusive education teachers; training of trainers; higher education; professional development

## INTRODUCTION

Since the mid-1970s, Italy has been recognised as a pioneer in the international education landscape for its pioneering role in the inclusion of students with disabilities into mainstream classes. This approach, which is now recognised worldwide and supported by numerous international standards and documents (UN, 2006, 2015; Unesco, 2017, 2019; EU, 2021), advocates inclusive

education not only for ethical reasons, but also because it provides an optimal framework to promote the development of each student's potential and create a climate of acceptance and respect for all forms of diversity.

The recent adoption of the "Government Disability Mandate Act" (L. 227/2021, *Delega al Governo in materia di disabilità*) represents a significant step forward. This law envisages a society in which people with disabilities participate fully and equally moving beyond specialized settings to live "on an equal basis with others" (Piccione, 2023; Tarantino, 2024). This paradigm shift emphasises the importance of an 'expert' education system, not only to integrate students with disabilities into mainstream environments but to prepare them for life, work and active democratic citizenship (Medeghini & Fornasa, 2011). This legislative milestone emphasises the need to develop pedagogical practises accordingly and to ensure that teachers are both theoretically informed and practically equipped to guide and facilitate these transformative changes (Bocci, 2018; 2021).

In response to these needs, the University of Turin has developed the Professional Development Course entitled "Expert in Inclusive Educational Processes" (CUAP). This initiative, aimed at those who conduct laboratory activities as part of CdS, focuses not only on improving the skills of teachers specialising in support education (Romano et al., 2021), but also and above all on the trainers who prepare these teachers.

The course is based on the principles of Disability Studies in Education (Gabel, 2005; Slee et al., 2019; Baglieri & Bacon 2020), a theoretical reorientation that not only challenges traditional approaches, but also encourages trainers to embrace inclusion as an opportunity to celebrate difference rather than simply accommodate students with disabilities (Kauffman & Hornby, 2020). Considering the great influence instructors have on the attitudes and practises of future educators, adopting a DSE-based approach is essential for reshaping perceptions of disability (Naraian, 2017).

## **1. BUILDING ALLIANCES TO CREATE AN ENLARGED EDUCATING COMMUNITY**

The University of Turin has implemented collaborative networks involving schools, educators, and policymakers to transform its theoretical commitment to inclusive education into practical initiatives that address evolving student and school needs (Alessandrini, 2007).

The institution of territorial networks represents an answer to increasingly urgent needs, and the presence of higher education institutions, as hubs for

innovation and research, is essential within these local networks (Harkavy, 2006). Within these networks, universities play a central role, not only as sources of advanced knowledge, but also as active contributors to social progress (Grau et al., 2017).

This approach reflects the broader mandate of the National Agency for the Evaluation of Universities and Research Institutes in Italy, which emphasises the need for academic knowledge to directly address societal challenges (ANVUR, 2018).

## **2. DEVELOPING EXPERT TRAINERS FOR INCLUSIVE EDUCATION: THE CUAP INITIATIVE.**

The CUAP programme was developed as part of a cooperation agreement between the University of Turin, the regional government of Piedmont, the regional education authority and various local educational organizations. The aim of this partnership was to cultivate a culture of inclusion by implementing systemic measures to improve the training of support teachers and ensure their seamless integration into the school environment (Covelli & De Anna, 2021).

The course followed a Competency-Based Education and Training (CBET) model, that combined theoretical instruction with practical application to enable participants to tackle complex professional challenges (Burke, 2005). The CUAP course consisted of 100 hours of blended learning and included both general course content and workshops that encouraged collaboration and sharing of best practises among participants.

The course was carefully structured to provide a comprehensive range of competences essential for promoting inclusive education. Both disciplinary and non-disciplinary elements were integrated to ensure the comprehensive development of participants (Gopalaswamy & Mahadevan, 2010): at the centre of the course was the promotion of cultural awareness, an essential competence that highlights the importance of understanding the complex social and cultural dynamics that underpin inclusive education (Ko & Sammons, 2013). In this way, participants were encouraged to critically engage with and appreciate the different contexts in which they work, providing the basis for sensitive and informed pedagogical approaches (Gibson et al., 2016).

In parallel, the programme emphasised the development of organisational skills to enable participants to navigate multi-layered school systems while effectively implementing inclusive strategies. Equally important were relational and emotional competencies that emphasised the ability to foster constructive

relationships and manage the complexity of diverse classroom dynamics (EASDNE, 2012).

In addition, strategic awareness took centre stage as participants were guided to align their teaching practises with the overarching principles of inclusive education (Gephart & Marsick, 2016). This holistic approach underscores the transformative potential of equipping educators with a solid and nuanced understanding of inclusion that enables them to effect meaningful and sustainable change.

To foster these competences, the course used a multi-faceted approach that incorporated participatory methods such as collaborative workshops, reflection exercises and interactive peer-learning sessions. These activities, deeply rooted in the principles of transformative learning theory (Taylor & Cranton, 2012), aimed to promote critical reflection and experiential learning as core elements of professional development. Through these combined strategies, the course sought to equip participants not only with technical expertise, but also with a reflective and adaptive mindset that is essential for tackling the complexities of inclusive education.

### **3. EARLY INSIGHTS AND IMPACT**

Based on the rights-based paradigm of the UN Convention on the Rights of Persons with Disabilities (CRPD), the programme aimed to empower educators to dismantle barriers and promote educational environments in which all learners can flourish. By embedding these competences within the theoretical framework of DSE, participants were encouraged to critically question existing pedagogical assumptions and to envision inclusion as a dynamic process that values diversity and human dignity as foundational principles.

Initial evaluations indicate that participants' perceptions of inclusion have changed significantly (Damiani et al., 2021). Participants reported an increased understanding of the broader implications of inclusive practises in creating an equitable educational environment (Di Masi et al., 2023).

The potential of the programme to create a multiplier effect lies in its ability to refine trainers' practises, ensuring that inclusive principles are not only adopted but also deeply embedded in teacher training. This systemic integration is expected to reshape pedagogical approaches by fostering a paradigm shift where inclusive education becomes deeply rooted in everyday classroom practise (Kammis et al., 2014).

## CONCLUSION

The CUAP programme *Expert in Inclusive Educational Processes* is a decisive step towards overcoming the challenges of inclusive education. By focussing on trainers as key agents of change, the initiative combines theoretical foundations with practical applications, promoting a holistic approach to teacher training. Through strategic alliances, interdisciplinary approaches and an emphasis on non-disciplinary skills, the CUAP programme is an example of a scalable model for systemic change. Its expected multiplier effect underscores the importance of investing in trainers to achieve sustainable and far-reaching impact on educational inclusion (Priestley et al., 2015). Continued research and analysis will further illuminate the long-term outcomes of this transformative initiative and contribute valuable insights to the global discourse on inclusive education.

### Acknowledgements

This study was supported by the Region of Piedmont in collaboration with the Department of Philosophy and Education Sciences at the University of Turin. The authors wish to thank all participants of the CUAP and CSS programs for their valuable contributions.

# DECISION-MAKING AND JUSTICE: UNRAVELING THE THREADS OF SOCIAL EQUITY

Teresa Rinaldi<sup>a</sup>

Annalisa Valle<sup>b</sup>

<sup>a</sup>eCampus University, Italy; <sup>b</sup>Università Cattolica del Sacro Cuore, Milano;

## INTRODUCTION

Decision-making is a multifaceted cognitive process central to human behavior. Defined as the ability to evaluate choices, assess risks and benefits, and select the most appropriate course of action, decision-making is an interdisciplinary area of study, incorporating insights from psychology, economics, and neuroscience (Hastie & Dawes, 2010). According to Sanfey (2004), “Good decision-making is a prime example of intelligent behavior,” highlighting its role not only in personal achievements but also in fostering social cooperation and societal advancement.

In this article, we aim to explore decision-making through a social lens, emphasizing how social decision-making shapes values such as fairness, altruism, and social equity. We will examine the psychological underpinnings of fairness sensitivity, discuss the development of altruistic behavior, and analyze how these contribute to social equity—a principle that extends fairness from interpersonal interactions to broader societal structures. By understanding the components and developmental stages of fairness sensitivity, we can appreciate how social decision-making supports justice-oriented behaviors, ultimately fostering a society where justice and equity thrive.

## DECISION-MAKING IN A SOCIAL CONTEXT

### The Nature and Theories of Decision-Making

Decision-making has traditionally been studied from two main perspectives. The normative approach, grounded in economics, posits that individuals should aim to make rational choices to maximize their utility. This perspective, embodied by the Expected Utility Theory (von Neumann & Morgenstern, 1947), suggests that decision-makers are rational agents who calculate the optimal course of action based on objective assessments of costs and benefits

(Marchetti & Castelli, 2012).

Conversely, the descriptive approach, rooted in psychology, emphasizes the limitations of human rationality. Prospect Theory, introduced by Kahneman and Tversky (1979), suggests that people often rely on heuristics and exhibit biases when making decisions, particularly under conditions of risk and uncertainty. This perspective acknowledges bounded rationality, where cognitive limitations and emotional states influence decision outcomes, often deviating from optimal choices.

### **Social Decision-Making: Definition and Dynamics**

Social decision-making extends beyond personal gain, incorporating ethical, moral, and collective considerations. Defined as choices that affect others, social decision-making involves balancing self-interest with societal expectations and values (Baumeister & Bushman, 2016). When individuals make decisions with social implications, they engage in behaviors guided by empathy, social norms, and fairness sensitivity.

One key component of social decision-making is altruism, the concern for others' welfare, which serves as a motivation for prosocial behavior (Batson, 1991). For example, research using social interaction games like the Ultimatum Game shows how individuals often reject unequal offers, even at a personal cost, to enforce fairness (Güth, Schmittberger, & Schwarze, 1982). Such findings reveal that people value equitable outcomes and are willing to make sacrifices to uphold fairness, even when acting anonymously.

The sensitivity to fairness is an essential part of moral development that begins in childhood. Developmental psychologists have observed that children as young as two years old show basic forms of altruistic behavior, such as sharing and helping (Warneken & Tomasello, 2009). By age five, children start to understand reciprocity and fairness, often expressing dissatisfaction when they perceive unequal distributions of resources (Marchetti & Castelli, 2012).

Through adolescence, individuals refine their sense of fairness, integrating principles of justice and empathy into their decision-making. This progression is influenced by socialization and exposure to prosocial values, leading to a greater alignment with social equity as they reach adulthood. At this stage, individuals are better able to evaluate situations from multiple perspectives, fostering a commitment to social justice that guides their interactions and influences their broader societal contributions (Eisenberg, Spinrad, & Morris, 2016).

## **SOCIAL EQUITY: A PSYCHOLOGICAL PERSPECTIVE**

### **Understanding Social Equity**

Social equity, in a psychological context, refers to a commitment to fairness, equality, and justice in opportunities and outcomes. Unlike simple equality, which implies uniform distribution, equity considers individual needs and circumstances, aiming for just outcomes that address systemic disparities (Tyler, 2000). According to Rawls (1971), a socially equitable society must ensure fair access to resources and opportunities, thereby minimizing inequalities that result from structural disadvantages.

Social equity is critical for fostering trust and cooperation within societies, as individuals who perceive fair treatment are more likely to engage positively with social institutions and participate in prosocial behaviors (Tyler & Lind, 1992). Conversely, a lack of social equity can lead to feelings of alienation, decreasing social cohesion and undermining community well-being (De Cremer & Tyler, 2005).

### **Interpersonal Equity as a Foundation for Social Equity**

Interpersonal equity—fairness in individual interactions—is essential for building social equity. When people experience fairness on a personal level, they develop a broader sense of justice that extends to societal structures. This foundation of fairness fosters fairness sensitivity, which is the inclination to notice and respond to issues of equity and justice. Individuals with heightened fairness sensitivity are more likely to champion social justice causes, as they internalize these values and apply them in broader social contexts (Fehr & Fischbacher, 2004).

## **FAIRNESS SENSITIVITY AND SOCIAL JUSTICE**

### **Cultivating Fairness Sensitivity for Social Justice**

Fairness sensitivity can be cultivated through educational and social programs that emphasize empathy, perspective-taking, and the moral implications of decision-making. Studies show that individuals who develop fairness sensitivity are more inclined to support social policies that promote equity and participate in activities that advocate for marginalized groups (Skitka, 2009). From a psycho-pedagogical perspective, fostering fairness sensitivity involves encouraging individuals to reflect on the consequences of their actions and recognize the value of just and equitable treatment for all members of society.

Fairness sensitivity thus plays a significant role in promoting social justice, as it

underpins actions and attitudes that advance equality. This sensitivity bridges personal interactions and societal norms, enabling individuals to contribute actively to a just society by making decisions that prioritize collective well-being over personal gain.

Decision-making, when viewed through a social lens, reveals the interconnectedness of personal choices and societal values. Through an understanding of fairness, altruism, and social equity, individuals can contribute to building a society grounded in justice. The development of fairness sensitivity, nurtured through socialization and education, empowers individuals to engage in actions that promote social equity and foster inclusive communities.

In advancing decision-making practices that emphasize fairness and empathy, we move closer to realizing a society where justice is not merely an ideal but a shared reality. By appreciating the psychological foundations of fairness and social equity, society can encourage decision-making that serves as a tool for social progress and justice.

This capacity for socially-informed decision-making reflects an integration of equity and fairness, essential for fostering altruism and prosocial behavior (Castelli et al., 2021; Marchetti et al., 2016). Research highlights how children's conceptions of fairness evolve alongside the development of empathy and the reduction of parochialism—the tendency to favor those within one's immediate social circle over others (Marchetti & Castelli, 2012). These qualities are foundational to promoting equitable decision-making, which involves balancing self-interest with the needs of others, often resulting in behaviors that favor shared well-being and cooperative relationships.

Contextual factors—from familial and cultural norms to educational practices—play a pivotal role in shaping children's decision-making skills. In family settings, decision-making is often exercised during resource allocation, where parents can model fair distribution practices that teach children the value of equity. Economic education, specifically, can underscore the importance of fair resource sharing, emphasizing both the ethical and practical benefits of altruistic decision-making (Bicchieri, Muldoon, & Sontuoso, 2018). Adults in both family and educational environments are crucial as models and guides, shaping how children perceive and implement fairness in their interactions. By helping children understand the consequences of their decisions, adults encourage behaviors that promote positive social relations and contribute to more equitable societies (Marchetti et al., 2021). As decision-making studies

expand, challenges emerge in fields like career selection, where young individuals make impactful decisions that shape their futures. Career choices often require consideration of personal aspirations and economic factors, encouraging individuals to prioritize decisions that enhance their quality of life. These decisions, influenced by values of fairness and self-improvement, illustrate how a well-developed sensitivity to equity can motivate actions aimed at personal and societal advancement. Such decision-making is integral to fostering social justice and equitable societies, where individuals, guided by fairness sensitivity, seek out roles and opportunities that benefit themselves while contributing positively to their communities.

# INDIVIDUAL VARIABLES INFLUENCING SUCCESSFUL CHOICES IN INTERNATIONAL WORK MOBILITY

Diego Boerchi<sup>a</sup>

Teresa Rinaldi<sup>b</sup>

<sup>a</sup>Università Cattolica del Sacro Cuore; <sup>b</sup>Università eCampus

International work mobility depends on motivations, skills, satisfaction, needs, and conditions. The AToM (Attitude Toward Moving) study, part of the EMoCC (European Mobility Career Counseling) project, looks at these factors to understand why people choose to work abroad. Through interviews and focus groups in Italy, France, Germany, and Spain, the study explored what influences mobility. It found five main areas: motivations (like cultural experiences and career growth), skills (such as adaptability and problem-solving), satisfaction (including personal and professional growth), needs (like education and family support), and conditions (such as financial stability and knowledge of the host country). These areas show the challenges and opportunities of working abroad. The study highlights the need for tailored support and inclusive policies to reduce barriers, improve skills, and help people succeed. It also suggests further research to improve frameworks and outcomes for international workers.

work mobility; career counseling; international migration; professional competencies; qualitative study

## INTRODUCTION

Migration and mobility are central to human development, driven by better living conditions, career growth, and personal goals. In today's world, international work mobility offers opportunities but also unique challenges. Decisions to work abroad depend on motivations, skills, satisfaction, needs, and conditions, shaping the experience and its outcomes.

While global labor markets create opportunities, barriers like cultural adaptation, economic inequality, and bureaucracy persist. Career counsellors lack tools to assist those pursuing international work. The AToM (Attitude

Toward Moving) study, part of the EMoCC (European Mobility Career Counseling) project, examines factors influencing mobility decisions. Using qualitative methods, it investigates personal and professional dynamics to guide counsellors and policymakers.

This article shares AToM findings across five themes: motivations, competencies, satisfaction, needs, and preconditions, offering insights to better support individuals working abroad.

## **1. INTERNATIONAL WORK MOBILITY CHALLENGES**

Migration and mobility have been studied through geographical, historical, and political lenses (Shah & Long, 2004), highlighting human capital—skills, talent, and knowledge—as key to modern labor markets. Challenges like “brain drain,” labor integration issues, and unemployment persist (Bhagwati & Hamada, 1974; Stark & Bloom, 1985). This paper explores mobility, labor market gaps, demographic shifts, and the “split labor market,” where low-skilled worker surpluses coexist with skilled labor shortages (Koser & Lutz, 1998; Massey et al., 1993).

Solutions include immigration policies to attract skilled workers, boost productivity, and address labor gaps (Ottaviano & Peri, 2008). Programs offering job placement and cultural training ease adaptation, while profiling migrant populations helps tailor policies (Bonacich, 1973). Anti-discrimination measures and intercultural training create inclusive environments benefiting migrants and communities (Bloemraad, 2006).

Theoretical insights call for tools to understand migration behaviors. Despite EU work mobility opportunities, cross-border transitions remain low. Career counseling helps individuals navigate working abroad, addressing psychological and practical mobility factors.

## **2. PSYCHOLOGICAL AND SOCIAL FACTORS IN GLOBAL JOB MOBILITY**

The study of migration and mobility reveals gaps in resources for career counsellors, limiting their ability to guide clients through career and geographic transitions. The EMoCC project addresses this with tools to explore mobility motivations. Social Cognitive Career Theory (SCCT) integrates personal beliefs, socio-environmental factors, and career actions (Lent et al., 1994), examining how self-efficacy, outcome expectations, and social influences shape migration decisions and adaptation (Lent & Brown, 2013). Career mobility depends on economic factors, perceived abilities, and social contexts (Betz, 2006).

SCCT's evolution includes intrinsic motivation and meaningful work in career decisions (Kaminsky & Behrend, 2015). Traits like extraversion and openness drive migration, while emotional stability and conscientiousness encourage caution (McCrae & Costa, 1987; Crown et al., 2021). Psychological well-being and family proximity, especially for women in Mediterranean regions, also play a role (Mulder et al., 2020). Policies combining economic strategies with social support improve labor market access and address demographic changes (Zimmermann, 2005). Incorporating SCCT fosters inclusivity and aligns expectations with workplace conditions (Brown et al., 2018), supporting aspirations and enhancing global mobility outcomes.

### **3. ADDRESSING RESEARCH GAPS IN CAREER COUNSELING FOR MOBILITY**

Building on prior research, there is a clear need for tools to help career counselors understand factors influencing decisions about job mobility. In a rapidly evolving global workforce, understanding the psychological basis of migration behaviors is key to effective policies. Despite the European Union's efforts to promote work abroad, mobility within Europe remains low, prompting questions about underutilized opportunities and how counseling can bridge this gap.

To address these issues, the EMOCC (European Mobility Career Counseling) project conducted two studies. First, the AToM (Attitude Toward Moving) study used interviews and focus groups to explore personal dynamics, skills, attitudes, and values shaping mobility decisions. Second, the WoMSA Scale (Work Mobility Skills and Attitude Scale), a quantitative self-assessment tool, was developed to evaluate mobility attitudes, offering valuable insights for counseling and policymaking.

## **4. THE ATOM STUDY**

### **4.1. Study objectives**

The AToM (Attitude Toward Moving) study aimed to examine the personal dynamics, skills, attitudes, and professional values that influence decisions related to geographical mobility for work purposes. Its primary goal was to understand the motivations and challenges behind these decisions and assess the attitudes and competencies of individuals considering relocation for professional opportunities.

## **4.2. Study design and data collection**

The study used a qualitative approach with semi-structured interviews and focus groups in four European countries: Italy, France, Germany, and Spain. The interviews took place between September and December 2022. The questions were created by Università Cattolica del Sacro Cuore after a detailed review of relevant studies, helping to define the main topics.

The focus groups involved different groups: university students in Italy, high school students in Spain, people interested in au-pair work in France, and young people in international civil service in Germany. Individual interviews included four groups: people who voluntarily moved abroad for at least six months, workers sent abroad by their companies, refugees or asylum seekers, and people who never left their home country.

The semi-structured interviews combined prepared questions with open-ended ones, allowing participants to share their experiences. The questions were adapted to fit each group's situation but stayed consistent across countries. Interviews were conducted in person or online, depending on what participants preferred. Ethical standards were strictly followed, including informed consent based on each country's rules.

## **4.3. Sample**

There were 160 participants: 120 joined individual interviews, and 128 took part in eight focus groups (two in each country). By descriptive statistics on key demographic variables emerged that mean age was 40.16 (SD = 13.08, range 19–82), gender distribution was perfectly balanced (50% male, 50% female), as the country representation (Italy: 27.6%, Spain: 25.6%, France: 24.4%, Germany: 22.4%). These descriptive analyses ensured the robustness of the sample composition and provided context for the thematic findings.

## **4.4. Data analysis**

Data analysis followed the thematic analysis method by Braun and Clarke (2006), chosen because it balances flexibility with rigor, allowing for a detailed and nuanced understanding of patterns in qualitative data without being tied to a specific theoretical framework.

Researchers in each country first analyzed transcripts on their own to find key ideas and themes. These ideas were then organized into bigger groups about motivations, skills, attitudes, and professional values. To ensure reliability, researchers shared their work with project partners to discuss and agree. This teamwork helped compare results across countries and made the findings

clearer. Researchers also thought about their own biases and how cultural differences might influence their work.

## **4.5. Results**

This section presents the results, organized into five thematic areas—motivations, competencies, satisfaction, needs, and preconditions. Each area is explored through its specific dimensions, offering a comprehensive understanding of the factors influencing work mobility decisions.

### *4.5.1. Motivations*

This area looks at why people choose to move for work. It explains what makes relocation attractive, such as personal growth, learning about new cultures, career progress, or gaining new skills. Reasons can differ but often connect, making the decision stronger and increasing satisfaction. Knowing these reasons helps create better support that matches people's goals and improves their experience abroad.

- **Cultural Knowledge:** This dimension refers to a strong interest in understanding the values, belief systems, and traditions of other cultures. Participants expressed a desire to authentically engage with local communities and move beyond superficial experiences or stereotypes.
- **Learning Different Languages:** Many participants highlighted the intrinsic satisfaction of mastering new languages, which enhances independence and fosters deeper connections with local communities.
- **Career Development:** The pursuit of career progression emerged as a key motivator. Participants sought opportunities for professional growth, higher-level positions, and qualifications gained abroad to increase their marketability.
- **Skills Improvement:** This dimension focused on the continuous desire to refine and expand professional skills, often through exposure to diverse work environments.
- **Independence:** The value placed on self-reliance and autonomy emerged as a significant factor, with participants associating mobility with personal empowerment and growth.
- **Relationships:** Social motivations included the desire to build meaningful connections, both personally and professionally, often driven by empathy and a commitment to collaboration.

#### *4.5.2. Competencies*

Competencies are skills and abilities that help people adapt and succeed in a foreign environment. They include practical skills like planning and communication, as well as interpersonal and emotional skills like understanding other cultures and handling stress. These skills help individuals face challenges and grow both personally and professionally in a new setting.

- **Adaptability:** The ability to adjust thoughts, behaviors, and emotions in response to new challenges was recognized as critical for navigating unfamiliar environments.
- **Cultural Sensitivity:** Understanding and respecting cultural differences, including norms, behaviors, and traditions, emerged as essential for building meaningful relationships in diverse settings.
- **Strategic Planning:** Participants emphasized the importance of detailed preparation, including anticipating obstacles and breaking goals into manageable steps.
- **Coping with Stress:** Resilience in handling emotional and physical pressures was viewed as fundamental for maintaining clarity and persistence in challenging situations.
- **Problem Solving:** The capacity to analyze and address issues creatively and effectively played a pivotal role in overcoming obstacles.
- **Effective Communication:** Clear and empathetic communication, particularly across cultural and linguistic boundaries, facilitated mutual understanding and collaboration.
- **Interpersonal Relationships:** Building trust-based connections and leveraging social networks were identified as crucial for both personal and professional success.

#### *4.5.3. Satisfaction*

This area looks at how people assess their experiences working abroad, focusing on what affects their sense of fulfillment. Factors like career growth, managing time, personal growth, rethinking their home country, and building meaningful relationships all play a role. Understanding these helps organizations and policymakers create ways to improve expatriates' well-being and encourage them to stay.

- **Professional Progression:** Rapid career advancement, higher earnings, and increased recognition contributed significantly to job satisfaction.

- **Time Management:** Effective allocation of time between professional and personal responsibilities enhanced work-life balance and overall well-being.
- **Personal Development:** Participants reported growth in self-awareness, confidence, and wisdom, often attributed to overcoming challenges abroad.
- **Home Country Re-evaluation:** Living abroad often led to a renewed appreciation for cultural and institutional aspects of participants' home countries.
- **Interpersonal Relationships:** Expanding social and professional networks was a source of satisfaction, fostering personal growth and collaborative opportunities.

#### *4.5.4. Needs*

Needs are the resources, opportunities, or situations people need to successfully move abroad. These include access to education, jobs, and family support, as well as solutions for problems like unstable governments or personal challenges. Meeting these needs helps people make better decisions and handle the move with more confidence.

- **Education:** Opportunities to specialize or complete academic programs abroad were seen as essential for professional growth.
- **Job Opportunities:** The perceived abundance of employment options and higher wages abroad motivated many participants.
- **Family Problems:** Relocation often stemmed from personal or familial circumstances, such as separation or health-related issues.
- **Professional Satisfaction:** Higher job satisfaction, freedom, and recognition abroad made international opportunities attractive.
- **Turning Points:** Life transitions, such as ending a relationship or finishing studies, often prompted individuals to seek change through mobility.
- **Government Instability:** Participants from politically unstable regions cited safety and freedom as primary reasons for leaving their home countries.

#### *4.5.5. Preconditions*

Preconditions are key factors to consider before deciding to work abroad. They include support from family and community, financial stability, professional help, and knowledge about the host country's culture and rules. These

preconditions help people prepare for their move, making it safer and more successful.

- **Family Support:** Emotional encouragement and practical assistance from family members played a critical role in fostering confidence.
- **Economic Availability:** Financial stability and independence were key enablers of mobility, providing a safety net during transitions.
- **Professional Support:** Organizational resources, such as accommodation and logistical assistance, eased the relocation process.
- **Affective Relationships:** Support networks in the host country helped participants navigate cultural and practical challenges.
- **Knowledge of the Host Country:** Reliable information about local socio-economic, political, and cultural contexts was crucial for effective adaptation.
- **Higher Qualification:** Specialized skills and international qualifications increased participants' competitiveness in the global job market.

## **CONCLUSIONS**

The AToM study highlights the many sides of international work mobility, focusing on motivations, skills, satisfaction, needs, and conditions that shape people's decisions and experiences. These five areas provide a clear framework to understand the personal and professional factors behind mobility, offering helpful insights for career counsellors, organizations, and policymakers.

Key motivations include career growth, cultural experiences, and personal independence. Important skills for success are adaptability, cultural sensitivity, and communication. Satisfaction comes from professional and personal development, showing the need to match individual goals with mobility opportunities. Meeting needs like financial stability and ensuring support systems can make mobility more achievable and successful.

The study suggests career counsellors should use tailored approaches to help individuals prepare for mobility and build the right skills. For policymakers and organizations, it emphasizes creating supportive policies and programs to remove barriers, promote cultural integration, and support international workers.

Future research should look deeper into how these areas connect and impact the long-term results of mobility. By using the study's findings, stakeholders can

create strategies that help people succeed in global job markets, supporting their personal growth and contributing to social and economic progress.

### **Acknowledgements**

Financial support for this study was provided by the EMOCC project, a Cooperation partnership in vocational education and training co-funded in 2021 under the Erasmus + Key Action 2 Cooperation among organisations and institutions (Grant Agreement nr.2021-1-IT01-KA220-VET-000030154).

# CAN THE SCHOOL CONTEXT FOSTER ALTRUISM? PRELIMINARY EVIDENCE FROM CHILDREN PLAYING THE DICTATOR GAME IN “SCUOLA SENZA ZAINO” METHOD

Ilaria Castelli

Nicole Zanga

University of Bergamo, Italy

The tendency to give and to share goods with others is a topic of study with a long tradition in developmental psychology, that involves both the domains of moral reasoning and of social decision-making. Studies with the well-known Dictator Game showed that children act altruistically already from the preschool period, and that the socio-economic status of their family plays a role indeed. But the receiver plays a role too: children tend to offer more to people belonging to their own social group, and less to people of another group. To better explore this aspect, 10 years old children were involved in a series of rounds with the DG under different conditions. The two groups belonged to two different Primary school contexts in Northern Italy: one group attended a school with a special method, the so-called “Scuola Senza Zaino” (Orsi, 2014; 2016) and the other group attended a classical primary school. Preliminary results showed the tendency of both groups to act altruistically and to be influenced by the “parochialism” phenomenon. More interesting elements emerged from the discussion, carried on after the three DG rounds. Implications for the education to citizenship at school are discussed.

Decision-making; altruism; Dictator Game; children; “Scuola Senza Zaino”

## INTRODUCTION

In a systemic view of human development and of educational processes rooted in a complex socio-cultural context, schools pay growing attention to the socio-relational dimension of children with teachers, with peers and with the

surrounding environment. School, therefore, plays a central role in the education for pro-sociality and altruism, and aims to form responsible and caring citizens in everyday life. The Italian guidelines for the school place the Constitution of the Italian Republic and other European and ONU documents that call citizens to ethical and solidarity-based behaviour at the basis of the teaching action. In this regard, it is necessary to allow children to actively participate and co-construct their learning process together with teachers. An alternative school model, attentive to these aspects, is the so-called “Scuola Senza Zaino” method, which allows children to learn what it really means to live in a democratic society, where learning is co-constructed by teachers and pupils and rules are agreed and shared, just like in a community.

### **1. “SCUOLA SENZA ZAINO” METHOD: A SCHOOL THAT BECOMES A COMMUNITY**

The idea of the “Scuola Senza Zaino” method was born in Lucca (Tuscany) in the late 1990s. The creator of the model, Marco Orsi, felt the need to rethink the school in a radical way, taking up the ideas of classical authors such as Montessori, Freinet, Dewey, Pestalozzi, Don Milani and Steiner. The basic idea was to build a more active school, one that would lead pupils to achieve skills, stable learning, and a truly useful education outside the school walls. Today, the “Scuola Senza Zaino” movement has 294 institutions and 634 schools throughout Italy, which apply the model from pre-school to secondary school. Marco Orsi (2014, 2015, 2016) points out how the schoolbag hints at a transmissive and individualistic school model, based on formalism, in which there is no connection between the various knowledge acquired and in which there is a strong dualism between the teacher and the learner. Removing the schoolbag, according to Orsi, would therefore mean a change in the educational process, where knowledge is co-constructed by teachers and students mainly from experience, and where teachers take care to work collectively to offer an environment rich in stimuli.

There are three core values of the “Scuola Senza Zaino” method (Orsi et al., 2013):

- Community, understood both as a *community of practice* and as a *research community*. Knowledge, methodologies and competences are shared among teachers at the plexus level. The pupils also operate in a context that enables them to learn through a research process.

- Hospitality, understood in a dimension of caring for both the environment and the relationships established in it. It is also a push towards autonomy, as the conditions are created for the pupils to experiment and learn to do things on their own.
- Responsibility, according to which learning must first and foremost be based on the free adherence of the subject and on the understanding of the meaning of what is being proposed. It is also understood as responsibility towards others, in that pupils are called upon to cooperate and help the fellow pupils, so that learning is effective.

In the “Scuola Senza Zaino” context there are tables arranged in groups, where the pupils work in small groups, but also in pairs or individually as required. Particularly significant is the Agorà space, used by the whole group of pupils for listening, for dialogue or guided discussion, and also to take decisions that affect the life of the community. The material is shared within each table and usually managed by a pupil in charge, who must make sure that everyone takes care of it and puts each item in the right place. The design of teaching paths is based on the Global Approach to the Curriculum, which means that the curriculum has a situational and contextual perspective and involves all the systems of school life which inevitably intersect with each other. The differentiation of teaching has strategic importance, as it enables teachers to identify potentialities and limitations of individuals, and to make them participate in the school community. Assessment is also referred to as ‘mild assessment’, as it should be friendly, give confidence to students and should be sustainable for teachers; it is also oriented towards a formative and metacognitive dimension. There is therefore a move towards an authentic assessment based on reality tasks, which allow the child to act in real or simulated contexts, applying knowledge and skills acquired at school to realize projects or solve problems related to a concrete need.

The pupils are involved in deciding the various procedures that govern the school day, such as the choice of places, assignments or organization of materials. All the collectively elaborated procedures and contents for the functioning of the class are included in the Class Manual, a notebook that can be consulted at the moment of need and possibly revised and modified: the written and agreed instructions are defined as IpU (Instructions for Use) and contain both a description of how a particular task is to be carried out, its contents and the reason and when they are to be used. The authentic tasks promote of openness towards the community and society: pupils, through

activities such as the one described above, can be confronted with real problems or needs that require a creative response, for which they are called upon to bring their skills into play and to collaborate with their peers. The model also involves pupils' parents, as this is a fundamental requirement for a meaningful learning condition for their personal and social growth.

## **2. EDUCATING IN PRO-SOCIALITY AND ALTRUISM**

Generally speaking, prosociality can be defined as the set of all those behaviors directed towards the benefit of others, without expecting external rewards (Eisenberg et al., 2006; Castelli & Marchetti, 2012). Although the term 'altruism' has sometimes been used as a synonym for 'prosociality', it can be considered as a specific form of prosocial behavior, centered mainly on the possibility of incurring personal costs, such as making a sacrifice. The rich debate about the roots of prosociality and of altruism – the well-known question “Nature or Nurture?” – has shown, on one hand, that infants between 14 and 18 months spontaneously act prosocially and altruistically (Warneken et al., 2007; Warneken, Tomasello, 2008), but on the other hand, the development of the variables influencing prosocial behaviour are closely linked to the child's socio-affective and cognitive-moral development, as well as to the social context. One of the variables that most influences the development of prosociality from early childhood is the quality of the educational relationship established with the child's main caregivers, i.e. parents and, later, teachers (De Beni, 1998). Children of parents who adopt an authoritative parenting style behave in a more responsible and affectionate manner in contrast to children of parents who treat them coldly and tend to be over-controlling: this points out that it is crucial to establish the right level of authority, which allows the children to feel encouraged and stimulated to develop their autonomy. Other studies have highlighted the importance of adopting a democratic education based on the freedom of the individual, so as to stimulate children above all to solve conflicts in a civilized manner.

When entering the school world, the child experiences another relationship that is fundamental to his/her growth, namely that with teachers (Pianta, 2001).

The teacher is called upon to establish personal contact with each child, and should aim to stimulate a sense of security, but also to foster dialogue and interpersonal collaboration. It is essential that the teacher listens to pupils, makes them feel welcome and places trust in their abilities. The teacher should also act as a role model, explicitly disapproving aggressive and violent behavior,

and valorizing the behavior of sharing, of cooperation and support for others. Even before implementing educational projects aimed at acquiring pro-social skills, it is essential to build a learning environment in which the relationship is at the center, where the teacher reflects on the communication methods adopted and on the quality of the teaching activities proposed. Curricular contents can also become vehicle to sensitize children to the implementation of pro-social behavior: for example, it can be interesting to introduce children to personalities from recent history who are famous for having acted in the name of solidarity values. Finally, it becomes increasingly necessary to have a critical mindset and structure systematic paths of socio-affective education.

### **3. A PRELIMINARY RESEARCH COMPARING CHILDREN IN “SCUOLA SENZA ZAINO” METHOD AND IN A CLASSICAL SCHOOL**

The starting hypothesis of this research project was that children who had followed the five years of “Scuola Senza Zaino” Method tended to implement more prosocial behavior than the others, who attend a classical school. This is because this model, as explained above, is strongly focused on the community dimension, and provides strategies and methodologies that focus on the relationship with the teacher and among pupils, to foster collaboration and sharing.

The experimental class consisted of 20 pupils (11 boys and 9 girls, 5 pupils had Special Educational Needs) from the Fifth grade of a “Scuola Senza Zaino” method in Northern Italy. The class in the control group, on the other hand, consisted of 23 pupils (12 boys and 11 girls, 5 pupils had Special Educational Needs) and followed a traditional school model.

Despite the different approach of the two school models, there were many similarities in the positive atmosphere in the classrooms, which showed how both groups, in the course of the five school years spent together, managed to build solid relationships and a learning atmosphere, both in terms of peer relations and relations with teachers. The analysis began, in both classes, with the administration of a variant of the Dictator Game to each pupil. The Dictator Game (Kahneman et al, 1986) is one of the most widely used interactive games in the developmental age to investigate decision-making skills in children and is one of the games used to assess the propensity for prosociality and altruism (for an overview, see Castelli & Marchetti, 2012). In this game, two individuals are called upon to share a given good within a single interaction, with no possibility of bargaining. The recipient has no power to decide whether or not to accept the

offer of the proposer, who can act in effect as a 'dictator'. Depending on the age of the participants, different goods may be used, e.g. money, cards or candy: in any case, it is essential to guarantee anonymity from the outset, so as to avoid distortions caused by the phenomenon of social desirability.

In this research project the variant of the Dictator Game involved the use of cards as a good to be shared, and served to analyze also the in-group and out-group dynamics and the presence of the phenomenon of parochialism (Fehr et al., 2008), through the following three questions:

1. You have 10 cards; you have to decide how to share them with one of your classmates. How many would you give to him/her and how many would you keep? Take into account that he/she cannot refuse your offer.
2. Now imagine that you have to share them with a child from another class in your school. What would you do?
3. Now let's play another game, you still have 10 cards, you always decide how to divide them up: now you play with a child from another school that you do not know. How would you act?

During the administration, gender homogeneity was maintained, i.e. boys were told that they were playing with boys, and the girls that they were playing with girls. Furthermore, the three rounds were counterbalanced, changing the order from time to time, so as to avoid any possible influence of the order on the decisions. Following each answer given, the pupils were asked to give a reason to understand the decision made.

There were some slight differences between the two groups, although the numerical responses and motivations were overall very similar. Six children from the experimental group and ten from the control group stated that they would split the number of cards equally, keeping five for themselves and giving five to the recipient, in all three variants of the game. There was the tendency of many children to motivate their choices based on moral reference to fairness, e.g.: *It would be fair if we had the same amount*. The phenomenon of parochialism also emerged quite well, as 12 children in the experimental group and 5 in the control group chose to keep more cards for themselves when the playing partner was not a classmate, with motivations such as *Since he is not in my class, I don't know him well, so we are not very good friends*. It may be also worth noting that one pupil in the experimental group and two in the control group chose to give more cards to children who were strangers or knew little about them, with this motivation: *I don't know him, so maybe we can become friends*. For the answer to the second question, since they were all fifth graders,

and there was only one section for each school, many of them took it for granted that the partner with whom they would share the asset would be from a lower class. This, however, has led to different attitudes in the two groups. In the experimental group, three stated that they would like to give fewer figurines to their smaller companion (example of motivation: *Since she is a bit smaller and I like the cards, I can decide. They would be mine, so I keep 6*), while in the control group two children would have given a few more (example of motivation: *I am already grown up, he needs more education and has to go all the way, he needs it more than I do*). There was also the tendency – on the part of a few boys – to donate figurines in the hope that, in the future, that their gesture would be reciprocated: *Since she is a classmate of mine, we see each other often and in the future she might find some more in the packets and give them to me*.

## CONCLUSION

This research, though based on a small sample, seems to show that the educational model adopted by a particular school is only one of many components that contribute to the development of prosocial and altruistic tendencies in children. The fact that there were no strong differences between the responses of the two groups may be related to the presence of a serene and welcoming atmosphere in both classes. Moreover, the Fifth grade of the “Senza Zaino Method” school was the first class in the institute to follow that model, and two school years were experienced with the string limitations of the Covid-19 pandemic, so all the pivotal elements described by Marco Orsi were not yet fully present at the time of the research. For the future, it would be interesting to extend the project to a larger sample, and it would be also meaningful to analyze the differences at an inter-temporal level, monitoring the prosocial tendencies of pupils from the First grade to the Fifth grade, so that more evidence could be obtained regarding the influence of the school context on the development of prosociality and altruism.

# EMPOWERING FUTURE GENERATIONS: THE CRUCIAL ROLE OF PARENTS IN SHAPING FINANCIAL DECISION-MAK- ING SKILLS

Teresa Rinaldi<sup>a</sup>

Annalisa Valle<sup>b</sup>

Antonella Marchetti<sup>b</sup>

<sup>a</sup>eCampus University, Italy

<sup>b</sup>Università Cattolica del Sacro Cuore, Milan, Italy

Financial education is a critical component in the development of responsible and conscious individuals. This study delves into the pivotal role that parents play in instilling financial skills in their children. According to the OECD (2017), financial education should start as early as possible, with parents being the first educators in this context. Early financial education, for example, appears to have a positive impact on long-term financial health, including a higher likelihood of saving and lower levels of indebtedness (Webley and Nyhus, 2006). Our study builds upon previous research (Jorgensen and Savla, 2010; Shim et al., 2010) that demonstrated the influence of parents on their children's financial behavior. We conducted an online pilot survey on a sample of parents (N= 21; Female= 18; mean age = 49 years) with children aged 6 to 14 years, examining parents' financial education practices and their perception of the financial attitude and knowledge in their children. Preliminary results indicate that 25% of parents perceive it as very important to discuss financial matters with their children and the same percentage consider themselves adequately equipped to educate their children. From the research analysis, it is observed that 44% parents feel confident in imparting financial knowledge to their children, yet admit to being unprepared when it comes to updating their own knowledge. Schools are viewed, for the 61% of the sample, as the primary source for a more structured education. Regarding pocket money, most children receive a fixed amount (67%), believed by parents to foster their financial competency. However, some parents refrain from this practice, considering their children too young to manage money (23%). However, only a 22% of the sample feel equipped to educate their children on financial matters, specifically when this education involves technologies (i.e., digital payment systems). Therefore, we underline the importance of providing parents with the resources and skills necessary to perform this key role. This could include training programs for parents,

educational materials, and the integration of financial education into school curricula. These findings underscore the importance of providing parents with the necessary resources and training to educate their children about financial matters, including digital payment systems. This could be achieved through various means, such as parental training programs, educational materials, and integrating financial education into school curricula.

financial education, decision-making, financial behaviour

## 1. INTRODUCTION

Children’s financial education is essential for developing future decision-making skills, with parents playing a pivotal role in guiding their children through practical experiences and imparting the knowledge necessary to make informed economic choices. This paper explores psychological concepts related to financial education and best practices for educational programs, presenting findings from a recent study and linking these ideas to the broader theme of social justice. Understanding these dynamics can lead to more effective financial education strategies, helping to reduce economic disparities across different social groups.

Research (Berti & Bombi, 1988; Berti et al., 2017; Valle et al. 2019) suggests that children develop “naïve” theories about the adult economic world. These initial understandings often lead to misunderstandings of essential economic concepts, which effective financial education should aim to bridge. Parents can address these misconceptions early, helping children align their ideas with the realities of economic contexts. Financial and economic literacy is often promoted in schools through extracurricular financial education programs that introduce children to adult economic concepts, such as money management and financial institutions (Lombardi & Ajello, 2017).

Amagir et al. (2018) identified the primary objective of financial education programs as motivating and empowering children to adopt positive financial behaviors, fostering sound decision-makers. These programs typically include three components of financial literacy: knowledge and understanding (providing information), skills and behaviors (teaching management practices), and attitudes and confidence (enhancing self-efficacy and motivation). Together, these components form a foundation for children’s financial literacy, equipping

them with not only knowledge but also the confidence and skills needed for effective financial decision-making.

### **1.1 The Psychological Perspective on Financial Education**

Children's economic behaviors are shaped not only by their understanding of the world but also by their developmental level regarding specific fundamental psychological skills (Lombardi et al., 2017). Financial education programs thus need to consider the following aspects: decision-making processes, time management, motivations and interests, mathematical reasoning skills. By addressing these foundational skills, financial education can be tailored to children's developmental stages, allowing them to gradually build a more realistic and practical understanding of economic concepts. Moreover, economic decisions often involve social contexts, then to train in social competencies can significantly enhance children's financial decision-making abilities. Key areas of focus include:

- **Emotional awareness and regulation:** these skills are essential for sound financial decision-making, helping children manage impulsive spending. Parents can support this by modeling responsible financial behavior and teaching children to recognize their emotional responses.
- **Perspective-taking and Theory of Mind:** perspective-taking enables children to consider economic outcomes from various viewpoints. Theory of Mind, the ability to understand others' thoughts and intentions (Bicchieri & Chavez, 2008; Castelli et al., 2014), is crucial in financial contexts characterized by interpersonal exchanges and the need to distribute resources. Encouraging children to see situations from multiple perspectives helps them predict the economic behaviors of others, leading to more empathetic and informed decisions.
- **Understanding social norms and rules:** economic behaviors are guided by social norms and expectations. By teaching these rules through everyday financial activities, parents can help children navigate financial decisions more effectively.

Developing these social competencies supports children in making better financial choices, integrating both individual and social perspectives in their decision-making processes. Effective financial education programs incorporate both cognitive and social aspects of financial decision-making. Practical, hands-on experiences are crucial, and parental involvement reinforces these lessons at home. Regular program evaluation also helps refine strategies and

improve outcomes. Recent study highlights the impact of parental involvement in financial education. Programs combining cognitive and social training appear to be most effective, with children of actively engaged parents displaying a stronger understanding of financial concepts. These findings underscore the importance of integrated financial education strategies.

One of the goals of good financial education is to build ever better social justice. Providing equitable access to financial knowledge can help reduce economic disparities, empowering individuals and promoting fair economic opportunities. Parents play a key role in ensuring that children, regardless of their background, have access to this essential education. Efforts to improve financial literacy ultimately contribute to a more equitable society.

## **2. THE RESEARCH**

Given the significant role parents play in financial education, it is crucial to understand the beliefs and assumptions they bring to this task, as well as their level of awareness regarding financial education. These factors are the foundation from which parents approach financial education, shaping both the values they emphasize and the strategies they use in guiding their children's financial development. The research aimed to explore parents' perceptions of their children's financial education through an online pilot survey conducted with 22 parents of children aged 6 to 14. We construct a questionnaire focused on several key areas: sociodemographic information, frequency and importance of financial discussions, parents' confidence in teaching financial concepts, and children's financial practices such as pocket money and digital payment usage.

## **RESULTS**

The first results concern the description of parents' responses to key issues:

- Importance of Financial Discussions in family: 54% of parents consider it very important to discuss financial matters with their children.
- Confidence in Financial Knowledge: only 23% feel confident in imparting financial knowledge, with 9% acknowledging gaps in their understanding.
- Pocket Money: 67% of children receive pocket money, which parents view as a way to foster financial competency.
- Digital Financial Education: only 22% of parents feel equipped to teach

their children about digital payments.

Non-parametric correlations were used to explore relationships among variables, revealing significant associations. The first result shows that parents who value discussing financial topics tend to feel more confident in their ability to educate their children ( $\rho = 0.585$ ;  $p < 0.05$ ). Second, we found a positive correlation between parents' perceived importance of financial education and their children's correct reception of financial concepts ( $\rho = 0.592$ ;  $p < 0.05$ ). Finally, familiarity with digital payments among parents was positively correlated with their capacity to educate their children about these tools ( $\rho = 0.731$ ;  $p < 0.05$ ).

## **DISCUSSION**

The study underscores a strong relationship between the perceived importance of financial education and parents' confidence in providing it. Effective communication also plays a critical role in ensuring children's understanding of financial concepts. Familiarity with digital payments enhances parents' ability to guide their children in this area, and pocket money is widely perceived as a valuable tool for practical financial learning.

## **CONCLUSIONS AND CALL TO ACTION**

Parents play an indispensable role in their children's financial education. To fulfill this role effectively, they need resources and training to bolster their confidence and knowledge. Collaboration between families, schools, and institutions is essential to support comprehensive financial education, which not only equips children with crucial life skills but also promotes social equity.

# DECODING CHILDHOOD PROSOCIAL DECISION-MAKING: THE ROLE OF MENTALIZATION AND PERSONALITY TRAITS IN SCHOOL-AGE CHILDREN

Annalisa Valle<sup>a</sup>

Elisabetta Lombardi<sup>b</sup>

Cinzia Di Dio<sup>a</sup>

Ilaria Castelli<sup>c</sup>

Davide Massaro<sup>a</sup>

Antonella Marchetti<sup>a</sup>

<sup>a</sup>Research Centre on Theory of Mind and Social Competence in the Lifespan (CeRiToM)

<sup>b</sup>eCampus University, Italy

<sup>c</sup>University of Bergamo, Italy

Prosocial decision-making, characterized by behaviors aimed at benefiting others, is a critical component of social development in childhood. This study explores the interplay between Mentalization (i.e., Theory of Mind and empathy), and personality traits in influencing fairness and altruism in school-aged children. Using decision-making tasks such as the Ultimatum Game (UG) and Dictator Game (DG), alongside assessments of cognitive abilities and personality dimensions, the study examines how mentalization and socio-emotional factors shape children's decisions. Results indicate significant relationships between empathy, ToM, and prosocial outcomes, offering insights into the mechanisms underpinning fairness and altruism during childhood development.

Decision-making; children; empathy; Theory of Mind; personality

## INTRODUCTION

Mentalization, defined as the understanding of one's own and others' minds, emotions, and thoughts, is considered a crucial process in mediating human experience within social contexts (Allen, 2006). This complex construct encompasses specific cognitive and emotional abilities, with Theory of Mind (ToM) and empathy being key components that develop during childhood

(Luyten et al., 2020).

The development of decision-making skills during childhood, particularly in primary school, is a significant focus. Prosocial decisions, involving considerations for the well-being of others, are often evaluated through tasks such as the Ultimatum Game (Guth et al., 1982) and Dictator Game (Kahneman et al., 1986; Benenson et al., 2007), where individuals decide how to share money with peers. Fairness is commonly understood through the lens of inequity aversion, which describes the tendency to avoid situations perceived as unjust or unequal. In social settings, fairness motivates individuals to sacrifice personal gains to restore balance and equality. The Ultimatum Game (UG), an interactive economic game, is often used to measure fairness. In this game, two participants—a Proposer and a Receiver—must decide how to divide a set amount of money or resources. Receivers generally accept equitable offers, where the distribution is fair, and reject inequitable ones, where the division is lopsided. Research indicates that children begin rejecting disadvantageous inequity by the age of 3–4, and by 8 years old, they also start rejecting advantageous inequity, even when it benefits them (Smith et al., 2013). Altruism refers to the human tendency to assist others in achieving their goals and to share valuable resources, with the broader aim of enhancing societal well-being, which indirectly benefits the individual. Children’s altruistic behaviors typically emerge around the ages of 2–3 years (Warneken & Tomasello, 2013) and become more consistent during the primary school years. The Dictator Game (DG) is a common method for assessing altruism, wherein the Proposer determines how much to share with the Receiver, who must accept the offered amount. Both fairness and altruism are associated with long-term benefits for communities while also providing immediate advantages to others. Concerning the psychological dimensions involved, literature highlights the role of the Theory of Mind in decisions involving other people (Castelli et al., 2014; Lombardi et al., 2017; Lombardi et al., 2021; Tsoi and McAuliffe, 2020), emphasizing how the ability to take another’s perspective leads to a better understanding of intention and, more generally, the internal states of the other player in the decision-making process. This ability helps children move beyond an egocentric position to consider this information from their own and others’ perspectives. More recently, some studies have shown that empathy plays a significant role not only in prosocial behavior (Brazil et al., 2023) but only specifically in decision-making related to fairness (Yijuan et al., 2022).

A final construct that could influence decision-making skills in children in social contexts is related to their personality traits. Recently, Demedardi and

colleagues (2021) demonstrated that certain personality traits, such as agreeableness, influence decision-making processes regarding white lies, a decision-making process specifically linked to prosociality aimed at building and maintaining positive relationships with others. Exploring this connection is crucial for a comprehensive understanding of the factors influencing decision-making in childhood. Furthermore, the study introduces the role of personality traits on decision-making processes, emphasizing the prosocial dimension aimed at building and maintaining positive relationships.

This study examines how fairness and altruism, assessed through the Ultimatum Game (UG) and Dictator Game (DG), respectively, are linked to ToM, empathy, personality traits, and cognitive abilities. While previous research has highlighted ToM's impact on fairness and empathy's role in altruism, the interplay between these constructs and personality traits in school-aged children remains underexplored.

## **2. METHOD**

### **2.1 Participants and measures**

Sixty (60) children (35 females) were recruited from public primary schools, grades 3<sup>rd</sup> and 5<sup>th</sup> (M=114 months, SD=12 months). Parental consent was obtained, and the study adhered to ethical guidelines.

The measures are:

- Fairness and Altruism using the Ultimatum Game (UG; Güth et al., 1982) and Dictator Game (DG; Kahneman et al., 1986). In both games, participants played as Proposers. In the UG, the Receiver could accept or reject the offer, with rejection resulting in no gain for either player. In the DG, the Receiver had no option to reject, and the amount offered by the Proposer was scored.
- Theory of Mind (ToM) was evaluated with three False Belief Tasks (FBTs; Astington et al., 2002; Perner & Wimmer, 1985), utilizing the unexpected displacement paradigm, assessing first and second-order reasoning through a combination of story-based questions and justifications. Each task offered a maximum score of 5, for a total of 15 points.
- Empathy was measured using two questionnaires: the Index of Empathy (IE; Bryant, 1982) a 22-item questionnaire evaluating affective empathy (score range: 0–22), and the How I Feel in Different Situations (HIFDS; Feshbach et al., 1991), a 12-item self-report assessing cognitive and affective empathy on a 4-point scale.

- Personality Traits were assessed with the Big Five Questionnaire for Children (BFQ-C; Barbaranelli et al., 1998), comprising 65 items rated on a 3-point Likert scale. It measured Extraversion, Neuroticism, Openness to Experiences, Agreeableness, and Conscientiousness.
- Cognitive abilities were tested using Raven's Coloured Progressive Matrices (CPM; Raven, 1984), a 36-item non-verbal task requiring participants to identify missing pieces in patterns.

## 2.2 Data Analysis

Pearson correlations were conducted to examine relationships between all variables. Statistical significance was set at  $p < .05$ .

## 3. RESULTS

The Pearson's correlational analysis revealed several significant correlations between the measures of prosocial decision-making (fairness and altruism), mentalization (ToM and empathy), personality traits, cognitive abilities, and age. These findings highlight the multifaceted nature of prosocial behaviors in childhood.

Fairness (measured by the UG) was positively correlated with ToM scores (measured by FBTs) ( $r = 0.341, p < .01$ ), indicating that children with greater ToM skills were more likely to make equitable offers. The cognitive dimension of empathy (measured by HIFDS) was moderately associated with fairness ( $r = 0.279, p < .05$ ), suggesting that the ability to understand others' emotions contributes to fair decision-making. Among personality dimensions, Agreeableness showed a significant positive correlation with fairness ( $r = 0.190, p < .05$ ), reflecting its role in cooperative and prosocial behavior.

About Altruism (measured by the DG), the affective dimension of empathy (measured by the IE), positively correlated with altruistic behavior in the DG ( $r = 0.291, p < .05$ ), suggesting that emotional resonance drives altruistic decisions. No significant direct relationship was found between ToM and altruistic offers, indicating that altruism may rely more on empathic dimension. Among personality dimensions, Conscientiousness is correlated with altruism ( $r = 0.301, p < .05$ ).

Cognitive abilities, as measured by Raven's scores, were strongly correlated with ToM ( $r = 0.483, p < .001$ ), suggesting that cognitive skills underpin mentalization processes but do not directly influence fairness or altruism.

#### 4. DISCUSSION

This study provides significant insights into the relationships between fairness, altruism, mentalization, personality traits, and cognitive abilities in school-aged children. These results highlight the multifaceted and interconnected nature of prosocial decision-making during a critical developmental period.

The positive correlation between fairness and Theory of Mind (ToM) underscores the importance of mentalization in guiding fair decisions. This finding aligns with previous research suggesting that ToM enables children to consider others' perspectives and intentions, facilitating fairer offers (Castelli et al., 2014; Lombardi et al., 2017). The ability to reason about others' beliefs and desires appears to play a critical role in shifting children away from egocentric behavior towards more socially considerate decision-making.

Empathy, as a multidimensional construct encompassing cognitive and affective components, demonstrated distinct relationships with prosocial behaviors. Cognitive empathy, reflected in the ability to understand others' emotions, was moderately associated with fairness, suggesting that children who can recognize and interpret others' feelings are more inclined to make fair decisions. On the other hand, affective empathy, which involves emotional resonance, was positively correlated with altruism in the DG. This suggests that altruistic behaviors, which often involve giving without reciprocity, are primarily driven by emotional sensitivity rather than cognitive reasoning. These findings are consistent with research suggesting that empathy motivates prosocial behaviors, particularly in the context of sharing and helping (Yijuan et al., 2022; Brazil et al., 2023).

The role of personality traits in prosocial decision-making was evident in the correlations between Agreeableness, Conscientiousness, fairness, and altruism. Agreeableness, characterized by traits such as kindness and cooperativeness, was linked to fairness, supporting its association with behaviors that prioritize social adaptability. Similarly, Conscientiousness, often associated with responsibility and self-discipline, was positively correlated with altruism, suggesting that children with higher conscientiousness may be more inclined to act in ways that benefit others. These findings corroborate existing literature on the influence of personality traits on prosocial behavior in adults and extend this understanding to children (Demedardi et al., 2021).

The strong correlation between Raven's scores and ToM highlights the cognitive underpinnings of ToM. Higher cognitive abilities may enhance children's capacity for complex reasoning about mental states, which in turn facilitates

more sophisticated social interactions. However, cognitive abilities did not directly correlate with fairness or altruism, suggesting that while they support mentalization processes, prosocial behaviors are more closely tied to socio-emotional factors such as empathy and personality traits.

Although not statistically significant, the observed trends indicating higher fairness and altruism in older children are consistent with developmental theories suggesting that prosocial decision-making becomes more refined with age. Older children's growing ability to consider others' perspectives, regulate emotions, and adhere to social norms likely contributes to these trends (Smith et al., 2013; Warneken & Tomasello, 2013).

These findings emphasize the importance of fostering both cognitive and emotional components of mentalization in educational settings to promote fairness and altruism. Programs designed to enhance ToM and empathy through perspective-taking exercises, role-playing, and social-emotional learning could support the development of prosocial behaviors. Additionally, incorporating personality assessments into interventions may help tailor approaches to individual differences.

The study's cross-sectional design limits the ability to infer causal relationships, and the sample size does not allow for the generalization of results. Additionally, the use of simplified economic games may not fully capture the complexity of real-world prosocial behaviors. Expanding the scope of assessment to include naturalistic decision-making scenarios could enhance ecological validity.

## **5. CONCLUSION**

These findings suggest a gradual improvement in prosocial decision-making with age.

Overall, the results demonstrate that fairness is closely linked to cognitive and personality dimensions, particularly ToM and Agreeableness, while altruism is more strongly associated with affective empathy and Conscientiousness. Cognitive abilities appear to support mentalization, which in turn influences prosocial tendencies. Understanding these relationships provides a foundation for interventions aimed at promoting prosocial development, ultimately fostering cooperation and equity within communities.

# COMPARING TEACHING METHODOLOGIES FOR THE DEVELOPMENT OF FINANCIAL LITERACY IN A PRIMARY SCHOOL: AN EXPLORATIVE AND EVIDENCE-BASED STUDY

Giovanna Andreatti<sup>a</sup>

Daniele Morselli<sup>a</sup>

Monica Parricchi<sup>a</sup>

Doris Kofler<sup>a</sup>

<sup>a</sup>Free University of Bozen-Bolzano

International and national surveys rank Italy among economies where financial literacy levels fall below the OECD average, indicating that many individuals lack basic financial skills for informed decision-making. Recognizing the importance of financial education for personal and social well-being, more systematic involvement from educational institutions is needed. This exploratory study investigates which of two innovative pedagogies—game-based learning and cooperative learning—is more effective in primary-level financial education programs. The research involves two fifth-grade classes in an Italian primary school, addressing topics aligned with the European Financial Competence Framework: one class employs cooperative learning, and the other uses game-based learning via the Jun€co program from the Amiotti Foundation. Pre- and post-tests, alongside focus groups, assess educational impact and offer deeper insights. Preliminary results show that while cooperative learning is more effective for enhancing students' financial literacy, both methods are well-suited for financial education, aligning with recent evidence-based research supporting experiential and active teaching approaches over traditional ones.

financial literacy; cooperative learning; game-based learning; evidence-based research; primary school

## INTRODUCTION

Financial education plays a fundamental role in fostering active citizenship in a rapidly changing and complex society (Amagir et al., 2018) and should be implemented in response to low financial literacy levels observed across all age groups and continents (OECD, 2020a; OECD, 2020b). Although this need is acknowledged internationally, there is still insufficient discussion on the educational processes necessary to support the development of financial literacy at the school level. This research aims to provide an in-depth analysis of the most effective teaching methods for financial education in primary schools. The research question is: “Which teaching method – gaming or cooperative learning – is more effective in developing financial literacy at the primary school level, and why?”. These methods fall within the cluster of innovative, student-centred pedagogies (Paniagua & Istance, 2018), designed to develop competencies through active learning processes.

Following a literature review on the topic, this article presents a study conducted in a primary school in the province of Trento with two fifth-grade classes. Both classes engaged in a financial education program aligned with the European Financial Competence Framework, though differing in teaching methods: one class adopted CL, while the other used GBL. By analysing the preliminary results, the study assesses the educational impact of each method on the development of financial literacy.

## 1. LITERATURE REVIEW

In Europe, financial literacy has been identified as a key competence to develop from early childhood, essential for achieving personal and financial well-being. This shift has redefined the perception of citizenship, now seen not only as a status with rights and responsibilities but as an active role involving public participation and accountability (Parricchi, 2019). Despite its recognized importance, financial illiteracy persists across all continents: studies such as the OECD’s PISA surveys and the Eurobarometer report indicate that knowledge, behaviours, and self-awareness related to personal financial literacy remain insufficient for individuals to act as active, informed, and responsible citizens.

Growing interest in strengthening the financial literacy of young European citizens culminated in the *Financial Competence Framework for Children and Youth in the European Union*, developed under the OECD-INFE initiative (OECD, 2023). This document aims to provide a unified framework for financial

competencies, categorized into knowledge, skills, and attitudes, and grouped into four content areas that all European citizens should develop, beginning in primary school.

While the European approach to financial literacy remains primarily finance-centred and often overlooks the educational processes needed to effectively develop these skills, in Italy, the academic debate has introduced a more pedagogical perspective. This approach emphasizes education aimed at well-being not only in financial terms but also in personal and social dimensions, embracing a holistic view of the individual. It seeks to foster active citizenship through participation, belonging, responsibility, awareness, and identity. As Parricchi notes, the objective is not simply to encourage financial socialization but to establish meaningful educational pathways that support present well-being with a forward-looking mindset. This vision led the Italian EduFin Committee to release guidelines (2020) for teachers to facilitate the integration of financial education into school curricula. These guidelines emphasize a vertical approach with increasing depth and complexity and advocate for the use of active, innovative teaching methods, though they do not specify which would be most effective. This gap, along with a lack of evidence-based research, motivated the design of this study. Drawing on clusters of innovative pedagogies (Paniagua & Istance, 2018), we chose to test the effectiveness of CL and GBL, as research indicates that the effect size of CL (0.53) is comparable to that of GBL (0.52) (Hattie, 2023). This allowed us to examine how their effectiveness differs in financial education programs.

In CL, students work collaboratively to achieve shared learning goals. This method relies on positive interdependence, individual and group accountability, constructive interaction, the use of social competencies, and group assessment (Johnson et al., 2021).

GBL, in contrast, employs games and playful environments to foster engagement and develop personal and social well-being. Games, with their mechanical elements (goals, participation, challenges, rapid feedback) and emotional elements (competition, collaboration, identities, and narratives), promote learning through inclusion, experimentation, and immersion. The educational value lies in connecting students' in-game experiences to personal and real-world topics (Flatt, 2016).

## 2. METHODOLOGY

This research adopts a case study methodology, offering an in-depth exploration of a single, contextualized unit from multiple perspectives. This approach captures the complexity and uniqueness of the phenomenon under study, avoiding oversimplification (Tight, 2022). Conducted in spring 2024, the research involved two fifth-grade classes totaling 32 children from a primary school in the Province of Trento, Northern Italy. The research question was: “Which teaching method – gaming or cooperative learning – is more effective in developing financial literacy at the primary school level, and why?”. To address this question, two 12-hour financial education programs were designed in line with the competencies of the European framework and Italian guidelines. Topics included the value of goods and services, specialization and exchange, price estimation, the history of money, loans and interest, and sustainable economy. Learning outcomes, teaching-learning activities, and assessment methods were initially defined according to Biggs’ constructive alignment (2022).

In Class A, CL was used, with students organized into stable, heterogeneous groups throughout the program and limited adult intervention. Each session comprised three phases: the first focused on group organization, reviewing feedback, and assigning roles; the second covered financial topics and activities to achieve the defined learning outcomes; and the third involved individual and group assessments to identify areas for improvement and further development.

In Class B, GBL was implemented using the educational kit *Jun€co – Ethical and Sustainable Economics for Active Citizenship*, developed by the Amiotti Foundation. This kit includes six games designed to enhance students’ financial literacy using flashcards, game boards, card decks, dice, game pieces, puzzles, sets of banknotes and coins, crosswords, income and expense ledgers, and rhymes.

To assess the effectiveness of each teaching method in achieving learning outcomes and developing financial literacy, pre- and post-tests were administered alongside semi-structured focus groups. Each test, comprising 24 items, was based on the Italian INVALSI tests for grade 5 in Italian and mathematics, covering financial topics from the programs and adopting a competency-based approach. Pre- and post-test results were compared to evaluate improvement and performance differences between classes, and to calculate the effect size of the two teaching methods.

Focus groups were conducted at the end of each session. Guiding questions

promoted discussion and encouraged students to reflect on both what they learned and how they learned it. Content analysis will be conducted to categorize patterns and speaking turns related to learned content or learning process. This analysis will clarify why one method proved more effective than the other in developing financial literacy among students.

### 3. PRELIMINARY RESULTS AND DISCUSSION

Figure 1 illustrates the pre- and post-test results for Class A, where the financial education program was implemented through CL. The figure enables a comparison of each student’s performance before and after the program: all students showed improvement, though the degree of progress varied. Some students, like Student 5, showed a notable increase of 13 correct answers, while others, such as Student 1, exhibited only a minor gain, with one additional correct answer in the post-test compared to the pre-test. This variation indicates considerable heterogeneity in the performance of students in Class A, possibly influenced by differences in motivation and engagement during the program – factors that have a significant impact on the learning process. The average pre-test score was 8.69 correct answers out of a total of 24, while the average post-test score rose to 14.63. Based on these results, the calculated *effect size* (ES) is 1.72.

Figure 1. Comparison of pre- and post-test results achieved by students in Class A.

Figure 2 shows the pre- and post-test results for students in Class B, where financial literacy was developed using GBL, specifically with the *Jun€co kit*.

Comparing each student's performance in the two tests reveals significant gains in some students (e.g. Student 11) and only minor differences in others (such as Student 6). Notably, Student 3 showed no change between the pre- and post-tests, while Student 7 experienced a decline, dropping from 10 correct answers in the pre-test to 6 in the post-test. In Class B, the average pre-test score was 8.5, similar to Class A's 8.69. However, the post-test average was 12.25, notably lower than Class A's post-test average, with an *effect size* (ES) of 1.08.

Figure 2. Comparison of pre- and post-test results achieved by students in Class B.

Both effect sizes exceed 0.4, which Hattie identifies as the hinge point, marking the threshold for desirable effects. According to Hattie (2023), 90% of educational programs are effective, with the highest impact occurring above this threshold. The application of both CL and GBL in financial education aligns with Hattie's findings and those of Paniagua & Istance (2018), suggesting that both methods were particularly effective. Kaiser & Menkhoff (2020) propose that high effect sizes in financial education may be attributed to factors such as small group settings, experiential learning, and the primary school environment, all of which enhance program effectiveness.

In terms of qualitative data, the authors are conducting a content analysis of the focus groups. Preliminary results show that students not only discussed the

content they learned but also reflected on the learning process. In Class A (CL), students emphasized their autonomy, fostering a strong sense of responsibility. Some compared their learning groups to assembly lines, where each member played a crucial role, managing their own part in the learning process.

In Class B (GBL), although an active method was used, focus group discussions revealed limited autonomy, as the games were teacher-led. Students noted that they had insufficient time to discuss and reflect on their experiences. The analysis also indicated that students were more focused on competition and winning than on the learning process, suggesting a potential limitation of this method. These preliminary findings may help explain the observed differences in efficacy between the two methods in promoting financial literacy in this study.

#### **4. CONCLUSION**

This study applied two teaching methods – Cooperative Learning and Game-Based Learning – to financial education at the primary school level. The research question investigated the effectiveness of each method regarding learning outcomes and explored the reasons for any differences in their effectiveness. Two fifth-grade classes from an Italian primary school participated, each receiving a 12-hour program on financial topics aligned with the OECD's Financial Competence Framework (2023) and the Edufin Committee's guidelines (2020). In Class A, topics were addressed through CL, while in Class B, GBL was employed. To address the research question, all students completed a financial literacy pre-test and post-test, with items based on INVALSI assessments, and focus groups were conducted after each learning session. Figures 1 and 2 compare each student's pre- and post-test results in Classes A and B.

Both teaching methods proved to be particularly effective, fitting within Hattie's (2023) zone of desired effects. However, CL was more effective ( $ES: 1.72$ ) than GBL ( $ES: 1.08$ ). Preliminary content analysis suggests a reason for this difference: students using CL appreciated the autonomy and responsibility involved and were highly engaged in the learning process. In contrast, GBL students reported limited time for discussion, less autonomy due to teacher-led games, and a greater focus on competition than on learning. A more detailed analysis will further clarify why one method may be more effective than the other. Future research could build on these findings by involving a larger student sample and a control group, evaluate the appropriateness of additional methods, and involve students of different ages and school types. These sample

studies could be complemented by extended studies, which could examine not only the rate of development in financial literacy but also the broader competencies and skills which would be honed through these learning experiences.

# FINANCIAL KNOWLEDGE AND HOUSEHOLD VULNERABILITY. EVIDENCE FROM ITALY

Riccardo Grazioli  
University of Milan

This study examines the role of financial knowledge in reducing financial vulnerability among Italian households. Drawing on a dataset of 4,412 observations from the Bank of Italy's IACOFI survey, the analysis employs multivariate linear and logistic regression models to evaluate whether enhanced financial knowledge reduces a household's risk of vulnerability. The findings indicate that higher levels of financial knowledge, as measured by the OECD/INFE Financial Knowledge Index, are generally associated with a lower probability of financial vulnerability. However, notable differences emerge based on specific socio-demographic characteristics, behaviours and attitudes. The study also highlights two significant phenomena: overconfidence and chronicisation. Overconfidence, driven by excessive financial self-efficacy, substantially increases the probability of financial vulnerability. Meanwhile, chronicisation underscores how being financially vulnerable perpetuates itself over time, often becoming a persistent condition that households struggle to overcome. The analysis concludes that while financial knowledge can help prevent financial vulnerability, it is not effective in addressing existing situations of vulnerability.

financial vulnerability; financial literacy; financial knowledge; financial education; financial inclusion.

## INTRODUCTION

Over the past two decades, and particularly since the 2007 financial crisis, a phenomenon known as 'everyday financialisation' (Martin, 2002) has emerged. This refers to the pervasive presence of finance in nearly every aspect of individuals' lives, from purchasing a home to planning for welfare needs (Bertolini and Moiso, 2020). In today's society, where managing financial resources – such as creating a savings plan, securing a mortgage, opening a

bank account, or investing – requires increasingly advanced knowledge and skills, interest in financial literacy and policies promoting it has significantly grown. However, the role of financial literacy in developing financial capability, and thereby fostering financial well-being, has only recently gained recognition (Sherraden, 2013; CFPB, 2015). Financial literacy is now understood as a multidimensional concept, with knowledge identified as its most crucial component. This knowledge underpins the development of skills that reduce financial vulnerability and support greater financial well-being (Willis, 2022).

A wealth of studies, supported by institutions, international organisations, and academic research, have explored the relation between vulnerability – a condition now pervasive in contemporary society, marked by employment, social, and family insecurity alongside insufficient welfare systems – and social exclusion. Despite this extensive attention from academia and leading institutions, there remains a lack of empirical analyses testing the importance of financial skills in preventing vulnerability and reducing the risk of exclusion. This study seeks to examine the relation between vulnerability and financial knowledge. By estimating a robust association, it aims to determine whether higher levels of financial knowledge can prevent households from becoming financially vulnerable. In essence, the research asks: does improving financial knowledge lower the probability that a household will find itself in a state of financial vulnerability?

## **DATA AND METHODS**

The analysis employed mono- and multivariate linear regression models, contingency tables, and a multivariate logistic model with interactions. These were applied to a sample of households residing in Italy (N=4,412), derived from the harmonised integration of data from the first two waves (2017 and 2020) of the Bank of Italy's Survey on the Financial Knowledge and Competence of Italians (IACOFI). Financial knowledge was measured using the Financial Knowledge (FK) Index developed by the OECD/INFE. The index, ranging from 0 to 7, is calculated as the sum of seven binary indicators (scored 0 or 1), derived from respondents' answers to questions on topics such as purchasing power, loan costs, simple and compound interest, the risk-return trade-off, inflation, and risk diversification. Financial vulnerability, on the other hand, was assessed using two combined indicators: one measuring a household's resilience to the adverse shock of losing its main income source, and the other evaluating the respondent's ability to manage an unexpected expense equal to its monthly

income. Vulnerability status was assigned following approaches proposed in studies by the ECB and the Bank of Italy, which provide methodologies for calibrating financial vulnerability indicators (Ampudia et al., 2016; Michelangeli and Rampazzi, 2016).

## RESULTS

The analysis reveals that 56.6% of Italian households are financially vulnerable. Overall, the probability of being in a vulnerable state decreases as financial knowledge increases. At the lowest level of knowledge (FK=0), households face a 67.6% probability of vulnerability, which drops to 46.7% at the highest level (FK=7). Thus, controlling for socio-demographic characteristics, financial knowledge reduces the probability of vulnerability by approximately 21 percentage points, from the lowest to the highest knowledge levels, equating to a 3-point reduction for each 1-point increase in FK.

Figure 1. Financial knowledge and probability of financial vulnerability by age group. Source: author's calculations based on data from the Bank of Italy's IACOFI survey.

Considering the interactions between socio-demographic characteristics, behaviours, and attitudes with financial knowledge reveals differences in vulnerability probabilities across household groups. Young people, for instance,

show a vulnerability rate of 79.1% at the lowest knowledge level, which decreases by over 26 percentage points at the highest level. However, they remain the most exposed group to financial vulnerability. As shown in Figure 1, the elderly (yellow line) consistently exhibit the lowest probability of vulnerability across all knowledge levels, in stark contrast to younger individuals (blue line). These results underscore the necessity of designing protective measures tailored specifically to young people, who often have low incomes and limited saving capacities, leaving them highly vulnerable. Current welfare models remain oriented towards the needs of older generations, who are less financially vulnerable.

Figure 2. Financial knowledge and probability of financial vulnerability by savings type. Source: author's calculations based on data from the Bank of Italy's IACOFI survey.

Although saving helps to mitigate income shocks, it is insufficient on its own to significantly reduce financial vulnerability. Figure 2 illustrates that households not utilising the financial system for savings (red line) reduce their vulnerability by only 6.7 percentage points as financial knowledge increases. Their vulnerability rates are comparable to households that do not save at all (blue line). Conversely, households that actively manage savings through the

financial system (green and yellow lines) achieve reductions of 31.5 and 46.4 points, respectively, due to increased knowledge and improved savings management. This suggests that financial knowledge influences the relationship between attitudes and behaviours, fostering better financial decisions and enhancing the ability to use savings effectively.

Figure 3. Financial knowledge and probability of financial vulnerability by financial knowledge self-assessment. Source: author’s calculations based on data from the Bank of Italy’s IACOFI survey.

Another critical factor impacting financial vulnerability is overconfidence – an overestimation of one’s financial knowledge and skills. As shown in Figure 3, individuals who significantly overestimate their financial knowledge (blue line, between FK=0 and FK=3) face consistently higher vulnerability probabilities compared to those who do not overestimate (green line) or slightly overestimate (red line, between FK=0 and FK=3). It is also noticeable that the more one overestimates one’s level of knowledge, the higher the probability of a household being vulnerable: at maximum overestimation (blue line, FK=0), the probability of vulnerability reaches 87.4%.

Studies by McCannon et al. (2015) and Robb et al. (2015) indicate that overconfident individuals are more likely to take risks when using financial

instruments and are prone to making decisions that are financially incorrect or, at the very least, unsuitable for their needs. Overconfidence leads to a strong reliance on inaccurate personal judgement, resulting in decisions that are difficult to control and reducing the likelihood of seeking advice or assistance from others. This lack of awareness about one's actual level of knowledge creates a vicious cycle: incorrect judgements lead to poor decisions, which, in turn, increase the likelihood of falling into a vulnerable state, further compounded by an inability to recognise it. As self-efficacy plays a crucial role in financial literacy and strongly influences behaviour, Furreboe and Nyhus (2022) emphasise the need for research to explore its determinants and identify strategies to prevent its excesses, which often result in an overestimation of individual abilities. Warmath and Zimmerman (2019) recommend adapting financial education programmes and initiatives by incorporating modules designed not only to clarify the gap between objective knowledge and subjective perception, but also to raise awareness of the tendency towards overconfidence.

Lastly, the analysis identifies the phenomenon of chronicisation in financial vulnerability. Similar to social vulnerability and exclusion, households that have previously experienced financial vulnerability are highly likely to remain in this state. Figure 4 shows that these households (red line) exhibit a significantly higher probability of vulnerability than others (blue line), with financial knowledge contributing to only about an 8-point reduction in vulnerability. In contrast, other households achieve a 28-point reduction when moving from the lowest to the highest knowledge levels.

The almost non-existent effect of knowledge appears to suggest that financial vulnerability is a determinant of its own consequences over time, thereby becoming a permanent condition for families who, from the moment they first experience it, tend to chronicise it and find it challenging to overcome. In summary, two key elements emerge. The first relates to the nature of vulnerability in general, and financial vulnerability in particular, which is shown to be not only a pervasive phenomenon but also a chronicising one: families experiencing a state of vulnerability struggle to escape it and remain in a state of permanent precariousness. The second issue concerns the role of financial knowledge in reducing vulnerability. It is clear that knowledge cannot resolve pre-existing situations of financial vulnerability but can, at best, serve a preventive role. For pre-existing vulnerability, alternative measures must be identified and implemented, whereas financial education, which enhances knowledge levels, can only serve as an effective tool for preventive purposes.

Figure 4. Financial knowledge and probability of financial vulnerability by past financial vulnerability. Source: author's calculations based on data from the Bank of Italy's IACOFI survey.

## CONCLUSIONS

The study demonstrates that financial knowledge plays a role in preventing financial vulnerability among Italian households, with the probability of vulnerability decreasing on average as the level of knowledge increases. However, significant differences arise in relation to socio-demographic and behavioural characteristics: young people are particularly vulnerable due to their low income and consequent difficulty in saving, as are households that manage to save but make poor choices in how they use their savings. The phenomena of overconfidence and chronicisation also emerge. Overconfidence, defined as an overestimation of one's financial competence, increases the probability of vulnerability through uninformed decisions and risky behaviour. Chronicisation, on the other hand, highlights that financial vulnerability is a condition that tends to persist over time, with already vulnerable households struggling to overcome it, even with improved financial knowledge. In conclusion, while financial education, which enhances knowledge, can be an effective tool for preventing vulnerability, it is insufficient

to address entrenched situations. It is essential to complement the increase in knowledge with targeted measures to support families that are already vulnerable and to ensure that the welfare system is better aligned with the needs of younger generations.

# FINANCIAL EDUCATION IN ITALY: TRAINING THE FUTURE TEACHERS

Claudia Maurini<sup>a</sup>

Luca Refrigeri<sup>b</sup>

Carlotta Rossi<sup>a</sup>

Maria Iride Vangelisti<sup>a</sup>

<sup>a</sup>Banca d'Italia

<sup>b</sup>Università del Molise

Financial literacy is an essential skill for navigating modern economic systems. This paper explores the Bank of Italy's collaboration with universities offering Primary Teacher Education programs to integrate financial education into the training of future primary school teachers. The initiative aims to equip educators with the basic knowledge necessary to teach economic and financial concepts effectively and to address cultural skepticism surrounding economics and finance.

financial literacy; teacher training; primary education.

## 1. THE CONTEXT

Before discussing financial education in schools, it is essential to address two key questions: How much do Italian students currently know? And why is financial education important for them? This first section aims to explore these core queries.

To understand the level of financial literacy among Italian students, we can turn to the PISA (Program for International Student Assessment) survey conducted by the Organisation for Economic Co-operation and Development (OECD). The OECD-PISA surveys assess the skills of 15-year-old students from over 80 countries every three years, evaluating their competencies in fundamental areas such as reading, mathematics, and science. For a subset of countries, the survey includes a module that measures the financial literacy of participants. According to the OECD, financial literacy encompasses “a combination of financial awareness, knowledge, skills, attitudes, and behaviors necessary to

make sound financial decisions and ultimately achieve individual financial well-being” (OECD, 2024).

The 2022 PISA survey revealed that the average financial literacy score across 14 OECD countries was 498 points. Italy’s score of 484 points placed it statistically below the international average (INVALSI, 2024). Over time, Italy’s results have remained consistent with those from 2015 and 2018, showing an improvement of 17 points compared to 2012. Gender, geography, school type and socio economic background all contributed to variations in scores.

To expand our understanding of young Italians beyond 15-year-olds, we can look at the 2023 Bank of Italy Financial Literacy Survey, which targeted individuals aged 18 to 34 (Marinucci et al., 2024). Only 35% of respondents correctly answered questions about core economic principles, such as inflation, interest rates, and risk diversification.

Focusing on university students pursuing degrees in Primary Teacher Education, there is a lack of comprehensive national data on their financial literacy. The only relevant study was conducted at the University of Molise in 2019 (Refrigeri, 2019). This survey, conducted on 340 students and not comparable with the Bank of Italy’s due to differences in the questionnaire and the sample, required students to answer progressively complex questions on economic and financial topics. Just 6.3% of students correctly responded to questions on basic financial topics.

These findings highlight significant gaps in financial literacy among young people, emphasizing the importance of targeted financial education initiatives at both the university and school levels. Addressing these gaps is essential to prepare educators to confidently teach financial literacy and basic economic concepts, and foster a cultural change.

Why is it important and why do we care? Financial education is increasingly relevant for navigating today’s complex economic and financial landscape, influenced by rapid financial innovation and digitalization (Bianco and Vangelisti, 2022). While accessing financial products has generally become easier, their variety and complexity demand greater understanding and more competences in order to be able to grasp opportunities and avoid unnecessary risks. Financial literacy empowers individuals to make informed decisions, manage credit responsibly, plan finances, and leverage legal protections effectively, reducing the likelihood of becoming a victim of fraud or over-indebted (Lusardi and Mitchell, 2014). Beyond individual benefits, financial education promotes social inclusion, reduces inequalities, builds trust in

financial systems, and enables informed citizenship, all essential components of a resilient and inclusive financial ecosystem (Bianco et al. 2022; Fornero and Lo Prete, 2022).

Against this background, the Bank of Italy is committed to contributing to increasing financial literacy among the young by training both current (Section 2) and future teachers (Section 3).

## **2. TRAINING CURRENT TEACHERS: FINANCIAL EDUCATION AT SCHOOL**

Financial education is a strategic priority in many countries, though approaches to its implementation in schools differ widely: in some nations, it is a mandatory component of the curriculum, in others it remains optional. In a few cases, it is taught as a standalone subject; however, it is more commonly integrated into broader disciplines, such as civic studies, economics, or social sciences. In Italy only recently has financial education become part of the curriculum: Law No. 21/2024 incorporates financial education into civic studies, that is a mandatory cross-disciplinary subject for all school levels since 2019. Following the law, the updated Ministerial guidelines on civic studies explicitly mentions financial education outlining specific competency goals for primary, lower and upper secondary schools (Ministry of Education and Merit, 2024).

The Bank of Italy has long been committed to financial education, particularly towards young people in schools (De Bonis et al. 2022; Cantarini et al. 2024). Starting young is effective because financial education, reinforced by daily decisions and repeated behaviors, tends to persist over time. Unlike other knowledge areas that may fade, financial literacy skills are practiced and strengthened throughout life (Lusardi et al, 2017).

The Bank of Italy's program for financial education in schools was launched in 2008 in collaboration with the Ministry of Education and Merit, when financial education was not yet a mandatory subject. This program targets students from primary to upper secondary schools and adopts a teacher-centered approach. Bank of Italy's experts provide training courses for teachers, who subsequently address economic and financial topics with their students using resources prepared by the Bank of Italy and made available free of charge. Since 2008 the program has reached over 600,000 students.

In 2022-23 the Bank of Italy, in collaboration with Politecnico di Milano and INVALSI, conducted a randomized study to evaluate its program's effectiveness in improving financial literacy among primary and lower secondary students (Agasisti et al, 2024). The findings indicated an approximate 8% improvement in

students' financial literacy level due to the program. In contrast, independent study of the learning resources, without teacher guidance, led to improvements primarily among students from higher socio-economic backgrounds, and only for secondary school students. This underscores the critical role teachers play in delivering financial education and reducing educational inequalities. Another finding was that students learned more effectively when taught by educators with prior experience in economics. Both these latter evidences reinforce the importance of having teachers equipped to tackle financial and economic issues in school.

### **3. TRAINING FUTURE TEACHERS: PRIMARY TEACHER EDUCATION**

The initiative to introduce financial education into universities for future teachers was launched as a pilot program in 2021, stemming from the combined observation of two interrelated phenomena: the low level of financial literacy among the young population and the difficulty in engaging primary school teachers Bank of Italy's program for schools.

The major challenge of the program is to overcome the skepticism often associated with economic and financial topics, which are perceived as overly technical and unappealing for children. Instead, the program demonstrates that these are not subjects reserved for experts but practical and relevant for everyday life, even for young children.

Financial education for students also offers an excellent opportunity to apply hands-on learning and cognitive activation techniques in core subjects (Lamboglia and Stacchini, 2022; Camizzi and Goracci, 2024). Integrated into civic studies, it promotes collaboration, multi-disciplinarity, and active, engaging teaching. This approach empowers students to take ownership of knowledge, apply it in practice, reflect on the surrounding world, and participate in peer discussions. Such experiences are vital for developing both soft and hard skills, which in turn foster autonomy and inclusion, also addressing gender gaps (Di Tommaso et al., 2024; Section 4).

The collaboration between Universities and the Bank of Italy constitutes an ideal laboratory for developing hands-on learning models. These models, developed together with future teachers, could be used by them once they become actual educators and may improve the design of the Bank of Italy Program for schools.

The training path for future teachers in Italy is governed by Law No. 79/2022. A degree in Primary Teacher Education (a five-year program) is required to access the public competition to become a teacher in primary schools. In the academic

year 2024-25, approximately 11,000 spots were available nationwide for enrollment in this program.

The Bank of Italy program for Primary Teacher Education started as a pilot with two universities and, due to the positive feedback from students and teachers, in 2021-22 it was expanded to seven more universities, reaching 1,400 students. In the following academic year, the program grew further, involving 16 universities (half of those offering the degree in Italy) and training 4,000 students.

The collaboration between the Bank of Italy and Universities is governed by a scientific agreement and relies on universities' willingness to integrate financial education into the curricula. A key feature of the project is its adaptability to different University needs.

Financial education is primarily included in the so called indirect internships<sup>1</sup>, leveraging the flexibility to introduce tailored educational activities and multi-year curricula. This approach allows future teachers to build a foundation in financial literacy through repeated and progressive training throughout their studies and to exploit the synergies with hands-on learning that represent one of the strengths of the program.

In 2023-24, about half of seminar participants responded to a survey, showing strong engagement. Ninety percent found the seminars valuable, were willing to recommend it to others, and to participate again. While only a quarter of the University students were skeptical about the usefulness of financial education for primary school children, fewer than 10% found the seminar content unhelpful.

The training seminars are based on the same resources used in primary schools for the Bank of Italy financial education program for schools. The topics covered align with the EU/OECD framework on financial competencies for children and young people, updated in September 2023 (European Commission, 2023), as well as the guidelines for teaching civic education in Italy issued in September 2024 (Ministry of Education and Merit, 2024).

#### **4. FINANCIAL EDUCATIONS AND GENDER GAPS**

In Italy, the gender gap in financial literacy is high in the international comparison, starting at age 15 and continuing into adulthood. Later in life, the

---

<sup>1</sup> Structured learning activities that prepare students for teaching through reflective practices, lesson planning, and theoretical exploration, without direct classroom interaction.

gap narrows only for employed or self-employed women. As in most OECD countries, women's scores are lower especially in knowledge questions, while in questions evaluating behaviors and attitudes women tend to have an advantage.

The causes of this disparity, which emerges at an early age, are complex and multifaceted. However, there is evidence that can shed light on the phenomenon and help understanding it. Such insights could, in turn, empower future teachers to recognize gender disparities, starting in primary school, and address them also through active learning methodologies (Di Tommaso et al., 2024).

Some studies highlight psychological and social factors that contribute to boys' greater familiarity with financial topics. Girls often perceive themselves as less capable than boys, even when their skills are comparable, and they are more likely to answer "I don't know" (Furrebøe et al, 2022). Gender stereotypes, both at home and school, can also influence outcomes (Lusardi and Mitchell, 2008). For example, when teachers are implicitly influenced by gender stereotypes, the gap in math performance between boys and girls widens (Carlana, 2019). Conversely, girls with mothers working in finance show higher financial literacy (Lusardi and Bottazzi, 2021).

Moreover, a key aspect for financial education among future female teachers is the influence of role models (de Gendre et al, 2023). Having a female role model, such as a teacher discussing economics and finance in the classroom, could inspire girls to develop financial skills and consider finance in their educational and career choices (Porter and Serra, 2020). This highlights the importance of the effort to train future teachers, especially female teachers that are predominant in the primary school, with the aim of enabling them to serve as more effective role models for their prospective female students.

Finally, the ease of teaching financial education through active and experiential teaching methods can help in disseminating advanced pedagogical techniques within schools, empowering female students to excel and promoting a more inclusive and equitable learning environment

#### **4. CONCLUSIONS AND FUTURE DIRECTIONS**

Looking ahead, the introduction of financial education in the school curricula can be a game changer, addressing in a ubiquitous and permanent manner the financial literacy gap still present in Italy. The Bank of Italy's program aims to equipping teachers with the competences necessary to make them confident to

engage with students on economic and financial topics, starting from the primary school. The objective is to expand its reach by involving more schools and more universities and fostering a stronger sense of community among participants through annual meetings and digital exchanges. In doing this, it is important to continue monitoring the effectiveness of the programs in order to understand what works better and how to achieve long-lasting results for the benefit of all.

# PROVIDING ACCESS TO ‘POWERFUL’ FINANCIAL KNOWLEDGE: A FINANCIAL LITERACY PROGRAMME FOR SCHOOL STUDENTS

Emanuel Mizzi  
University of Malta

All students have the right to access ‘powerful’ financial knowledge that guides their financial decisions. In this paper, I extend the theory of powerful knowledge to financial literacy by articulating the nature of powerful disciplinary knowledge in the area. Based on the literature and research findings, I propose a financial literacy programme for the secondary school years that includes the ‘powerful’ financial knowledge that can empower students to make decisions in a way that can positively influence their lives. Considering the relationship between financial literacy, powerful knowledge, and threshold concepts assists in the reflection, policy development and practice of financial wisdom.

financial literacy; financial inclusion; powerful knowledge; powerful financial knowledge; school financial literacy programme

Powerful knowledge differs from the everyday knowledge and personal experience that students bring to school: it is specialised, and students can apply their newly earned knowledge to unfamiliar contexts beyond their experience.

Following an approach similar to Mizzi (2023), I propose two ways of conceiving powerful knowledge in financial literacy. The first type is discipline-based and theoretical, outside the student’s direct experience. The second type derives from this first type of powerful knowledge. It gives students the intellectual ability to analyse, evaluate and think about the world in ways that are beyond their experience.

## **1. DISCIPLINE-BASED KNOWLEDGE**

What content in financial literacy is likely to be most powerful? Since financial literacy draws heavily from the discipline of economics (Mizzi, 2021a, 2022), I draw upon the economics threshold concepts proposed by the literature (Davies & Mangan, 2007; Meyer & Land, 2003; Mizzi, 2022; Modig, 2021; Shanahan, 2016). These are essential when deciding what content students need access to, enabling them to understand financial issues. Developed by experts within epistemic communities, they constitute powerful knowledge from a disciplinary perspective. When students grasp economics threshold concepts, they reconfigure ways of classifying and understanding financial phenomena. These conceptual aspects become embedded in their thinking, providing access to a better understanding of financial literacy.

Economics threshold concepts that the literature identifies include opportunity cost, price formation through market interaction, marginality and equilibrium. Opportunity cost is the most emphasised concept (Davies, 2018; Davies & Mangan, 2007; Meyer & Land, 2003; Mizzi, 2022, 2023; Modig, 2021; Shanahan, 2016). It is the foundation of a web of interconnected concepts, such as the production possibility curve, consumer choice, demand schedules, the decision to supply, perfect competition, efficiency, comparative advantage, incentives, price signals and markets.

## **2. EXPRESSIONS OF POWERFUL FINANCIAL KNOWLEDGE**

Young defines powerful knowledge as knowledge that provides students with the intellectual ability to analyse the world in ways beyond their personal experience (Young, 2013, 2014). In this section, I discuss expressions of powerful financial knowledge derived directly from this definition, describing the types of financial knowledge that might be considered powerful.

### **2.1. Expression 1: Knowledge that enables a deeper understanding of the financial world**

This knowledge is powerful when it enables students to understand and explain phenomena or events in the financial world, particularly those beyond their personal experience. It is powerful when it provides an explanatory function to help young people better understand financial and economic issues. It gives them a distinctive way of perceiving the world, enabling them to make informed choices as consumers, citizens and workers (Davies & Brant, 2006; Mizzi, 2021a, b, 2023, 2024a, b, c). The threshold concept of price formation through

market interaction, for example, helps students better understand the forces and tendencies of demand and supply that influence prices and the decisions of consumers and firms.

## **2.2. Expression 2: Knowledge that equips students with new ways of thinking about the financial world**

Based on discipline-based knowledge and its application, financial knowledge can empower young people to ‘think in new ways’ (Young, 2014) about financial events. Such knowledge provides them with approaches to analysing financial situations and improving the world in which they live.

‘Powerful financial education’ assists students in exploring the generative mechanisms and tendencies that contribute to the production of some identified financial phenomena. Students proceed from mechanisms at a deeper level of reality, moving from a surface phenomenon to explaining a more profound causal factor (Bhaskar, 2017). They can then propose sound explanations.

I illustrate by referring to the ‘price’ of a commodity. Processes generate this that we do not directly experience but can model through our reasoning. Students are accompanied by their teachers to think critically about the generative mechanisms underlying the ideas of supply, demand and equilibrium. They can understand that the reality that gives rise to these processes lies a step further removed from their experience. However, that does not mean that its nature does not influence us. They can better understand the social structures, powers, mechanisms and tendencies responsible for financial events (Mizzi, 2023, 2024c).

## **2.3. Expression 3: Knowledge that develops the students’ criticality of thought and their participation in financial debates**

Powerful financial knowledge allows those with access to it to question it and the authority on which it is based and gain the sense of freedom that it can offer. It enables students to be independent thinkers who can be critical of the opinions of others, including those of people in authority positions. For example, they become critical of politicians’ claims about financial and economic issues, such as when quoting national income statistics.

Young people can become active participants in their learning, gradually maturing into critiquing financial situations, thinking ‘the unthinkable and the not yet thought’ (Young, 2013). Their criticality of thought is enhanced, and their perspectives about the financial world are broadened. They start asking: “Who

is benefiting from the situation?” For example, situations where students’ knowledge of the banking sector largely depends on the story the industry narrates about itself are not healthy for democracy (Davies, 2015).

Mizzi’s research (2021a, b, 2022) suggests that teachers can educate about this healthy aspect of democracy through their efforts in financial education. In line with relevant literature (e.g., Brant, 2018; Davies, 2015; Davies & Brant, 2006), teachers did attempt to extend their students’ thinking by considering aspects of critical financial literacy. This included being critical of the services offered by financial institutions and their motivation when they attempt to educate the public in financial literacy.

Financial education must be unbiased, educating students to consider alternatives and become critics of financial policy (e.g., Mallia, 2015). Teachers accompany young people to critically judge issues and official statistics while understanding the basis for their judgements. Students can evaluate the decisions of policymakers and voice their opinions. These outcomes can be powerful (Mizzi, 2023).

### **3. A FINANCIAL LITERACY PROGRAMME THAT INCLUDES POWERFUL FINANCIAL KNOWLEDGE**

Research suggests that powerful financial knowledge includes distinguishing between a need and a want, scarcity, opportunity cost, market operation, how prices are established, money and banking services (Mizzi, 2021a, b, 2022, 2023, 2024b). This substantive knowledge assists young people in thinking in new ways (ibid.).

The author’s research and that of Farrugia (2021) highlight the importance of educating students to distinguish between their needs and wants (Mizzi, 2021a, b, 2022). Young people need to realise that they cannot have everything they want due to the scarcity of resources, leading them to make choices involving opportunity costs. It is beneficial that the concept of opportunity cost is introduced in the primary years of schooling, assisting students in reflecting on their actions and becoming more responsible citizens.

Learning about the characteristics and functions of money assists young people in appreciating the value of money (Buhagiar, 2018; Farrugia, 2021; Mizzi, 2022). Other relevant aspects include the role of commercial banks, banking services (such as the different types of accounts and pension schemes), the risks involved with various investments, sources of finance available to individuals and businesses, and online banking. Educating students in critical financial

literacy is essential here; criticality in financial issues expresses powerful financial knowledge. For example, when discussing the advantages of banking services used by a customer, teachers need to invite their students to consider the advantages that the bank benefits from, prompting them to reflect on whether financial decisions benefit them or the bank. This reflection can help students make more informed choices, ultimately shaping their financial behaviour. Being aware of the roles of financial regulators and advisory services, such as a country's Stock Exchange, is also essential to enable future generations to make more informed financial decisions.

A financial literacy programme needs to include an understanding of demand and supply and how prices are determined. This enables participants to grasp why prices fluctuate and how to make more informed and sustainable purchasing decisions. The programme also needs to emphasise the importance of knowing one's rights as a consumer. This knowledge equips individuals to navigate the marketplace and make informed financial choices.

Budgeting is vital to be included in the programme because it assists students in managing their finances. Research suggests that young people find creating and sticking to a budget challenging (Amagir et al., 2017; Farrugia, 2021; Mangion, 2023). Investing in human capital by educating students on financial skills related to money management is critical. Knowledge of remuneration systems and how to interpret a payslip is also essential, enabling individuals to account for their earnings when planning their budget.

Digital financial literacy is becoming increasingly essential in today's rapidly evolving financial landscape (e.g., Ciantar, 2024). For example, students struggle to grasp the value of money due to their reliance on electronic wallets, which often diminishes their awareness of spending habits (ibid.). Traditional financial literacy education may not spark interest in blockchain technology, digital assets such as cryptocurrencies, tokens and virtual currencies, and associated management tools. Education in digital financial literacy addresses this gap.

Young people need to be aware of aspects of macroeconomics, enabling them to understand governments' policies that shape the national and international financial environment and equipping them with the tools to be critical citizens who can evaluate politicians' claims, for instance, as regards real and nominal increases in GDP, inflation, taxation and a country's budget (Mizzi, 2023, 2024a, c). This echoes the argument of Davies (2015) about educating young citizens in economic literacy, empowering them to understand the broader context of

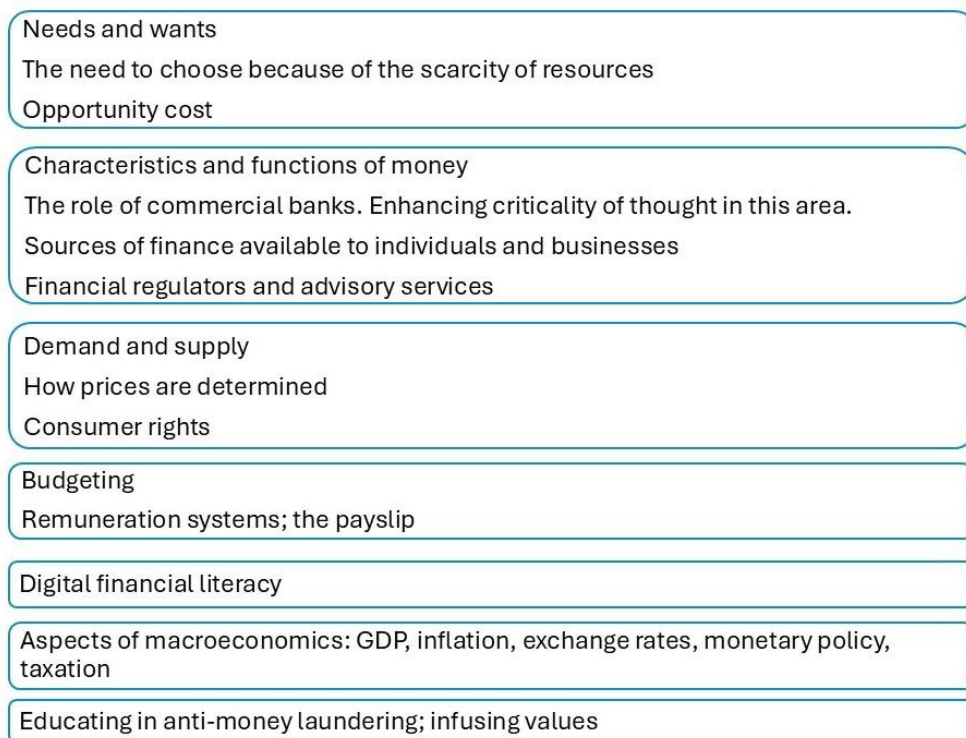

financial decisions better. Research also highlights the need for students, as citizens of the European Union, to possess knowledge related to monetary policy and exchange rates because, very often, the discussion emerging from the news may revolve around these issues (Mizzi, 2021a, b).

There is a lack of education on anti-money laundering and combating the financing of terrorism (Ciantar, 2024). The consequences include irresponsible financial practices, financial loss, reputational damage and psychological distress. A financial literacy programme must incorporate aspects of empowering young people against financial crime<sup>1</sup>, and infuse ethical aspects such as care for the vulnerable, accountability and transparency.

Figure 1 summarises the aspects of the proposed programme.

Figure 1: Outline of the proposed financial literacy programme.

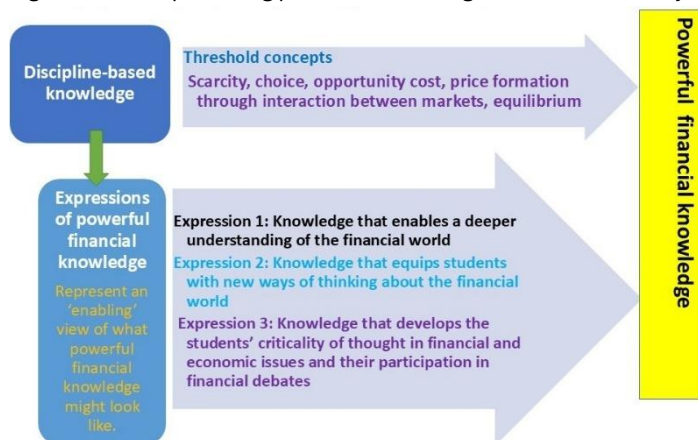

---

<sup>1</sup> Ciantar (2024) proposes a valuable resource pack.

## 4. CONCLUSION

In this paper, I contribute to knowledge by articulating what powerful knowledge in financial literacy looks like. This is summarised in Figure 2.

Figure 2: Conceptualising powerful knowledge in financial literacy

The financial literacy programme I propose is based on the powerful financial knowledge conceptualised in this paper. This programme needs to be part of a school's curriculum to satisfy the right of all students to access knowledge that guides their financial decisions.

# THE RELATION BETWEEN EXPERIENCE, EDUCATION AND AI

Alessio Fabiano<sup>a</sup>

Giuseppe Spadafora<sup>b</sup>

<sup>a</sup>University of Basilicata; <sup>b</sup>University of Calabria

The relationship between A.I. and education is one of the basic issues of contemporary educational research. From this perspective, it is quite evident that learning, within experience, is one of the most important aspects to analyze the relationship between A.I. and education. To clarify this concept, we have tried to focus, first, on the relationship between experience and education, as defined by John Dewey's book *Experience and Education* of 1938, and to focus on some A.I. issues related to education just to understand the relationship between experience, education and A.I.

Experience; Education; AI

## 1. EXPERIENCE AND EDUCATION

It should be made clear that learning is based on the student's constructive approach and not passive and receptive. Learning by doing, in fact, is a methodology, which emphasizes practical experience as the main tool to acquire knowledge and skills.

This approach promotes a dynamic and participatory education that prepares students to respond creatively and actively to the real-world challenges.

Education is fundamental to democracy, as Dewey affirms in *Democracy and Education* of 1916 (Spadafora, 2015; Pezzano, 2017) because this relation educates citizens capable of critical thinking and active participation. Dewey considers the teacher's job as the art of orienting students, just to discover the interior talent, which is present in each student.

The theme of experience is closely related to education. It is interesting to note how this theme was mainly developed through the concept of experience clarified, in particular, in the 1938 Dewey's book *Experience and Education* (Dewey, 1938).

This book is an expression of the complex relationship between experience and education that represents a critical moment to understand the meaning of experience as an educational phenomenon compared with traditional education, which is transmissive. The centrality of progressive education, then, is its relationship with experience.

The relationship between experience and education determines the central issue of the Deweyan theory: the concept of freedom. In this sense, traditional education was tied to the problems of the past, where progressive education determines the future development of the human potential of each student.

Learning through experience implies this possibility. Even traditional education conveys past experiences, but these past experiences have a defective character, because they do not plan what the future experiences are. Experience, in other words, must be considered as a project to the future experiences. These experiences must be considered projects to discover the future possibilities, and this discovery is regarded by Dewey as an experimental continuum (Dewey, 1938, pp. 26-29). Continuity means that growth is necessary in one specific direction rather than another. In this sense, it is quite evident that the growth develops in one direction, but if this direction is negative, it is necessary that this dimension stops. In this sense, the teacher must understand the specificities of the learner's experience linked to the others' experiences (Experience and Education, p. 38)

Indeed, the teacher is a designer of the learning environments and the unique and unrepeatable growth of each student. For this reason, the teacher must keep in mind the situation in which the student's inner dimensions develop in relation to the responses of the environment in which he or she lives. The experience, therefore, can be considered positive and negative. This depends, fundamentally, on the direction this path may take. A negative experience develops in a direction that, in Dewey's view, can not have continuity. A negative experience, in fact, stops insofar as it can have a development.

That is why education can not be considered a preparation for further education, but education is characterized from experience that expresses a clear relationship between the continuity and interaction of the individual with the environment according to the nature of freedom. (Dewey, 1938, pp. 39-42).

Indeed, there is the need to analyze experience as a project of individual development towards the natural and social environment. It is in this perspective that experience epistemologically determines continuous and constructive learning that enhances the freedom of the individual within his or

her environment (Fesmire, 2014). This aspect is central to the reflection on Experience and Education: the freedom is linked to the development of experience that determines a constructive dimension of learning.

The central aspect of the human project is determined, in Dewey's view, in its possibility of having a vision to achieve an end. This is precisely why it is necessary for the curriculum in the schools to insert various dimensions of experience, to highlight the problems and stimulate reflection and meta-reflection (Gardner, 2011).

It is quite evident, from this analysis, that the central issue that determines the democracy in the school is the centrality of experience related to the importance of science and technology to develop the unexpressed potential of each student and, also, to understand the cultural and professional role of the teacher in the school organization (Hickman, 1991).

## **2. EXPERIENCE, EDUCATION AND A.I.**

Digital and Artificial Intelligence represent a technological model that integrates different aspects of human experience (Fabiano, 2018). Experience is the center of various disciplinary dimensions, and the cultural and technological model to understand human learning. In particular, the relationship between Experience, Learning and Artificial Intelligence represents an epistemological and educational issue fundamental to analyze the possibilities of the contemporary inclusive school.

It is necessary to examine what educational applications can determine the curriculum in the school, in particular the individualization and personalization, the various issues of assessment and the new dimensions of the teacher's professionalism.

Artificial intelligence, if used correctly, can become a valuable ally in the transformation of education. Its ability to analyze and interpret data, adapt to students' needs and provide a personalized experience open to new horizons of didactics.

Artificial Intelligence can be used in diverse areas of education, such as creating interactive, stimulating learning materials, personalized assessment of student skills, analysis of student's feedback. (Panciroli, Rivoltella, 2023)

These applications can help to limit the gap in access to education, provide personalized instruction, can help students with disabilities to achieve more inclusive and equitable educational experience (Sibilio, 2023).

However, the introduction of Artificial Intelligence in education raises fundamental ethical questions to improve and defend the citizen's privacy to solve different and fundamental problems for democracy.

It is necessary for democracy to ensure the protection of student's data and to respect the principles of Artificial Intelligence ethics, such as transparency, and human and social control.

If used properly, Artificial Intelligence has the potential to transform the field of education, improving students' learning, supporting teachers and creating a more inclusive and equitable educational environment. However, to take full advantage of the benefits of Artificial Intelligence in education to improve the learning's opportunity, it is necessary that Artificial intelligence should be seen as a complement to human intelligence, a valuable aid to improving the quality and efficiency of education.

In conclusion, Artificial Intelligence represents a powerful resource that can profoundly change the educational processes, helping to create a more inclusive, personalized and effective learning environment.

### **3. EDUCATIONAL APPLICATIONS OF A.I.**

Personalization of learning is one of the main applications of Artificial Intelligence in education. By collecting and analyzing student data, AI systems can develop an individual profile for each student, understanding his or her needs, preferences and abilities.

Based on this information, AI can create personalized learning plans, offering content and activities tailored to each individual's characteristics (Pireddu, Moriggi, 2024).

Personalization of learning can help teachers monitor and assess student progress more accurately, offering the ability to intervene early to provide personalized support. The introduction of Artificial Intelligence in education has also improved the assessment process.

Through the use of Artificial Intelligence algorithms, assessment can be automated, enabling faster and more efficient improvement of students' tasks and activities. Artificial Intelligence can analyze the students' results, evaluating their responses based on predefined criteria and returning immediate feedback.

This approach opens up new perspectives for the enrichment and diversification of educational aspects of building democracy. Artificial intelligence offers numerous benefits in educational processes.

It can increase teachers' efficiency by automating tasks such as assessing student's performance and creating instruction contents. Artificial Intelligence can play a key role in improving student's performance. Through data analysis, Artificial Intelligence can identify students' learning gaps, providing personalized suggestions and study materials tailored to their specific needs.

Despite the many benefits offered by Artificial Intelligence in education, it is also important to consider the possible negative effects on human learning. The introduction of Artificial Intelligence systems could affect students' social interaction and learning, reducing, for example, opportunities for exchange and discussion among classmates.

It is therefore crucial to carefully assess the impact of Artificial Intelligence on human learning and take measures to mitigate any negative effects, such as promoting collaborative activities and cognitive skill development.

With the introduction of Artificial Intelligence in education, the need for appropriate training for teachers arises. In order for them to use smart technologies effectively, teachers need to acquire specific skills in the field of Artificial Intelligence and understand how to integrate them into their teaching approach. The use of Artificial Intelligence in the educational domain has manifested considerable influence. Its implementation, ranging from the personalization of training paths to virtual tutoring, through automated analysis and the production of teaching materials, has contributed to meaningful improvements.

The central issue is that the relationship between educational experience and A.I. demonstrates that the student can develop his or her unexpressed potential, and the teacher can only professionally improve his or her scientific action to improve the educational and inclusive quality of the classroom

In conclusion, only with the hybridization of A.I in education it is possible to enlarge the possibility of human experience and, consequently, improve the student's learning for the inclusive school.

# ARTIFICIAL INTELLIGENCE AND LANGUAGE LEARNING: WHAT OPPORTUNITIES FOR ALLOPHONE LEARNERS

Marika Calenda  
University of Basilicata

European countries are increasingly experiencing multicultural dynamics driven by phenomena such as mobility, migration, wars, political instability, and the resulting economic crises, with significant repercussions on the structure of school systems. In terms of student population composition, schools are multi-ethnic and multicultural realities. This contribution is linked to the Erasmus Allophone Teacher Academy project, led by the pedagogical area group of the University of Basilicata. The project addresses two main issues: initial teacher training from a multicultural and multilingual perspective, and the learning of the language of schooling, with particular attention to the linguistic needs of students from migrant backgrounds. The product that the Basilicata unit will produce is a collection of pedagogical tools and proposals for teaching activities for classes with foreign students. This contribution focuses on the opportunities and advantages that artificial intelligence can offer foreign students in learning the language of schooling. In particular, the contribution reflects on the problems related to intercultural language education and focuses on the possibility offered by enabling technologies to determine an expansion of vocabulary, useful for communicative, relational, and educational exchange, from a multilingual and inclusive perspective.

Teacher Academy, artificial intelligence; foreign students; language learning

## INTRODUCTION

The ALTA project is coordinated by the Académie d'Amiens (France) and involves other French partners, such as the University of Picardie Jules Verne, the University of Lille, the University of Rouen Normandie, the Centre International de Formation et d'Outils à DEstination des Maîtres (CIFODEM) in Paris, along with the University of Basilicata (Italy), the University of Murcia

(Spain), and the University of Veliko Tarnovo (Bulgaria). The main object of the project's investigation is language learning, with particular attention to the needs of students with linguistic vulnerabilities and/or those from migrant backgrounds, for whom the process of acquiring proficiency in the language of schooling can be difficult. The project's objectives are in line with the European Union's priorities in the field of language education. The Council of Europe has long been committed to addressing the issue of educational language policies with a fruitful production of documents that have become an indispensable reference in the context of multilingual and intercultural education (Beacco, Byram, Cavalli, Coste, Cuenat, Goullier & Panthier, 2016; Beacco, Fleming, Goullier, Thürmann, & Vollmer, 2016). In this sense, the Council has established a specific Language Policy Unit engaged in the development and collection of multiple tools that converge into a Platform of resources and references for multilingual and multicultural education. The project is structured in a series of actions planned for the academic triennium 2022-2025. In the first two years, 2022-2023 and 2023-2024, four pedagogical training mobilities took place in Amiens (February 2023), Rouen (May 2023), Matera (November 2023), and Lille (February 2024), during which the project partners offered theoretical and practical training workshops for university trainers: tutors, teachers, researchers, and doctoral students. In Italy, the training content was then reworked for students of the Single-Cycle Master's Degree in Primary Education Sciences (SFP) at the University of Basilicata, Matera campus, and subsequently integrated into the teaching activities provided for in the curriculum, particularly in indirect internships. In the 2024-2025 Academic Year, the experimentation of the methodological-didactic guide prototype and the proposed Learning Units designed by the students with the support of internship tutors and teachers of the Course of Study is planned at the Enrico Fermi Comprehensive Institute of Matera, a partner of the project. The Basilicata Unit is engaged in the activities foreseen by work package n. 4 aimed at the experimentation and creation of devices for the inclusion of allophone students. The product that the Basilicata unit will have to produce consists of a collection of Learning Units containing proposals for teaching activities for classes with foreign students.

## **1. LANGUAGE LEARNING AND THE IMPORTANCE OF VOCABULARY**

Language plays a key role in accessing knowledge, understanding it, and co-constructing it thanks to its multiple functions, representation: exposition and dissemination of knowledge established independently of the language;

mediation: transposition, verbalization, allowing one to move from one semiotic system to another; interaction: transforming and allowing exchanges (discussions, debates, disputes) between knowledge producers and between producers and users of knowledge, exchanges that can lead to progress in knowledge; creative: the creation of knowledge, the creation and recording of knowledge in writing, which are two sides of the same process (Beacco et al., 2016). Among the various functions, the one that most clearly highlights the link between language and knowledge is the heuristic function that governs the discovery and development of the comprehension processes involved in learning. The heuristic function thus allows acquiring new knowledge, formulating definitions about it, interpreting it, relating it to prior knowledge and/or other contexts, and reconfiguring the systems of knowledge representation in each domain or semantic field. Language therefore helps to structure thought and reasoning: each of these functions is both linguistic and cognitive because it accompanies the cognitive processes just described with verbalizations, arguments, explanations that highlight the deep interconnections between language and thought (Beacco, Coste, Van De Ven, & Vollmer, 2011). The school has the task of designing paths centered on the three main competences at the base of linguistic mastery to reduce the risks of learning difficulties for foreign students. Pragmatic competence: one of the most urgent needs for the foreign student is to understand and recognize the rules of behavior that govern daily interactions in school; linguistic competence: the second language teacher has the task of promoting, first of all, the development of language for everyday communication; metalinguistic competence: in addition to linguistic competence, the teacher must also promote the metalinguistic and metacognitive dimension, i.e., the development of explicit knowledge about the second language and study skills, which will guarantee access to disciplinary content (Brichese, 2015). Vocabulary knowledge is a fundamental aspect of overall linguistic competence concerning the knowledge and use of the vocabulary of a language: the memorization of words, the understanding of semantic relationships between words (synonymy, antonymy, hyponymy, etc.), the ability to infer the meaning of unknown words from elements of the communication context, the mastery of the different meanings that a word can assume depending on the situation and its use. Research has shown a strong correlation between vocabulary and success in language learning: a wide and well-structured vocabulary facilitates reading and listening comprehension and improves the ability to produce fluent and accurate written and oral texts (Cardona, 2008). Studies in the field of

psycholinguistics and applied linguistics have shown that lexical competence is closely related to language comprehension and production skills. Research conducted by Nagy and Herman (1987) highlighted how a wide vocabulary is a significant predictor of text comprehension, positively influencing students' learning performance. The development of lexical competence is described as a complex and incremental process involving multiple dimensions. These include the breadth of vocabulary, i.e., the number of words an individual can recognize and use, the depth of lexical knowledge, which includes aspects such as form, meaning, relationships with other lexical units, and appropriateness of use, automaticity which refers to the speed with which a lexical unit is made accessible and used (Prada, 2024). These dimensions contribute to the development of learning both in terms of the quantity of words known and in terms of depth of knowledge and ability to access each word (De Mauro, 1999). Knowing a word goes beyond the simple referential object-word association and implies a multidimensional understanding that integrates several aspects (Nation, 1990): the form (signifier), the position (grammatical and syntactic role), the function (frequency, contextual appropriateness), and the meaning (semantic relationships with other words, polysemy, synonymy, etc.). Vocabulary acquisition can occur through various processes, including explicit learning, for example through the study of word lists, and implicit learning through exposure to the language in authentic contexts (Ferreri, 2005). Consequently, strategies to improve lexical assets can include explicit learning through the study of vocabulary lists, contextual inference during extensive reading, and the use of mnemonic techniques. Furthermore, repeated exposure to words in different contexts promotes their acquisition and consolidation in long-term memory (Schmitt, 2008). Effective methods for developing lexical competence include extensive reading, listening to authentic material, writing and conversation, using dictionaries and vocabularies, and employing active learning strategies such as creating concept maps and using flashcards (Balboni, 2008).

## **2. ARTIFICIAL INTELLIGENCE FOR LANGUAGE LEARNING**

Artificial intelligence can provide valuable support for students from migrant backgrounds in learning the language of schooling. For example, through voice assistants or numerous apps that use artificial intelligence, such as Duolingo, Rosetta Stone, Busuu, Babbel, Memrise, etc. ChatGPT also has applications for language learning and offers support in writing texts and in conversation (Montesano, 2023). Through some functions, such as speech recognition

software and text-to-speech software, artificial intelligence can apply innovative technologies to support the teaching and learning of languages to offer personalized intervention. Learning a new language has always been associated with the possibility of opening new doors to the understanding of different cultures and interacting with people from all over the world. AI can revolutionize language acquisition, offering a simplified and personalized approach to students. Clearly, for this to happen, it is necessary for the teacher to be trained in the construction of an environment that mediates and co-constructs learning processes. Immersive language learning seems to be able to strengthen attention, mental clarity, and promote the approach to a global mentality, therefore open to new cultures and diversity (Alimisis, 2013). AI algorithms can adapt the learning experience to the needs of each student, reducing time, costs, and frustrations. AI-supported language learning platforms can analyze writing, monitor and provide immediate feedback to students, allowing them to correct errors and improve performance. Thanks to AI, students can study at their own pace, set personalized goals, and follow a tailor-made study path. Furthermore, artificial intelligence is able to develop games, quizzes, and activities in line with students' interests, thus improving engagement and participation in the learning process. An important aspect, in enriching the vocabulary, can be provided by robots. AI-supported language learning chatbots provide personalized answers and evaluations, allowing students to practice speaking the language without fear of being judged and relying on the support and feedback best suited to them. This improves their personal experience and allows them to refine their skills regularly. Bots offer conversation exercises, vocabulary improvement, and grammatical explanations to promote a stress-free learning environment (Ioannou & Makridou, 2018; Jung & Won, 2018; Sullivan & Bers, 2018). Teaching Italian to foreigners can have an ally in tools like ChatGPT, a widely used chatbot also thanks to the possibility of free access. The aim of its creators was precisely to reach the public through a technology available to everyone, also in order to increase user feedback. In fact, this type of model continues to learn precisely from the feedback it receives, according to what in technical jargon is defined as the *Reinforcement Learning From Human Feedback method*. In this way, the system can adapt to different interaction styles, offering increasingly consistent and personalized responses. Regarding the teaching of Italian to foreign students, ChatGPT can be useful for generating texts on specific topics, designing activities or exercises (comprehension, vocabulary expansion, grammatical aspects, etc.), for independent study and as a

dictionary/translator. The fields of greatest interest for the use of artificial intelligence in language learning are mainly aimed at: personalizing teaching-learning (Buccini, 2024); identifying and understanding spelling and grammatical errors through timely feedback (Fu et al., 2020); increasing engagement and motivation (Yang et al., 2023); translating texts and acquiring new vocabulary with reference to the situational context (Montesano, 2023); searching for resources and material for self-learning. For example, within a teaching activity on emotions that involves reading the children's book "El Monstruo de Colores" (Llenas, 2012), through ChatGPT it is possible to generate a glossary in Italian and Arabic for Moroccan students, or to translate and listen to the text in Arabic. In this way, teaching practices will be inspired by the principle of intertextuality, which refers to the dynamic implemented by non-native students to understand and produce discourses and texts in Italian, establishing links with the language and culture of origin (Cole, 1996).

# STORYTELLING WITH AI. A NEW PARADIGM FOR THE SCHOOL OF THE NEXT YEARS

Andrea Cirolia

Università della Basilicata

Self-learning is one of the central aspects of the contemporary inclusive school. Digital storytelling can represent a fundamental moment for the multiple development of unexpressed potential. AI storytelling is a further step that will change the relationship between teaching and learning and will enhance the student ability to solve problem situations developing the creativity of each individual. In this perspective it is more correct to define the learning as an expression of infinite intelligences. My research aims to identify new learning spaces in the inclusion school to raise the qualitative level of the teaching- learning process linked to a possible relation between story-telling and A.I.

Storytelling; Digital Learning Spaces; AI; inclusion

## INTRODUCTION

In our time we are facing a great digital revolution. Because of the spread of the GPT chat, A.I. is becoming fundamental to improve the learning of every student. In this paper I will try to explore the possibility to link traditional teaching tools as Storytelling with new digital technologies and in particular A.I.

An example of this relation is this kind of storytelling, the kamishibai, a very ancient tool that could be associated with digital and Artificial Intelligence since the nursery school. This is because the strengthening of basic skills is possible with a relation between old and new methodology in the classroom.

The relation between old and new methods could permit to develop new visions for the future. Storytelling is a fundamental way of expression of the student. In the contemporary school a new didactic situation is emerging in which the ability to create stories can be shared with the digital and A.I. didactics.

The ability to do storytelling, for example, can be determined by robots which can write newspaper articles, narrative works, film scripts, advertising texts,

political speeches. Artificial digital systems are capable of writing texts of all kinds because they have the ability to receive infinite Big Data. Stephen Hawking, before his death, declared that Artificial Intelligence could destroy our civilization (Moriggi, Pireddu, 2024). The risk and the danger could exist. Due to this it is necessary to analyse and control the use of Artificial Intelligence, especially for the new generations, combining the traditional didactic systems with A.I. The role of the school will be decisive in the coming years.

In fact with the help of Artificial Intelligence, we can project robots as fantastic storytelling assistants, support systems to cooperate with students to develop a creativity to conceive new stories. The contemporary research, then, must be oriented to construct a new paradigm of an A.I. storytelling experience.

## **1. THE IMAGE AS AN INSTRUMENT TO IMPROVE THE STUDENT'S LEARNING**

In our time it is necessary to clarify the possible central role of Artificial Intelligence in the school considering the thoughts of the most important theorists of education of the last century, who intended to give us some guidelines on how school can be suitable for experimenting innovation to improve in the school the educational actions.

John Dewey affirms that technology can change in a good direction the society, only if it is oriented by education and democracy (Spadafora, 2015). More than a century ago, Dewey already analysed the image as essential for the education of every student. In *My Pedagogic Creed* of 1897 he argues that the image is the greatest teaching tool, because the child draws from any topic presented to him different aspects of an image. (Dewey, 1897) He also claims that the teacher must enhance the child's imagination to facilitate his/her own work.

The reference to Dewey's is appropriate if we consider that he was the American philosopher, who established the concept of "laboratory school", linked to democracy and to the centred learning. (Dewey, 1899-1915; Dewey, 1916). In fact Dewey considers education linked to the science's innovation but also to the traditional system of education.

In *The School and Society* of 1899 he affirms that the industrial revolution was the most profound change ever observed in human history and that the school must consider this change connected to the traditional system of education.

Starting from this premise the relation between traditional and innovative technological education has been a focal meaning and is fundamental to open the way towards a specific integrated multi-modality that develops learning. and deuterio-learning (Bateson, 1977).

The image provides a meaning to the textual discourse and, above all, allows us to understand the complexity, particularly in a dynamic visualization dimension. The recognition of the self-image is of great interest from the point of view of developmental psychology, especially to improve the self-awareness in the child.

When the student is invited to describe what he sees in the image, it is fundamental that the adult draws attention to what is depicted in it, just to discover what is important in the image for the student's attention.

The use of the image can also represent an important integrative tool for the educational act of *Philosophy for Children*, as Lipman (Lipman, 2005) intends it, as a teaching method that aims to develop the complex thinking.

Another important example of the relation between image and reading and writing is the Gardner's theory of multiple intelligences, in which is fundamental the role of what he calls visuo-spatial intelligence (Gardner, 2013). For this reason, the relation between traditional and innovative didactics has always been present in the modern teaching.

## **2. LEARNING PROCESSES WITH ARTIFICIAL INTELLIGENCE. SOME ASPECTS.**

The theme of narration is fundamental as an ancient Jewish saying states. "God created man because He loves stories" (Eli Weisel). This quote contains a concept full of meanings and symbolic implications.

First of all, it must be stated that among all the living organisms, none has ever been able to tell stories before man. Storytelling is a prerogative of the human species.

In our time is emerging a completely new situation in which the ability to create stories can be shared with someone or something else through the A.I.

A.I., in fact, can determine a new possibility to create a new dimension of generative experience, in which creativity is linked to science and technology through a narrative construction. Generative Artificial Intelligences can work for inclusion if well managed, giving the teacher the possibility to develop relationships with students for the education of so-called soft skills, and to form a new role for a responsible student, who must develop a continuous critical reflection on one's own learning process.

The important role of the school will be decisive in the coming years, in which probably will be necessary to create a good balance between old and new aspect of didactics (Lipman, 2018).

In this perspective there are many opportunities for Artificial Intelligence and some authors analyse an important question: How does our memory change? What is the relationship between the memory and the learning? How this relation can be orient by an “A.I. pedagogy”? (Panciroli, Rivoltella, 2023) If we imagine an encyclopaedia, we can think of it as a tool that provides us with instructions and information to decode contexts, an encyclopaedia allows us to select information, exclude unacceptable interpretations despite the indeterminacy of the reading. Even our social memory, collective memory, is therefore based on the selection and deletion of data.

Concerning modern technologies, however, in a sort of epistemic egalitarianism, we tend to record everything that happens, collectively or individually. And this is the real problem. It is necessary to discriminate the data and enhance the possibility of human choices. Otherwise, we could have a memory block due to an excess of digital memory, due to an excess of information.

It is certain that the selection of what should be preserved or discarded is a political responsibility, because it is the selection that decides what information will allow us to orient ourselves in the future. Each historical period has had its own way of spreading knowledge and transmitting it. What’s the historical period of Chat GPT?. It will depend on us.

Tamburrini addresses the ethical dilemmas that emerge from the use of robotics and Artificial Intelligence such as the human responsibility in relation to the decisions and actions of machines, the impact of AI on society, and the ethical challenges that arise from it. All this considers the human responsibility at the centre: to what extent should humans retain control over the decisions made by Artificial Intelligence? (Tamburrini, 2020).

We must be aware of our limits and therefore know how to manage the limitations in our ability to explain and predict the behaviour of robots that learn and interact with other systems.

Floridi raises several specific ethical implications regarding AI. The digital revolution offers extraordinary opportunities, but also doubts and concerns and it is essential to understand the technological transformations to guide them in a sustainable direction.

For example, the importance of transparency and understanding of AI technologies is crucial. Only through an analysis of this phenomenon we avoid mistakes and ethically orient the development of digital technologies. In fact AI can have a meaningful impact not only technologically, but also culturally and

politically.

It is necessary to develop a code of ethics for AI that can guide its responsible use and applications (Floridi, 2022).

It is essential to understand this new paradigm to orient in a direction socially and environmentally sustainable. It is necessary a collective effort of intelligence to face the ethical challenges of AI, sharing ideas and working together to develop a philosophy of our time.

## CONCLUSIONS

I tried to demonstrate that it is necessary to link old and traditional didactic systems to build a new paradigm of a modern school inclusive of high quality. To achieve this aim it is necessary to construct a new didactics based on the relation between old and new methodologies, storytelling and A.I. for example.

For this reason it is fundamental to link the impact of image on the student's learning, a storytelling as kamishbai for example, with the new educational technology as A.I.

I tried also to demonstrate how A.I. can change the traditional aspects of the learning. As many authors have demonstrated, A.I. determines a creative learning in which it is possible to develop the embedded powers of every student. In this perspective it could be very interesting to link the storytelling with A.I. to build a possible didactic new paradigm in the contemporary school.

The storytelling can be enhanced by A.I. and also the creativity of every student can be improved by the relation between the storytelling and A.I. This new didactics can develop a fundamental paradigm to explore the possibility to build a new inclusive school. The future trends of the contemporary school will depend on this profound link between the technology and the human approach.

# EXPERIENCE, THEATER AND POLITICS FOR AN INCLUSIVE AND DEMOCRATIC SCHOOL

Vincenza Costantino  
University of Basilicata

The work offers some criticism on the intertwining of art and democracy, starting from a possible rereading and updating of Deweyan's concepts of art and experience. These concepts today can be studied in light of the changes that affect the way of fruition of performing arts and their renovated pedagogical value in the school and social fields in the age of digital arts and AI applications. Through the analysis and comparison of some fundamental pedagogical and aesthetic theories with contemporary artistic practices, we consider the centrality of theatrical art in the formation, in contemporary society and especially in the school. The theoretical path, which focuses on John Dewey, enhances the educational meaning of the theater by recognizing the subject-person the experiential approach to art, the ability to live in a circular way the encounter with the work and the tension of active and relational participation with other spectators. Theater can significantly contribute to the education of children and adolescents more aware of the values of active citizenship and of social solidarity in an era in which the concepts of community and participation are increasingly undermined by exasperated individualism and by unawareness in the use of digital media.

experience; theater; democracy; inclusive school; AI

## INTRODUCTION

The presentation offers some critical insights into the intertwining of art and democracy, starting from a reinterpretation of the Deweyan concepts of experience and art, previously and mainly discussed by the philosopher in *Experience and Nature* (1925 – 1929) and *Art as Experience* (1934). These concepts can now be revisited, considering the changes affecting new languages and attitudes that belong to artistic fruition. It is to be said that

performing arts reveal a significant, pedagogical value in school and social contexts in the digital technologies and AI applications era. The deep “social” and “political” nature of John Dewey’s thought outlines, nowadays, an adequate general vision for constructing a new educational paradigm based on equality, inclusion, and democracy.

My contribution suggests enhancing the arts, particularly theatre, in the education of 21st-century students in a democratic school setting. The theoretical approach I propose, still under development, highlights the centrality of experiential approaches and imagination in young people’s encounters with performing arts. These arts allow students to experience performances spontaneously, thoroughly, and holistically, fostering active and shared participation in artistic events and a sense of belonging to a community.

Throughout the 20th century, art underwent significant transformations. Analog and digital reproduction technologies revolutionized theatre. Both artists and audiences challenged the performing arts. The contemporary art system had to renew itself to avoid succumbing to producing, reproducing, and disseminating works via streaming platforms. Aspects such as relationality, corporality, interactivity, and multimodal sensory technologies have become central to the aesthetic dimension, renewing the relationship between individuals and art (Balzola and Rosa, 2019). The event’s uniqueness, connection with others, and choral and ritualistic dimensions of theatre have enriched this art form and established new ties and impacts within the educational environment (Costantino, 2015).

The language and strategies of theatre (Fischer-Lichte, 2004) have been shaped and fostered by Relationality, which also suggests significant influences on the education of young people. Even this foundational element is now being questioned or recalibrated considering the changes in contemporary society, transformed by digital technologies and dominated by Big Data and AI (Crawford, 2021). In a democratic school, it is essential, so far, that theatre, as an art of relationships, plays a role in educating social students and active citizens in the complex post-capitalist society and a world subject to the “derealization” of reality (Han, 2021).

## **1. EXPERIENCE, SCHOOL, AND SOCIETY**

In the framework of social pedagogy, theoretical reflection on the relationship between experience and theatre cannot disregard the exceptional changes that have reshaped the social, economic, and political landscapes in which the

school operates. Dewey is so aware of this connection that in Article I of *My Pedagogic Creed*, he states: “With the advent of democracy and modern industrial conditions, it is impossible to foretell definitely just what civilization will be twenty years from now” (Dewey, 1897, 6). School is, first and foremost, a social institution (Article II), and it “represent present life” (Ibid., 7). This general premise leads the philosopher to affirm:

If we eliminate the social factor from the child we are left only with an abstraction; if we eliminate the individual factor from society, we are left only with an inert and lifeless mass (Dewey, 1897, 6).

In the first two articles of his “pedagogical Manifesto” (Pezzano, 2023, 13), Dewey emphasizes two crucial issues: the importance of education as a process of life for the present and the impossibility of predicting the future. Indeed, from the era in which he wrote, in 1897, he pointed out the inability to foresee the transformations that would occur in just twenty years. Thus, the philosopher outlines a system of thought that must consider the relationship between individual and society in education, subjecting it periodically to scientific and technological progress evolutions.

The twenty-year measure of time imagined at the beginning of the twentieth century progressively shrinks over the following century to the point where it is impossible to predict what civilization will look like in just five years. If we reflect on the democratic school of 2024, we must place it in a society profoundly marked by two events:

- The start of Artificial Intelligence technology.
- The Covid-19 pandemic.

These two factors have significantly influenced each other in the educational field and still trigger ongoing reactions. While AI is a technology whose scope, speed, and pervasiveness on a global scale cannot yet be predicted – or its impact measured in terms of environmental and human costs and exploitation – the pandemic, as a relatively circumscribed event, allows us to consider some critical consequences. For instance, it caused an “interruption” in the continuation of established teaching methodologies and educational paths, highlighting critical issues that could serve as an opportunity for a profound rethinking of the school system (Morin, 2020).

These two factors are intertwined in the school environment. Due to specific political measures implemented during the emergency phase, the pandemic, in turn, accelerated the process of school digitalization, legitimized the integration

of AI in the classrooms through guided or independent use of specific applications, and facilitated the normalized use of digital devices in support of teaching.

Dewey's reflection is crucial as it highlights the centrality of experience in relationships with others and the world. Human beings cannot be conceived as detached from the world, as they are "in" and "with" the world they are educated in. Direct experience and sensory engagement with nature are valuable educational tools.

The sensory approach finds its ideal physical setting in Dewey's "Learning by Doing Laboratory," where one can gain experience, resolve the conflict between theory and practice, and build a more natural conception of the individual. Experience, as a tool for relationships, connection, and knowledge of the world, pertains to theoretical and practical, mental and physical, imaginary and material aspects of the whole concept. It is a point of convergence where the fluid boundaries of theoretical speculation meet the sharp and tangible edges of practical realization.

For Dewey, children and adolescents educate themselves through contact with an external environment where they interact and recognize themselves as equal to their peers and unique in their differences. Discovering their belonging to nature and various social institutions through experience leads to a recognition of themselves as part of a community and the discovery of the world as "other than oneself".

## **2. LIVING ART. AESTHETIC AND POLITICAL DIMENSIONS**

### **2.1. The Value of Imagination**

Experience serves as the "means" to experience the world, oneself, and the "way" in which this occurs. In experiential tension, not everything is nature, matter, and reality; imagination also plays a vital role. Today, imagination is rarely practiced because everything is given, defined, and generated by digital technologies of audiovisual reproduction. It is also underused due to a lack of opportunities in a society dominated by the myth of efficiency, the rejection of waiting times, the elimination of rest areas in cities, and the removal of any moments of boredom, inactivity, and free play from people's lives (Han, 2015).

For Han, a society driven by the hysteria of "achievement" and by the neurotic obsession of hyperactivity has lost its possibility of contemplation, a spiritual relationship with the world through the calm and slow gaze on things and on others (Picchione, 2023, 8).

All situations where imagination might come into play are disappearing. Empty times and spaces are now filled by scrolling through texts and data on smartphone screens.

As early as 1980, Anna Maria Ortese, reflecting on the importance of creative expression in the relationship between children and adolescents and reality, referred to this phenomenon as an “imaginary amputation” (Ortese, 1997, 61-62), describing how young people enter the world solely through “the possession of market goods” (Ibid., 61). It is as if the writer foresaw the pervasiveness of digital multimedia technology, which offers an “already made” world, leaving no room for invention and creativity. Digital devices, especially smartphones, on which we constantly type, create the illusion of total availability of people, things, and places simply because their image exists and can be managed with a “tap” (Han, 2017).

Art is a precious experience because it opens the door to imagination and beauty in an era where economic policies push us to exclude the aesthetic dimension from daily life, reducing art to mere entertainment. Imagination fosters knowledge and the creation of worlds that, though not real, can become the object of human experience: “Human experience however has also the pathetic longing for truth, beauty and order” (Dewey, 1929, 59). It helps us experience the world beyond the material and the contingent, urging us to open to the “beyond”. The desire to know other situations, worlds, and contexts signals a practice, a proposal for civilization, freedom, and humanity.

In *Art as Experience* (1934) Dewey highlights the nature of aesthetic experience and emphasizes the close relationship between the individual and the world. This relationship begins with the environment and aims not only at discovering reality but also at transcending it. These dimensions become knowable through perception, facilitated by the senses, and amplified by an aesthetic sentiment (Dewey, 1980, 194-195).

Theatre represents the ideal art form for activating this interplay of perception because it does not produce an object but offers a sensory experience open to imagination and creativity. Furthermore, theatre is an inclusive and sustainable art form, requiring only human participation to access and practice it (Brook, 1968; Brook, 1993). Dewey views the complexity of artistic experience without imposing limits on the artist’s creative possibilities or the observer’s interpretative capacities. The birth of a work of art catalyzes layers of meaning from both the artist and the observer.

## **2.2. The Value of Community**

Art is a complete object itself, but it also needs to be completed through the sensitivity of its audience. This makes a work of art a product of human experience, ever renewed in the present yet layered and enriched with past experiences, contexts, and cultures. There is a close connection between art, culture, and the society of previous eras. A work of art inherently contains past experiences and elements drawn from diverse sources. For Dewey, art enables us to penetrate the fundamental attitudes of entire eras and civilizations. Works of art serve as the axis of continuity in a community's life, representing its highest expression due to their imaginative quality, which brings customs, laws, and rituals to life.

Artistic experience enables a transition from the “private” to the “public” and is characterized as an opportunity to communicate with humanity, fostering unity and solidarity. Art becomes a common language for collective action, a chance to engage in an organic experience with the world and nature.

Art possesses an exceptional capacity for communication, overcoming linguistic barriers, and cultural differences among individuals. Experiencing art is an active, vital activity rather than a passive one. Dewey's reflections link experience with knowledge, attributing equal importance to both. Experience is the knowledge through which the world is built; it is an active, direct knowing experience. Dewey's model appears particularly relevant today, showing its inner revolutionary potential. While art may have lost its ritualistic and religious dimensions, it persists as one of the most complete and fulfilling experiences. It considers the complexity of individuals and the educational process.

Dewey's perspective is open, inclusive, and reasonably focused on the future while deeply rooted in the past and firmly grounded in the present. Among its many facets, art emerges as the “most beautiful” and complete, which Dewey approaches naturally, dismantling any separation or distance:

In the end, works of art are the only media of complete and unhindered communication between man and man that can occur in a world full of gulf and walls that limit community of experience (Dewey, 1980, 105).

Today's society has undergone unimaginable transformations compared to Dewey's era, yet his lessons remain relevant. In this new context, dominated by increasingly invasive technologies, individuals must navigate a world where, acting organically, in a continuum with nature and others, is ever more challenging. Through theater, pedagogical and aesthetic experiences can

provide new opportunities for design and implementation in democratic schools. They can contribute to creating a new educational paradigm that is more attuned to and open to the arts (visual, musical, choreographic, etc.) and can make young people's relationship with cultural heritage more varied and inclusive. This approach fosters love, knowledge of one's culture, and respect for others.

Establishing theatre workshops and regular access to live performances can significantly contribute to educating students, to be more aware of the values of active citizenship and social solidarity. This is particularly critical in an era where concepts of community and participation are undermined by excessive individualism and unconscious use of digital media. Efforts must be made on multiple fronts, with strategies encompassing pedagogy, aesthetics, politics, rights, and ethics (Casonato, 2022; Fabris, 2012). These should protect the most vulnerable from the intrusiveness and pervasiveness of the misuse of digital technologies and promote activities that encourage creativity, imagination, spontaneity, and expressive freedom.

As Franco Lorenzoni reminds us, arts – especially theatre, music, and singing – enhance learning and help build democracy (2023, 76-77). Perhaps this is why, even today, the singing of women<sup>1</sup> causes fear in the Taliban regime in Afghanistan.

# EDUCATING ARTIFICIAL INTELLIGENCE TO ENHANCE UNIQUENESS

Concetta Ferrantino<sup>a</sup>

Roberta Scarano<sup>a</sup>

Marika Calenda<sup>b</sup>

<sup>a</sup>Università degli Studi di Salerno; <sup>b</sup>Università degli Studi della Basilicata

Creating a school that addresses the diverse needs of all students necessitates implementing inclusive practices that foster participation and enhance the learning experience. The concept of inclusion now focuses not only students with disabilities but also how schools can meet various needs (Demeris, Childs, and Jordan, 2007). The principles of Dewey's democratic school are aligned with this shift, which emphasizes the importance of social progress in the development of constructive learning (Spadafora, 2015). Recently, there has been a push to incorporate digital tools into educational practices (Parra González et al., 2019). The use of robots in education is increasing, with the goal of improving digital skills, computational thinking, and AI education to create inclusive processes for children and young people. Continuous improvement of teaching practices is necessary to integrate the potential of AI into educational processes within this transformative logic. Based on these premises, the aim of this work is to extract specific information about AI education through the voices of key educational stakeholders.

Artificial Intelligence; inclusion; learning by doing; digital competence.

## INTRODUCTION

Establishing a school that aims to address the diverse needs of all students necessitates the implementation of inclusive practices that foster participation and enhance the learning experience. School inclusion is a multidimensional phenomenon, encompassing organizational, methodological, and didactic dimensions (Cottini, 2017). The complexity of this phenomenon is justified by regulations and official documents from national and international relevant bodies. However, the transformation of the school into an inclusive environment remains a challenge. The logic of inclusion now focuses not only on students

with disabilities but also on the ability of schools to accommodate a variety of needs (Demeris, Childs e Jordan, 2007). This shift aligns with the principles of Dewey's democratic school and emphasizes the centrality of the influence of social progress in the development of constructive learning (Spadafora, 2015). In educational processes, attention has shifted from knowing and doing to the need to read and educate for the complexity of action (Ciappei e Cinque, 2014). In recent years, efforts have been made to integrate digital tools into educational practices (Parra González et al., 2019). Studies have highlighted how extended reality, combining real and virtual environments with human-machine interaction, can promote the development of authentic learning (Ausubel, 2004). A growing trend in education proposes activities using robots for children and young people, introducing themes of digital skills, computational thinking, and education for artificial intelligence (AI) to generate inclusive processes. Beyond the technical aspects of understanding how AI systems work and how algorithms are built, it is essential to introduce students to AI education that includes an active, reflective, and ethical plan. This novel educational approach encourages awareness of being digital citizens (Council of Europe, 2019). To work within this transformative logic, integrating the potential of AI into educational processes requires continuous improvement of teaching action.

## **1. AN INCLUSIVE SCHOOL FOR THE VALORIZATION OF UNIQUENESS**

The need to create an inclusive school, with a renewed teaching culture capable of benefiting from the pedagogical principles, leads to reflecting on the need for adapt and regenerate theories, practices and actions in education and training systems.

The model of inclusive education requires that educational systems develop a student-centred pedagogy, responding in a flexible way to the needs of each. This pedagogy, taking up the founding values of the inclusive school manifesto, namely the Declaration of Salamanca (UNESCO, 1994a; 1994b), is based on the idea that differences should be considered as a resource for education. The enhancement of differences requires the ability of education systems to identify and respond appropriately to the diverse educational needs of pupils. The full realization of the inclusive education system, therefore, does not consist in giving a place in school only to those who are representatives of some diversity, it consists in transforming the school system into an organisation suitable for the educational take-up of the different needs that each pupil may encounter

(Lascioli, 2011). It becomes essential to raise cultural awareness of the theme of differences in schools and society, with the aim of promoting awareness of the main obstacles that influence the process of school inclusion at different levels: scientific, technical, social, cultural and political (Vannini, 2019).

Those who really work in an inclusive perspective act on the devices, mechanisms and contexts that must be changed, as inclusive education is a challenge to the normativity typical of the assimilationist paradigm of regular school (Bocci, 2018, p. 21).

The logic of inclusion focuses on the ability of schools to accommodate a variety of needs (Demeris, Childs & Jordan, 2007), recalling the principles of the Dewey's democratic school and the centrality of the influence of social progress in the development of constructive learning (Spadafora, 2015).

Dewey's arguments are still relevant to the current educational situation and the educational needs of a globalized society. In fact, the importance of implementing an active and constructive teaching-learning process, in relation to the social dimension of the subject, is recalled in many national and international educational research and documents. The construction of competence, on which the entire national and international school system is based, refers not only to resources of a cognitive nature, but also to the ability to act, to be able to act and to want to act (Le Boterf, 2008). Another tangible example is taken from the National Guidelines (2018), in which underlines the need to:

- build a learning environment able to value the experience and knowledge of pupils, to anchor new content;
- implement appropriate interventions for diversity, to ensure that it does not become inequality;
- encourage exploration and discovery in order to foster the desire to seek new knowledge; encourage collaborative learning;
- promote awareness of one's own way of learning, in order to learn how to learn and to carry out teaching activities in the form of a workshop.

Dewey proposes, in his various works, a conception of teaching very advanced compared to its time and absolutely in line with current research. Nowadays didactics is no longer considered as a mere operational and/or application discipline but as an education science with its own epistemological status that reflects on the relationship between pedagogical theory and teaching practice, between learning content and the learner's development, between

environmental conditions, space, time, relationships, socialisation and learning processes (Franceschini, 2023).

In the training processes, therefore, it is necessary to understand the current complexity of the teaching action, with the aim of creating a continuum with the daily life of the student in training (Ciappei & Cinque, 2014; Parra González, Segura Robles, Fuentes Cabrera, & López Belmonte, 2019). One aspect that is certainly relevant in the current education system is inherent to the experience of the subjects being taught, and this is given by the digital world. More recently, attention is being drawn to the first literacy on the subject of artificial intelligence (AI) education. The latter should be a priority in any education system. Although the potential of educational robotics is now many, it is also necessary to ask what it means for a teacher to educate AI.

## **2. EDUCATING ON ARTIFICIAL INTELLIGENCE**

AI education mediated by the construction of a curriculum design is a theme that must be considered, first of all, with aspects of ethical and social nature. However, as Nan emphasises (2020)

due to the relatively short period of birth of artificial intelligence technology, many teachers still consider it a high-end and very mysterious technology (...). The essence of real artificial intelligence education is no different from that of multimedia and the Internet (p. 1).

The teaching of fundamental AI and computer science subjects at school or pre-school level, nowadays, does not exist or is at an embryonic level. However, it is a priority that pupils are introduced to an AI education that includes an active, reflective and ethical level: an education that stimulates awareness of being digital citizens (Council of Europe, 2019).

Less isolated than a few years ago, the school system is spreading the idea of offering children and young people educational activities based on the use of robots to introduce the topic of digital skills, computational thinking and artificial intelligence (AI). Robotics can be successfully employed and to do this it is necessary to make both teachers and students understand that the robot can only mediate the teaching-learning experience, but they remain active builders of the learning process. Given this, it is possible to identify great potential for the use of robots and AI in education (Cheng, Su & Chen, 2018), such as:

- the ability to reproduce and perform repetitive tasks with precision;
- flexibility, interactivity, humanoid aspect (including body movement);
- simplifying learning through play and hands-on experiences;
- creating an engaging, attractive and interactive learning environment;
- the possibility of increasing student motivation and learning performance.

In addition, learning activities mediated by robot and AI can help develop learning skills such as those related to science, technology, engineering and mathematics teaching (STEM). This type of experience has developed mainly within certain disciplines and in certain age groups of students. In fact, a form of literacy mediated by the use of such mediators from early childhood would be desirable. Literacy is mentioned precisely because it is considered necessary to understand the potentialities and risks. To do this, it is necessary to approach the first form of knowledge. Indeed, in preschool age, robots and AI can be used for educational purposes through the play dimension, but only after a digital literacy by all actors involved in the process.

Before teachers and educators at all levels are hurried to exploit robotics in education, appropriate teaching methods must be formulated and incorporated into the school curriculum, since most schools and teachers not only lack experience and resources, but in most cases, they also have to operate under a school directive that does not encourage educational innovation (Alimisis & Kynigos, p. 1).

What potential does AI offer for the development of cross-cutting skills? What strategies should be adopted in the classroom for its use? What dimensions of learning can be involved? How well trained are the teachers in these subjects from a theoretical-practical point of view? How aware are students of these changes?

Starting from these questions and the theoretical premises described, it is intended to start focus groups in the various preschool and primary schools of the province of Salerno to obtain, through the voice of the main school stakeholders, specific information on the topic of AI education and understand how to act, later, with projects targeted at those needs. The didactic action, only if collegially shared, in terms of practice and culture can generate a formative process of real inclusion: therefore, not the path of the individual compared to class, but the path of the class that values the individuals (Notti, 2021).

## CONCLUSION

The educational action, only if collegially shared, in terms of practice and culture can generate a formative process of real inclusion: therefore, not the path of the individual compared to class, but the path of the class that values individuals (Notti, 2021). Collegiality, in fact, remains a fundamental feature for the success of training. Only the collective dimension can make the community become an educational community. The latter must necessarily interact with the cultural and social context and the changes inherent in it to determine a quality, equitable and inclusive training for all. Today the educational challenges are multiple and global, and it is necessary to reverse our visions of knowledge and move our center of observation and action to seek co-constructed paths in terms of teaching practice. The study, still in its embryonic stage, aims to enhance the promotion of research-training courses that actively involve teachers and students as representatives of the essence of the educational process.

The beliefs, attitudes and actions of teachers and students on innovative technologies may in fact be a driving force or barriers to their full implementation (Hew & Brush, 2007) and to provide a meaningful picture of their role within inclusive learning systems.

# EDUCATION OF THE FUTURE: AN INTEGRATED APPROACH BETWEEN JOHN DEWEY AND ARTIFICIAL INTELLIGENCE. WHAT PERSPECTIVE FOR CHILDREN WITH SPECIAL EDUCATIONAL NEEDS?

Carolina Leva  
University of Basilicata

According to John Dewey, school is the key to understand democracy, conceived as the full realization of the person, a moral and dynamic realization that “must” extend to the entire community (Pezzano, 2014). Therefore, school must represent “the laboratory of democracy”, that is to say a “way of life” towards which every person must naturally tend in their individuality and in their natural tendency to associate (Spadafora, 2018). In the current context emerges the need to reformulate traditional educational paradigms due to rapid changes and global challenges. With his emphasis on experiential learning and the social function of education, John Dewey provides a solid base to develop a fresh outlook for the school (Dewey, 1938). Similarly, the advent of artificial intelligence (AI) in the field of education is a key tool to optimize learning paths (Luckin et al., 2016). The integration of John Dewey’s visions with AI can give life to a sustainable educational model. This helps students not only to face the present challenges but also to design their own future. John Dewey emphasised the values of an education capable of fostering critical inquiry and active learning (Dewey, 1938).

Education; Artificial Intelligence; Special Education

## INTRODUCTION

The use of AI in education has shown significant progress, from personalizing learning paths to assessing skills (Baker & Smith, 2014). This vision finds increasing quality in the potential of AI as capacities of providing personalized learning based on competencies, which meets the individual needs of students (Zawacki-Richter et al., 2019). However, the integration of AI raises ethical and practical issues, including the need for adequate infrastructure and policies for

data protection (Holmes et al., 2019). An educational model that integrates AI to Deweyan principles requires an holistic approach treating students not only as learners but as active citizens (Selwyn, 2017). Project-based learning, supported by AI, can facilitate rich and engaging educational experiences, promoting collaboration, critical thinking, and the solution of real problems (Zhang et al., 2018). Adopting an educational model inspired by Dewey and enhanced by AI requires a renewal of teaching practices and educational policies. Educators must be trained on how to effectively use AI technologies, while institutions must ensure that such technologies are used ethically and inclusively. In terms of inclusion, AI is able of enhancing learning facilitation processes and better guiding individuals with disabilities to design their life choices (Fabiano, 2022). In conclusion, the integration of Dewey's educational visions with the capabilities of AI offers a unique opportunity to realize an education that is truly sustainable, equitable, and capable of preparing students for the challenges of the future. This requires active cooperations between all the proponents of these practices in order to ensure that technologies are employed in a way that increases the educational experience without replacing the fundamental human interaction for learning (Facer & Selwyn, 2021; Perla, 2023).

## **1. INTELLIGENT TUTORING SYSTEMS (ITS)**

Sleeman and Brown, in 1982, introduced the term “Intelligent Tutoring Systems” (ITS) to describe software designed to facilitate learning through tutorial services that exhibit a certain degree of “intelligence” in their functioning. ITS are computer-based learning environments that use intelligent algorithms to:

- Support students in acquiring knowledge and skills.
- Dynamically adapt their behavior based on the specific needs of each learner, identified during the learning process.

This passage highlights the main advantages of computer-based tutors in education. The key points are:

- Continuous availability: They provide ongoing support, overcoming the time and patience limitations of human tutors.
- Reduced pressure for students: By alleviating the fear of making mistakes compared to interactions with a human tutor, they foster a more relaxed learning experience.

- Personalized activities: They tailor explanations, questions, and practice sessions to the specific needs of the learner, enhancing the effectiveness of individualized learning.
- Constant monitoring: They support personalized instructional programs through their ability to monitor and dynamically adjust to the student's progress.

These aspects make ITS powerful tools for improving the educational process. Research shows that Intelligent Tutoring Systems are comparable to human tutors in terms of effectiveness in one-on-one tutoring, especially in well-defined knowledge domains such as mathematics or physics. Moreover, they are significantly more effective than traditional classroom interactions (Trincherro, 2022).

Despite their theoretical potential and empirical confirmations, ITS (Intelligent Tutoring Systems) are not widely used in education and training. This is mainly due to the difficulty and costs involved in creating comprehensive knowledge bases, which are only economically viable for courses aimed at a large number of learners, such as in military training or basic courses. The situation becomes even more complex if loading the knowledge bases requires programming skills from domain experts or the use of complex interfaces. Furthermore, update costs are significant, as knowledge bases must adapt to the evolution of knowledge, teaching methodologies, learner characteristics, and the technological interfaces used. Therefore, there is a risk of investing significant resources in a product that could become obsolete within a few years (Ritter et al. 2014). To perform its functions, an ITS must manage various elements of knowledge. These range from knowledge of the topics to be taught, to managing the learning objectives and sub-objectives, to understanding the ways in which students process and assimilate information, as well as knowledge of the best teaching and assessment methods. Such knowledge is essential for creating flexible tutoring plans that can identify discrepancies between students' acquisitions and the expected knowledge/skills and define a plan to bridge them. In the traditional architecture, an ITS includes four fundamental components: the domain knowledge model (what is taught, in terms of knowledge, skills, and competencies), the student model (who it is taught to, in terms of cognitive, metacognitive, emotional, and motivational characteristics), the tutor model (how it is taught, in terms of tutoring techniques and strategies), and the user interface (how interaction takes place, both between the ITS and the student and between the ITS and the domain expert) (Trincherro, 2021).

The current (and future) challenge is to create a machine capable of:

- “Learning” a specific topic by interacting with various information sources, integrating different perspectives;
- Diagnosing a wide range of student characteristics (cognitive, affective, and motivational) to define optimal learning paths;
- Adapting its tutoring actions to the learner’s needs, presenting information in different ways, optimizing cognitive load, providing personalized feedback, and using “social intelligence” techniques to increase motivation for interaction;
- Promoting exchange and collaboration among learners, encouraging dialogue, shared knowledge construction, and the linking of experiences (Yang, Zhang 2019).

## **2. FROM ITS TO ITR: SOCIAL ROBOTS AS INTELLIGENT TUTORING AND COMMUNICATION SYSTEMS**

The challenge that presents itself today and will extend into the future is to develop a machine capable of:

- “Learning” a specific topic by interacting with a multitude of information sources, gathering, comparing, and integrating different perspectives and opinions in order to gain a deep and multifaceted understanding of the subject;
- Diagnosing a wide range of student characteristics precisely, understanding cognitive, affective, and motivational aspects, in order to design personalized and optimal learning paths for each individual;
- Dynamically adapting its tutoring strategies based on the learner’s needs, presenting content in various formats, minimizing cognitive load, providing specific and targeted feedback, and using forms of “social intelligence” to stimulate motivation and interaction, leveraging a broad repertoire of effective teaching methods and techniques;
- Promoting and encouraging collaboration among learners, fostering dialogue, co-creation of knowledge, and the linking of personal experiences to stimulate a shared and interactive learning environment.

Robotics, combined with artificial intelligence and distributed information processing through high-speed mobile networks, can contribute to the creation of effective ITS (Intelligent Tutoring Systems), evolving them into ITR (Intelligent Tutoring Robots). Specific studies highlight that tutor robots can:

- provide personalized interactions with specific users;
- offer learning paths with gradually and purposefully increasing levels of difficulty;
- leverage the potential of learning analytics and educational data mining. These elements collectively enhance learning outcomes (Trincherò, 2022; Brignone, Grimaldi, Palmieri, 2021).

ITRs can complement traditional ITS by incorporating para-social interaction and the use of surrounding space and objects as learning aids, which is useful for teaching fine motor skills (e.g., handwriting), gross motor skills, rehabilitation, and enhancing specific functions in individuals with disabilities. Research shows that physical interaction with a robot increases engagement compared to a virtual agent and provides positive tutoring effects in various contexts. An intriguing area of application is the use of ITRs to foster self-regulated learning in children, promoting self-monitoring, goal management, and targeted support requests. Research on Interactive Tutoring Systems (ITS) is recent and has several areas for improvement, including:

- Recognition of the learner's mental states: the ability to understand when the student is attentive, motivated, or needs different stimuli.
- Long-term strategic choices: difficulty in guiding the student's actions, similar to human tutors, related to a vision of the future.
- Personalization of interactions: depends on the quality of the student model and its ability to dynamically adapt to the student's progress.
- Optimized management of interactions across multiple sessions: the ability to retain and update information about the user and propose distributed practice and concept revision over time (Trincherò, 2022).

In summary, ITRs (Intelligent Teaching Robots) are advanced robotic systems capable of moving autonomously within defined spaces, such as a classroom during regular educational activities. These robots are able to learn by observing both the teacher and students as they interact and work. They can engage in conversations, ask specific questions to explore topics or concepts, and provide answers enriched with knowledge acquired through quick consultation of online resources.

Such systems could become valuable allies for teachers, offering both cognitive and motivational support, helping to facilitate the learning process and enhance classroom interaction. However, this possibility raises important issues regarding privacy and the ethical aspects of using advanced technologies in

educational settings. Despite the challenges it presents, the introduction of such technologies opens up a broad range of opportunities for future research, inviting in-depth reflections on how to responsibly integrate these resources into the educational world.

# HOW TO FACE ARTIFICIAL TYRANNY. HOW GOOD THINKING SAVES DEMOC- RACY IN THE IN THE AI ERA

Aldo Pisano<sup>a</sup>

<sup>a</sup>University of Calabria

This paper examines the contemporary relevance of active thinking, to argue for the centrality of critical reflection and free argumentation in fostering democratic processes. Anchored in Arendt's view of individuals as social actors entering the world through actions and discourse, the study underscores the importance of educational environments centred on dialogue and co-construction of knowledge. These environments enable the development of skills complementary to computational thinking, with divergent thinking supporting pluralism and democracy. In the context of AI, the increasing reliance on mathematical models risks prioritising algorithmic cognitive processes, rooted in an erroneous presumption of AI as inherently accurate and infallible. This paper critiques such assumptions and advocates for strengthening debate, critical thinking, and constructive reasoning as tools to safeguard democratic ideals. By rehabilitating dialectics as a mode of engagement, it reaffirms the role of pluralism in problem-solving and social deliberation. The study calls for education that promotes active thinking, dialogue, and free debate, countering the "tyranny of truth". This approach resists delegating responsibility to abstract systems, encourages frame analysis, and democratic processes. Ultimately, it positions debate as an ethical and political practice essential for navigating the complexities of modern society.

Artificial Intelligence; Dewey; Thinking; Ethics; Education

## INTRODUCTION

This paper builds upon John Dewey's conception of thinking as presented in *How We Think* (1933 edition), considering the wide use of AI as a tool to impose mathematical and computational thinking. In the opening pages, Dewey analyzes what should be defined 'good thinking' in relation to reflection activity as a way to return on state of mind or state of facts re-discovering them in a not-biased sense: "The better way of thinking that is to be considered in this book is

called reflective thinking: the kind of thinking that consists in turning a subject over in the mind and giving it serious and consecutive consideration” (Dewey, 1933, 3). Dewey’s theory finds references in the epistemological theories of Francis Bacon<sup>1</sup> and John Locke, particularly regarding knowledge and belief. Notably, Dewey associates flawed thinking with what might now be recognized as cognitive bias. Furthermore, Dewey’s discussion of autonomous thought emphasizes a philosophical approach grounded in uncertainty and doubt. To ‘think well’, he argues, one must critically reassess beliefs (including biases) acquired through formal education. This process reveals a paradox inherent in the relationship between education and democracy. Indeed, in the framework of ‘critical ethics’ (Da Re, 2011; Arendt, 1965-66), democracy provides individuals with the freedom to critically evaluate the values and cultural norms that shaped them in the context where they live.

In this sense, for Dewey, ‘good thinking’ constitutes an ethical habit—or attitude—that must be cultivated through education and safeguarded by democratic structures. This intertwining of education, democracy, and ethics underscores the transformative potential of critical reflection in fostering autonomy and intellectual growth.

About the idea of Artificial Intelligence, from Turing’s paper published on *Mind* in 1950 and from Dartmouth Congress in 1956, something started changing. In the beginning, the idea was to develop a computational system which could ‘think’ as a human being. Now, it seems that the best way of thinking matches with the computational one (e. g. HIP model). This inversion – where a good way of thinking conforms itself to a formal-mathematical model – finds its basis on two biases:

The analogy bias. The idea is that individuals could be biased in their representation of AI as scientists started using ‘intelligence’ for machines in an inappropriate way. According to Dewey’s theory, thinking is a way of intelligence that is properly human; and if a machine cannot think – that is the question posed by Turing in 1950 – then it cannot be intelligent with reference to human intelligence.

The second one is the automation bias – the representation of the machine (AI) that cannot fail because it is a model of computation-based thinking. The problem comes moving from the problem-solving logical dominion to the decision-making ethical dominion. Applying the formal-mathematical model in

---

<sup>1</sup>Specifically, the reference is to the *Novum Organum* and Bacon’s epistemology, when the philosopher introduces the concept of ‘idola’.

both fields is a sort of mathematical fallacy. Differently from the “is-ought” question opened by David Hume (Hume, 2011) and from *Principia Ethica* (1933) by George Edward Moore, the derivational problem remains the same. In this case, the error is to tail a practical reasoning (thinking) on formal propositions – and they are not the same think considering a frame analysis approach. The fallacy is that Prescription (ethics) cannot be derived from logically correct proposition.

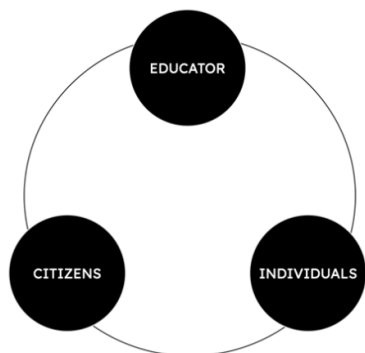

Dewey’s idea of thinking is closer to the activity to criticize bias in a democratic society where decisions are taken through debate, forum and dialectics: “We may recapitulate by saying that the origin of thinking is some perplexity, confusion, or doubt” (Dewey, 1933, 15). This idea of thinking can help in risk prevention about AI pervasive use. The answer to face this risks and challenge is Education of individuals as future citizens and workers who must revision the automation bias in order to avoid the tyranny of truth (Arendt, 2004).

## 1. THINKING, DEBATING AND DEMOCRACY

Greek *Paideia* (Jaeger, 1978) played a significant role as educational model. Its aim was education of individuals as both independent personality and as members of a world built through interactions with others. Therefore, education blended a conformational model based on historical state laws and traditions (heteronomy) with an individuation model grounded on critical thinking (autonomy) (Figure 1).

Education, in the first place, is not an individual affair, but, by its very nature, a matter of the community. The character of the community is imprinted in its individual members, and in man, *zoon politikón*, it is the source of all action and behaviour to an extent that has no parallel in the animal (Jaeger, 1978, 1-2).

Figure 1. Paideia Circle from Educator to Individuals to Citizens

Education is not only an individual issue, but it is about community:

Education, in the first place, is not an individual affair, but, by its very nature, a matter of the community. The character of the community is imprinted in its individual members, and in man, *zoon politikón*, it is the source of all action and behaviour to an extent that has no parallel in the animal (Jaeger, 1978, 1-2).

Education preserves pluralism starting from individual development. In the contemporary era, AI speaks a univocal, mathematical, or ‘aletheic’ language, referencing the formalistic-platonic model (Mubeen, 2023). It can precisely express truth because it is free from any sensory contamination, being a pure mathematical expression. AI is a sort of divine thought (Snell, 2002): disempowering and annihilating every form of dialectics and freedom of argumentation. Entrusting action to the machine easily leads to a scientific-demonstrative model that exceeds the proper domain of ethical and political decisions. From a logical perspective, as Boniolo and Vidali write,

Dialectical argumentation arises from the necessity of addressing, through rational discussion, cognitive domains where the truth of premises is not recognized. It is not just any discussion, therefore, but a confrontation between positions, in which logical principles – first among them the principle of non-contradiction – are respected, and argumentative fallacies are avoided (Boniolo & Vidali, 2011, 15).

The crisis of the neopositivist model of knowledge and science, the crisis of ideologies, which “has reintroduced the need to delve deeper into premises and values otherwise taken for granted or considered beyond rational evaluation” (*ibidem*), the democratization of decision-making processes, “which entails discussion and deliberation based on arguments and opposing theses” (*ibidem*), communicative development, and the globalization “of exchange processes and knowledge” (*ibidem*). All these elements have rehabilitated the value of dialectics. Dialectics should be addressed as an argumentative confrontation/clash over solutions/conclusions that cannot be framed as universal and necessary, but are instead contingent on the specific scenario. The space of democracy is built through dialectical plurality, debate, and free participation via actions and words. This is also Habermas’ perspective about rationality which “concerns not so much knowledge and the acquisition of understanding but rather how language- and action-capable subjects use knowledge” (Habermas, 2022, 53). This notion is also deeply rooted in Arendt’s political conception: “Through words and speech, we insert ourselves into the

human world, and this insertion is akin to a second birth” (Arendt, 2014, 128). Such plural space is threatened by the technocratic degeneration of ‘algorithmic aletheia’ (Sadin 2019). The ethical risk lies, therefore, in entrusting AI with decision-making processes without a critical analysis of the potential dangers to democracy, free debate, and situational analysis (frame analysis): “Statements (...) once perceived as true and declared so, share the characteristic of being beyond agreement, discussion, opinion, or consensus” (Arendt, 2004).

If this formal-mathematical model dominates:

- In Education, the risk is to compromise critical thinking in favor of a computational approach;
- In Politics, the risk is to over-trust AI;
- In Society, the risk is to think that decisions can rely only on rigorous demonstration and not on dialectics;
- In Ontology, the risk is to reduce individual and systemic complexity and to impair truth.
- An example of how truth can be compromised is the reiteration effect, which reinforces bias. The perception of false information as fact often depends on the number of communication channels disseminating it. The greater the repetition and reach of such information, the more likely it is to be accepted as true. Chatbots, such as ChatGPT, contribute to this phenomenon by acting as additional channels. If automation bias is not addressed, this can lead to a self-perpetuating cycle of misinformation. While this cycle is facilitated by machines, it is ultimately shaped by human interaction within flawed human-computer interfaces (HCI), resulting in significant ethical implications. By catering to human biases, these systems not only reinforce misinformation but also pose a threat to democratic principles.

## **2. EDUCATION AND CRITICAL THINKING IN THE AI ERA**

In education today, thinking cannot be introduced as a formal model without considering it as genuine human process. Dewey would disagree about this, because such an idea of thinking is only a logical procedure, but not human-centered one.

On this subject, in *How We Think*, Dewey writes:

Because forms are uniform and hospitable to any subject matter whatever, they pay no attention to context. Actual thinking, on the other hand, always has reference to some context. It occurs (...), because of some unsettled situation that itself lies outside of thinking (Dewey, 1933, 72).

As long as we live in a human-tailed world, thinking is thinking about human categories and ideas: “it is evident that education is primarily concerned with thinking as it actually takes place in human beings” (Dewey, 1933, 75). Education through active thinking, dialogue prevents the risk of a tyranny of truth. As Dewey poses, what an educator should do is to teach critical thinking as a habit. Critical Thinking opens to democracy as far as it is assumed as an ethical disposition. In education we can provide some strategies to support a critical approach to AI:

- Inform about the automation bias through a model of AI and Ethics Literacy (Pisano, 2023).
- Empowering Education about critical and lateral thinking in order to promote democratic sharing of ideas and pluralism, even using AI. Every argument can start from premises which are ‘shared by most’ and not only founded as mathematical premises.
- Fact checking rules encouraging lateral reading and divergent solutions.
- Frame analysis to understand that one simple solution cannot be applied in all possible scenarios. Dewey writes: “correct thinking does not limit itself to finding ‘any’ kind of relation, but conducts the search until it has found an accurately defined relation as far as the situation allows” (Dewey, 1933, 80).
- Argumentation skills in decision making processes (Simon, 1987).

Ethics and Education come together in order to save democracy, starting from the risk that we run to conform to a computational model the thinking model of individual student.

# REFLEXIVITY: LIGHTS AND SHADOWS OF THE RELATIONSHIP BETWEEN TECHNOLOGY AND EDUCATION

Maria Sammarro<sup>a</sup>

Silvestro Malara<sup>b</sup>

<sup>a</sup> Mediterranean University of Reggio Calabria; <sup>b</sup> Mediterranean University of Reggio Calabria

In the work *How We Think* (1910), Dewey places reflective thinking at the centre of his discussion, which is considered “the best way of thinking” and implemented when we faced with a problematic situation with no certain solution. As a result, the need arises to create new patterns of action, modifying or replacing previous ones. Reflective thinking enables the individual to question the logic behind the interpretation of everyday life experiences, that is, all those actions that are habitually performed following the interpretive canons given by past experiences. Therefore, enhancing the generative drive of thought through the development of critical and reflective thinking is one of the challenges of complexity culture. But how are the characters of reflexivity, freedom and self-awareness (Cambi, Pinto Minerva, 2023) combined with the assumptions of the onlife Era (Floridi, 2015), a new existence within which the real and virtual merge (and blur) and where the speed and instantaneousness of social networks do encourage instantaneous and unthoughtful reactions? Tech-age education calls for a post-human broadening of the field of experience. The very technology that has changed times, liquefying them, and dilated places, even defining them as non-places, can represent a crossroads of new reflexive intentionalities, and the peculiar conjunction of reflexivity and new technologies seems to be an opportunity for authentic educational design. There is a need, therefore, to find that Pirandellian lantern which allows one to illuminate experience and to sift through the fallout it has in the re-elaboration of consciousness, as guarantee of the “proper distance”, wished by Silverstone (2007), which requires the world of education, to reconfigure itself as a promise of generativity, of identity construction and social inclusion also in the era of technics and technology (Bonaiuti et al., 2017). The encroachment thus initiated, mediated by the virtues of the digital (Rivoltella, 2015), builds bridges between the analog and the virtual, the old and the new, the human and the post-human, preserving the all-too-human and ethically set creative act of all cultural artifacts.

## INTRODUCTION

In his work *How We Think* (1910), John Dewey places reflective thought at the center of his discussion, considering it “the best way of thinking” and defining it as a process activated when one faces a problematic situation with no clear solution. This triggers the need to create new action models, modifying or replacing the existing ones. Reflective thought enables individuals to question the logic behind their interpretations of everyday life experiences those actions habitually performed based on interpretive frameworks derived from past experiences. For Dewey, reflective action occurs in problematic situations without a certain solution, prompting the creation of new action models. He describes the function of reflective thought as “to transform a situation in which one has experienced darkness, doubt, conflict, or some disturbance, into a clear, coherent, resolved, harmonious situation” (Dewey, 1910, p. 172).

Dewey contrasts reflective thought with other types of mental processes commonly referred to as “thinking.” The first type is the so-called “stream of consciousness,” characterized as an “uncontrolled course of ideas,” “automatic and ruleless,” a “disorderly meandering of mental images, random reminiscences, pleasant but unfounded hopes, rapid and sketchy impressions” (Dewey, 1910). It consists of a more or less extended sequence of ideas without a particular order, where the ideas are connected but lack a unifying principle to guide the sequence. In contrast, reflective thought is not a chaotic sequence of ideas but a “sequence” of ideas: “an ordered series or chain,” a consecutive order where each idea determines the next as its result, and each result relies on or refers to what precedes it.

The second meaning of thought is limited to “things not directly perceived or felt, things not seen, heard, touched, smelled, or tasted” a purely imaginary construction produced by imagination. In this sense, “a thought or idea is a mental representation of something not currently present, and thinking is the succession of such representations” (Dewey, 1910). Reflective thought, however, aims at a conclusion: the chain of thoughts must lead toward a specific endpoint or conclusion established beyond the mere flow of images.

The third definition of thought aligns with belief, encompassing matters about

which we lack certain knowledge but are sufficiently confident to act upon, as well as matters we currently accept as true or as knowledge but might question in the future. Thinking as synonymous with believing is a decidedly passive operation: it entails adopting ideas from others and accepting them because they are commonly held, not because the individual has examined the issue or actively contributed to forming that belief. Such ideas, often termed prejudices (premature judgments not derived from observation or data analysis), infiltrate the mind and become part of our mental framework without our conscious awareness. Reflective thought, in contrast, involves an active process: “it requires examination, careful inquiry, and personal investigation” and consists of an “active, persistent, and diligent consideration of a belief or hypothetical form of knowledge in light of the evidence that supports it and the further conclusions to which it leads.”

## **1. REFLEXIVITY AS A POSSIBILITY**

How, then, do the characteristics of reflexivity, freedom, and self-awareness (Cambi, Pinto Minerva, 2023) align with the premises of the “onlife era” (Floridi, 2015) a new existence where the real and virtual merge (and blur) and where the speed and immediacy of social networks encourage unconsidered, instantaneous reactions? Applying Dewey’s mental processes to the digital realm reveals intriguing parallels with the behavior of the “technological” user. The stream of consciousness, for example, can be associated with the torrent of “stories” we share daily on social media—disconnected, illogical glimpses of public and private moments.

Stories, posts, and videos published on social platforms for only a few hours, before disappearing, seem to fulfill other needs and intentions among young people, linked to projecting an image of themselves that is beautiful, happy, or provisional, partial, enigmatic, and challenging to decode without the necessary contextual codes (Lancini, Cirillo, 2022).

Additionally, the rapidity and transience of information encourage decreased focus and the development of fragmented knowledge, as digital culture often prioritizes granularity and fragmentation over length and complexity. Practices like “cut and paste” flatten content into an eternal present (Rivoltella, 2015), reducing knowledge to disjointed, copied, and repurposed fragments.

Imagination, on the other hand, can be situated at the heart of the eternal tension between being and appearing. Concepts like the “society of the image,”

social self-display, and prioritizing appearance over being are increasingly pervasive in digital culture, where young people construct their identities and fulfill their desire for “extimacy” (Tisseron, 2013), driven by a relentless quest for validation and appreciation (Rivoltella, 2015). The imperative is to live under the spotlight, favoring the public sphere over the private, in a never-ending pursuit of followers and likes a phenomenon aligned with the so-called “like addiction” or “digital narcissism.”

Finally, belief can be likened to the frequent habit of being guided by common sense rather than evidence, sharing and posting fake news without verifying their credibility.

Media transformations, evolving communication models, and the intense and continuous use of electronic technologies (...) lead us to believe that knowledge must adapt to the medium, rather than us, as reflective and critical individuals, deciding how to use a particular tool and how it should function (Bocciolosi, 2014).

This is why fostering the generative force of thought through the development of critical and reflective thinking represents one of the challenges of a culture of complexity. In the face of the contemporary world’s fluidity and complexity (Bauman, 2008), the plurality of educational agents, the pervasive use of new technologies, and constant access to information and online interconnections, it is essential to autonomously find ways to access and connect knowledge, maintain a level of critical reflection that enables the development of one’s own perspective, remain flexible to shift viewpoints, and tolerate doubt and uncertainty. Rather than passively absorbing others’ thoughts, we must strive to influence the world actively.

## **2. STONES THROWN AND ARTIFACTS**

A reflection on the age of technology and its governance (Cambi, Pinto Minerva, 2023) must necessarily delve into the relationship between the subject conceived as a thinking human being or, in the case of educators, as reflective practitioners (Schön, 1983) and their artifacts, including digital products and methodologies. Such an inquiry essentially revisits the nature-culture debate, almost resolving it into the new alliance foreshadowed by Prigogine and Stengers (1981), between human history, knowledge, and societies, and nature’s own exploratory journey. Neuroscience (Rizzolatti, Sinigaglia, 2006; Gallese, 2007) has in recent years advocated overcoming the dualism between realism and constructivism (Rivoltella, Rossi, 2019), as well as the polarity

between nature and culture. Digital technology appears to silence the age-old opposition between knowledge and action, between perception and action (Berthoz, 2009), inaugurating a new infospheric era (Floridi, 2015), perhaps ungovernable, where humans and machines, natural subjects, and cultural objects, merge to create a world in which humans and artifacts are nearly indistinguishable.

To understand how artifacts and subjects can effectively interpenetrate, it is necessary to consider the possibility that artifacts might escape human control, deviating from the ontological-technological-political process of “hominization” (Sloterdijk, 2004). In human evolution, the stone symbolizes a positive relationship and reaction to the environment, allowing humans to transcend the constraints of flight through reflection and the development of mediated solutions. By contemplating the stone and its uses, humanity transforms it into a tool of power. This reflective process leads humans to continually choose between possible actions within their environment. Sloterdijk investigates the human-stone relationship, showing how gestures like striking and cutting prelinguistic and mediatory acts revolve around the physical proximity and manipulability of the stone, an object both from and within the world. However, when the stone is thrown when humans make a technical formalization choice (Sloterdijk, 2004) it becomes an artifact. The stone shifts from being merely an object within the world to an object for the world, creating new spaces and expanding human experience.

If the image of the stone evolving into an artifact, capable of expanding human experience, can serve to illustrate how digital technology blurs the distinction between artifacts and subjects, further reflection is needed on the human activities involved in creating artifacts and the contributions these artifacts can make beyond their practical utility. Norman (1993) reflects on the difference between the stone as a cutting tool and the stone as a projectile between the pragmatic, experiential aspect of the stone-object and the reflective use of the stone-artifact. Similarly, Rabardel (1995) clarifies the distinction between the stone as an object and as an artifact, critiquing technocentrism. Technologies, from stones to learning machines, have always been defined by their function and purpose without adequate consideration of their relationship to context and environment. Rabardel argues that artifacts possess dual natures: they are simultaneously *outil* (physical structures) and *instrument* (relational entities linked to human action, usage patterns, and emerging knowledge). An artifact thus becomes an instrumental entity shaped by and shaping its user (Rivoltella, Rossi, 2019). Vygotsky (1934) similarly recognizes tools’ dual potential to

regulate human conduct and transform the environment, as well as to guide one's behavior and that of others.

### **3. LANTERNS AND PROPER DISTANCES IN THE ERA OF THE INTERNET OF THINGS**

The advent of artificial intelligence (AI) has dissolved the marked distinction between subjects, objects, tools, and the environment. AI has disrupted traditional conceptions of technological tools (Panciroli, Rivoltella, 2023): gone are the days of mass media representing mass communication, creating new public spaces (like television and later social networks) analogous to the stone's transformative role for early hominids. Technological objects are no longer central; the era of the materiality of objects be it stone or television is over. The Internet of Things (Za, 2021) has reinvigorated objects, embedding them with connectivity and transforming them into smart entities. For instance, the Internet of Toys (Mascheroni, Holloway, 2019) has redefined childhood toys and caregiving tools, while social robotics has forever changed everyday objects like watches (now smart) and homes (now automated). In this post-media world, human-artifact relations are mediated by AI, which, like the thrown stone, demands ethical decision-making. AI introduces an unprecedented form of world governance that often leaves humanity disoriented. Floridi (2014) describes this as the "information revolution." Platformization and mandatory datafication transform human capital into algorithmic capital (Marangi, 2023), creating a cultural hegemony akin to a new religion (Balbi, 2022; Van Dijk, 2014). Amid the light and shadows of digital innovation, we must rediscover the "proper distance" (Silverstone, 2007). Like modern Mattia Pascals (Pirandello, 2023), we must question whether humans still retain their place in the human-artifact-environment relationship or whether artifacts have wholly consumed their creators. Using the reflective lantern metaphor, we must structure new relational possibilities with the environment, the world, and others, reaffirming humanity's ability to control its creations as a vital, creative act.

### **4. FOR AN ETHICAL FUTURE OF EDUCATION**

Education represents this lantern's beam; it is the luminous projection that illuminates human experience, revealing reality as something to engage with and understand. Cambi and Pinto Minerva (2023) restore to education the role of recovering the lantern's angle of projection. The digital jungle must be reimagined as the wild environment where early humans began shaping their world with stones, now embodied by AI.

The Beijing Consensus (2019), a key international document on AI and education, invites reflection on ethics, safety, and responsibility, advocating for an AI guided by ethical principles and respect for humanity. As an artifact, AI must be designed to avoid consuming its creator, echoing the dystopian visions of body horror in art and cinema. Reflective thinking is thus crucial for promoting knowledge and awareness of tool usage, identifying biases, evaluating risks, and adopting a multisystemic vision rooted in Von Bertalanffy's ideas (2004).

# ADDED VALUE AND SCHOOL EFFECTIVENESS FOR A DEMOCRATIC SCHOOL

Vincenzo Nunzio Scalcione<sup>a</sup>

<sup>a</sup>University of Basilicata

The analysis of added value has taken on a significant role in the national debate, in relation to the need, expressed by numerous subjects, to innovate the evaluation models in use. In fact, the need to prepare tools for the synthesis of complexity, using the measurement of added value, is emerging. In the scientific community, the debate is important, focused on the models to be adopted, but above all on their didactic use, and the related fields of application, having to consider variables linked to measurement methods and tools. In this essay, therefore, we intend to proceed with the examination of the calque of added value, for the promotion of a school capable of valorizing the personal path of each student.

quality; control; evaluation; added value; student performance

## INTRODUCTION

Evaluation is an integral part of the teaching-learning process; it precedes, accompanies and follows the curricular paths. It activates the actions to be undertaken, regulates those started, promotes the critical assessment of those completed and takes on a prominent formative function, of accompanying the learning processes and of stimulating continuous improvement (MIUR, 2012, p. 13).

Evaluating means “giving value”, or attributing a certain “weight” to everything that happens in the school context in relation to pre-established objectives. The evaluation process takes place by taking into consideration not only the educational event and the context in which it takes place, but is linked to the content and methods of teaching that lead to implementing learning dependent on the quality of teaching and the validity of the training offer. The evaluation of the quality of the school service performed takes into account the outcomes (judgment on the possession of skills and knowledge observable in the

performances) and the processes (consistency between activities carried out and planned training purposes) (Scalcione, 2024).

## **1. VALUE ADDED MEASUREMENT MODELS**

Within the national debate, relating to the definition of an evaluation model of the school system, added value has also assumed a central role in recent years (Silva, 2016, p. 55).

Representing an important indicator that allows pursuing the purpose of measuring and appreciating performance (Montrone, 2000), added value “in recent years is applied in goods whose quality and value is increased by high level of technology and skill in the manufacturing process” (Corsini, 2008, p. 29).

In the educational field, it therefore indicates the ability of school institutions to add value to the development of each student, thanks to the result of the different interactions between the action of the school and the factors external to it (Corsini, 2008), being therefore understood as “estimate of the contribution that a school may have given to the evolution of the skills of its students” (Sestito, 2012, p. 28).

The variability is produced by factors extrinsic to the school and by the educational action, or “exogenous” variables, which influence the results achieved and which cannot be controlled by the school such as: the socio-demographic characteristics of each student or the incoming skills (Kubler, 2012, p. 1). Its use has as its main purpose that of dividing the factors that determine an influence on the learning of students and studying their effect.

An obvious reflection that follows is that it is possible to analyze inputs and outputs within school contexts; characteristic aspects of the added value measurement model thus appear, namely: student performance considered as progress over a period of time; added value as an indicator that allows for the evaluation of effectiveness through student results; the isolation of variables, which through their effect influence the scholastic performance of students. “The added value therefore measures the contribution provided by an institution to the progress of its students net of the factors that affect their performance but which are not attributable to the school’s intervention, such as socioeconomic characteristics or their performance upon entry” (Corsini, 2008, p. 30).

## 2. SCHOOL AND ADDED VALUE

To evaluate the effectiveness of a school, it is necessary to distinguish the effect of the school (intentional management, organizational, didactic and educational processes) on learning from the effect of uncontrollable factors (personal characteristics of students and context) but which still have the power to influence learning (Martini, 2020).

The school effect (added value) can be measured in different ways:

- with the difference between the average raw score of that school and the general average of a certain territory;
- by measuring the average progress that students make in a given period of time (cognitive gains).
- by means of the average difference between the observed scores and the expected scores in relation to the characteristics of the students (socio-economic-cultural condition, aptitudes, etc.).
- by means of the average net cognitive gain with respect to all the contextual factors that are not controlled by the school (Ricci, 2008, p. 4).

From a statistical point of view, the measurement of added value occurs through the study of the effect of the school and the teachers, which represent the independent variables, on the students' performance through the administration of standardized achievement tests that represent the dependent variables. The variables are inserted into an even broader relational context in which there are in turn other variables that determine relationships and influences and this is why these should also be considered and kept under control in the measurement of the school effect.

This relationship is then expressed through the linear equation of the straight line:

$$\hat{Y}_i = \alpha + \beta X_i + \varepsilon_i \text{ (Silva, 2016).}$$

The effect of schools and classes by means of added value will therefore be expressed as the unexplained part of variance, or the sum of the regression residues aggregated at school and class level. If this formula includes the variables detected relating to the socio-cultural level of students, as the literature widely recommends, it will be necessary to refer instead to a form of linear regression called multiple or multivariate:

$$\hat{Y}_i = \alpha + \beta_1 X_{i1} + \beta_2 X_{i2} + \epsilon_i^1 \text{ (Silva, 2016, p. 39).}$$

The two regressors are therefore indicated by  $\beta_1$  and  $\beta_2$ , to indicate the incidence of the two control variables: previous performance and socio-cultural level. At a theoretical level, the added value is defined as the difference between the observed result and the expected result: in this equation, the concept is expressed from a statistical point of view by the difference between  $Y$  and  $\hat{Y}_i$ . This difference is also called the regression residue and therefore represents the part of  $Y$  that cannot be explained by the regressors considered in the model.

## 2.1 Added value as an indicator of school efficiency and effectiveness

If efficiency, as a measure of how an activity achieves its objective by minimizing the use of resources, corresponds, at school level, to the construction of an optimal balance between means and ends, with a positive balance to be achieved in order to activate and use available resources and the identified purposes, effectiveness considers and measures, instead, the degree of impact of educational action and its capacity to transform and increase available resources (Miniello, 2012, p. 216).

The need to report data on school effectiveness, to show how education can influence students' progress beyond their social, cultural and economic background and the need to understand which factors allow determining the influence have allowed the birth of an important line of research: School Effectiveness Research (SER) (Rosa, 2013), today declined through:

- Research on effective schools, which attempts to study the variables related to the school;
- Research on instructional effectiveness, which instead deals with the teaching/learning processes that take place within classrooms.

These are approaches that investigate different effectiveness factors that influence instructional processes but share the objective of highlighting the ability of schools to significantly influence student performance beyond personal and entry characteristics.

---

<sup>1</sup> Where:  $\hat{Y}_i$  = expected exit performance of student  $i$ ;  $\alpha$  = intercept or constant (value assumed by  $Y$  when  $X_1$  and  $X_2$  are equal to zero);  $\beta_1$  = first regression coefficient (average change in  $Y$  associated with a unit change in  $X_1$  holding  $X_2$  constant, i.e. net of its effect);  $X_{i1}$  = entry performance of student  $i$ ;  $\beta_2$  = second regression coefficient (average change in  $Y$  associated with a unit change in  $X_2$  holding  $X_1$  constant, i.e. net of its effect);  $X_{i2}$  = socio-cultural level of student  $i$ ;  $\epsilon_i$  = regression residue (difference between  $Y_i$  and  $\hat{Y}_i$ , i.e. between observed performance and expected performance).

It is therefore a question of predicting the use of multilevel regression models, capable of “allowing, unlike classic ones, to take into account the hierarchical nature of the data” (Rosa, 2013, p. 17).

These models are characterized by observing the hierarchical nature of institutions, paying attention to considering students belonging to classes and classes to schools. Furthermore, they consider the effect and influence of the environment on the individual and on their performance, taking into account socioeconomic characteristics (Corsini, 2008).

In multilevel regression models, the “classical” linear regression formula is extended to the case of hierarchically organized data, where student  $i$  is considered a first-level unit and schools  $j$  are considered second-level units:

$$Y_{ij} = \beta_0j + \beta_1jX_{ij} + e_{ij} \text{ (Corsini, 2008)}$$

In the hierarchical formulation, a student’s performance is therefore a function of the average performance of the school, the effect of the relationship with the socio-economic status within his school and the residual of the regression.

In this way, multilevel analyses can pursue with greater precision the two fundamental objectives in SER research:

1. Establish the net effects of each of the variables in play, that is, net of the influence exerted by the other variables considered that affect student performance.
2. Attempt to identify, keeping under control the characteristics of the students and those of the context, the school variables (those that we could define as process variables: organization, relational climate, teaching methods, etc.) that have a significant influence on the results.

### **3. REPORTING THROUGH ADDED VALUE FOR A DEMOCRATIC SCHOOL**

The Coleman Report (Rosa, 2013), to measure school effectiveness, when the school’s objective is to lead to reaching the learning levels desired by students, deals with measuring and considering student performance (output) as a fundamental parameter of school effectiveness. When one wants to obtain information on the effect of the school on student performance, then all exogenous variables that determine an influence on the educational processes are taken into consideration (Kubler, 2012).

To determine a measurement of student performance and the quality of educational institutions, one can use added value.

With reference to the issue of school effectiveness and its measurement, added value indicates the specific contribution of the school to the progress of students “net” of other factors that, although “external” to the educational processes, significantly influence such progress (Rosa, 2013, p. 35).

Among the various variables, two types of these have a very important value: the socio-economic-cultural level and previous performance. Research has widely highlighted how the disadvantage that resides in the family environment can influence the performance of students and how previous performance is a predictor of subsequent performance.

These factors within the learning context are intertwined with numerous other variables but to determine the effectiveness of an education and training system, an analysis must be put in place that allows the starting conditions of students to be included and that cannot be limited to considering exclusively the results achieved by students (Capperucci, 2017).

In recent years, greater interest has developed in added value as an indicator of school effectiveness, this aspect has led many States to base their reporting systems on the detection of added value with the production of models that allow the overcoming of those previously mentioned.

Evaluation systems that allow institutions to meet their external reporting needs have been adopted by many countries around the world and have used scientific and methodological results to identify tools and procedures that could lead to a “valid, reliable and fair system evaluation” (Rosa, 2013, p. 22).

As a result, measurements are carried out on different students each time and it is not possible to observe whether changes between one measurement and another determine progress or regression in the school or student performance.

Using the longitudinal approach, students’ progress can be determined using multiple measurements over a period of time, in this way it is possible to adopt the added value and separate its contribution to students’ progress by comparing it with other schools that present important conditions such as entry skills and the socio-cultural background of students (Rosa, Silva, 2014).

The differences between the various accountability measures are represented by a different approach to the evaluation of school effectiveness, but these can use incentives to support self-assessment with a view to improving the institutions (Castellana, Corsini, 2018).

By proceeding in this way, it was intended to obtain results (expected values) relating to the districts or constituencies of the school system; their comparison with real values allows us to detect the effectiveness of each institution, and the possibility of creating tools that allow us to have a more profitable relationship with experience, subjected to empirical control (Dewey, 1959), creating contexts that put users in a position to exercise their own choices.

Over the years, added value has been used to respond to the need to evaluate teachers and managers based on effectiveness and on their ability to determine an additional value to student learning, thus promoting authentically democratic institutions, to the extent that they allow each user to exercise informed choices.

However, this aspect is determined within multi-colored contexts characterized by heterogeneous groups that are influenced by factors that are correlated with each other and that are not included in the models of added value (Corsini, 2012). Finally, another aspect, detectable in the American debate, has highlighted how the measurement of added value does not offer the possibility of knowing the ways in which teachers can make a contribution in terms of learning for their students, since it only records data that allows the school to be classified as effective and ineffective based on the value produced (Covi, Olivero, 2019).

## **CONCLUSIONS**

Evaluating the effectiveness of a school allows us to determine how much an educational reality is able to influence the improvement of each individual student. Added value allows us to further clarify this last aspect because it collects information to detect the effectiveness of a school and leads to filtering the results obtained by students from factors over which the school cannot exercise control. The ever-increasing autonomy with which schools are equipped has allowed us to pay greater attention to this type of evaluation, which is why in several countries the systems for evaluating school effectiveness have been based on added value. The aspects outlined above are still alive in the debate that concerns the investigation in educational contexts. Attention is paid to combining the quantitative dimension that is detected by measuring added value with a qualitative dimension determined by the observation of what happens within schools (Corsini, 2008) and which regulates the teaching/learning process.

Added value measures often record untrue values because the rewards or

sanctions stipulated for teachers lead to concentrating the work in the classroom to teach ways to students to face structured tests. Surely in the future, within the debate, there will be new aspects to consider such as: the influence of added value as a means to motivate or on the contrary, not motivate students in achieving objectives.

# CARING PROFESSIONS IN SUPERDIVERSE SOCIETIES: A STUDY ON SOCIAL WORK STUDENTS WITH MIGRATION BACKGROUND

Maria Grazia Galantino<sup>a</sup>

Francesca Messineo<sup>a</sup>

<sup>a</sup>Sapienza University of Rome

This paper presents the preliminary results of a qualitative study on the experiences of students with migration backgrounds enrolled in social work degree programmes at the University of Rome La Sapienza. In the context of an increasing demand for health and social care professionals, which represents a significant pull factor for immigration in many countries, the study explores the motivations that drive and the resources that support the choice to pursue social work education. This decision is influenced by a complex interplay of attitudinal and practical considerations. On the one hand, this is in accordance with the prevailing 'vocational' orientation among second-generation students, due to the programme's professional orientation and open-entry policy. Conversely, in the context of the care sector's expansion and its redefinition as an increasingly intercultural field, this educational path offers significant opportunities for social recognition and inclusion. The migrant background is both an asset and a challenge, as it enhances their ability to empathise with and address the needs of diverse service users, but may also pose difficulties in navigating institutional systems and achieving professional integration. Ultimately, this background profoundly informs their understanding of the profession and their approach to future careers.

second generations; care professions; higher education; social work

## **1. PEOPLE WITH MIGRATION BACKGROUND IN UNIVERSITY EDUCATION IN ITALY**

International migration transforms our social worlds in countless ways, influencing job markets, political systems, material and immaterial cultures, demographics, and educational systems. The increasing number of students with foreign citizenship in Italy has prompted the development of a new area of research, focusing on the so-called “second generation” in the educational system (Azzolini et al., 2019; Cannavò et al., 2019; Ceravolo and Molina, 2013). However, while much has been written about challenges and opportunities that the school system offers for integration (Bertozzi, 2018; Giancola and Salmieri, 2019; Mantovani et al., 2018; Vianello and Toffanin, 2021), significantly less is known about transition pathways from school to university.

Despite the fact that the proportion of tertiary students from abroad in Italy remains considerably below the European average (4.2% in 2022), there has been a gradual increase over the past decade (Giudici et al., 2024). The data, based on legal-formal classification criteria, do not permit the inclusion of the entire population of students with a migration background, nor the accurate distinction between international students (those who have relocated to the country for the purpose of studying) and second-generation students. Nevertheless, their experience represents a field of investigation of significant interest for the comprehension of the transformations that are reconfiguring our education systems and societies. Born and/or raised in Italy, second generations challenge the mechanisms of ‘subaltern integration’ experienced by first-generation immigrants (Ambrosini, 2001).

The transmission of disadvantage across generations has been shown to impact educational choices and achievements. However, students with a migrant background often hold higher expectations regarding education as a critical tool for social mobility (Hadjar and Scharf, 2019). Consequently, their experience in tertiary education represents a valuable area of study for examining new forms of identification and integration, as well as for understanding the underlying mechanisms shaping educational choices and their subsequent impact on specific occupational fields (Bertozzi and Lagomarsino, 2019; Bozzetti, 2021; Crul et al., 2017; Heath et al., 2008).

Against this background, our study focuses on tertiary education for social care work. This choice is motivated by the recognition that the increasing demand for health and social work staff constituted a significant pull factor for immigration in numerous countries (Bartely et al., 2012). Indeed, the so-called ‘care drain’

phenomenon (Ehrenreich and Hochschild, 2003; Bettio et al., 2006) is gradually changing in the direction of both attracting more qualified professionals from abroad (Schilgen et al., 2017) and stimulating domestic supply. In Italy, care work has traditionally served as an entry point and a key occupational sector for low-skilled, first-generation migrants. More recently, though, the Covid-19 pandemic has brought to light the long-standing paradox between the growing demand for qualified migrant care workers and the existing barriers to legal and social recognition (Ranci et al., 2021).

## **2. THE CASE OF SOCIAL WORK STUDENTS AT SAPIENZA UNIVERSITY**

This study examines the case of students with a migrant background enrolled in social work degree programs at the Sapienza University of Rome. Students from abroad in the social work bachelors are proportionally less compared to the overall foreign student population at Sapienza (in 2022-23, respectively 4.2 compared to 8.8), but a significant majority of these students, approximately 90%, can be classified as second-generation.

This study's objective is to understand whether, in line with international trends, the care sector represents a preferred choice for children of immigrants enrolled in higher education pathways. Additionally, the study aims to ascertain whether this choice is driven by attitudinal preferences, assessments of employment opportunities, and/or linked to the persistence, even among second generations, of processes of subordinate integration.

To date, fifteen biographical interviews have been collected through snowball sampling strategies. The majority of the interviewees are females (14) hailing from a variety of countries and continents, including Europe, South America, Africa and Asia. They also represent a diverse range of generational statuses. In accordance with Rumbaut's (1997) typology, three interviewees can be classified as first-generation migrants, two as 1.25 (arrived at 13–17), three as 1.5 (arrived at 6–12), four as 1.75 (arrived at 0–6), two as second-generation migrants (born in Italy), and one as 2.5 (one foreign and one Italian parent). Ten students obtained their diploma from *liceo*, three from a vocational school related to the chosen university pathway (eg. *istituto professionale socio-sanitario*), and two from 'unrelated' vocational schools. At the time of the interviews, seven of them declared to work and study, five are full time students and three carry a considerable amount of care work within their household.

### **3. MOTIVATIONS: BETWEEN INSTRUMENTAL AND ATTITUDINAL CHOICES**

The transition to tertiary education for our interviewees is consistent with broader trends in the Italian education system, wherein the majority of high school graduates pursue further studies. When asked about the decision to enroll in a social work bachelor's program, the interviewees primarily highlighted their passion for social and psychological subjects during school and their strong desire to help others, which also represents an opportunity for personal growth and, in many cases, a way to address their own challenges. Upon deeper reflection, they also cited practical factors influencing their choice, such as the program's open-entry policy and its professional orientation, which facilitates employment after graduation. Many admitted they initially aspired to study psychology but either failed the entrance exam or found the prospect of a decade-long academic journey unfeasible.

Consistent with previous research (Azzolini et al., 2019; Bertozzi, 2018), we underscore the persistence of socio-cultural and economic constraints affecting second generations educational choices: limited economic resources, which often compel them to work alongside their studies, as well as perceptions of inadequate school preparation and insufficient linguistic and cultural skills required to succeed in higher education. Families play a twofold role in shaping the educational path of the interviewees. Some reported feeling entirely responsible for their decisions, viewing the lack of guidance from parents or other family members as a disadvantage – especially when compared to their Italian peers, whose parents are usually more actively involved. Nevertheless, the majority acknowledged the support and encouragement they receive from their families, who strongly motivated them to pursue higher education, regardless of the specific career path chosen. Migrant families' belief in education as a pathway to social mobility, a means of ensuring a better life for their children, and a way to justify the sacrifices inherent in the migratory experience is thus confirmed (Curl et al., 2017; Eve, 2015; Hadjar and Scharf, 2019).

Although many parents, particularly mothers, have worked in the care sector, the students do not perceive a direct link between their parents' professional background and their own educational choices. This disconnect underscores the stratification of the care professions and the undervaluation of less qualified positions such as domestic or elder care work (Ranci et al., 2021). Yet, they appreciate the commitment and care their family members exhibit in their daily caregiving tasks and, more broadly, admire the solidarity and compassion their

parents display, particularly in supporting fellow migrants in need. These values have often inspired the interviewees' passion for helping others, which aligns closely with the fundamental principles of social work.

### **3. CHALLENGES AND OPPORTUNITY OF SOCIAL WORK AS AN EDUCATIONAL AND PROFESSIONAL FIELD**

The interviewed students report high level of satisfaction with their experience in the university. With only one exception, they describe it as a multicultural and inclusive environment, contrasting sharply with their experiences in middle and high school, where racialized students were particularly likely to perceive discrimination as a recurring challenge.

In the positive evaluation of the chosen bachelor's program, they highlight the professors' dedication, the interdisciplinary structure of the curriculum, and the inclusion of practical activities, such as internships, group work, and case study development. These components provide valuable opportunities to engage with professional environments, understand the principles of social intervention and planning, and acquire essential practical skills for their future careers. They also recognize the diversity of context in which social workers can find employment, and approximately half of the interviewees say they would like to work with migrants, while other preferred areas entail gender violence, mental health, and childhood.

They appreciate the helpful and relational features of the profession, but they are aware of the limited social prestige associated with social work and acknowledge a disconnect between societal perceptions and their own understanding of its value. For some students, passion and sense of vocation outweigh concerns about future economic and social rewards. Others, albeit a minority, admit that they do not dare to aspire to more prestigious careers or those requiring significantly greater financial and time investment. This hesitation is linked to their migratory background, which they perceive as a disadvantage, fostering an attitude of 'settling for enough'.

The interviewees express nuanced views on how their migratory background will impact and shape their professional roles in social work. On one hand, they perceive their background as an asset, emphasizing that personal experiences of disadvantage enhance their empathy towards services' beneficiaries, foster openness to diversity, and offer the advantage of multilingualism and intercultural skills in addressing the needs and connecting with increasingly diverse service users. These insights add on research examining the emergence

of a transnational professional space within the social work sector (Bartley et al., 2012), highlighting the presence of professional who, though educated locally thus not entirely 'foreigners', bring with them intercultural values, experiences, and skills. On the other hand, they recognize certain limitations, such as a lack of familiarity with local institutional and territorial systems. Some perceive their limited proficiency in Italian as an issue that impact their confidence, authority with the beneficiaries and professional integration.

#### **4. CONCLUSIONS: IMPLICATIONS FOR THE UNIVERSITY AND THE CARE WORK SECTOR**

Our research reveals that students with migration background's choice to pursue a social work degree program is shaped by a combination of attitudinal preferences, practical considerations, and cross generational values. This interplay makes it difficult to isolate individual factors influencing their choices. Besides the opportunities for integration and social mobility, this decision appears to be in continuity with the vocational choices prevalent among second generation students. They value the professionalizing nature of their degree – highlighting the immediate employability it provides as social workers – and recognize that tertiary education is essential for securing decent employment. Families play a significant role by framing education as the primary pathway for social mobility and by fostering a 'culture of solidarity'. This influence shapes students' perceptions of their migratory background that, in turn, informs their understanding of the profession and their approach to future careers. Overall, our preliminary findings show the enduring processes of 'subaltern integration' (Ambrosini, 2001) that shape the educational and professional expectations of students with a migrant background but, at the same time, they underscore the growing intercultural orientation within the social work sector, a phenomenon that warrants further investigation.

Fostering the inclusion of second-generation students in our universities requires addressing the specific barriers they face. This includes improving access to information, as their social and family networks may not always provide adequate support; providing targeted support for their linguistic challenges; and promoting a more equitable balance between work and study, a challenge that increasingly affects the broader student population.

More knowledge on the experiences of professionals with migrant background is needed to advance policy recommendations for the social work professional sector. Future research could examine how globalization and migration

contribute to the creation of transnational spaces for social workers, shaping their roles, practices, and professional identities across borders. It could also investigate how the diversity of workers' backgrounds interacts with broader social processes, such as bargaining power and the gendered composition of the profession.

# **INCLUSIVE SOCIETIES AND EQUITY IN EDUCATION: EXPERIENCES AND OPPORTUNITIES THROUGH SERVICE LEARNING FOR CULTURAL CHANGE**

Silvia Guetta<sup>a</sup>

Patrizia Lotti<sup>b</sup>

Lorenza Orlandini<sup>b</sup>

<sup>a</sup>University of Florence; <sup>b</sup>INDIRE – Istituto Nazionale Documentazione Innovazione e Ricerca Educativa

In recent years, the topic of fairness in education has been a major policy issue at supranational and national levels. At the Gothenburg Social Summit (2017), the priority of every person's right to quality and inclusive education, training and lifelong learning was reaffirmed, and the following year, the Council of Europe confirmed the need to ensure 'effective equitable access to quality inclusive education for all students as an indispensable factor in achieving more cohesive societies'. The need to reaffirm these principles tells us that political, social, and cultural interventions for an inclusive education, one that promotes cultural change and respects the talents of students, are still struggling to come to fruition. The numerous and diversified emergencies of recent years, from the pandemic to the environmental issue, from war scenarios to the economic crisis, have put the system even more in crisis and strengthened the need to propose and experiment inclusive and innovative teaching and training proposals, aimed at making the school an environment where knowledge and know-how meet social and cultural needs and interested in preventing and combating phenomena of school drop-out, abandonment and educational poverty.

Focusing on creating educational processes rooted in equity, inclusion, and solidarity fosters connections with practices of peaceful coexistence. In line with the 2023 UNESCO Recommendation on education for peace, human rights, international understanding, cooperation, fundamental freedoms, global

citizenship, and sustainable development, it is increasingly necessary—and effective—to engage students in the co-design of sustainable proposals for building environments of peaceful coexistence.

Intervention proposals strongly consistent with the goals of Agenda 2030. These proposals align with the principles of sustainable development and seek to integrate education as a driving force for achieving the 17 Sustainable Development Goals (SDGs), particularly SDG 4, which emphasizes inclusive and equitable quality education and lifelong learning opportunities for all. Fostering personal well-being, active citizenship, and the acquisition of the skills necessary to promote sustainable development through human rights, gender equality, the promotion of a culture of peace and non-violence, global citizenship, and the valorization of cultural diversity are not only fundamental democratic values, but also educational practices necessary to deconstruct violent realities that consume us daily.

This approach emphasizes the need to transform education systems to equip individuals with the critical thinking and problem-solving skills necessary to address contemporary challenges, such as climate change, inequality, and technological disruption. For example, integrating human rights education into school curricula fosters a sense of empathy and social responsibility, helping students to engage as active participants in their communities (UNESCO, 2013). Similarly, promoting gender equality in education, as highlighted in SDG 5, ensures that all individuals, regardless of gender, have equal opportunities to thrive and contribute to societal progress.

Goals renewed by the United Nations through Our Common Agenda (2021), which proposes a shift from globalization to multilateralism and from cooperation to solidarity. This agenda underscores the importance of rethinking traditional models of international collaboration to prioritize shared responsibility and collective action. It calls for the education sector to play a pivotal role in fostering global citizenship, where individuals recognize their interconnectedness and are prepared to act in solidarity with others across borders. The valorization of cultural diversity within this framework promotes not only tolerance but also mutual enrichment, laying the groundwork for more cohesive and inclusive societies (United Nations, 2021).

Moreover, educational practices aligned with Agenda 2030 must go beyond traditional classroom settings, leveraging digital technologies and community-based learning to reach marginalized populations. Initiatives like UNESCO's Futures of Education project advocate for the integration of innovative

pedagogies that empower learners to co-create sustainable solutions, reinforcing education as a public and global common good (UNESCO, 2021). By embedding these values into teaching and learning processes, schools become incubators for the social and environmental change envisioned by the global community.

Within this problematic framework, through Service Learning (SL) concepts of social justice can be made practical, linking academic learning with civic engagement so as to develop a culture of peace (Crews & Weigert, 1999), innovating education through the keys of reciprocity and critical reflection (Asghar, 2017), reducing social inequalities and investing knowledge for the benefit of the community. Over the past decades, SL has been extensively studied internationally, both as an educational philosophy (Sheffield, 2005; Butin, 2005) and as a method for educational innovation and regeneration of educational practice (Furco, 1996; Tapia, 2000).

Similarly, the panel ‘Inclusive societies and equity in education: experiences and opportunities through service learning for cultural change’ provided a platform for discussing these themes. The event featured 18 presentations across 3 sessions, representing diverse perspectives from Italy and Europe. Facilitating the development of global citizenship competences (Aramburuzabala et al., 2020), key insights included:

- educational philosophy perspectives,
- pedagogical and didactic methodology across primary, secondary, and tertiary education levels, and
- exploration of links between educational institutions, local organizations, and international educational bodies through SL projects.

The discussion was enriched by references to projects implemented within the European EASHLE association and the ‘Manifesto of Italian Universities Network for Service-Learning’ and highlights the growing interest in SL as an approach to strengthen relationships between educational institutions and communities, with a focus on collective well-being (Di Masi et al. 2023).

This panel represented a significant step in understanding the potential of SL as a framework for educational innovation and regeneration in a democratic context, as well as its role in combating social injustice (Aramburuzabala & Cerrillo, 2023).

# EMOTIONS ON STAGE: AN INTERNATIONAL SERVICE-LEARNING EXPERIENCE IN BRAZIL WITH CHILDREN AND ADOLESCENTS, BASED ON A GLOCAL APPROACH

Nicola Andrian<sup>a</sup>

Giulia Sailis<sup>b</sup>

<sup>a</sup>University of the State of Bahia; <sup>b</sup>University of Padova

‘Emotions on stage’ (*Emoções no Teatro*), a support group for minors in psychological distress in the north-eastern region of Brazil, created by two students from the University of Padua, Italy, was the heart of an international Service-Learning experience with a GloCal approach (Bringle & Hatcher, 2011; Brown, 2011; Crabtree, 2008; Khoja-Moolji & Karsan, 2015; UNIBO, 2020, Andrian, 2024). This article aims to present a project developed within the Intereurisland exchange and research program (Andrian, 2024) through a bilateral agreement between the University of the State of Bahia and the University of Padua. The project’s focus on emotional literacy through drama aligned with the academic goals of the students’ psychology curriculum, allowing them to apply theoretical knowledge in a real-world setting. The main objective of the support group was to create a safe space in which adolescents could identify, distinguish, understand, share and regulate their emotions. Despite the limitations identified and the short duration, the project demonstrates how SL can be a relevant tool for both academic learning, as well as for supporting emotional development and promoting psychological well-being in children and adolescents (Joronen et al., 2008; Larson and Brown, 2007), as well as for the development of an active and prosocial Global citizenship.

GloCal Service-Learning, emotional development, mental health, adolescents, Intereurisland.

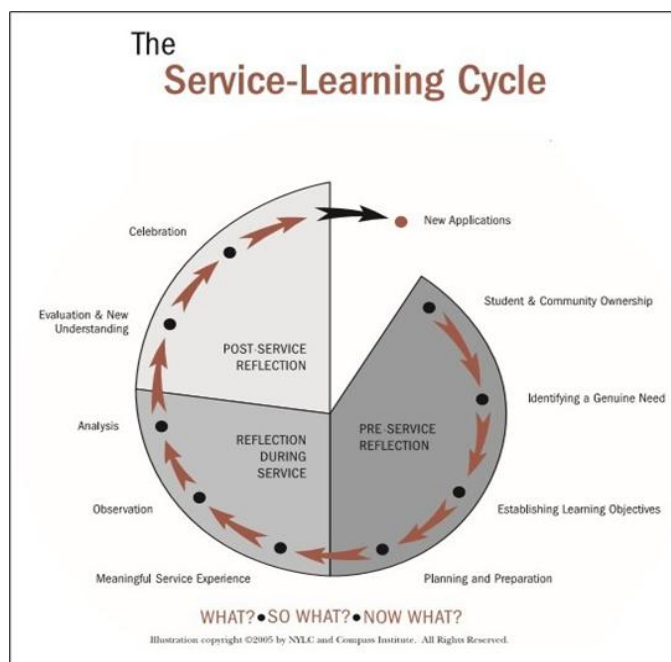

## INTRODUCTION

This article presents an international Service-Learning (SL) experience, 'Emotions on Stage' (*Emoções no Teatro*), developed as part of the Intereuriland exchange and research program (Andrian, 2024). This initiative, conducted by two psychology students and interns from the University of Padua (UNIPD), Italy, was implemented within a bilateral agreement between UNIPD and the University of the State of Bahia (UNEB), specifically with the Department of Human Sciences (DCH), Campus III, in the city of Juazeiro, Bahia, Brazil. The project, as a practical part of the third mission course 'Interpersonal relations and group dynamics', was developed in Petrolina, Pernambuco, Brazil, in a mental health support center for children and adolescents (*Centro de Assistência Psicossocial para Crianças e Adolescentes, CAPS-ij*) who are at psychosocial risk and/or suffer from severe and/or persistent psychiatric and psychological disorders. This initiative led to create an opportunity where students could achieve their academic learning goals, and adolescents could explore, express and regulate their emotions through group activities based on theatre. A 'context' in which, through the relationship between subjects of different ages and cultures, the deep meaning of the SL proposal was expressed, with a GloCal approach.

### 1. THEORETICAL FRAMEWORK: SERVICE-LEARNING AND GLOCAL APPROACH

SL is a methodology that combines community service with structured learning objectives, enhancing both students' academic experiences and the community's well-being (Furco, 2005; Tapia, 2006; Fiorin, 2016). As defined by Bringle and Hatcher (2011), SL involves a "course-based, credit-bearing educational experience" in which students engage in activities that meet identified community needs while reflecting on these experiences to deepen their understanding of academic content.

Figure 1: The Service-Learning Cycle (NYLC, 2005)

The project 'Emotions on Stage' was developed following the SL cycle proposed by the National Youth Leadership Council (2005). It aimed to provide psychological support to adolescents at CAPS-ij while enhancing the educational and social development of the students leading the project. This is in line with Kolb's (1984) experiential learning cycle, which emphasizes learning through experience, reflection, conceptualization, and experimentation. The project's focus on emotional literacy through drama aligned with the academic goals of the students' psychology curriculum, allowing them to apply theoretical knowledge in a real-world setting.

The GloCal approach emphasizes the importance of connecting global knowledge with the needs of the local community (Bringle & Hatcher, 2011; Brown, 2011). Through the Intereurisland program, however, in a path of mutual education, mediated by the world (Freire, 1981), the interest is to create "(...) 'Space' and 'Time' for encounter and dialogue between people who belong to different places and carry different cultures, analyzing the relationship can exist between contextualized education and intercultural dialogue (...)" (Andrian, 2024, p. 66).

This cross-cultural exchange is at the heart of SL and encourages students to develop intercultural competencies, including empathy, cultural sensitivity, and adaptability, as advocated by Crabtree (2008) and Khoja-Moolji & Karsan (2015).

## **2. CONTEXT AND PROJECT SETTING**

The SL project was developed within the research of a National Postdoctoral Program (PNPD) of the Coordination for the Improvement of Higher Education Personnel Foundation (CAPES), Brazil, approved by the UNEB Ethics Committee, dated 18 October 2018, with protocol no. 2.948.670.

At the time of the project, CAPS-ij primarily offered individual consultations and the distribution of medication, with limited group therapy activities. In line with the needs of the center -as identified by both students and staff- the main objective was to provide a space for emotional support and psycho-educational engagement for adolescents experiencing mental distress.

As psychology trainees, the two students, both master's students in Clinical Psychology, used theatrical propaedeutics and movement as tools for psychological and emotional development to create a support group focused on emotional literacy. The choice to use art was supported by research that shows that role-playing and drama can reduce stress, foster emotional development, and promote psychological well-being, particularly in children and adolescents (Joronen et al., 2008; Larson & Brown, 2007; Keiller et al., 2022).

The sample was defined based on the following inclusion criteria: (a) being already a CAPS-ij patient at the time of recruitment, and (b) being between the ages of 13 and 17. Information about the group was shared via leaflets distributed by healthcare professionals within the center to their patients, as well as through direct phone calls to patients identified as requiring additional support. The final sample consisted of 11 participants, including 7 males and 4 females with varying diagnoses and psychological distress conditions, with a mean age of 15.1 years.

Given that the sample was composed of minors under the care of CAPS-ij, an Informed Consent for project and data collection was obtained from the institution's coordination before the activities were carried out.

### 3. EMOTIONS ON STAGE

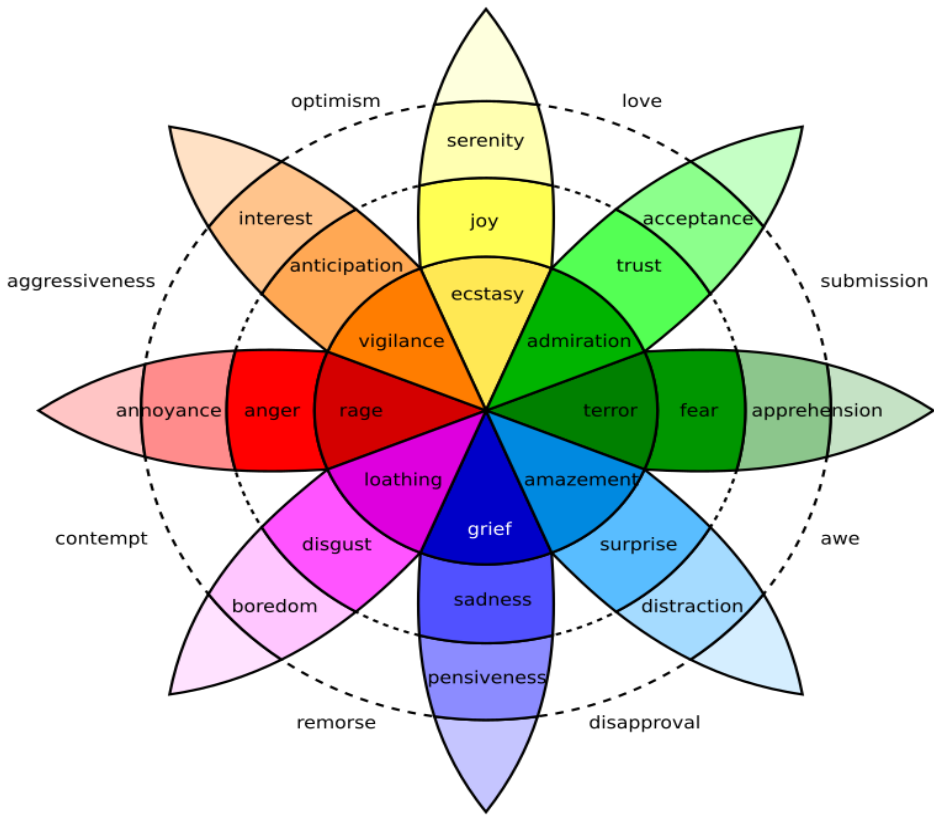

The support group was structured around four two-hour sessions conducted during November and December 2023. Each session followed a clear sequence of activities, designed to build emotional awareness and encourage creative expression.

Each session followed a four-phase structure:

- Ice-breaking and group cohesion: verbal, non-verbal and movement exercises were used to introduce themselves, encourage group bonding and ease participants into the activities.
- Improvisation and creativity: activities aimed at stimulating participants' creativity and preparing them for emotional exploration (i.e. being details of a photograph), which encouraged spontaneity and imagination.
- Theatrical propaedeutics: in this phase, participants engaged in drama exercises focused on identifying, expressing, and regulating emotions. Tools like 'emotion square' or 'crescendo of emotions' were used to help participants explore a wide range of emotions, based on Plutchik's emotional spectrum (Plutchik, 1984) as shown in Figure 2. The exercises aimed to help adolescents distinguish between primary emotions and gain a deeper understanding of their emotional experiences in the present, past and future.
- Reflection: each session concluded with a final moment of reflection, where participants shared their emotional responses and feedback to the activities. These moments could include written open questions to encourage deeper introspection and sharing.

Research diaries, participant observation, audio, photos and video recordings were used from the two students to monitor the progression of the sessions and to gain an in-depth understanding of feedback related to the group's objectives.

Figure 2: Wheel of Emotions (Plutchik, 1984).

## 4. RESULTS

### 4.1. Impact of the Service-Learning Project

The results of the project demonstrated the reciprocal nature of SL. Despite challenges such as irregular attendance and the overall feedback was positive and the project provided a valuable space for emotional exploration. Several adolescents reported experiencing positive emotions during the sessions, including happiness, surprise, and a sense of relief.

During a group reflection, one participant identified happiness as the predominant emotion during that session, in contrast with sadness as the most experienced emotion in daily life. Another participant, despite challenges with reading and writing, engaged comfortably in the group by using alternative

strategies. In the final session, the same participant shared that anger was the most frequent emotion in his life but reported feeling surprise and happiness as dominant emotions during the group activities.

During the last group reflection, another participant explained:

On the first day of the theater group, it was the day I left the hospital, I was feeling sad, but when I arrived here I felt good. I smiled, I thought about how (...) that was the best day of my life. The emotions (...) I feel the most are, like, fear, when I close my eyes, but I liked everything about this group, from the heart. You are my friends, I trust you.

The same participant showed a significant improvement in mood during the involvement in the group, also confirmed by positive feedback from the CAPS-ij nurse. The coordinator of the center expressed strong appreciation for the use of art as a tool for mental health care and support. During the final professional meeting, he expressed positive surprise at hearing noise in the facility, not from crises, but as a result of patients' creative and emotional expression. The feedback from other project collaborators was also positive, particularly regarding the structure of the sessions and active collaboration of participants. The students' learning experience was also positive, despite some limitations and challenges. Among their predefined academic aims, they reported the development of several professional skills, in line with SL principles (Astin et al, 2000; Salam et al, 2019). First of all, the ability to structure and lead social projects, such as support and prevention groups that involve adolescents with psychological distress. Second, they reported an improvement in their social and interpersonal abilities in creating trusting relationships with the users, teamwork, critical and analytical thinking and problem solving. They also reported an increment of their awareness and active listening skills. Moreover, carrying out the project in an intercultural context allowed them to face linguistic and interpersonal challenges, fostering relationships based on empathy, respect, without judgment or prejudice.

Regarding the specific support group objective (i.e., promoting the understanding, experimentation, and differentiation of emotions among the participants) considering the feedback received and their own learning, the students reported that "The Project constructively responded to the needs of the center, expanding the support and care provided to the patients from a broader and more comprehensive perspective". (Final evaluation focus group, 2023)

## **4.2. Limits and difficulties**

One of the main limitations was the use of Portuguese; while the preference for a GloCal approach facilitates deep immersion within the context (Andrian, 2024), the target group expressed itself with language and slang that, at times, is challenging to fully comprehend for non-native speakers, even with a high level of proficiency.

Participants recruitment also presented several challenges: considering that they were all minors, many parents either refused to participate or were unable and/or unwilling to accompany them to the center. As a consequence, an additional limitation was the inconsistency in participants attendance: only 3 participants out of 11 consistently attended all sessions.

Another potential limitation is that the co-author of this article was also one of the two students who developed the SL Project, which may have influenced its presentation.

## **5. CONCLUSION: LESSONS AND REFLECTIONS**

Despite the limitations identified and the short duration, the project 'Emotions on Stage' demonstrates how SL can be a relevant tool for both academic learning, as well as for the needs of the local community, as well as for the development of an active and prosocial Global citizenship. Through their work at CAPS-ij, the Italian students not only contributed to the emotional well-being of adolescents but also gained intercultural competencies and improved their ability to operate in unfamiliar contexts. This aligns with the goals of the Intereuriland exchange program, which seeks to foster collaboration between academic institutions across different cultural and geographical regions (Andrian, 2024).

The project's use of theatrical propedeutics and movement for emotional expression reflects a broader trend in psychological interventions, where creative arts are increasingly recognized for their therapeutic potential. By using drama as a tool for emotional literacy, the project addressed a critical gap in CAPS-ij's services, providing adolescents new ways to understand and regulate their emotions.

Looking forward, future iterations of international SL projects could benefit from a longer duration and more structured support to maximize both the educational outcome for students and the emotional benefit for participants. Nevertheless, the project demonstrated the potential of SL as a tool to deepen the dialogue between the global and local dimensions, supporting the mental health of

adolescents in need, in Petrolina, Brazil, while fostering critical skills in future psychologists, who will operate in Italy.

# ENHANCING GLOBAL ENGAGEMENT: INSIGHTS FROM THE FLY PROGRAM IN EUROPEAN INTERUNIVERSITY SERVICE- LEARNING

Irene Culcasi<sup>a</sup>

Alzbeta Brozmanová Gregorová<sup>b</sup>

Maria Cinque<sup>a</sup>

Milagros Ávila Olías<sup>c</sup>

Aitor Arbaiza Valero<sup>d</sup>

<sup>a</sup>LUMSA University; <sup>b</sup>Matej Bel University; <sup>c</sup>Universidad Loyola Andalucía; <sup>d</sup>Universidad de Deusto.

Service-learning (SL) combines university engagement with community needs, fostering co-responsibility and solidarity. It supports intercultural growth and integrates local and global perspectives, encouraging collaboration to address societal challenges. This paper focuses on the FLY program, a European inter-university SL initiative involving universities from Spain, Portugal, Italy, and Slovakia. Active since 2021, FLY organizes over 50 annual SL projects across 14 countries, promoting reciprocity, social justice among universities, students and partners. This study evaluates the 2023/2024 program's impact on community partners. The results show that community partners identified significant impacts including increased visibility and networking opportunities, new perspectives, strengthened community interactions, and the educational value for students through hands-on learning and meaningful relationships with the community.

service-learning; global engagement; interuniversity cooperation; higher education

## INTRODUCTION

In the UNESCO Global Report (2021, p. 10), education is described as “the foundation for the renewal and transformation of our societies”, connecting people and providing the knowledge to address challenges for a socially inclusive, just, and sustainable future. Teaching and learning must link to civic

engagement, defined by the APA (2009, paragraph 2) as “individual and collective actions designed to identify and address issues of public concern”. Education fostering such engagement helps students connect with reality and build a fairer society where diverse knowledge is valued (UNESCO, 2021).

The purpose of the Service-Learning (SL) pedagogical approach is to bring civic engagement into the curriculum by connecting students and social partners to practise solidarity and cooperation while learning knowledge and developing curricular and extracurricular skills. To be applied, SL needs the whole community because it is based on reciprocity between university and territory in facing common challenges to positively transform the reality. In this process, the curricular and transversal knowledge and skills of the students are the tools for engaging and acting in the real world. In the same way, the knowledge and skills of the community involved in SL, are the educational resources for the students and for the joint action in collaboration with the university.

At the European level, many universities are promoting civic engagement through SL, e.g. through SL based Erasmus + projects, which since 2015 have been more than 25 (Culcasi et al., 2024). This synergy of commitment among universities contributes to a more comprehensive approach to addressing global challenges and offers more opportunities of engagement for students and community partners.

This is the case of FLY, the European inter-university volunteering and Service-Learning program that promotes the co-design of innovative SL pathways by involving students and community partners worldwide.

This contribution presents the impact gathered in the academic year 2023/2024 within the unique FLY program. Specifically, it is intended to present the results of the evaluation and reflection of the community partners they completed after the experience to assess the project and the program’s effectiveness in general. This focus on the community partners is for both because they represent a fundamental building block for the SL to be effectively implemented and to meet a gap in the literature (Compare et al., 2023).

## **1. THE FLY INTERNATIONAL SERVICE-LEARNING-BASED PROGRAM**

According to the European Association of Service-Learning in Higher Education (EASLHE, 2019):

Service-learning is an experiential educational pedagogy in which students engage in community service, reflect critically on this experience, and learn from it personally, socially and academically. The activities address human,

social and environmental needs from the perspective of social justice and sustainable development, and aim at enriching learning in higher education, fostering civic responsibility and strengthening communities (...).

In international SL, students participate in a structured program in another country. They do community service to meet local needs, learn through interactions and discussions with diverse people, and reflect on the experience. This helps them better understand their course material, appreciate the host country and their field, and feel more responsible as citizens, both in their local area and worldwide. (Bringle and Hatcher, 2011) SL emphasises the importance of shared community and the systemic interdependencies that connect us to address contemporary challenges (Culcasi et al., 2023).

FLY is an International SL based-program focused on reciprocity at personal and institutional levels (students-locals, students-students, university-university, university-social partners, etc.) where the richness of diversity and social justice are core values. The program runs from the 2020-2021 academic year. FLY is coordinated by eight universities in Europe (5 in Spain, 1 in Portugal, 1 in Italy and 1 in Slovakia) and offers more than 50 different SL projects in 14 countries worldwide every year (Brozmanová Gregorová et al., 2024). The SL projects cover 3 main impact areas: “migrants and refugees”, “people at risk of social exclusion”, and “people and community care”; projects vary in duration from one week to two months and take place in the summer period. To date, more than 550 university students have participated in 150 projects in 14 countries.

## **2. THE ROLE OF COMMUNITY PARTNERS IN SL**

SL is only possible with community involvement. Effective and sustainable SL depends on mutually beneficial partnerships between the university and the community. Indeed, community partners play a pivotal role in identifying or assisting students in analysing community needs while serving as the primary point of contact for faculty and students. Community partners are uniquely responsible for helping create a real-world experience for the students. Moreover, they provide essential guidance and opportunities that maximise the experience for the students, the community, and the intended beneficiaries. In the context of SL, community partners are not merely partners, but rather co-educators, actively engaged in the student’s educational journey.

In the FLY program, community partners have a specific role. A partner university recruits them to collaborate and offer SL projects for students. A representative of the university meets with a representative of the community

partner at the time of planning the program, together they clarify expectations and define the needs of the organisation, the workload of the students, their role and the expected learning outcomes and benefits. A representative from a community organization also defines the profile of students suitable for the project and their numbers. In this way, the student's learning experience is co-created with the community partner. The mentors from community organizations are in contact with the students before they arrive in the country, organising independent sessions with them to prepare them for the implementation of the project in another country and life in another country. During the implementation of the SL projects, the partners accompany the students through the whole process, providing them with instruction, feedback, mentoring, supervision, and responses to the questions and needs of the students. In the end, they participate together in an evaluation and reflection of the learners' experience. With the university representative, they reflect on their cooperation, the student's involvement and the benefits for the partner.

Concurring with Rubin and Matthews (2013), comprehensive academic research into education incorporating international experiential components and SL should also prioritise examining the impacts on the host communities of these programs. This broader focus aligns with SL as a reciprocal experience where all stakeholders – students, faculty, and community members – benefit mutually (Celio et al., 2011).

### **3. RESULTS OF FLY COMMUNITY PARTNERS**

In the academic year 2023/2024 17 community partners were involved in the FLY program: 7 partners from Spain, 3 from Slovakia, 2 from Italy, 2 from Brasil, 2 from Africa and 1 from Honduras. All partners had previous experience in community service or SL at the time of evaluation. They assessed the program considering all the parties involved; specifically, they analysed the benefits of collaborating with universities in terms of the impact on their own organizations, the communities they serve, and the students involved.

Figure 1 shows which areas community partners identified as having experienced an impact. The greatest impact is perceived on the organizations participating in the program (33,3% of responses). This impact encompasses various dimensions, including: the fresh perspectives that students bring to the organization, which in turn improves the work environment; the willingness of students to collaborate with the local team, especially during a time of year when volunteers are generally less available due to summer vacations (many

partners emphasized that some activities they propose for the communities they serve during the summer can only take place thanks to the presence of university students); and the adaptability and flexibility of the students, along with their capacity to integrate into the context and with the people served.

A high percentage of the community partners (30%) consider that the university collaboration has positively contribute to: gaining greater visibility as organization and becoming part of a network where the support of universities becomes a pivotal element of fieldwork; increasing visibility for the community served and the projects implemented; expanding opportunities for access to international volunteering and cooperation; gaining new perspectives through partnerships with universities.

Another highly valued aspect is the impact on the communities served (16,7%), particularly in terms of the new forms of interaction developed by beneficiaries through their engagement with university students from different cultures. Additionally, the strong interpersonal connections formed between the students and the broader community ensure that the impact extends beyond the direct beneficiaries to the community as a whole.

Finally, community partners recognize the educational value of the experience for university students, who gain the opportunity to engage in hands-on learning, deepen their awareness of the social issues underlying the activities of the partners they support, and build meaningful relationships with members of the community.

Fig. 1. FLY impact according to community partners

#### 4. CONCLUSION

According to Dorado et al. (2004, p. 26), “Service-learning partnerships can be traveling on at least three qualitatively different paths: tentative, aligned, and committed”. Tentative partnerships are typically newly established and involve instructors and community organizations with little or no prior experience in service-learning. Aligned partnerships, on the other hand, represent a more advanced stage, where participants have successfully navigated the tentative phase and are actively working to refine and adapt the collaboration to better meet the needs of students and the community. Finally, committed partnerships are defined by a deeper, long-term dedication from all parties, extending beyond the scope of individual projects.

This framework offers a valuable lens for understanding the development and sustainability of SL initiatives. Community partners, as co-educators, play a pivotal role in ensuring the relevance and sustainability of SL initiatives. Their feedback underscores the program’s impact on organizational dynamics, community relationships, and the overall quality of services offered. Key contributions include fostering social networks, increasing visibility, and promoting intercultural exchange —outcomes aligned with the core principles of SL. Furthermore, the partnerships forged through FLY emphasize the importance of collaboration across diverse cultural and institutional contexts, enriching all stakeholders involved.

Ultimately, this contribution advocates for a new social contract for education that integrates formal, non-formal, and informal knowledge and skills through SL. By emphasizing mutual respect, cultural diversity, and shared goals, the FLY program advances the vision of education as a tool for social inclusion, justice, and sustainability. Moving forward, fostering deeper commitments among partners and scaling such initiatives will be essential to address global challenges and build a more interconnected and equitable world.

# INTERSECTIONS AMONG HIGHER EDUCATION, PEACE EDUCATION, SUSTAINABILITY AND SERVICE LEARNING: CIVIC ENGAGEMENT FOR THE PRESENT AND THE FUTURE

Silvia Guetta  
University of Florence

This article explores Service Learning (SL) as an innovative pedagogical approach and its potential in connecting peace education, sustainability and global citizenship. Through the integration of experiential learning and critical reflection, SL is proposed not only as a tool for the development of professional and transversal skills, but also as a promoter of social justice and civic responsibility. The article highlights how transformative pedagogy, focusing on disorienting experiences and critical thinking, offers a theoretical framework for linking SL to peace education, addressing inequalities and promoting values of cooperation and inclusion. Furthermore, the role of higher education in fostering the institutionalisation of SL and building an educational model that integrates academic knowledge and active engagement in society, contributing to the construction of a more equitable and sustainable society, is discussed.

service learning, transformative learning, higher education, peace education,, interdisciplinary learning, global citizenship education, sustainability.

## INTRODUCTION

The integration of Service Learning, higher education, peace and democracy education is the way that can help shape new consciousnesses for sustainability and the realization of peaceful coexistence<sup>1</sup>.

Several studies and policy documents have emphasized the importance of

---

<sup>1</sup> European Association of Service-Learning in Higher Education <https://www.easlhe.eu/>  
20.11.2024

overcoming an exclusively nationalist educational model, which is incapable of promoting open-mindedness and an interdisciplinary approach to global issues, as well as contributing to effective social improvement (Ribeiro, Aramburuzabala & Paz-Lourido, 2021).

Although SL has been present in Italy since the beginning of the 21st century, its insertion within academic courses remains rather limited. In the Italian panorama, several universities have built networks between departments or experimented and then activated interdisciplinary service-learning pathways within their courses in order to implement and consolidate the learning itself, while fostering the construction of social and civic competences in students.

In particular, the School of Higher Education *Educare all’Incontro e alla Solidarietà* (EIS) of the LUMSA<sup>2</sup> University in Rome is an important reference point for the development of projects, research and the sharing of good practices. The school proposes to deepen on different levels, from the theoretical to the projectual, from the methodological to the experimental, from the pre- and in-service training to the dissemination of good practices, the SL pedagogical approach, for the potential that this proposal presents for human, professional, cultural and social growth (Fiorin, 2021).

Over the past few years, other universities have recognized how SL can be increasingly valued as an essential component of higher education and how, within many universities, there are researchers who consider it an integral part of their students’ education. From the sharing of many common experiences, the Italian University Network for Service-Learning (UniSL)<sup>3</sup> was born in 2016, which connects to other international networks of universities such as Uniservitate<sup>4</sup> (Serelli, 2024).

In the “Guidelines for the Institutionalisation of Service-Learning in European Higher Education” (Ribeiro, Aramburuzabala & Paz-Lourido, 2021), it is clearly highlighted that the implementation of SL is crucial to promote social engagement among students. This educational modality allows an experiential exchange with community partners, contributing to mutual enrichment and increased relevance of university teaching and research missions.

The paper explains that in order to initiate an effective institutionalization process of SL, higher education institutions should be supported in developing

<sup>3</sup> Rete universitaria italiana per il service-learning (UNI SL) <https://eis.lumsa.it/internazionalizzazione/reti-di-service-learning> 20.11.2024

<sup>4</sup> UNIVERSITARE <https://www.uniservitate.org/> 20.11.2024

continuous and systematic evaluations. These evaluations should not only aim at the development of course-specific competences, but also take action to promote transversal competences, which are essential for peace and democracy education. SL integration at all institutional levels is therefore crucial to ensure that students acquire, alongside academic knowledge, a strong sense of civic responsibility.

Furthermore, the guidelines emphasize that SL should be considered an educational approach committed to building a more equitable and sustainable society. This implies continuous improvement and sensitivity to different social contexts, as well as the active involvement of students and teachers in projects that foster peace and democracy (Ribeiro, Aramburuzabala & Paz-Lourido, 2021).

There is therefore no doubt that the widespread institutionalization of SL in universities may represent a significant and innovative step towards a high-quality education, which is not only aimed at preparing students for professional careers, but also educates them to become active and aware citizens, capable of contributing positively to society.

## **1. THE SL IN THE CONSTRUCTION OF UNIVERSITY STUDENTS' LEARNING AND COMPETENCES**

SL has a significant impact on students' competences, offering numerous benefits that can enhance both their academic training and their personal and professional skills (Scandurra, Laperuta, Sabatino, Simioli & Majello, 2024). By allowing theoretical knowledge to be used in a personal way to design the improvement of living conditions in the community, SL lends an original and creative specificity to the experience. For this reason, the experiential learning (Kolb, 1984) that this approach proposes cannot be reduced to mere internship. The SL differs from an apprenticeship both in its design approach and in its aims. The apprenticeship is essentially aimed at consolidating knowledge through a contextualization of this knowledge in professional contexts. Its purpose is to generate a circularity between knowledge and skills for those who are preparing to enter the world of work. The SL establishes a circularity between knowledge and skills aimed at entering into action with the territory, with social and cultural issues and with the needs of sustainability. Specific is also the interaction that is being built with the communities of the territory that are bearers of historical, new and evolving cultures and knowledge. These are knowledge expressing values, oral traditions, social practices and performing arts of local intangible

heritage that, as UNESCO has affirmed since the 1990s<sup>5</sup> (UNESCO, 2022), are an integral part of cultural heritage.

The search for how to bring together the knowledge, knowledge and relational dynamics of an area, the implementation of engaging and effective improvement actions, also requires the development of sustainable problem-solving skills. A search for possible solutions that fuels the implementation of dynamic communication and action strategies that are suitable, as we shall see later, for peace education as well. Problem solving represents the positive use of contextualized creativity (Proctor, 2021). The possibility of concretely experiencing how and how important it is to have an interdisciplinary and transdisciplinary approach that can foster connections between the various areas of study, the building of relational mindsets and the habit of reading problems through the lens of the complexity of interconnected elements.

As we return to reflect on the two training experiences of the beyond the classroom, we can note that SL and internship training both foster the acquisition of fundamental transversal skills such as communication, teamwork, leadership and time management (Boni, Walker, 2013). These skills are considered essential for success in both the academic and professional worlds. However, SL projects engage students in the personal development of a sense of civic responsibility, through the many facets of society and the ways in which they can better understand the role they can play within these (Howard, 2021). In maintaining a dialogue of reciprocity between formal, non-formal and informal learning, students acquire sensitivity and awareness of social issues and different forms of injustice, marginalization, neglect, discrimination, poverty.

In the university experience, the development of critical reflection allows for a mature and personal reworking of the knowledge learnt in the face of life circumstances, the need for improvement, political choices and individually and socially lived experiences (Scandurra, Laperuta, Sabatino, Simioli & Majello, 2024). By encouraging students to reflect on what they have learnt and how their actions affect the community, they can develop a greater awareness of social and cultural dynamics. In this sense, engagement in community service activities not only develops professional skills, but also promotes personal growth; as found by the fact that students often report increased self-confidence, self-efficacy and personal satisfaction (Cassidy, 2015).

---

<sup>5</sup> Intangible Cultural Heritage <https://ich.unesco.org/doc/src/05361-EN.pdf>

In sum, SL not only enriches students' educational experience, but also contributes to the formation of aware and engaged citizens, equipped with skills that can transform their lives and those of the communities in which they work. Through participation in projects that integrate learning and service, students develop essential skills such as communication, teamwork and leadership, which also prepare them effectively for the world of work. These projects offer them the opportunity to acquire practical skills and an in-depth understanding of human relationships, interconnections between systems and social dynamics. The integration of SL in university research and teaching thus brings significant benefits also for teachers, promoting new perspectives and innovative pedagogical approaches. (Serelli 2004). Designing cooperatively by sharing objectives that lead to wellbeing generates a constructive and professionally capable approach that also influences relational and learning wellbeing. This is an opportunity to promote creative and constructive dialogue between the university and the community, helping to create positive and generative partnerships (Serelli 2024). For these reasons, higher education courses should increasingly promote the inclusion of SL in curricula and build partnerships with communities, so that individuals feel engaged and responsible, ready to contribute to a more just and supportive world.

## **2. TRANSFORMATIVE PEDAGOGY AS A CONNECTOR BETWEEN SL AND PEACE EDUCATION**

Before delving into the definition of peace education, it is useful to recall the theoretical reference that significantly connects it to SL. This connection is particularly relevant in light of the latest UNESCO Recommendation on Peace Education (2023), which emphasizes transformative pedagogy as central to promoting change at all levels and in all spheres of society.

Transformative pedagogy is an educational approach focused on profound and meaningful change in students' thinking patterns, perspectives and behaviour. Based primarily on the work of Jack Mezirow (1997), this pedagogy aims to promote greater critical awareness, autonomy and capacity to act for social change. Both SL and peace education interventions find a solid reference in transformative pedagogy, as they accentuate personal and social change generated by critical experience and direct confrontation with reality. Both approaches share the idea that meaningful learning is not limited to the mere acquisition of technical or theoretical knowledge, but also includes the ability to reflect on oneself, one's role in society and the power structures that govern

it (Giunti, Lotti, 2023).

The 21st century is characterized by increasing global interconnectedness, rapid technological change and unprecedented environmental challenges. These factors call for the need to make use of different approaches in promoting education. Moving beyond the practice of imparting knowledge and skills has long been insufficient to prepare students to contribute to a sustainable society. Transformative education and ESD<sup>6</sup> (Education for Sustainable Development) emerge as key approaches to promote a paradigm shift towards a pedagogy that integrates critical thinking, conscious action and commitment to the common good (Bell, 2016).

Although transformative pedagogy can also find links in authors such as Freire (1970) and Galtung (1996), it was above all Mezirow (1997) who defined some foundational concepts that initiated the development of this theoretical reflection. According to the author, it aims, first and foremost, to change individuals' interpretative frameworks through experiences that challenge their beliefs and promote meaningful learning. With the disorienting experience, which involves students in experiences that confront them with real challenges, we enter the first process that initiates the transformative dynamic. The disorienting experience activates a deep and meaningful learning process that leads to the transformation of the individual's beliefs, values and perspectives. This type of experience is characterized by events or situations that challenge pre-existing beliefs, causing a sense of discomfort or cognitive and emotional disorientation. Its transformative power also lies in its ability to disrupt established patterns of thought by questioning what has always been taken for granted, through revisiting the nature and construction of basic beliefs. This stimulates critical thinking because it prompts, first and foremost, reflection on oneself, one's assumptions and the social, cultural or political context in which one lives. At the same time, critical thinking becomes a tool for analyzing and reinterpreting the meaning of lived experience.

It should not be forgotten or underestimated that feelings of insecurity, uneasiness and confusion may be generated during this phase of disorienting experience, as the person is confronted with uncertainty, fragility, insecurity, and the questioning of one's comfort zone. For this reason, it is necessary to involve pupils from the first classes of primary school in experiences that confront them with real challenges.

In the educational context, transformative pedagogy is realized through

---

<sup>6</sup> ESD <https://www.unesco.org/en/sustainable-development/education> 21.11. 2024

methods such as action-based learning, systemic approaches and a holistic integration of disciplines (Milton, 2012). The main objective is not limited to the transmission of knowledge, but to promote the development of critical thinking skills, creativity and collaboration.

These principles find a close connection with SL, which focuses on the critical processing of lived experience. Through reflection, students are encouraged to question self-referential viewpoints, prejudices or attribution errors, fostering forms of self-assessment that are highly effective in transforming perceptions, representations and relationships.

In line with the principles of transformative pedagogy, SL adopts an experiential and reflective approach that emphasizes the use of disorienting experience and structured reflection. This process encourages learners to question their own actions, their ethical implications and the social structures that influence the problems they face, thus transforming experience into meaningful learning.

### **3. THE CONNECTION BETWEEN SL AND PEACE EDUCATION: A TRANSFORMATIVE PERSPECTIVE IN HIGHER EDUCATION**

The analysis of how transformative pedagogy relates to peace education has been deepened over the years by Massimiliano Tarozzi (2015), with specific references to intercultural, global and complex contexts. In particular, the importance of global citizenship education as a tool to promote social justice and peace through transformative educational processes emerges. The relationship between global citizenship education and transformative pedagogy is based on a close connection between educational objectives that aim to form individuals who are aware of global challenges and capable of promoting social change. The main aspects that characterize this relationship are described below:

Specifically, Tarozzi (2015) closely links transformative pedagogy to peace education, arguing that the latter should not be limited to the transmission of knowledge, but should promote inner and social transformation. Through critical reflection and dialogue, individuals can develop a deeper understanding of the causes of conflict and injustice, and actively engage in building a culture of peace (Guetta, 2015).

However, it is necessary to translate theory into practical experiences that consolidate both the skills and metacognitive strategies associated with learning, and the moral principles and values of coexistence and dialogue. In order to achieve this transition, we believe it is important to point out the set of

methodological models proposed by Indire, which goes by the name of the Movimento Avanguardie Educative<sup>7</sup>, of which SL is one of the main ones.

A Movement that started from the awareness of the need to start a path of transformation of the school model in relation to critical elements highlighted in the national and international scenario in the comparison between Italy and other European countries (Orlandini, Chipa, Giunti, 2020). In order to promote the transformation of models it is necessary to create interaction with other systems, such as, for example, the social one, or the political and regulatory ones that, through their action, can support the processes promoted with dedicated interventions and with progressive and shared timeframes (Orlandini, Chipa, Giunti, 2020).

The UNESCO Recommendation on Education for Peace, Human Rights, International Understanding, Cooperation, Fundamental Freedoms, Global Citizenship and Sustainable Development adopted in 2023<sup>8</sup>, emphasizes the importance of educational approaches that promote a profound transformation in the knowledge, skills, values and attitudes of individuals. It also states that peace in the 21st century requires not only the absence of war or armed conflict, but is based on inclusive, participatory and dynamic processes that promote our ability to value human dignity and care for ourselves, others and the planet. This document explains how education in all its forms and dimensions, in and out of school, shapes the way we see the world and relate to others.

Although the term ‘transformative pedagogy’ is not explicitly mentioned, the basic principles of this approach are clearly present in several sections of the document. Thus, peace education and SL share a common vision: education as a tool to promote personal and social change through critical reflection, experiential learning and active engagement. The Recommendation marks the need to design educational proposals that also involve the territory and that go beyond the transmission of knowledge, in order to activate, in a more concrete and real way, a profound transformation of the attitudes of passivity that most of the younger generations are experiencing. This is fully in line with the SL, whose constant commitment is to integrate theory and practice, allowing students to face, in the first person and with their own perceptions, the concrete issues of local communities, contributing to the development of transversal skills and educating a sense of civic responsibility. Both perspectives converge

<sup>7</sup> Movimento Avanguardie Educative <https://www.indire.it/progetto/avanguardie-educative/> 22.11.2024

<sup>8</sup> UNESCO Recommendation on education for peace <https://www.unesco.org/en/global-citizenship-peace-education/recommendation> 22.11.2024

in promoting participatory education, which uses dialogue and reciprocal actions to create environments of possible alliances for well-being and social growth. Empathic communication allows one to observe the world through the principle that every human being is a system of needs and as such has both the right and the responsibility to choose, within a context of respect, acceptance and coexistence, the path that he or she considers most suitable to meet those needs (Rosenberg, 2003) In this context, the transformative pedagogy of SL represents a concrete bridge between the ideals promoted by the UNESCO Recommendation and educational practices, training individuals capable of acting as agents of peace and sustainable change in their communities and beyond.

As seen, SL is an important educational device in higher education, capable of promoting professional skills, social justice values and active global citizenship. Through involvement in solidarity projects, students not only learn how to put their knowledge into practice, but also develop a greater awareness of social challenges and how to envision positive and sustainable change.

Despite their transformative potential, both SL and peace education remain marginal approaches in the higher education landscape. This low visibility is revealing of an educational model still strongly anchored to traditional paradigms, oriented to the transmission of theoretical knowledge and technical-professional training, rather than to the integral formation of the person (Bringle & Hatcher, 1995; Freire, 1970).

SL and peace education share a pedagogical vision that transcends the mere acquisition of academic skills and the maintenance of their sectoriality and separation (Ribeiro, Aramburuzabala & Paz-Lourido, 2021). Both refer from an interdisciplinary treatment of knowledge to the implementation of good coexistence practices through experiential learning and civic engagement, to the ability to creatively address the complex challenges of the contemporary world. However, their role is often underestimated in academic institutions, which tend to separate the cognitive dimension from the ethical and social dimension (Kolb, 1984; Galtung, 1996).

A unifying element between SL and peace education is also that of commitment to social justice and improving the living conditions of communities. SL, through active collaboration with local communities, enables students to confront concrete problems of inequality, social exclusion, poverty and conflict. This process fosters the development of transversal skills such as empathy, dialogue skills and sustainable problem solving, all of which are fundamental to building

a culture of peace (Eyler & Giles, 1999).

Similarly, peace education provides the tools to understand and address the roots of conflict, promoting values such as non-violence, cooperation and respect for cultural diversity (Capitini, 1955; Bajaj & Hantzopoulos, 2016). It should not be forgotten that peace education and SL also share a critical dimension: they invite questions about power structures and the dynamics of exclusion that perpetuate injustice (Freire, 1970). In academia, this critical approach can stimulate deeper reflection on the role of universities as actors of social change, as well as centres of knowledge production and dissemination.

In order to promote the visibility and integration of these approaches, it is necessary for academic institutions to adopt more inclusive and multidimensional policies, capable of enhancing the contribution of peace education and SL in the formation of conscious and committed students. The integration of the two could be a turning point in making higher education more attentive to the needs of communities and oriented towards a global and sustainable vision of human development. A civic engagement, declined in all those activities oriented to participation in common life and to strengthening the relationship between citizens and institutions capable of promoting and involving in a generative thinking, aimed at preventing that depersonalization that risks emptying relations and flowing into disinterest and hatred.

A deeper connection between these two educational contexts highlights the need to refer to the meanings involved in peace education and the ways in which SL helps to experience the impact of sustainability on the ground, promoting not only environmental awareness but also civic engagement oriented towards social change. In this way, higher education is positioned at the centre of a global education that links sustainable development, personal responsibility, respect for rights and deconstruction of all forms of violence.

In conclusion we quote UNESCO's Recommendation (2023b):

Cooperative work between students, the development of research projects, problem-solving, individual study, seminar dialogue, field study, writing, action research, community projects – these and many other pedagogical forms need to infuse higher education. (...) Values such as respect, empathy, equality, and solidarity must be core to the mission of universities, colleges, and technical institutes in the future. Higher education must foster ethics and support students to be better and more capable citizens with greater awareness of their civic and environmental responsibilities. Higher education must also be socio-culturally relevant. Appreciation of cultural diversity, a commitment to defend human rights, and intolerance for racism,

sexism, classism, ethnocentrism and discrimination in all forms must be key educational objectives. Higher education that advances such values and principles goes beyond the confines of lecture halls and virtual spaces. It is ever evolving in its content as it empowers individuals to become better versions of themselves, to take strong value systems forward, and to transform their environments (UNESCO, 2023, p. 60).

# THE PENSARE IN GRANDE/THINKING BIG PROJECT: A PARADIGM FOR DEMOCRATIC EDUCATION

Vanessa Macchia<sup>a</sup>

Stefania Torri<sup>a</sup>

Gianluca Amatori<sup>b</sup>

Silvia Maggiolini<sup>c</sup>

Moira Sannipoli<sup>d</sup>

<sup>a</sup>Free University of Bolzano-Bozen, Italy; <sup>b</sup>Università Europea di Roma, Italy; <sup>c</sup>Università Cattolica del Sacro Cuore di Milano, Italy; <sup>d</sup>Università di Perugia, Italy;

The debate to affirm justice in educational spaces in Europe focuses on a democratic education based on some key dimensions: the appreciation of differences, an attitude of openness, a set of skills related to the emotional sphere and a critical knowledge and understanding of oneself and the world. (Council of Europe, 2018). Research has shown that Early Childhood Education and Care is crucial both for the development of the person and for the early detection of difficulties. (Motiejunaite, 2021, Starting Strong VI, 2021). The Pensare IN Grande project focuses on Italian services for children aged 0-6 years and aims to implement their quality to help professionals support every child. This paper summarises the preliminary findings from the main questionnaire, based on the self-reflection tool for kindergarten teachers developed by the European Agency (IECE Environment Self-Reflection Tool, 2017). They reveal positive attitudes towards inclusion, but also a complex landscape where progress towards inclusivity is juxtaposed with persistent systemic barriers. Despite a strong commitment to fostering inclusive environments, educators' efforts are often constrained by structural limitations, including lack of resources, inadequate training and fragmented institutional support. Increased investment in infrastructure, expanded professional development opportunities and stronger cross-sectorial collaboration are needed.

ECEC; integrated system 0-6; inclusion in 0-6; inclusion and democratic education

## **INTRODUCTION**

The Pensare IN Grande (*Thinking Big*) project represents a transformative initiative in early childhood education, addressing systemic inequities in access, quality, and inclusivity for children aged 0–6. This developmental stage is of great consequence, as disparities established during this period often persist throughout life (European Commission, 2021). The project is aligned with European efforts such as the European Pillar of Social Rights (European Parliament, 2017), which emphasises access to quality education for all, building on Italy’s recent legislative reforms that establish an integrated 0–6 education system.

This paper examines the project’s general theoretical foundations, research methodology, and presents preliminary findings, thereby contributing to the ongoing debate on equity and inclusion in early childhood education.

The project’s alignment with the Council of Europe’s Reference Framework of Competence for Democratic Culture (Council of Europe, 2018) serves to highlight its democratic underpinnings. The framework is comprised of four elements: values, attitudes, skills and critical understanding. In particular, the framework identifies a number of values, attitudes and skills as being essential for the promotion of inclusive education systems. These include, for example, openness to diversity, respect and tolerance, autonomy, flexibility and empathy, as well as critical understanding of the personal, social and political dimensions. The project’s objective is to dismantle barriers to inclusion for marginalised groups, including children with disabilities and those at risk of social exclusion, by integrating these principles.

These democratic principles are further supported by frameworks such as the United Nations Convention on the Rights of the Child (UNICEF, 1989), which emphasises the right to inclusive and equitable education for all children. This alignment serves to illustrate the broader applicability of the Pensare IN Grande model, extending beyond the boundaries of Italy.

## **1. RESEARCH ON ECEC AND INCLUSION**

The existing research evidence indicates that ECEC (Early Childhood Education and Care) is of significant importance for both the development of the individual and the early identification of potential difficulties. (Motiejunaite, 2021, p. 10). The fourth goal of the 2030 Agenda is to guarantee that all children, youth, and adults, particularly those who are marginalized and vulnerable, have access to education and training that is pertinent to their needs and the context in which

they live. However, the latest OECD data on the participation of children with special educational needs or at risk of social exclusion indicates that only a quarter of these children (27%) are included in early childhood education and care (Council of Europe Recommendation, 2022).

A comprehensive review of the principal documents and laws governing early childhood education from the age of 0 to 6 has recently demonstrated that there has been a paradigm shift in approach. This shift goes beyond the notion of removing barriers and addressing the injustices faced by children in difficulty, towards a holistic understanding of the child. This approach emphasises the harmonisation of the physical, social and cognitive aspects of the child (Macchia & Torri, 2023).

The necessity of early childhood intervention was recently corroborated by an article in *The Lancet*, which underscores the significance of the subsequent 1,000 days of a child's life (ages 2-5) as a pivotal period for consolidating early developmental gains. The report draws attention to the stark disparities in care across regions, with particular concern for low- and middle-income countries (LMICs), where only 25% of children receive adequate support, leaving millions at risk. Despite evidence indicating that the provision of quality early childhood education and positive parenting can have a significant positive impact on child development, access to early childhood care and interventions remains limited, particularly in low- and middle-income countries (LMICs). In order to address these shortcomings, the article proposes the implementation of multisectoral strategies across the domains of health, education and social protection. The article underscores the imperative of enhancing the quality, equity, and accessibility of early childhood programmes in order to achieve the Sustainable Development Goals (SDG 4.2) and mitigate the risks to global progress and child well-being (Draper et al., 2024). Another similar article in the same journal argues that not investing in the next 1000 days (ages 2-5) results in significant societal costs, including lost developmental opportunities and economic benefits. Early Childhood Care and Education (ECCE) programmes yield benefits 8-19 times their costs, improving long-term outcomes such as education and earnings. Failure to act results in GDP losses of 2-7% for low- and middle-income countries. (Nores et al, 2024).

## **2. THE PENSARE IN GRANDE PROJECT IN DETAIL**

The Italian context offers a particularly fruitful setting for examining the intersections between policy, practice and inclusivity in early childhood

education. The Pensare IN Grande project, a collaborative undertaking among four prominent Italian universities (the Free University of Bozen-Bolzano/Principal Investigator, the Catholic University of Milan, the University of Perugia and the European University of Rome), employs a mixed-methods approach to identify existing best practices while delineating areas necessitating systemic intervention. This comprehensive study targets early educators across a range of settings, including kindergartens, playgroups and family centres, thereby ensuring a holistic understanding of the sector.

The project is informed by three overarching research questions:

- To what extent is the promotion of inclusivity shaped by the prevailing institutional frameworks, as opposed to the actions of individual educators?
- What strategies might be employed to ensure that education extends beyond the mere imparting of basic skills to encompass the integration of values and the promotion of learning outcomes that facilitate personal and intellectual growth?
- What innovative practices and strategies can be employed to overcome the obstacles to inclusivity that are encountered in a variety of contexts?

These questions reflect the project's dual focus on the contributions of systemic and individual factors to the fostering of inclusive education, emphasising the interplay between policy, practice and educator agency.

## **2.1 Methodology**

The research employs the IECE Environment Self-Reflection Tool (Björck-Åkesson et al., 2017), which has been adapted to evaluate eight dimensions of inclusivity: welcoming atmosphere, social environment, child-centred approaches, physical environment, resources, communication, teaching methods, learning environments and family collaboration. The data pertaining to family cooperation are currently undergoing processing. A Likert-scale questionnaire is employed to collect quantitative data, while open-ended questions are used to elicit rich qualitative insights, thereby capturing the nuanced experiences and perspectives of educators. As of May 2024, the survey was completed by 120 educators, representing a diverse range of roles and qualifications. The participants included teachers, playgroup facilitators, and family centre educators, thereby providing a comprehensive view of the sector.

### 3. PRELIMINARY FINDINGS

The initial analysis of the data has yielded significant insights into the current state of inclusivity in early childhood education. The findings illustrate both the existence of systemic strengths and the persistence of challenges.

The quantitative data derived from the Likert-scale responses indicate a predominantly positive perception of inclusivity across the majority of dimensions. Areas such as a welcoming atmosphere and child-centred approaches were rated highly, reflecting the commitment of educators to the creation of supportive environments. However, specific domains, particularly those pertaining to personalised support for learning and access to external resources, belonging to the area 3, were identified as significant challenges. It is worthy of note that:

- Dimension 3.5: Only 54% of respondents indicated that personalised support was consistently available for children with specific needs.
- Dimension 3.6: A mere 42% of respondents indicated that they had sufficient access to additional resources when needed, thereby underscoring a critical gap in systemic support.

These findings indicate a necessity for the implementation of targeted interventions with the objective of addressing resource constraints and enhancing the capacity of educators in these areas.

The open-ended responses to the question “What would you change?” facilitate a more profound comprehension of the challenges identified in the quantitative data. A number of recurring themes emerged from the data.

The first of these was the physical environment. Educators emphasised the importance of well-designed, inclusive spaces. A significant number of respondents identified a lack of modern infrastructure, inadequate outdoor areas and poorly adapted furniture as key barriers to effective inclusivity. For example, one respondent observed that “our classrooms are not designed with diversity in mind; we lack the space and resources required to accommodate all children comfortably.”

A pervasive theme was the necessity for more comprehensive training in areas such as conflict management, intercultural communication, and individualised instruction. Educators articulated frustration with the dearth of accessible professional development opportunities, with one stating, “We are expected to meet diverse needs, but the training we receive is insufficient for the realities of our classrooms.”

A notable concern was the lack of collaboration among educators, families, and health institutions. The respondents emphasised the necessity for more robust collaborative arrangements to guarantee comprehensive and coherent assistance for children. One educator observed that “without clear communication and collaboration, our efforts often feel fragmented and less effective.”

Financial constraints were frequently referenced, particularly in relation to the procurement of specialised materials and toys. A considerable number of educators conveyed their exasperation with the bureaucratic delays and inadequate funding, which impede their capacity to provide bespoke assistance to children with special needs.

Educators finally identified a need for innovative teaching strategies that prioritise inclusivity. The suggestions included a reduction in class sizes, the incorporation of technology to support diverse learning styles, and the adoption of flexible curricula that cater to individual needs.

#### **4. DISCUSSION AND CONCLUSION**

The findings reveal a dichotomy: while educators demonstrate a commitment to inclusivity, their efforts are undermined by systemic barriers such as inadequate training and insufficient resources. These challenges are echoed by international findings that emphasise the necessity for targeted investments and reforms in early childhood education and care (ECEC) (Starting Strong IV, 2021).

The qualitative data highlight specific areas for improvement, particularly in relation to enhancing infrastructure, professional development and inter-sectoral collaboration. These insights are in alignment with the objectives of the European Agency for Special Needs and Inclusive Education, which advocates for comprehensive approaches to inclusivity (Björck-Åkesson et al., 2017).

In conclusion, the Pensare IN Grande project offers significant insights into the current state of inclusivity in early childhood education, combining empirical data with practical recommendations. Its findings contribute to an expanding body of research advocating for the establishment of equitable and inclusive education systems. Future efforts should prioritise systemic investments, expanded training opportunities and strengthened partnerships in order to achieve these goals.

# INTEGRATING OPERA INTO SERVICE LEARNING: A MULTIDISCIPLINARY APPROACH IN TRAINING FUTURE TEACHERS

Benedetta Miro <sup>a</sup>

Alessandra La Marca <sup>b</sup>

<sup>a</sup>Università degli Studi di Macerata – Università degli Studi di Palermo; <sup>b</sup>Università degli Studi di Palermo

This study explores the implementation of Opera as a key element within a Service Learning (SL) program. This innovative methodology aims to engage students in community service activities while enriching their educational experience and their musical culture. Since 2010, the Degree Course in Primary Education Sciences of University of Palermo has implemented SL to enhance lifelong, meaningful, and responsible learning in students, in order to increase a deep awareness of themselves, their community, and their education. Solidarity, collaboration, and active participation are just some of the dimensions that this activity will promote. SL represents the intersection between theory and practice, between research and experimentation, between culture, values, and life, between learning individual skills and active citizenship skills. In this contribution, in continuity with other activities, we present the design of a SL activity offered to third-year students during a.y. 2024/25. In collaboration with local institutions, a program that integrates Opera with SL projects in at-risk neighborhoods was developed. University students, future teachers, who participated, were trained on how to integrate Opera into curriculum and how to design relevant SL projects. For this purpose, in addition to preparatory meetings specifically on SL, some activities aimed at listening to and understanding Opera were planned.

Service Learning; Musical Education; Innovative Teaching; Citizenship Skills

## **INTRODUCTION**

The University of Palermo has always been committed to offering its students a learning and teaching experience that is stimulating, engaging and innovative. As a demonstration of this mission, numerous Service Learning (SL) activities have been implemented in recent years, which is considered a successful and effective approach to engage actively university students. The effectiveness of Service Learning lies precisely in being able to combine the experiential and value-based learning of the students involved and the solidarity service done towards their community.

From 2020 to 2022, the e-Learning Service project ‘Nobody Left Behind’ was implemented, aimed at designing and implementing educational and empowerment paths for primary school pupils in Palermo. The project involved 869 students enrolled in the LM85bis degree course (303 third year; 293 fourth year; 273 fifth year) in the design and implementation of targeted teaching courses aimed at ‘fragile’ pupils in Palermo. A total of 60,000 hours of DAD activities were delivered. The challenging didactic activities realised thanks to innovative digital resources, favoured cognitive stimulation and the development of pupils’ motivation to learn and the development of the relational and digital skills of the university students who carried out the SL activities (La Marca & Longo, 2022).

Another relevant testimony is the project ‘[PR]A.S.I. Apprendere serve, Servire insegna’, implemented during the academic year 2022-2023, aimed at promoting educational and training activities addressed to minors in the Ballarò – Albergheria neighbourhood of Palermo with a sample of 38 students enrolled in the first year of the primary education science degree course. The project envisaged initial distance learning (4 meetings, for a total of 16 hours) through which the students were able to experiment and acquire operational project models, develop reflective, relational, research skills and civic-social and metacognitive attitudes, exploiting the e-Learning methodology (La Marca, Martino & Zuccaro, 2023).

The latest initiative organized by Palermo University, again involving students of Primary Education, is a project that combines Service Learning and Music Education, specifically, opera.

### **1. SERVICE LEARNING IN FUTURE TEACHER TRAINING**

Why Service Learning as a key element for increasing the skills and capacity of future teachers?

Nowadays, it is essential to have many skills: hard and soft skills, which are useful to be able to live fully and face daily challenges.

Skills have become increasingly fundamental in any fields: work, professional and personal, because they enable us to find alternative solutions to problems (problem solving), to listen actively. They develop digital, communication, creative skills, etc.

It is therefore essential to ensure that teachers have these skills, so that they can pass them on to their pupils and make them prepared for life's challenges.

Nowadays, more and more skills are required from an early age; in 2023, the World Economic Forum drew up a list of the most useful and in-demand skills that are considered essential.

Figure 1. Top 10 skills of 2023, World Economic Forum (2023)

In addition, it is precisely for this reason that the possession of skills proves to be a fundamental requirement, especially for a teacher.

Possessing all these skills, in fact, allows one to reinvent oneself and make one's work original. In the case of teachers, this ability is fundamental: the teaching profession is already very complicated, nowadays it is an even more difficult job.

The teacher must make their lessons interesting, interactive, engaging and stimulating. They must be able to use many different pedagogical methods and

strategies, to invent challenging activities and to use multiple pedagogical approaches.

It is precisely in order to achieve the objective that, as an original and innovative solution, in this contribution we propose Service Learning as an effective tool to support teachers in creating interesting lessons.

To achieve this goal, we propose Service Learning as an original and innovative solution, as an effective tool to support teachers in creating interesting lessons. We choose service learning because it is able to merge both the area of skills and that of values such as solidarity, mutual help and commitment to others and to the community.

In fact, a good teacher must train in life, values, respect and help, not just in theoretical content.

Therefore, equipping future teachers to be able to do this, means laying the foundations for skilled, capable and prepared teachers in the future, and Service Learning represents a transversal and multidisciplinary approach useful in achieve this aim.

## **2. THE PROJECT: THE JOY OF WELL-MADE OPERA WITH SERVICE LEARNING**

During the design phase of this activity, we wondered about the commonalities between service learning and opera.

These are, apparently, two completely distant and different worlds. Upon deeper study, we realised that in truth they have many more points of contact!

Indeed, in both cases, they are pedagogical and didactic approaches, which aim to form values and skills in people. They both develop, in adults and children, ethical behaviours and improve everyone's experiential baggage. Among the values that are most developed in both SL and music are responsibility, collaboration, teamwork, problem solving, creativity and many others. This is why, during the conception phase, we realised that putting these two realities side by side in an initiative could be a winning challenge; in both cases, the main concept is sharing with others.

## **3. AIMS OF THE ACTIVITY**

The present study therefore used the Service Learning approach and music education and involved a number of university students in the development of a product concerning the re-adaptation of an opera addressed to primary school pupils in a disadvantaged neighbourhood of the city of Palermo.

During the first step, students have identified the educational need to be rehabilitated within the community, i.e. that of poverty, school dropouts and crime. Once they identified it, then the plots of various operas were analysed in search of one that was most appropriate and adaptable to the chosen context, with the aim of raising the awareness of young students and pupils to the effectiveness and originality and transversality of education and, of course, of music.

The research, in fact, was conducted with the intention of elaborating a transferable and sharable product for future teachers and equipping them with relevant tools and educational strategies to make the learning-teaching moment an authentic and valuable exchange, meaningful and stimulating.

The initiative involved around 200 students in the third year of the Master's Degree Course in Primary Education at the University of Palermo who, during the first semester of the 2024-2025 academic year, were engaged in designing a Learning Unit to be implemented with their future pupils.

The students were organised into large groups (10-15 members) and randomly, in order to foster their interaction and acquaintance, they independently elected a leader and proceeded to the division of roles and tasks. Each group worked independently and autonomously: some decided to start from the identification of a community need and then, as a result, search for analogies and similarities in the plot that would make it easily re-adaptable to the school context; others, on the other hand, preferred to analyse various plots and then identify a community need.

Each group carried out a screening and selection phase of the best-known operas, studying their plots and learning about their various characters. The opera that each group then decided to deal with was the one that gave them the most ideas, points for reflection, plans for possible activities and links with the identified social need.

One of the objectives that each group set itself was to be able to create a product that was appealing and that could activate curiosity in primary school children from disadvantaged neighbourhoods in the city of Palermo, while at the same time going beyond the commonplace that sees opera as something that tends to be boring and outdated.

The challenge was therefore both a design-didactic one and a social one: to imagine being faced with a class group more prone to dropping out of school and delinquency than to diligent study. Simulating this context, during the conception and design phase, pushed the students to find didactic expedients,

engaging activities and succeed in intriguing a hypothetical class group, with the aim of awakening a healthy desire to attend school. Among the various products realised, here is a rather relevant example, which involved an in-depth study of the needs of a community in Palermo and a heartfelt commitment to designing activities that were first inclusive, fun and innovative.

#### **4. ORGANISATION OF THE ACTIVITY**

The project presented concerns the re-adaptation of the opera ‘Cavalleria Rusticana’ by Pietro Mascagni (first performance 1890), chosen not only for its points of contact with the context of Palermo, as the opera is set in Sicily, but also for its characters, which are easily connected to the city’s folkloristic aspects.

The work of the group followed three major phases:

- Compilation of design tables for Service Learning initiatives (La Marca & Falzone, 2023);
- Drafting of a ‘script’ with plot and adapted characters;
- Designing teaching activities, choosing the most relevant pedagogical approaches, strategies and educational methodologies;
- Creation of a presentation of the finished product.

The first step (compilation of the tables) represented a fundamental step. These tables are made precisely for the planning of service learning interventions and allow the work to be organised very precisely.

The educational issue is identified: the community need to be solved, the human and financial resources to be mobilised, time and place, related disciplines, prerequisites and more. You can plan every aspect of the operation in the most comprehensive manner. In fact, slots are provided where possible obstacles, limitations and benefits can be entered in order to prevent possible difficulties.

The community need identified in this activity was to counter school dropouts resulting from mistrust by families of pupils towards the school. In addition to this need, there is a heavy economic disadvantage and a high level of school dropout.

The main objective is to improve the relationship between school and families in order to renew mutual trust. With this activity, we hope that families will understand the effectiveness of education and schooling, seen as an opportunity to save their children.

The experience encourages the students to develop artistic skills, raises their

motivation and stimulates their creativity, making each of them feel important and fundamental.

We carried out an in-depth study that tried to find points of contact between the plot and Sicilian culture. We inserted folkloristic characters into the revisited plot, in order to make it simpler to understand.

The new plot, in fact, speaks of food, typical dances and cultural aspects specific to Palermo. This is a great pedagogical expedient: something that is apparently very distant became more appealing and closer to one's own culture. Thanks to this strategy, pupils will be more stimulated and intrigued. We edited the main songs of the opera, to bring young people from a disadvantaged neighbourhood even closer to the initiative. One song was completely re-adapted in a rap key, another one was re-written adding some words in English to facilitate learning and yet another was transcribed into Sicilian dialect. The last song, however, was learned in sign language.

## **5. CONCLUSION AND FUTURE PERSPECTIVES**

Working on this product with the third-year students was very useful and meaningful. They will be the real protagonists of the school in the future, so working with their feedback was effective. We involved the students right from the concept phase, then in the planning and, lastly, in the design. The students were enthusiastic about the initiative because we gave them a new tool they could use to expand their teaching skills. They learned about the transversality of music education and the potential of service learning, and they realised that their role is crucial. They have to know how to invent educational interventions to meet the needs of their class and each individual pupil. This is already, thinking small, a service learning intervention, because each class is a small community.

The potential of this project lies in being so versatile and transferable. It is a product that can be repeated and modified in every context.

The values that emerge from an activity like this will be formative and permanent in the lives of the pupils.

### **Acknowledgements**

# EDUCATIONAL INNOVATION FOR SOCIAL TRANSFORMATION. BUILDING INCLUSIVE CULTURES AND PROFESSIONALISM THROUGH UNIVERSITY SERVICE LEARNING

Maria Moscato<sup>a</sup>

Francesca Pedone<sup>a</sup>

Cinzia Novara<sup>a</sup>

Gaetano Di Napoli<sup>a</sup>

<sup>a</sup>University of Palermo

Promoting universities as hubs for fostering citizenship presents a challenge that balances the development of competencies with the need to nurture democratic attitudes. The Service Learning approach (SL) offers a promising response, providing an innovative, philosophically grounded, and socially responsible methodology aligned with universities' commitment to social responsibility. This paper examines the institutionalisation of SL at the University of Palermo, focusing on developing an evaluative framework and implementing SL initiative within the master's degree in Pedagogical Sciences. Integrating theory and practice, SL enables future pedagogists to engage in community service while reflecting on classroom experiences and fostering civic engagement. In this context, SL represents a "pedagogical formula" that bridges university education with societal needs, emphasising inclusion, participation, democracy, and solidarity. For the master's degree in Pedagogical Sciences, this approach provides a unique opportunity to position the university at the forefront of social progress, promoting inclusive processes and active citizenship.

civic engagement; higher education; inclusive processes; pedagogical professionalism; service learning.

## INTRODUCTION

This paper aims to describe a SL programme implemented within the degree programmes at the University of Palermo during the academic year 2023/2024. The initiative forms part of a two-year university project spearheaded by the Centre for Innovation and Improvement of University Teaching (CIMDU). The

overarching objectives of the project are threefold: (a) to enhance the educational effectiveness of degree courses; (b) to foster active student involvement, thereby increasing motivation and promoting autonomy and self-awareness in their academic journeys; and (c) to support marginalised communities within the local area. SL emerges as an innovative pedagogical strategy that seamlessly integrates academic learning with community engagement. This approach directly connects theoretical knowledge with practical application, allowing students to partake in civic initiatives while cultivating reflective and critical thinking skills.

Particular attention will be given to the multilevel and transversal implemented evaluation system, emphasising its application in the master's degree in Pedagogical Sciences focused on ensuring a robust assessment of student performance, on the one hand, and the broader impacts of the SL initiative, on the other, while simultaneously enriching the students' professional preparation.

## **1. THEORETICAL BACKGROUND**

The 2021 UNESCO report, *Reimagining Our Futures Together: A New Social Contract for Education*, underscores education's transformative potential. It advocates for a paradigm shift in teaching and learning methodologies, rooted in collaboration, solidarity, and a model centred on care. The report proposes a comprehensive social contract that broadens the concept of citizenship, integrating civil society and fostering interdependence among knowledge systems, societal frameworks, and educational processes (Tarozzi & Milana, 2022). Within this framework, innovative methodologies such as SL play a pivotal role. By linking social and academic competencies, SL fosters active citizenship and addresses educational disparities through cooperative learning practices (Cinque et al., 2021).

In literature, there are more than 200 definitions of SL, each offering a unique nuance to the practice. Bringle and Hatcher (1996) define SL as an educational experience that combines academic learning and community service through a process of critical reflection. This allows students to gain a deeper understanding of disciplinary content, develop civic responsibilities, and appreciate the connection between theory and practice. In this way, the model is recognised for its transformative potential, offering authentic and meaningful learning opportunities that transcend barriers between social classes and cultural contexts. Definitions such as this help distinguish SL from other

experiential learning experiences, focusing on the mutual benefit for both students and communities. Through participatory design, communities become active partners in the educational process, rather than simply recipients of service. As Ferrari and Chapman (2014) point out, SL strengthens students' theoretical understanding by applying it practically, offering a holistic view of learning.

Grounded in experiential learning theories (Dewey, 1938; Kolb, 1984), SL fosters the cyclical interplay between concrete experience, reflective observation, abstract conceptualisation, and active experimentation. This dynamic underpins the theoretical frameworks essential for integrating SL into academic curricula, facilitating a holistic development of students' personal, professional, and civic competencies. Additional theoretical lenses, including social-cognitive theory and cultural-historical activity theory, further underscore SL's capacity to merge pedagogical goals with societal needs (Carson & Raguse, 2014).

The multifaceted benefits of SL are evident across its key stakeholders:

- Communities benefit from enhanced social cohesion, targeted interventions, and sustainable problem-solving practices.
- Students develop critical thinking, teamwork, and professional skills, along with a heightened awareness of social responsibility.
- Academic staff and institutions gain opportunities to innovate teaching practices, engage in interdisciplinary research, and strengthen community-university partnerships (Salam et al., 2017).

## **2. REASONS FOR IMPLEMENTING SL AT THE MASTER'S DEGREE IN PEDAGOGICAL SCIENCES**

At the University of Palermo, SL represents a cornerstone of academic innovation, redefining the pedagogical relationship between universities and local communities. This approach is more than an instructional method; it is a transformative framework that reimagines curricula to align with the university's mission of fostering democratic citizenship and addressing societal challenges. Through SL, the university cultivates an environment of empowerment, encouraging students and educators to collaboratively engage in community-driven projects. It answers the call of the University that regards social responsibility as an integral part of its mission. SL, therefore, becomes a reflective practice for all involved, as immersion in the field is guided by an ongoing feedback loop of thought and action. This allows participants to see

themselves as part of a complex and interconnected reality.

This highlights the value dimension of SL, which does not merely interpret the university's third mission as a reciprocal relationship of service but enriches it by creating contexts that foster empowerment and the development of truly democratic cultures and practices.

Specifically for the degrees in Pedagogical Sciences, the literature emphasises the need to train professionals capable of exercising critical judgment and decision-making through complex processes: associating ideas, revisiting perspectives, reframing problems, and changing attitudes or behaviours. In this sense, educational action is always a *praxis*, a transformative knowledge-action aimed at fostering change through the creative implementation of purpose (Freire, 1970; Mezirow, 1978). This underscores the importance for professional pedagogists to develop reflective and creative competence, allowing them to question their assumptions and modify their approach in an informed and deliberate manner. From this perspective, it is crucial to avoid performance-driven approaches focused solely on technical rationality in the design, management, coordination, and monitoring of university training programmes for pedagogists. Instead, training should be grounded in solid epistemological, theoretical, and methodological foundations that respect the educational nature of their role. This entails moving away from what Biesta (2006) calls *learnification*, which reduces education to an individualistic process focused on producing performers within a competitive system, rather than fostering mutual recognition and promoting an inclusive, democratic society. From this perspective, the question of competence becomes central. Competence, understood as the ability to independently and responsibly manage one's knowledge and skills, must empower pedagogists to think of themselves as true professionals (Fioretti et al., 2023).

The University of Palermo's master's degree in Pedagogical Sciences SL, grounded in the rediscovery of ideas that have shaped pedagogical culture and its core values, offered an opportunity to place the university at the heart of pedagogical services and policies aimed at promoting social progress. It involved teachers and students in a teaching and learning process that challenges academic knowledge, making it more relevant and effective in addressing critical community needs: on the one hand, it integrated the theoretical and practical dimensions of learning through activities closely aligned with disciplinary content; on the other, it addressed a structural gap in the programme, which, in 2023-2024, lacked a mandatory curricular internship.

Subject	Target	Partner
<b>Special Pedagogy for Inclusion</b> (Prof. F. Pedone)	Design and implementation of socio-pedagogical services and interventions aimed at vulnerable people and those at high risk of marginalisation, especially children and young people with socio-cultural disadvantage, unaccompanied foreign minors and people with disabilities	Social Cooperative 'Libera... mente' (PA) Foudation 'MondoAltro' (AG)
<b>Foundation of educational research</b> (Proff. G. D'Addelfio, L. Romano, F. Alba)	Design and implementation of socio-pedagogical services and interventions aimed at non-EU immigrants, refugees and asylum seekers	'Centro Astalli' (PA)
<b>Teaching Methodology</b> (Prof. A. La Marca)	Design and implementation of services and interventions for the prevention of early school leaving and is aimed at students in schools of the first cycle of disadvantaged neighbourhoods	'Scuole a rischio' (PA)
<b>Family Psychology: Marginality and Deviance</b> (Prof. C. Novara)	Actions in support of the Family Space concerning the tasks of information/education/orientation of the couple to the services of the territory. The beneficiaries are the partners who apply to the court to initiate separation proceedings, to prevent the climate of tensions between the partners, which would also have repercussions on the children.	'Spazio Famiglie', (born from the Agreement between the SPPEFF Department and the Court of Palermo)
<b>Theories, Strategies and Systems of Education</b> (Prof. E. Mignosi)	Reading of picture books in the paediatrics wards of the Polyclinic and the Children's Hospital. hospitalised children between the ages of 2 and 10 who are not long-term patients	Paediatrics departments of the Polyclinic and Children's Hospital UNIPA Library Service

To ensure comprehensive SL implementation, it was adopted Musa and collaborators (2017) three-phase model:

- Project Planning, engaging stakeholders in co-creating objectives and methodologies.
- Service Delivery, facilitating hands-on, community-centred activities aligned with disciplinary content.
- Evaluation and Reflection, employing rigorous assessment tools to measure impact and facilitate continuous improvement.

During the 2023/2024 academic year, the programme encompassed the involvement of 120 students, five academic subjects, and six community stakeholders, underscoring the initiative's collaborative ethos.

### **3. THE EVALUATION SYSTEM**

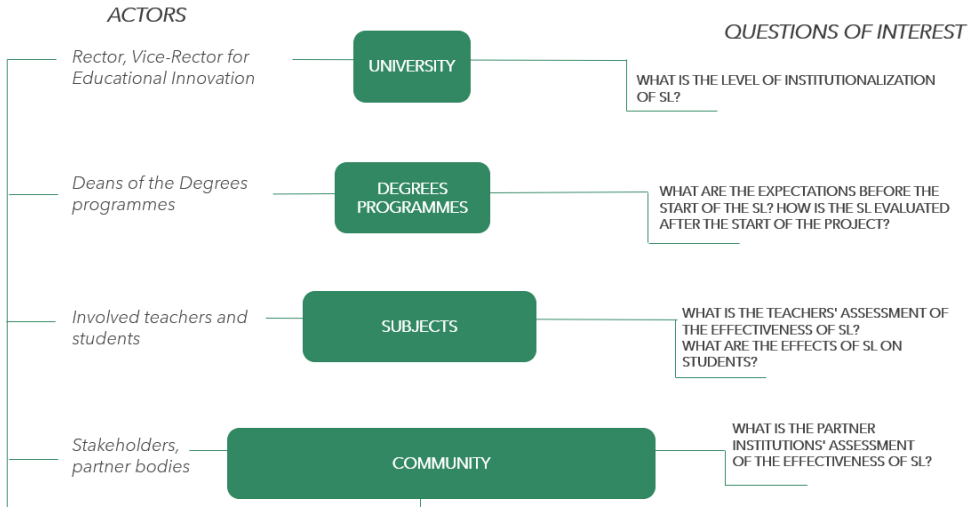

To position SL as a “new model of excellence” in higher education (Zlotkowski, 1998), it must be fully integrated into the university's evaluation processes. The evaluation of SL is crucial in ensuring its meaningful impact, both in terms of achieving learning objectives and contributing to educational innovation and the well-being of the involved communities.

Over two decades of research have shown that high-quality SL enhances student learning (Eyler & Giles, 1999; Eyler et al., 2001). It is recognised that significant evaluation helps integrate SL into the debate about the quality of university education. It responds to concerns that universities do not adequately focus on skills that guarantee success beyond academia, such as critical thinking, real-world problem-solving, or the ability to transfer theoretical knowledge into practice. Substantial scientific evidence indicates that engaging in effective and rigorous reflection is key to enhancing the impact of SL. Reflections provide valuable insights into what students are learning, the depth of their learning, and how critically they engage with their experiences.

The evaluation system adopted for the entire project is multilevel and transversal: multilevel, as it applies simultaneously to the university, individual degree programmes, professors, students, and community partners; transversal, as it involves and monitors eight SL projects across eight different degree programmes over two years.

Fig. 2. The multilevel evaluation system and its questions of interest

The multilevel and transversal evaluation system employed in this project addresses the complexities of SL integration. At the institutional level, the SL Level Self-Assessment rubric (Furco, 1996) provided a structured analysis across five dimensions, facilitating continuous assessment of SL's institutionalisation:

- Philosophy and Mission of SL.
- Faculty Support and Engagement in SL.
- Student Support and Engagement in SL.
- Community Participation and Partnerships.
- Institutional Support for SL.

For academic staff, reflective journals and narrative notebooks served as tools for documenting pedagogical practices and identifying areas for improvement. Student evaluations combined qualitative and quantitative methodologies. Core tools included:

- Self-assessment protocols, encompassing the Soft Skills Scale (Lucisano & Rubat du Merac, 2019), the Self-Efficacy Scale (Di Nuovo & Magnano, 2013), and the Civic Commitment Scale (Doolittle & Faul, 2013).
- Reflective reports, guided by the DEAL model (Ash & Clayton, 2009), that structure critical reflection into descriptive, analytical, and interpretive phases.

- Logbooks, optional self-reflection tools facilitating introspection on activities, methodologies, and interpersonal dynamics.

For community partners, semi-structured interviews and collective self-efficacy scales provided insights into the SL initiative's broader impacts.

Collaborative efforts with organisations such as Rai per il Sociale further amplify the initiative's reach, developing a learning machine tool to analyse video reels that students shared on the University's social media to document their experience.

#### **4. IMPROVEMENT ACTIONS**

The analysis of data from the first year of the project is ongoing. The aim is to collect feedback that will improve the quality of SL and enhance student learning. Increasing SL evaluation is expected to focus attention on assessments that better measure competencies needed for success outside the academic environment.

To foster interdisciplinary collaboration and community partner engagement, a SL Working Group (G.L.S.L.) has been established. This group aims to:

- Strengthen communication between project participants and local communities.
- Implement advanced monitoring and evaluation tools.
- Promote interdisciplinary collaboration across different degree programmes.

The G.L.S.L. also aims to create a stable network of community partners and integrate digital technologies for documenting and sharing experiences, facilitating real-time feedback and creating digital archives of activities.

# IT IS INTERPROFESSIONAL TEAMWORKS IN THE SCHOOL CONTEXT: SERVICE-LEARNING PROJECTS IN THE EMPOLI AREA BETWEEN FORMAL AND NON-FORMAL EDUCATION

Massimiliano Naldini<sup>a</sup>

Patrizia Lotti<sup>b</sup>

<sup>a</sup>INDIRE – Istituto Nazionale Documentazione Innovazione e Ricerca Educativa; <sup>b</sup>INDIRE– Istituto Nazionale Documentazione Innovazione e Ricerca Educativa

This research explored Service-Learning (SL) within Indire’s “Avanguardie Educative” Movement by focusing on the setting up of interprofessional teams in the implementation of SL projects, in order to explore the modes of interaction and understand the added value of collaboration in the school-territory connection through the practice defined by this educational framework. During the period 2020-2023, the Indire team supported SL pathway co-design in schools in the Empoli area, examining impacts on students, teachers, and no-formal educators with qualitative tools used in three project stages – initial, ongoing, final – to collect data for analysis. Findings suggest formal education can benefit from collaboration with non-formal education experts, enhancing professional skills, motivation, and community climate. However, successful implementation requires a shared commitment to didactic and organizational innovation in the school context.

interprofessionalism; service research; research-training; Service-Learning

## INTRODUCTION

The research focused on Service-Learning (SL) within the context of Indire’s “Avanguardie Educative” (AE) Movement. It investigated and analysed educational experiences across the national territory, supported by a comprehensive literature review (Orlandini, Chipa & Giunti, 2020). Since 2014, the enhancement of the Movement’s idea “Dentro/fuori la scuola – Service

learning” has promoted educational and organisational innovation, by the ongoing dialogue between research group and participating schools (Orlandini & Lotti, 2023). Specifically, the evolution of the “Dentro/fuori la scuola – Service Learning” idea has strengthened collaboration between the INDIRE research team and school communities involved in the AE movement. This collaboration adopts a ‘service research’ perspective, utilizing data to inform decision-making processes in educational practice (Mortari, 2017) and aiming for innovation within the SL framework.

During the school years 2020/21 to 2022/23, the Indire research team supported a codesign process of SL pathways in some schools in the Empoli area and explored the perceptions of students, teachers and no-formal educators throughout the design and implementation of SL activities. The main project of which this activity was a part focused on the Service-Learning (SL) approach in the collaboration between schools and the Third Sector, that included both an investigation into interprofessional dialogue and the institutionalization of SL in the schools’ vision. Qualitative instruments used to describe relationship between teachers and no-formal educators were developed from the interprofessional dimensions of the PINCOM-Q framework (Ødegård, 2006; Hynek et al., 2020), from “la forme scolaire” (Maulini & Perrenoud 2005) and from the identity elements of the SL (Furco, 1996; Tapia, 2006; Lotti & Orlandini, 2022). Even if the INDIRE analysis was organized into four thematic areas – Teachers-Educators relationship, School-Territory dialogue, Transformative value of SL and School Governance – this paper presents some reflections on collected data regarding interprofessional dynamics between formal education teachers and no-formal education educators.

The research questions guided this research study include:

- How can Schools and the Third Sector build an educational relationship that goes beyond a utilitarian approach? What is the role of the third sector?
- What is the added value for schools? What expertise can the third sector put at the service of schools to build quality educational pathways?
- How can schools review their organization in relation to constructive dialogue with the local area and the third sector?

## 1. THE PROJECT

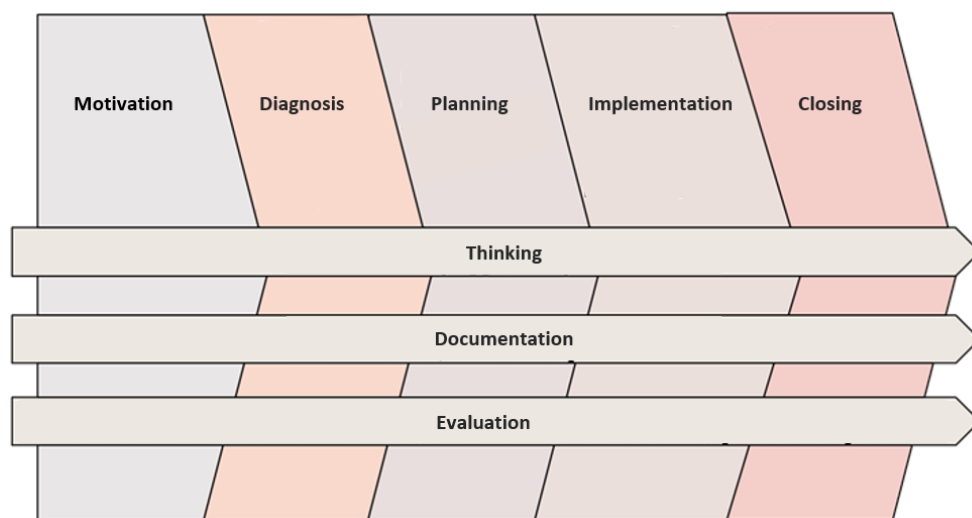

To answer at these questions a research agreement was signed between Indire and CO&SO Empoli, a consortium that aggregates social enterprises from the Empoli-Valdelsa territory, Lower Valdarno and beyond. The research agreement aimed to start a dialogue with the proposing Third Sector towards school institutions by disseminating SL in the territory of reference and creating interprofessional teams that, after an initial training phase on the approach by Indire, implement the projects within the 4 schools involved. The schools involved are IC 'F. Sacchetti' of San Miniato; IC 'Baccio da Montelupo of Montelupo Fiorentino; IC Capraia and Limite; IS 'F. Enriques' of Castelfiorentino. The students involved in the project belonged to primary and secondary school. In these contexts, the INDIRE research group implemented a research-training initiative to test how SL can support teachers in building an intentionally co-designed relationship between schools and their communities. This was achieved through interprofessional teams composed of formal education teachers and no-formal education educators, with active student participation.

Activities began in March 2021 with an initial outreach phase dedicated to schools in the area, following which four educational institutions signed up: three comprehensive schools and one secondary school. Starting in April 2021, INDIRE's team of researchers launched a training activity for no-formal educators from the COeSO Empoli Consortium who would work alongside the schools in designing the SL pathways. Four working groups composed of the schools' teachers, two no-formal educators and an INDIRE researcher were, therefore, structured. The researcher mainly acted as an observer of the relational dynamics within the group and as a guide for both formal education teachers and no-formal education educators, with respect to the identity elements of SL. The initial training actions allowed for the construction of a common vision and shared language on SL, making explicit its values and frameworks that guide its educational action in the 21st century school. At the same time, the research team facilitated the emergence of the training needs of schools, teachers, and no-formal educators in relation to the approach. Beginning in September 2021, training activities involved teachers from participating schools with in-person meetings (common to all schools) and online meetings dedicated to co-design, meetings during which no-formal educators moderated and coordinated interactions, intervening in relation to the needs of individual work groups. No-formal educators also took part in the activities carried out with students, providing teachers with professionalism and

specific skills. During the period December 2021-April 2022, schools were supported by no-formal educators and INDIRE researchers in the implementation of the pathways with online and in-person appointments aimed at guiding the design of the pathways. In addition, at the conclusion of the execution phase, a final event was organized for the presentation to the public of what the schools and no-formal educators had achieved.

The activities and their implementation were planned in accordance with the implementation phases of a SL project. For one to be able to speak of SL furthermore, it is necessary to consider those cross-cutting processes that in the project described here were particularly useful in defining the tools and the timing of administration to those involved (Figure 1).

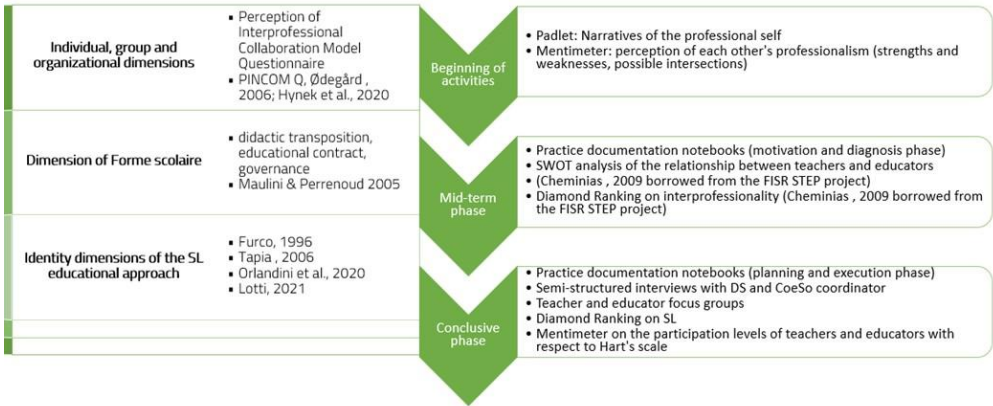

Figure 1 – SL pathway, derived from CLAYSS (Tapia, 2006)

The INDIRE analysis was based on tools designed on several dimensions deduced from specific frameworks. The tools were used at different stages of the research project: initial, ongoing, and final (Figure 2).

Figure 2 – Survey programme: tools for stages

For the framework INDIRE recognized substantial importance to the perception of interprofessional collaboration, school transposition, and institutionalization of SL within the school. From the data, information was collected for four thematic areas: teachers-educators relationship, school-territory dialogue, transformative value of SL, and school governance. The framework made it possible to think about and construct tools designed for the professional figures involved in the project, no-formal educators, teachers, and school leaders, but also to investigate the perceptions of students involved in SL activities.

## 2. RESULTS

In this contribution, some results concerning interprofessionalism between teachers and no-formal educators involved in the project are returned. In particular, this work presents the analysis of the instruments submitted in three moments of the SL paths – initial: group training padlet; ongoing: diamond SL; final: SWOT on interprofessionalism – from the results of which it emerges how formal education can benefit from the collaboration with professional figures expert in non-formal education in terms of consolidation of professional skills, motivation and climate in the educating community, but also needs a shared will for didactic and organisational innovation.

The data collected through the instruments used in the three topical moments (start-up phase, intermediate phase, and final phase) allow us to observe the elements qualifying the transformative value of Service Learning both on the individual level of the professionals involved and on the collective level. What emerged from the longitudinal analysis among the data from the instruments of

the three phases allows us to appreciate the transformations initiated in educational practice and in the relationship with other professional figures and with the referents of specific realities present in the territory. On the collective level, there has been a shift from the initial confrontation on the methodological closure and the lack of professional collaboration of teachers (as well as on the lack of knowledge of school organization on the part of no-formal educators) to the professional recognition of the intermediate phase, in which the no-formal educator is seen as a mediator in relations with students and the territory, and finally to the reflection on the transposition of professional skills in the final phase. Reflection on the individual level has also led to greater openness to active methodologies and recognition of the value of soft skills even to the benefit of curricular ones.

Teachers note in their documentation notebooks an effective renewal of teaching and learning practices that allows them to move beyond transmissive teaching, proposing experiences in which students are personally involved, as well as discussions among colleagues and with educators in the active management of class groups. The educators' reflections confirm the change of attitude of teachers who, thanks to the SL pathway, have opened to the active involvement of students and recognized their professionalism in the context of formal education. In addition, in the SL pathways implemented, teachers and educators share experiences, plan activities, confront each other and make available their specificities and skills within the working group, actively building a professional community based on the sharing of the approach's own values, relationship, dialogue and mutual and equal exchange. The development of the projects through inter-professional dialogue in the various phases and transversal processes of the SL pathway has allowed the transition from extemporaneousness, functionality and emergency response to a school-territory connection of a programmatic and systemic type (De Bartolomeis, 1983)

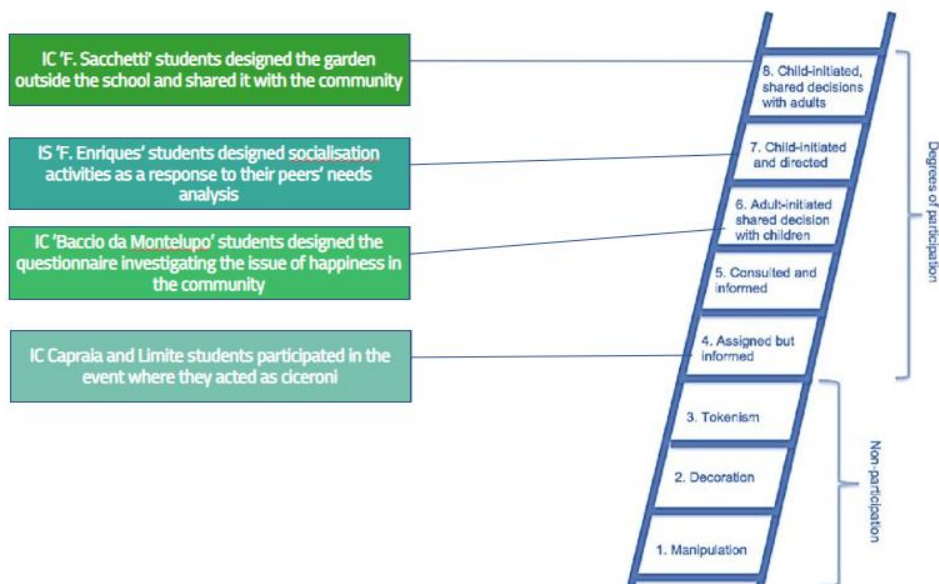

Teachers acknowledged the valuable role of educators in organizing activities that fostered inclusive participation, strengthened interpersonal bonds, and mitigated internal conflicts and frustrations within student groups, as well as among teachers themselves. They support and structure active participation of students such as:

- circle time, drama and brainstorming activities to facilitate the students' reflection process,
- workshop activities (in and out of school) for the realization of artefacts

- administration of interviews and questionnaires in the community,
- participative Agora as places for the exercise of democracy and decision-making on project development.

The informal approach to educational relationships enabled no-formal educators to establish more authentic connections with student groups, thereby facilitating the engagement of students who are typically more insecure or withdrawn. However, the varying degrees of involvement in the interprofessional dialogue of the four groups and, above all, the differing ability or willingness to modify and innovate didactics and the organization of the school context in relation to the territory also led to varying degrees of student protagonism. Referring to the participation scale (Hart, 2008), the analysis of the data reveals a progression from being informed and invested with a role – IC Capraia e Limite – to planning and operational sharing- [IC ‘F. Sacchetti’ – (Figure 3)].

Figure 3 – The paths of the 4 schools in relation to the degree of student participation

## CONCLUSIONS

In conclusion, the no-formal educator initially assumed the role of scaffolding, i.e., supporting and sustaining the teaching staff in approaching and appropriating the identity and distinctive elements of Service Learning (or

Supportive Service Learning, inspired by the pedagogical trends of Place-based education that propose a link between learning and everyday life, tying basic skills with soft skills and ethical values) as a teaching staff previously trained on the educational approach. Despite this difference in roles, during the planning period, both professional groups understood that participation in the project represented an opportunity for growth. It was thus possible to hybridize formal learning paths with modalities and activities from the context more properly related to non-formal and informal learning, mainly managed by educators. The no-formal educators, moreover, stated that the significance of participation in the course is determined by the possibility of understanding the mechanisms of operation of educational institutions (with all the constraints and opportunities that characterize them). At the same time, the experience represents a moment to reflect on the meaning and significance of one's professionalism within a broader professional system, to understand the contribution that each person, in his or her specificity, is able to offer in the construction of meaningful learning paths for students.

# THE CONTRIBUTION OF SERVICE LEARNING TO COUNTER EDUCATIONAL POVERTY. THE EXPERIENCES OF THE “AVANGUARDIE EDUCATIVE” MOVEMENT

Lorenza Orlandini<sup>a</sup>

Massimiliano Naldini<sup>a</sup>

<sup>a</sup>INDIRE – Istituto Nazionale Documentazione Innovazione Ricerca Educativa

The paper presents some educational experiences in countering educational poverty developed within the Movement “Avanguardie Educative (AE) under the Idea “Inside-Outside-School – Service Learning” (SL). The SL makes it possible to design educational experiences in real-life contexts, fostering participation and motivation to study, the acquisition of knowledge, disciplinary skills, soft skills and active citizenship. The actions are the result of co-design pathways that result in activities aimed at achieving learning and service objectives by fostering participation in the pathways by the school and the external community. In this context, SL experiences contribute to combating educational poverty, a construct defined in this article according to the four dimensions proposed by “Save the Children”.

educational poverty; service learning; school-community relation

## INTRODUCTION

This paper presents some educational experiences in countering educational poverty developed within the “Avanguardie educative” (AE) Movement as part of the Idea “Inside-Outside-School – Service Learning.” The Idea uses the educational approach of Service Learning (SL) as a framework for developing learning pathways that connect the school with the external context and community (Orlandini et al., 2020). AE is a network of innovative schools being researched by INDIRE with the aim of studying how teaching and organizational changes may be implemented within a school and mainstreamed to other schools (Laici & Orlandini, 2016). 1568 Italian Schools involved in AE “adopting” at least 2 of 16 ideas for innovation included in a “Gallery of Ideas for

Innovation”. 241 Italian Schools in AE choose SL as innovative approach to change and innovate education at school.

In the spirit of AE, which promotes bottom-up experiences of innovation and transformation of the traditional school model, SL pathways are instrumental in preventing and combating educational poverty through activities guided by a pedagogical and value-driven vision that enable students to act within the community.

SL enables the design of educational experiences in real-life contexts, fostering participation and motivation for study, the acquisition of knowledge, disciplinary competencies, soft skills, and active citizenship, and allows the community to achieve benefits (McIlrath et al., 2016; Tapia, 2010) in terms of developing services, activities, and solutions to emerging problems (Figure 1).

Figure 1.

The actions are therefore the outcome of co-design pathways that result in activities aimed at achieving learning and service objectives (Tapia, 2006). With respect to the issue of educational poverty (Nuzzacci et al., 2020), SL encourages participation in the pathways by the school (students and teachers) and the external community; in relation to this, this educational approach has been used by some educational institutions (Chipa et al, 2021) as a pedagogy for countering the various emergencies that emerged with the Covid-19 pandemic (UNESCO, 2022), at a time when conditions of material deprivation have been compounded by cultural deprivation (Save the Children, 2018; 2020) due to school closures and difficult access to educational activities.

According to Save the Children’s (2018) definition, the construct of educational

poverty is represented by four operational dimensions, with respect to which it is possible to identify the contribution of SL as an approach and as a concrete experience through what the AE Movement schools have developed.

The first dimension, Learning to be, highlights the personal development aspect of education, emphasizing the importance of self-awareness, emotional intelligence, and resilience. This dimension is strongly linked to SL, as this approach not only fosters intrinsic motivation but also enhances individuals' sense of self-efficacy. Through engaging in real-world problem-solving activities, students learn to navigate and manage difficult and stressful situations effectively, equipping them with the emotional and psychological tools needed for lifelong growth and adaptability (De Pietro, 2019). The second dimension, Learning to understand, focuses on building the cognitive and analytical skills required to grasp the complexities of the modern world. SL connects deeply with this dimension through its foundation as a pedagogy of reality, where learning is rooted in authentic, experiential contexts. This methodology encourages students to develop the competencies needed to address contemporary challenges critically and creatively, fostering a deeper understanding of their environment and society (Lotti & Orlandini, 2022). The third dimension, Learning to live together, underscores the value of social cohesion and collaboration in a diverse and interconnected world. SL corresponds to this dimension by promoting a pedagogy of cooperation and solidarity, where participants actively engage in teamwork, empathetic dialogue, and collective problem-solving. These experiences contribute significantly to the development of soft skills—such as communication, leadership, and adaptability—and social skills, including empathy, cultural sensitivity, and conflict resolution (Mendía, 2017; Gregorová et al., 2016). By fostering meaningful connections with others, SL helps students understand the importance of living harmoniously within diverse communities, while also building a sense of global citizenship (UNESCO, 2022). Finally, the fourth dimension, Learning to lead an autonomous and active life focuses on empowering individuals to take responsibility for their own lives and actively contribute to their communities. SL aligns closely with this dimension by creating opportunities for participants to perceive themselves as agents of change and social improvement. Through collaborative projects addressing the specific needs of target areas, SL cultivates a sense of empowerment and civic responsibility, encouraging individuals to take initiative and actively shape their social and cultural environments (Zlotkowski, 2007). By bridging personal growth with community impact, SL enables learners to lead autonomous,

purpose-driven, and engaged lives.

In this article the four operational dimensions will guide the analysis of the experiences presented, which, moreover, have been developed from the needs of the reference context in continuity with the characterizing elements of SL (Tapia, 2006; Furco, 1996; Orlandini et al., 2020), fostering the “virtuous circle” (Tapia, 2006) between learning and service.

## **1. THE SCHOOLS OF THE AE MOVEMENT AND THE SERVICE LEARNING**

During the last few years, the INDIRE research team has observed and documented some experiences of SL where the didactic actions meet the communities’ needs developing a sense of belonging to the local area and helping students strengthen disciplinary and life skills.

The need to open the school to the territorial context including the weakest elements of the population leads the experiences of ISIS Europa di Pomigliano d’Arco, small town near Naples, and IC Amerigo Vespucci of Vibo Marina.

The socio-economic context, in which ISIS “Europa” in Pomigliano d’Arco is located, is characterized as fragile and the community is characterized by phenomena of deep disaffection and distrust of public operators and, above all, by the deep-rooted belief in the impossibility of changing conditions that are not conducive to the full development of the individual. In this context, the SL experience aimed to strengthen the relationship between schools and institutions by consolidating the role of students as active citizens. The project with the support of Junior Achievement (the world’s largest nonprofit organization that prepares young people for entrepreneurship and their future employment) enabled the creation of the Academy Europa Community Service – a business school organized and self-managed by students in the fifth grades – which, in a learning organization perspective, provides telematics services to citizens of the municipality. The Covid-19 health emergency resulted in a rethinking of the Europa Community Service project by taking the activities of the Public Relations Office from presence to online. Students were able to replace the in-person citizen support function with the programming and implementation of a chatbot, an instant messaging service (the term chatbot comes from the union of two words: chat and robot) that can offer user assistance by providing answers and solutions to users without waiting time. Overall, the experience fostered the development of respect for others and critical thinking, which is essential to counter stereotypes and prejudices. In particular, the SL action has enabled the increase of a sense of social and

democratic responsibility by creating more moments of relationship with others, fostering individual growth and social inclusion through collaboration and sharing experiences.

The SL experience of the IC “Amerigo Vespicci of Vibo Marina (VV) was born from a careful analysis and reading of the territory that is affected by a continuous flow of migrants. The SL paths “Migrants are not a danger, but they are in danger” and “When integration becomes an opportunity and learning” (which involved young people from the secondary school) were born with the aim of forming citizens capable of participating in a conscious way in the construction of complex communities, developing in children curiosity for the world by valuing ‘other’ cultures and creating educational situations in which pupils can be protagonists of their own growth by focusing on educational models different from the traditional ones. The SL experience aimed to educate pupils in the values of active citizenship and the development of the social dimension. The SL action therefore took the form of an intercultural path with the aim of developing respect for the other and critical thinking, the latter being indispensable to counter stereotypes and prejudices. The reception in the school community of young migrants who landed in the port of Vibo Marina, and the recounting of their experiences gave rise to a cultural exchange involving not only students but also families by initiating a path of inclusion of migrants in the social fabric and a reflection by students on cultural differences and similarities. At the same time, the experiences of the schools in Lucca and Acireale (CT) allowed them to consolidate and leverage local knowledge to develop civic and prosocial skills through the creation and management of a tourist information center for the city of Lucca, organized guided tours and developed content for audio guides and websites and a digital InfoPoint to enhance the city and to promote virtuous behavior that respects the environment and cultural traditions.

The “Pertini Tourist InfoPoint” route is configured as an SL experience thanks to which the school opens to the territory by integrating its educational organization for the benefit of visitors, tour operators and citizenship. Since September 2015, students from “Pertini” (address “Tourism”) have been carrying out daily reception activities at the “Pertini Tourist InfoPoint,” the Tourist Information and Reception Office near the train station in Lucca. The goal was to implement a continuous model of SL, not limited only to the times set aside for curricular activities but also extending outside of them (e.g., during holidays or during the summer recess period), to foster learning that – in

addition to being authentic – was permanent. The project also had an important spin-off on the citizenship education plan by fostering education on the value of places and the recognition of Cultural Heritage as the shared heritage of the community by supporting the development of specific skills the active participation of students.

Considering that the city of Acireale did not provide a tourist information service and no information material on artistic heritage was available in the area, the “Giovanni XXIII” Comprehensive Institute started an SL path with all the classes of the Institute in which the area was used as an open-air laboratory. The project created a digital info point capable of providing information material on the city and its artistic and environmental heritage while also promoting ways of using the territory that respect the environment and local traditions. In addition, the school’s website is decent becomes a repository of content and hosts, in a dedicated section, an online shop where it is possible to purchase products of local crafts. In this way, the project has contributed to fostering the active participation of students, families, and the community in the school’s action as an educating community by developing the ability in students to make choices and develop autonomy, awareness, and a sense of responsibility, and ensuring the centrality of the student and teamwork.

The SL opens to the care of weak portions of the population as in the case of the IC “Caniana” di Bergamo in which students collaborated with elderly people and refugees, providing their expertise in developing self-narratives and the activities of the CI of Villa d’Almè (BG) where the school implements SL paths with local voluntary associations, selected based on themes and problems identified by the students.

The IS “Caniana” curriculum includes an educational pathway that allows students to learn about the justice system through the places and specific professionalities, as well as to simulate professional situations related to the world of justice. In this formative context, the students posed the problem of how to help society overcome the cinematic stereotypes and social stigma that characterize the representations of prison reality and incarcerated persons in the social imagination. The students worked on the idea of the narrative of the prison condition made by incarcerated people by translating it into images to create a desire to go beyond the stereotype in people who are unfamiliar with prison environments and “rehabilitation” paths.

In the IC Villa d’Almè, students’ reflection and interests also guided the design and implementation of SL projects. The activities promoted by the school’s

students range from visits to the RSA, to the collection of food, clothing or toys for the association that takes care of families in poverty, from the time bank to be dedicated to adults with disabilities to exhibitions of various products (seedlings grown in recycled pots, ecological cleaning products, various handicrafts...) to raise funds for the activities of associations identified by the pupils, with the support of the Parents' Committee. All these activities offer pupils the opportunity to experience, as protagonists, forms of participation and active citizenship, meeting the needs of the local context.

The focus on social engagement as a guide for service learning activities is also present in the "DopoSocioScuolaPuntoevirgola" project at ISIS in Follonica (GR) where a class from the vocational address composed of subjects with low self-esteem and insufficient sense of self-efficacy set up a dedicated classroom within the school itself an after-school service that would help families in the management of children and young people beyond school hours and support them in studying and homework. The vocational students oversaw every step of the way from setting up the classroom to implementing the after-school service and evaluating the impact on the community and the enjoyment of the activity offered. The project represented an opportunity for the students of the Follonica school to practice the knowledge learned in the classroom and to present themselves to the territory by showing their human and professional skills, to perceive themselves as adequate, prepared, and useful for the community they belong to.

The experience of the "Scialoja-Cortese" primary school in Naples is also located in a peripheral territorial context characterized by degradation and abandonment. The SL project involved pupils in activities to redevelop urban areas and renovate some of the school's environments by focusing on social, inclusive issues and respect for the environment and the historical, artistic and cultural heritage that led to the re-appropriation of their roots.

## **CONCLUSIONS**

If learning articulated around the four directions of UNESCO aims to rethink educational processes, it must prioritize giving students an active role in their own learning journey. This shift is essential for consolidating not only disciplinary competencies but also crucial life skills, such as critical thinking, problem-solving, collaboration, and adaptability. In this context, Service-Learning (SL) offers a robust theoretical and practical framework to achieve these objectives. By engaging students in co-design processes based on real,

tangible, and felt issues within their communities, SL ensures meaningful involvement and participation. This approach not only strengthens students' connection to their learning but also fosters a deeper sense of belonging to their community and civic identity. This approach is particularly important for tackling educational poverty, as emerge by the experiences, as it provides all students with equitable opportunities to acquire essential skills and to actively engage in their communities, counteracting systemic barriers that limit access to quality education.

A key feature of SL is the integration of constant reflection throughout its various phases—design, planning, implementation, and closure. This reflective practice plays a dual role in enhancing the learning experience. First, it facilitates students' awareness of the specific competency goals they are achieving, enabling them to track their growth in both academic and personal dimensions. Second, it fosters a sense of self-efficacy by helping students recognize their own capacity to make meaningful contributions, both within their educational journey and as active participants in social and civic life.

By intertwining action with reflection, SL cultivates a transformative learning process that goes beyond the classroom. It encourages students to view themselves not merely as recipients of knowledge but as empowered agents of change capable of addressing real-world challenges. This dynamic process bridges the gap between theoretical knowledge and practical application, reinforcing a holistic development that aligns with UNESCO's vision of education for sustainable development, global citizenship, and lifelong learning. Ultimately, SL equips learners with the tools and mindset to navigate their future roles as informed, engaged, and responsible citizens in a rapidly evolving world.

## CONTEMPORARY HIGHER EDUCATION CHALLENGES

The 2024 Report on the Status of Implementations of the Bologna Process identifies dropout rates as an unresolved challenge to achieving a fully inclusive and accessible European Higher Education Area. Addressing this problem implies the need to find solutions that ensure the promotion of equity, particularly for underrepresented and disadvantaged groups. This challenge opens a deep reflection on the need to increase the flexibility of learning pathways and improve student support services and recognition of learning pathways aiming at the development of recognition and validation systems through micro-credentials. Tirana Communication also stresses the importance of flexible learning pathways and student-centered approaches as key strategies to combat academic disengagement. The Communique pushes

---

<sup>1</sup> Erasmus+ project – ENHANCE – Enhancing Career and Service Learning in Higher Education 2021-1-ES01 KA220-HED-000031128

the education system toward innovative teaching methods introduced with digital transformation to address, both structural and individual barriers that contribute to dropout rates. The Bologna Process and the Tirana Communiqué recognize the importance of innovative teaching methodologies and the need for higher education institutions to adapt to the changing demands of the global landscape (Blandford et al., 2015). Both documents reveal a clear direction toward learning frameworks in which academic engagement and interdisciplinary collaboration become essential components in modern curricula. The expected impact of this push in universities points not only to innovation in educational offerings but also to gathering and transferring societal needs into learning processes (Wray-Lake et al., 2017). This alignment aims to prepare students for successful career paths and also promotes a renewed lifelong civic engagement (Zaff et al., 2011). By fostering a sense of belonging and community through service-learning, educational institutions can help mitigate these challenges and promote higher retention rates among students (Hawke et al., 2018). In this context, numerous studies show that students who participate in SL programs are more likely to complete their academic journey (Hope & Jagers, 2014), particularly underrepresented and marginalized groups, who often face additional barriers to academic success (Metzger et al., 2016).

## **THE BENEFITS OF SERVICE LEARNING IN HE**

Service Learning (SL) is an innovative pedagogical paradigm that synergistically integrates academic learning with community service, promoting holistic development of cognitive and non-cognitive skills in university students (Bringle et al., 2016). This methodology is based on the principle of reciprocity, generating a virtuous cycle of learning and social impact that benefits both students and the community. SL transcends traditional dichotomies in educational contexts, overcoming the distinction between cognitive and non-cognitive skills, and between curricular and life skills (Felten & Clayton, 2011). Its distinctive features include organic integration with the academic curriculum, structured reflection, systematic collaboration with community partners, significant project duration, and reciprocity between students and community. Effective implementation of SL in the university context requires strategic planning and systematic institutionalization (Jacoby, 2015). SL is situated within the conceptual framework of lifelong learning and lifelong guidance (Barnett, 2018), it contributes to lifelong learning by promoting active and self-directed learning, developing transferable skills, critical reflection on

experiences, and cognitive adaptability. This integration creates a dynamic educational ecosystem that prepares students to face the challenges of an evolving world (Hora et al., 2020). SL offers multiple benefits that extend beyond the academic sphere, positively influencing the personal, professional, and civic development of university students, as well as higher education institutions and the community at large (Holsapple & Brush, 2019). SL plays a crucial role in promoting civic engagement, contributing to the formation of aware and responsible citizens. Benefits include increased social and political awareness, development of a sense of civic responsibility, greater participation in community activities, in-depth understanding of social issues, and advanced ability to critically analyze complex problems (Whitley & Walsh, 2014). SL fosters the development of essential transversal skills, including critical thinking and problem-solving, effective communication, teamwork, leadership, empathy, and adaptability. These skills enrich students' professional profiles and contribute to their personal development (Celio et al., 2011). The adoption of SL in universities catalyzes the creation of innovative relationships with the local community, transforming academic institutions into "Profigurative Centers for Intergenerational Training" (Tapia et al., 2016). This approach generates multiple benefits: more relevant research oriented to community needs, greater visibility and social impact of universities, creation of lasting collaboration networks with local organizations, opportunities for social innovation and entrepreneurship, and improved public perception of higher education (Bringle & Clayton, 2020).

In conclusion, SL represents a transformative educational approach that bridges the gap between academia and community, fostering holistic student development and contributing to social progress. Its implementation requires careful planning and institutional commitment, but the benefits for students, universities, and communities are substantial and far-reaching.

## **IDENTIFYING BEST PRACTICES IN THE ENHANCE PROJECT**

The project "ENHANCE – Enhancing Career and Service Learning in Higher Education" aims to develop an innovative Community Service Learning (CSL) approach through educational tools and digital resources. This system promotes student's self-awareness, empathy, communication skills, and cultural awareness, enabling them to acquire social skills applicable to everyday life. CSL is also seen as a key element in improving career guidance and academic tutoring, as it helps students master the information they learn,

improve their academic performance, and become more involved in academic life. The project aims to integrate CSL into tutoring and career services of the partner universities, using micro-credentials to certify learning outcomes.

### Methodology

The methodology used within the project is based on the participatory action research approach, which allows different theories and perspectives to be brought together with the aim of developing an integrated, practice-oriented learning model. This process actively involved students, universities, and local communities in the planning and implementation of activities. The tools used included moments of reflection based on the storytelling strategy, which enabled the students to develop critical reflection and storytelling skills about their learning experiences. In particular, the project examined the impact of SL on learning through the collection of testimonies of university students from partner universities. The sample analyzed is to be considered a collection of best practices, and was carried out following a snowball approach. The project partners contacted some students who had had SL or similar experiences, and who through peer-to-peer networking contacted other students with similar experiences.

Tab. 1. Interview sample and country of origin. Source: (ENHANCE Project)

Sample	n. Student	Country
	6	Spain
	6	Italy
	6	Turkey
	6	Greece
	6	Romania
Total	32 <sup>2</sup>	

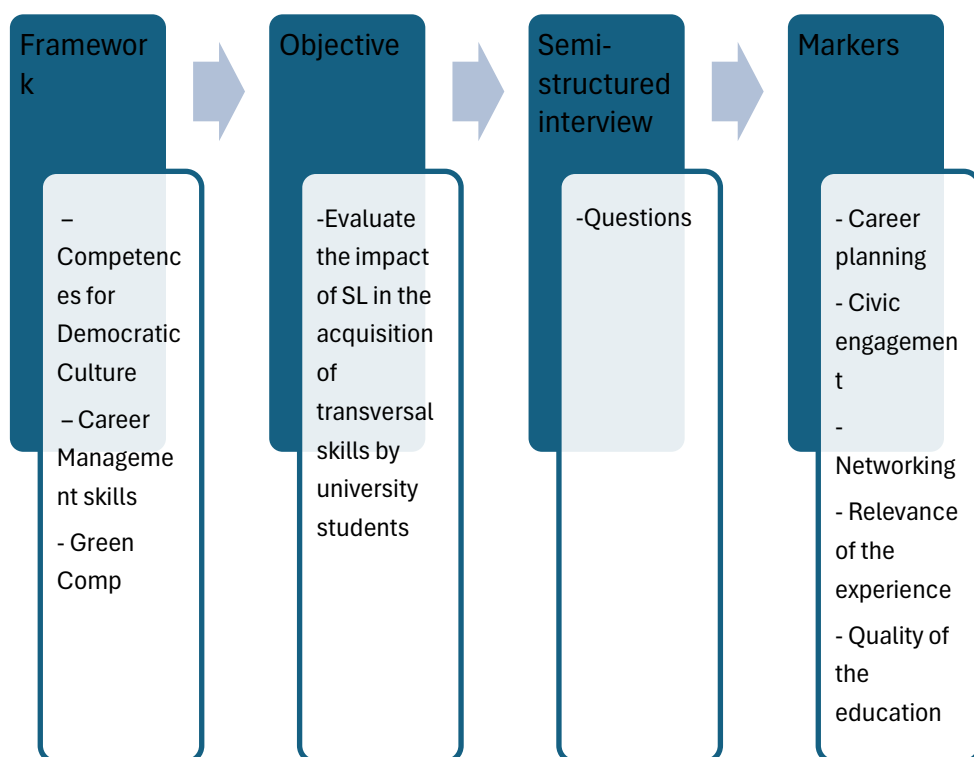

Data were collected by means of semi-structured interviews administered to the selected students. The main objective of the investigation was to understand the correlation between SL experiences and student learning outcomes. Therefore, the interviews were structured from the theoretical frameworks such as the Reference Framework of Competences for Democratic Culture (RFDCDC)

---

<sup>2</sup> The sample analyzed is not to be considered significant.

(Council of Europe, 2013), Career Management Skills (ELPGN, 2015), and the Green Comp (Bianchi, Pisiotis, & Cabrera Giraldez, 2022), with the aim of detecting the transversal competences acquired by the students after their SL experience.

Tab. 2. Process of constructing and analyzing interviews. Source: ENHANCE Project.

The qualitative analysis of the interviews content was carried out with Atlas.it software through document coding, which allows for a set of procedures based on textual data. The indicators that led the analysis process were deduced from the areas investigated and concerned the skills acquired, the value attributed to the experience in terms of career planning, the development of civic engagement and a sustainable mindset, networking opportunities, the significance of the experience in relation to the course of study and the quality of the training offered.

## **SURVEY RESULTS**

The findings indicate that structured SL programs within universities are virtually non-existent. Students reported practices that could potentially be recognised as SL, but these lack a formal framework. The most common activities within the university involve student associations, event committees or similar initiatives. It should be noted that professors themselves often promote these experiences to their students, during classroom lectures, but there is no more structured organisational support for the dissemination and recognition of these experiences. While, as far as experiences outside the university context are concerned, these mainly involve voluntary associations. It is important to note that these activities are not always formally recognised.

Regarding the skills acquired during these experiences, Table 3 presents some testimonies from the interviews. Students reported using these experiences as opportunities to reflect on their professional paths. In some cases, they gained insight into potential workplaces where they could apply their knowledge, while in others, they re-evaluated their academic journey, discovering new interests and professions they had not previously considered. For example, the experience led students to consider the possibility of continuing their studies, to confirm their choice of academic course or to decide further training steps. With regard to the transversal skills acquired, the results mainly highlight interpersonal skills. SL experiences allowed students to challenge themselves in different situations from those they are used to, promoting adaptability and problem-solving skills. Development of these skills is valuable in dealing with the dynamic and ever-changing demands of personal and professional contexts. In addition, results indicate that some students from science and technical fields (STEAM) emphasized how the SL experience enabled them to develop civic commitment skills that they would not otherwise have encountered. In addition, emotional intelligence skills were frequently mentioned, highlighting their pervasive presence in the various SL situations the students encountered. emotional intelligence skills were always at the core, despite different contexts, roles, functions or academic backgrounds. The experiences reported by the students took place in challenging contexts that pushed them into situations of personal and professional challenge. However, these experiences allowed them to experiment, develop new skills and deal with failure in a protected and accessible environment where they could reflect on the experience as a formative moment. In addition, these experiences allowed students to engage with different professionals and working environments. These opportunities facilitated networking, both with peers and with

organizations operating in the local area, even when not directly related to the university context or their specific field of study.

Tab. 3. Main results from the students' interviews. Source: (ENHANCE Project)

Main results	Quotes
Reflection on their professional paths	<p>"I think that if I had not had this experience, I would not have decided to study for a doctorate or to continue with higher studies" (M.M.).</p> <p>"It gave me a lot of strength to continue with special education" (E.A.).</p> <p>"It helped me to choose my master's program" (V.M).</p>
Interpersonal skills	<p>"I improved my ability to communicate effectively with people with autism" (E.).</p> <p>"I improved my organizational and teamwork skills, which are essential for navigating complex and collaborative environments" (M.K.).</p>
Adaptability and problem solving skills	<p>"I initially experienced difficulties in coordinating students", but that this allowed her to "become more adaptable and adept at coming up with creative solutions" (A.N.).</p>
Civic commitment	<p>"It gave me the opportunity to be more social" (D.K.).</p>
Emotional intelligence skills	<p>"The experience of providing psychological support to fire victims helped me to develop self-control and a deeper understanding of others" (D.K.).</p> <p>"This experience influenced my decision to pursue a teaching career, emphasising the transformative impact of cultivating empathy and emotional intelligence" (V.M.S.).</p>

There are two key aspects on which all interviewees agree: i) The community experience prompted them to reflect on their future, their course of study, and their social role; ii) all respondents confirmed they would recommend the experience to their peers as an enriching addition to their educational journey.

The project presented made it possible to integrate theory and practice into an innovative learning model, centered on the development of student's professional in close connection with the local context.

## CONCLUSION

The topics discussed and the results drawn from the interviews, highlight a significant correlation between SL experiences and the acquisition of transversal skills, as well as the effectiveness of this experience as a career guidance tool for university students. Creating structured and formally recognized SL experiences increasingly necessary for universities to build a space in which the university, territory, community continuum is made explicit. By integrating SL into academic programs, universities can offer richer and more holistic learning experiences that better prepare students for the complexities of professional world.

# EMPOWERING EDUCATION: INTEGRATING DESIGN FOR CHANGE AND SERVICE-LEARNING FOR SOCIALLY COMMITTED LEARNING EXPERIENCES

Juan Peña-Martínez<sup>a</sup>

Stefania Falchi<sup>b</sup>

Antioco Luigi Zurru<sup>b</sup>

<sup>a</sup>Complutense University of Madrid; <sup>b</sup>University of Cagliari

This study explores the use of Service-Learning (SL) through the Design for Change (DFC) methodology, which is based on design thinking. The initiative facilitated collaboration between pre-service teachers and students with intellectual disabilities, who worked together to update teaching resources for cognitive diversity. By following the DFC phases—feel, imagine, do, evolve, and share—the pre-service teachers' projects cultivated empathy, creativity, teamwork, and critical thinking. Additionally, pre-service teachers documented their process and the project's impact through digital portfolios, offering valuable insights into the transformative potential of this approach. Both the pre-service teachers and the educators working with the students with intellectual disabilities provided highly positive feedback on the experience. The integration of SL and DFC proved effective in promoting social responsibility and experiential learning. This model offers significant value for pre-service teacher preparation programs, equipping future educators to address current educational challenges.

Design For Change; Service-Learning; intellectual disability; pre-service teacher training

## INTRODUCTION

To empower individuals prepared to tackle the pressing challenges of our planetary emergency, education must prioritize student-centered and action-oriented approaches (Williams and Whiteman, 2021). They will need practical tools and realistic strategies to confront personal, social, intellectual, and emotional challenges (Leal, 2009). This vision is well-supported by the Service-

Learning (SL) methodology, which bridges the gap between knowledge acquisition and its practical application (Resch & Schritteser, 2021). SL transforms learning into an engaging process where students not only develop academic and practical competencies but also participate in meaningful contributions that foster their growth while benefiting the wider community (Cervantes & Meaney, 2013).

In this context, while universities are pivotal in generating knowledge through research, their most profound impact lies in the students they cultivate (Aramburuzabala et al., 2015). SL has emerged as an exemplary approach within higher education, enabling the implementation of teaching and learning practices that not only prepare students for their professional futures but also inspire them to embrace active, socially responsible roles within their communities (Francisco and Moliner, 2010; Martínez, 2008).

In light of this, the purpose of this work is to implement the SL methodology in a practical context for pre-service teachers training, i.e., the initiative seeks to empower them to design and carry out tangible actions that align with the academic and professional demands of their future teaching roles.

In addition, the initiative aims to enrich the curriculum by offering a framework for professional development, particularly in supporting specific groups—in this case, students with cognitive diversity. Pre-service teachers engage in collaborative activities with these students, creating a shared learning environment. They also extend their involvement by working with an association to promote social benefits, specifically contributing to the education of students with intellectual disabilities. This effort seeks to enhance their inclusion and active participation in society, reinforcing the pre-service teachers' social responsibility and professional skills.

## **1. EXPERIMENTAL DESIGN**

### **1.1. Sample characterization**

The sample comprises 44 pre-service teachers—43 women and 1 man—with an average age of 22. All participants are enrolled in the *Didactics of Natural Sciences* subject at the Faculty of Education, Complutense University of Madrid (UCM), Spain.

### **1.2. Service-Learning design**

The pre-service teachers' projects are aimed at providing service to the Achalay association (<https://www.achalay.es/>), which in collaboration with the UCM,

develops the LICEO Diploma with the aim of assisting in the education of young people with intellectual disabilities. It is a program against educational, social, and economic exclusion. Through this specific two-year program, young people are provided with a training diploma that enables individuals with cognitive diversity to fully develop their human potential, sense of dignity, self-esteem, and reinforces respect for human rights, as well as promoting the maximum development of personality, mental and physical abilities, and effective participation in a free society. Not only does it promote the value of inclusion in the university environment, but it also contributes to destroying stereotypes, promoting values such as solidarity, openness, and flexibility (Izuzquiza, 2012). Specifically, the framework for pre-service teachers' work is to support the aforementioned association in adapting materials and resources for students with intellectual disabilities who are studying the speciality of *Health and Social Attention*.

Regarding the development of activities, it began with a seminar on the main characteristics of SL and Design For Change methodologies, indicating for the latter the various stages necessary to successfully carry out a project based on design thinking; in total, five stages or phases: *Feel, Imagine, Act, Evolve, and Share* (Cantón and Ojeda, 2017). The five stages of DFC were fundamental in guiding the development of the projects, from identifying an initial challenge to reflection and projection for the future. The role of the teacher was limited to being a facilitator of learning situations.

As for the evaluation system, the pre-service teachers prepare a digital portfolio documenting the project's development. Attendance at sessions and this portfolio account for 40% of the final grade for the subject.

## **2. RESULTS AND DISCUSSION**

### **2.1. Development of activities**

Following the DFC stages, during the *Feel* phase, aimed at generating empathy with students with intellectual disabilities, a representative of the Achalay association introduced the main characteristics of the LICEO Diploma and expressed the needs to be addressed. Additionally, a session of interaction between both groups of students was organized as a source of inspiration to encourage their active participation. Students were even offered the opportunity to visit their classmates' classes with disabilities to better understand their needs and thus adapt their solutions more effectively.

Once the challenge was identified and the action area defined, students

selected the type of solution they preferred to work on. Then, they developed a prototype and designed an action plan (*Imagine* phase), which they subsequently implemented (*Do* phase). Afterwards, an evaluation and reflection on the process and the achieved product were carried out to improve it (*Evolve* phase). Finally, in the *Share* phase, each team presented a video summary of the project to the entire class, with a duration of approximately 5 minutes. Each team received feedback from the teacher, and there was an opportunity for all students to ask questions and expand on aspects of the developed products.

In contrast to the typical linear and logical problem-solving approach, projects based on design thinking focus on intuition and emotional interpretation (Cantón and Ojeda, 2017). Students gain empathy with their environment (in our case, students with cognitive diversity sharing spaces in their faculty), generate ideas as a group, materialize them, and reflect on the process. There are alternating moments of divergent thinking to broaden options and convergent thinking to select the best ones. This combination provides a broad perspective, although it sometimes involves uncertainty, although this is normal. The teacher must promote confidence in the process, and eventually, step by step, this uncertainty dissipates.

## **2.2. Critical reflections of pre-service teachers**

Through the construction of a digital portfolio, students reflected on their learning experiences in order to improve and evolve their projects. From these reflections, a very positive evaluation of the work done has been noted, as well as its impact on their professional development. As an example, a pre-service teacher pointed out:

From the project, we take away real experiences that have made us learn not only curriculum content but also life experiences, emotions, and learnings that we will always carry in our backpacks.

Moreover, they have learned to organize themselves and rework their ideas when they encounter difficulties:

In the *Imagine* phase... the group had certain complications regarding brainstorming, as we were not clear about what we wanted to do or how we would do it... We were mentally blocked. But with patience, speaking frankly, we analysed very well what each member of the group thought. Finally, we were able to organize and make the necessary connections to find and visualize the activity and the resource.

Likewise, they have strengthened their collaboration skills, learning to depend on each other, assuming the corresponding responsibilities to achieve the success of their DFC project:

Working in a team has been another highlight of our academic process. Constant collaboration and organization present in the subject have strengthened our ability to face challenges together and enhance the individual strengths of each team member.

Finally, a change in attitude towards inclusion is highlighted, expressing that adapting materials for students with intellectual disabilities has not only been an educational challenge but also an act of empathy and humanity. They have internalized the importance of inclusion and accessibility in education as can be seen from the following reflection:

We have learned to see differences as opportunities to learn. By working with the kids from *Achalay*, we have realized that people with intellectual disabilities are often undervalued or infantilized and actually have other abilities and potentials.

And to a large extent, the students' motivation towards learning has improved due to the integration of SL and DFC methodologies:

The best way to learn is by carrying out what you learn, and that's exactly what we have done with this project. We always talk about diversity, curriculum adaptations, flexibility, inclusion, etc., but from a theoretical standpoint. In contrast, this time, we have been able to experience these aspects firsthand.

## **CONCLUSIONS**

This study is part of a series of initiatives implemented in recent academic years with pre-service teachers, aimed at fostering active methodologies that enhance creativity, teamwork, and critical thinking. These experiences also strive to empower future educators by giving them the opportunity to articulate and implement their ideas, contributing to systemic improvements, particularly in their social commitment to supporting vulnerable groups.

Reflections captured in their digital portfolios reveal a profoundly positive impact, particularly in their attitudes toward students with cognitive diversity. Participants describe the experience as deeply enriching, emphasizing the opportunity to apply their knowledge and skills in meaningful, real-world contexts beyond the traditional academic environment.

The incorporation of the Design for Change (DFC) methodology in the SL framework, despite initial uncertainties, has proven to be transformative. It has fostered critical social and emotional competencies such as active listening, the exchange of personal interests to uncover commonalities and differences, emotional expression, and the cultivation of core values like respect and empathy. All these social and emotional skills are relevant both for personal growth and for the professional development of future teachers and educators.

### **Acknowledgements**

Financial support for this study was provided by the Complutense University of Madrid, Spain. Service-Learning projects call 2023/24. In addition, financial support was provided by the National Operational Program on Research and Innovation 2014-2020 (NOP R&I 2014–2020) of the Ministry of Education, University and Research, targeting the goals of Axis IV “Education and research for recovery” and Action IV.5, within the framework of the PhD program in Philosophy, Epistemology, and Human Sciences at the University of Cagliari.

# SERVICE-LEARNING IN ITALY AND SPAIN. A COMPARATIVE ANALYSIS OF THE TWO EDUCATIONAL EXPERIENCES

Jady Safira Silveira<sup>a</sup>

<sup>a</sup>University of Florence

Service-Learning combines community service with academic learning, fostering critical thinking and active citizenship. This study compares its development in Spain and Italy. In Spain, a bottom-up approach drove its integration, with grassroots initiatives supported by REDAPS and government institutions, leading to mandatory adoption across schools. Spain's mature model offers cohesion and consistency. Italy, on the other hand, blends top-down and bottom-up strategies. INDIRE and programs like *Oltre l'aula* support its spread, but documentation remains fragmented, lacking a unified methodology. While Spain sets a benchmark with robust networks and institutional backing, Italy requires improved coordination to fully realize Service-Learning's potential.

Service-Learning; active citizenship; inclusive society; critical thinking; responsible participation.

## INTRODUCTION

Service-Learning stands as an agent of student emancipation. Through it they are freed from the limitations imposed by certain educational contexts. They experience the learning process as a fully engaging experience, allowing them to be leading actors in their education. Rather than following the conventional separation of theory and practice, this methodology creates a synergistic connection between academic spaces and the concrete reality of communities (Battle, 2013).

The connection with the surrounding community is essential. Service-Learning is not only an act of service, but also an opportunity for active participation that creates genuine relationships. Through this practice, students position themselves as conscious, responsible citizens and builders of a more just and

inclusive society, maturing critical and reflective thinking. It is not just a school/territory collaboration, but a horizontal relationship is created between the giver and the beneficiary (Furco, 1996), a reciprocity, because the two components, service and learning, are equally important and mutually enriching, creating a “virtuous circle” (Tapia, 2015) between knowledge and action: the quality of training and the application of notions improve the quality of service to the community, and service strengthens learning, transversal, prosocial and professional skills.

Analysis of the literature and experiences in Italy and Spain clearly shows that this practice is not just a complement to the curriculum, but a radical change in the way students relate to knowledge and society. From this perspective, Service-Learning represents an inflection point in education, innovating the way education is conceived and implemented.

Achieving this requires collaboration among several institutions: educational institutions, which provide the training to students; social agencies, which offer the service-learning activities to the community; and government institutions, which provide the regulatory and financial support.

## **1. CHARACTERISTICS OF SERVICE-LEARNING**

Service-Learning is an educational methodology that has developed in a variety of historical and cultural contexts, and is loosely defined, with as many as 147 definitions found (Furco, 1996). It manifests itself under various names in different nations, such as “Active learning in the community” in Great Britain, “Civic Internship” in the Netherlands, and “Aprendizaje-servicio” in Spain, but in each case it implies the integration of supportive action with systematic learning. When this combination is present, we can speak of Service Learning, regardless of the name used (Fiorin, 2016).

This practice helps to form aware and critical citizens, promoting values such as active citizenship and participation. Service-Learning education emphasizes the importance of developing a culture of participation and altruism, which goes beyond the individual, creating a sense of collective responsibility and active citizenship. It is essential, therefore, to develop an ethic of mutual care, which forms the basis of a citizenship that cares for each other. Fiorin (2016) summarizes the main features of Service-Learning as follows:

- Curricular: it is integrated into the regular curriculum.
- Research-oriented: arises from real problems and leads to the search for solutions.

- Skills-focused: students apply knowledge and skills in real-world contexts.
- Interdisciplinary: addresses complex problems that require the integration of different disciplines.
- Oriented to meaningful learning: learning is meaningful when it is reframed and responds to personal motivations.
- Collaborative: involves the whole class as a learning community.
- Participatory: students actively collaborate with the beneficiaries of the project.
- Empowering: promotes social and civic responsibility, forming conscious citizens.
- Transformative: social responsibility implies a commitment that leads to personal and social improvements, changing both the doer and the surrounding reality.

## **2. HISTORY AND DEVELOPMENT OF SERVICE-LEARNING IN ITALY**

Service-Learning, as a pedagogical method in Italy, has had a growing impact since 2006, when Maria Nieves Tapia introduced the concept with her book *Educazione e Solidarietà*. This work was instrumental in raising awareness in the Italian educational field of the importance of learning through community service, becoming the first Italian-language reference on the topic. This text represented a “seed” that, finding fertile ground, nurtured a series of practical experiments in schools.

Among the pioneering projects, one of the most significant was *Oltre l’Aula* (2012-2013), a two-year initiative promoted by the Center for Teacher Education of the Autonomous Province of Trento. This project involved a select group of educators, including teachers and school leaders, and focused on exploring the educational potential of Service-Learning, catalyzing attention on its ability to promote active learning and direct involvement in the community.

Another turning point occurred in 2014, with the establishment of the School of Higher Education Educare all’Incontro e alla Solidarietà (EIS) at LUMSA University in Rome. This school represented an epicenter of pedagogical innovation, with the goal of spreading Service-Learning in the university context. LUMSA not only promoted Service-Learning as an educational approach, but also played a dissemination function at the national level, organizing seminars, conferences and publications. Among the most notable contributions was the

publication of the volume *Oltre l'aula. La proposta pedagogica del Service Learning* (Fiorin, 2016), which served as an indispensable theoretical and practical guide for the in-depth study of the methodology. This book was crucial to understanding the theory and practice of Service-Learning, highlighting the origins of the method, its founding principles and modes of operation, and offering numerous examples of experiences implemented in different educational contexts.

Since 2016, the Ministry of Education has undertaken a process of active support for Service-Learning by acting concretely with actions, programs and funding. An experimental path has been launched in some Italian regions (Lombardy, Tuscany and Calabria) aimed at training students and teachers on the potential of Service-Learning. The publication of the ministerial document *Una via italiana per il Service Learning* (2018) marked an important step in this process, highlighting how the introduction of Service-Learning pathways allows curving curricular learning in the direction of community service. At the same time, INDIRE (National Institute for Documentation, Innovation and Educational Research) recognized the pedagogical innovation of Service-Learning, helping to consolidate it as one of the most promising teaching practices in the Italian educational landscape.

## **2.1. Movimento delle avanguardie educative**

The Avanguardie Educative, born in 2014 as the result of an important research-action promoted by INDIRE, represent a cultural movement that has had a significant impact on the Italian educational landscape. This movement came to life thanks to the collaboration with 22 pioneer schools that, together, drafted and signed a Programmatic Manifesto for Innovation. The Avanguardie Educative set out to go beyond traditional educational models, questioning how to adapt education to the challenges of a rapidly changing world. The movement's goal was not only to test new methodologies, but also to make them easily accessible and transferable so that they could be adopted by a variety of educational settings. Avanguardie Educative has created a major resource called The Ideas, which brings together innovative pathways to inspire and provide practical tools for educators interested in introducing alternative teaching methods. Among them, the *Dentro/fuori la scuola – Service Learning* project represents an emblematic example. It reworks the vision of the school, no longer as a closed place, but as a crossroads of experience, where theory merges with practice in a continuous dialogue with the local area. In this context, the school embraces its surroundings, collaborating with local

authorities, institutions and the world of work to transform the territory into a learning laboratory. Service-Learning practices, within this framework, push schools toward an increasingly outward opening, fostering a culture of collaboration and co-design.

### **3. SERVICE-LEARNING IN THE SPANISH CONTEXT**

The process of Service-Learning diffusion in Spain officially began on April 18, 2002, when, at an event held at the European Parliament in Madrid, the country welcomed Service-Learning as a new pedagogical paradigm. Until then, this methodology had been relegated to a marginal practice within the Spanish educational ecosystem. However, the introduction of this concept represented a true “pedagogical revolution,” a step toward a type of education that would not only transmit content, but also form individuals who were aware of and actively involved in society. Initially, the term “Community Service Learning” was used, which was later replaced by the broader and more recognized term Service-Learning.

Research and debates around this methodology culminated in 2003 with a significant agreement in Catalonia, where the Instituto Superior de Formación del Profesorado collaborated with the Ministry of Education, Culture and Sports to train teachers in Service-Learning. This collaboration marked the beginning of a series of seminars and training activities that led to the legitimization of Service-Learning as an integral part of school and university curricula.

In order to root the methodology in the Spanish educational context, the support of a number of organizations was crucial. The Asociación Española de Voluntariado (AEVOL), in particular, played a leading function in the initial phase, acting as a catalyst for the spread of SL. Subsequently, the Fórum Cívico Educativo, which took AEVOL’s place, continued to promote it, encouraging teacher training and stimulating the integration of the methodology in schools through outreach activities and training workshops.

In parallel with the spread of Service-Learning in schools, the academic context saw the emergence of important theoretical contributions. A significant example was Dr. Arantzasu Martínez Odría’s doctoral thesis, presented in 2005, which laid the theoretical and conceptual foundations of Service-Learning in Spain. Her research represented one of the first systematic studies on the methodology, providing a solid academic foundation that allowed its more widely recognized dissemination.

In 2005, the Jaume Bofill Foundation in Barcelona, together with representatives of Catalan educational, social and political organizations, created the Centre Promotor d'Aprenentatge Servei, which has played a key role in advancing the methodology in Catalonia. This center has acted as a driving force, producing research, documentation and teaching materials, supporting the dissemination of SL through seminars and training activities aimed at teachers and other social actors. Similarly, the creation of the Fundació Zerbikas in the Basque Country in 2008 and the collaboration with the Fundació Tomillo in Madrid helped create an interterritorial network that united different local realities and facilitated the exchange of practices and knowledge among different autonomous communities.

These developments led to the birth of the Red Española de Aprendizaje-Servicio (REDAPS), a national network that has played a crucial role in the consolidation of SL in Spain. REDAPS acted as a reference point, providing technical support, materials and training for schools and social organizations involved in Service-Learning projects. Its network structure, consisting of 17 territorial groups throughout Spain's Autonomous Communities, has enabled widespread dissemination and consolidation of ApS throughout the country, making it an integral part of the educational system.

#### **4. CONCLUSION**

The analysis of the diffusion of Service-Learning in Spain and Italy highlights different approaches in the integration of this methodology in the educational and legislative context. In particular, two approaches were identified: bottom-up and top-down.

The bottom-up approach builds on the experience already present in the territory, starting from the bottom and developing institutional support that accompanies and regulates these experiences, rather than imposing them. In this case, policies are adapted to local needs, with the active participation of the actors involved in the process. The top-down approach, on the other hand, starts from the central level, defining in advance the objectives and policies to be applied, and then implementing them locally.

In Spain, the diffusion of service-learning was mainly driven by a bottom-up approach, with bottom-up initiatives involving local schools and organizations, which then attracted support from institutions. Government policies have followed this thrust, including Service-Learning in school curricula.

In Italy, the approach to Service-Learning diffusion has been a mix of top-down

and bottom-up. Although initially the top-down influence was predominant, especially with the experimentation of the Beyond the Classroom project, autonomous experiences in schools also emerged (bottom-up approach), supported by INDIRE at the institutional level.

The comparative analysis of educational experiences shows a significant disparity in the implementation of Service-Learning. Spain is an advanced and promising model to follow, with a wide network of promoting entities, primarily the Red Española de Aprendizaje-Servicio (REDAPS), together with Editorial Edebé and the Ministerio de Educación y Formación Profesional. Its established experience has led to the mandatory integration of Service-Learning in all schools of all levels. In addition, the almost ten-year time difference in the field highlights the maturity and solidity of the Spanish model, accumulating a significant wealth of experience and knowledge in the field. Conversely, Italy is still at an intermediate stage, due to the lack of a coordinated network of institutions and a rigorous methodology. It is true that INDIRE has recognized and enhanced the practice of Service-Learning, including it within the Educational Vanguard Movement. However, the search for projects to analyze, conducted by examining official sites that promote Service-Learning projects, such as the School of Higher Education Educare all'Incontro e alla Solidarietà (EIS), revealed fragmented project documentation and haphazard presentation. This indicates the need for greater cohesion and clarity in Italian Service-Learning practices.

# FOSTERING ACTIVE CITIZENSHIP AND ETHICAL PROFESSIONALISM: A SERVICE-LEARNING PARADIGM FOR TRANSLATOR EDUCATION

Stempniewicz Patrycja Lidia

Bernardini Silvia

University of Bologna

The increasing attention to the professional components of translation competences and the growing emphasis on the social role of translators highlight the need for pedagogical approaches that foster both active citizenship and ethical reflection. Service-learning (SL) has emerged as an effective didactic approach, merging academic learning with community service to cultivate socially engaged professionals. This article introduces a novel SL model for translator education, which integrates civic engagement within academic curricula. Combining Gouadec's socio-constructivist-inspired project-based translation pedagogy (2005) and Dewey's democratic education principles (1916), our model advocates for the potential of translation service-learning (TSL) to bridge academic instruction and community-based professional practice. Through the case study of IN.TRA (Inclusive Translation for Community Engagement), a pro bono language service provider initiated at the University of Bologna in 2021, we analyse the implications of SL for enhancing translator education with global citizenship competences.

service-learning, translator education, active citizenship, ethical professionalism, language diversity, project-based learning

## 1. INTRODUCTION

In today's interconnected world, translators play an increasingly important role in addressing global challenges, such as fostering intercultural understanding, promoting social justice, and preserving linguistic diversity. A growing body of literature, including works by scholars such as Wolf, Drugan, Taibi, and Ozolins, has reconceptualized the role of translators, positioning them as proactive

agents of social change rather than passive ambassadors of words. Wolf (2007) underscores the importance of training translators as social agents, emphasizing their role as active participants in the co-construction of meaning. Building on Wolf's views, Drugan and Megone (2011) argue that the ethical dimensions of translation must be integrated into the profession, given the significant societal impacts of translation decisions. Similarly, Taibi and Ozolins (2016) frame translation as a socially engaged practice that actively promotes social transformation beyond linguistic mediation.

Grounded in the principles of university social responsibility (Larrán Jorge and Andrades Peña 2017), the expanded understanding of the translator's role calls for both individuals and institutions to actively contribute to societal well-being and sustainability. In the translation field, adopting this perspective involves moving beyond the question of individual motivation—whether translators act out of self-interest or a commitment to the greater good—thus shifting the focus towards broader considerations of how translation can facilitate ethical coexistence (Drugan & Tipton 2017). To achieve this overarching aim, we must transcend the notion of teaching translation as mere transfer of technical skills and best practices, emphasizing instead its role as a bridge that fosters empathy, mutual respect, and understanding across cultural and linguistic divides. By critically engaging with their future professional responsibilities, translation students have the potential to shape discourse and drive social progress, during their studies and beyond.

Service-learning (SL) —a pedagogical approach that integrates community engagement with academic learning (Bringle and Hatcher 1995, Furco 1996)—offers a compelling solution to these evolving demands. Our paper therefore explores the potential of SL to enrich translator education by integrating Gouadec's (2005) project-based pedagogy with Dewey's (1916) democratic ideals. The case of IN.TRA, a student-run translation service agency at the University of Bologna, serves as an example of how SL can create meaningful opportunities for future translators to engage with local and international communities, encouraging them to reflect on their role in shaping intercultural communication and promoting social change.

## **2. TRANSLATOR EDUCATION: CURRENT GAPS AND FUTURE NEEDS**

Over the past two decades, the number of translator education programs has grown significantly, accompanied by extensive reflection on the competences required for translation and the pedagogical approaches necessary to cultivate

them. Initiatives like the European Master's in Translation (EMT) have played a crucial role in fostering collaboration among higher education institutions, contributing to the development of future language professionals. The EMT quality label, currently awarded to 81 university translation programs (8 of which in Italy), ensures that these programs meet professional standards and respond to market demands. According to the EMT Competence Framework (2022), translators are expected to master a wide array of competences, including proficiency in translation, cultural and linguistic expertise, technological skills, and the development of personal and interpersonal abilities. The framework also highlights the importance of service provision skills. These diverse competences reflect the evolving demands placed on translators in a globalized world, where their role extends beyond linguistic mediation to active participation in complex social and professional contexts.

In response to this evolving focus, various pedagogical models have emerged to better prepare translators for the modern profession. Two foundational approaches in translator education are Kiraly's socio-constructivist model (2000) and Gouadec's project-based learning (2005). Kiraly's approach emphasizes collaborative learning, where students construct knowledge through interaction with peers and instructors, applying theoretical skills in realistic contexts. Gouadec's model, on the other hand, allows students to work on real or simulated translation projects (e.g. van Egdom et al. (2020)'s INSTB), linking linguistic, technological, and managerial competences. Together, these approaches encourage critical reflection and active engagement, ensuring that students are not only technically proficient but also well-equipped to navigate the broader challenges they will face.

In this context, one cannot help but question how social responsibility, defined as "a set of prosocial values representing personal commitments to contribute to community and society" (Wray-Lake et al. 2016, p. 130), can be effectively woven into the fabric of translator education. The emphasis on personal and interpersonal competence in the EMT framework, along with the focus on service provision, suggests that social responsibility is not only a relevant component of a translator education, but an essential one. These competences indeed implicitly align with the notion of the translator as a socially aware professional (see section 1), tasked not only with accurate linguistic transfer but with responsible execution of their work.

A curriculum that integrates social responsibility will prepare students for the ethical challenges they will encounter. By fostering critical reflection on the

social and cultural consequences of their work, students will be empowered to act as agents of positive change within the communities they serve, thereby enhancing the overall impact of their professional contributions. This pedagogical shift from a task-oriented approach to a view of translation as a dynamic process founded on active engagement and ethical considerations requires the integration of reflective competences into translator education.

The reflective attitude, referred to here as “ethical professionalism” should in our opinion be distinguished from traditional notions of professional ethics (or deontology), as it encompasses a broader engagement with social responsibility. Professional ethics refers to the codified standards and guidelines that govern the behaviour and responsibilities of translators within their profession, ensuring accuracy, confidentiality, and fairness in their work. While no doubt important, professional ethics primarily focuses on adherence to these transactional norms. On the other hand, ethical professionalism as we conceive it extends beyond compliance with these norms. It entails a deeper engagement with the broader social responsibilities inherent in the translator’s role, prompting individuals to reflect critically on how their work influences and shapes social realities. This approach encourages translators to consider the ethical impact of their decisions on marginalized communities, global justice, and intercultural understanding.

Fostering ethical professionalism in future translators requires thoughtful and deliberate approaches, and one of the most promising methods, in our view, is the integration of service-learning into translation curricula. Service-learning as a pedagogical model that combines academic instruction with meaningful community engagement, offers a renewed socio-constructivist framework (Kiraly 2000) for nurturing both technical proficiency and a heightened sense of social responsibility.

### **3. IN.TRA: A CASE STUDY IN TRANSLATION SERVICE-LEARNING**

To integrate social responsibility into translator education, the Department of Interpretation and Translation at the University of Bologna established IN.TRA, a pro bono translation agency managed by students with the supervision of academic staff. Inspired by the model of simulated translation bureaus (van Egdom et al. 2020), IN.TRA was launched in March 2021 as part of the master’s degree in Specialized Translation. IN.TRA’s pedagogical approach is firmly grounded in service-learning principles, connecting academic instruction with real-world community service. The translation service-learning (TSL) model

represents an innovative fusion of Gouadec’s project-based translation pedagogy (2005) and Dewey’s democratic pedagogy (1916): the first makes it possible to apply and boost the knowledge, skills and abilities acquired in the individual modules of a Master’s degree translation course, rooting them in professional experience; the second enables the development through service-learning of active citizenship skills, by stimulating reflection on the practical civic engagement and solidarity values in the community. By providing interlingual community services, IN.TRA students help non-profit organizations (NPOs) disseminate their activities and share the stories of their members through translation, empowering students to apply their skills to projects that promote social justice and inclusivity. The collaborative effort with community partners contributes to breaking down linguistic and cultural barriers and broadens public access to the work of NPOs, promoting and safeguarding linguistic diversity as outlined in the European Parliament Resolution 2018/2028(INI) on language equality in the digital age.

As a case study of TSL, we provide here the experiences of the IN.TRA students in the SLIT (Service Learning, Innovation, and Translation) project<sup>1</sup>, which represents an attempt to connect two international translation networks by the EMT-affiliated department of Translation and Interpreting of the University of Bologna (Italy) and the PAMCIT-affiliated departments of translation and interpreting of the universities of Nairobi (Kenya) and Gaston Berger de Saint-Louis (Senegal). The aim of the SLIT project was to favour a professional and cultural exchange and the emergence of a cross-continent community of practice (Cadwell et al. 2022).

SLIT brought together students from the three universities in a year-long course in which they shared online classes in translation technologies, localization and sociolinguistics of African languages, and then paired up to carry out projects with NPOs (COMI and Cittadinanza Onlus) active in the two African countries. The project facilitated direct engagement of students across the two continents with communities in Kibera (Nairobi) and Kaffrine (Senegal). They applied their skills in specialised tasks —the translation of health-related interviews from Swahili to English and of milk pasteurisation instruction manuals from Italian to Wolof— thus obtaining first-hand experience of the vital service they are capable of providing to the well-being of society.

At the end of the project, students from the three universities took part in short

---

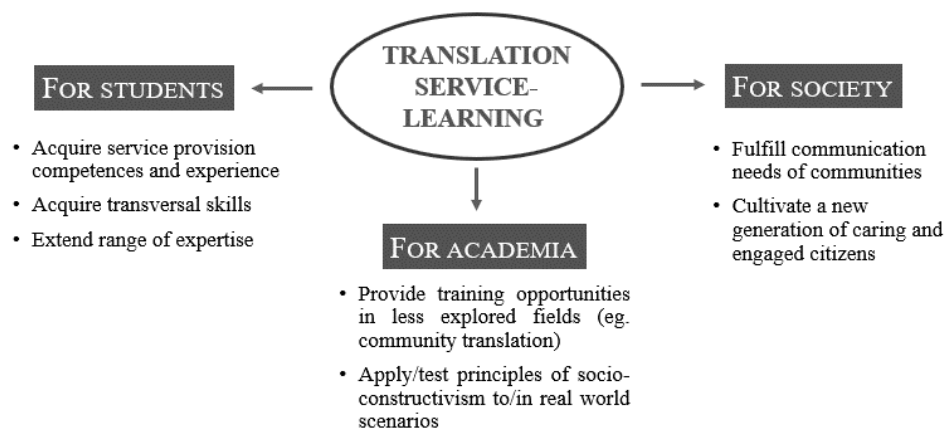

<sup>1</sup> The project was funded by the University of Bologna under a complete scheme for Cooperation Development projects (Global South 2021)

mobility stays in another partner university, where they attended and delivered seminars and got in touch with the local recipient communities. Notwithstanding the difficulties encountered, both cultural and technical, SLIT offered students an opportunity to experience balanced collaboration in which all involved parties contributed to filling a gap that none could fill independently.

#### 4. CONCLUSIONS

The integration of service-learning into translator education offers a transformative approach that bridges the gap between theory and practice, while simultaneously fostering active citizenship and ethical professionalism. The IN.TRA initiative exemplifies how service-learning provides translation students with invaluable real-world experience, enriching both their academic growth and social development. As illustrated in Figure 1, our experience shows how translation service-learning yields benefits for three key stakeholders: students, academia, and society. Our ongoing research seeks to examine its potential impact on specific dimensions of student development, such as the enhancement of translation competences, civic responsibility, and soft skills. Looking forward, the expansion of service-learning within translator education presents an invaluable opportunity to reinforce the connection between academia and society, ultimately addressing immediate communication needs of the communities while fostering long-term social impact, as emphasized in Target 4.7 of the Global Education Agenda 2030. By participating in real-world TSL projects such as SLIT, students are encouraged to reflect critically on their roles as socially responsible citizens, thus embracing ethical professionalism as an integral part of their academic and personal development.

Figure 1. Potential benefits of translation service-learning

Our future research will focus on evaluating the impact of service-learning on both translation-specific competences and transversal skills through structured student questionnaires and content analysis of reflective journals. These instruments will offer valuable insights into how service-learning fosters not only technical proficiency but also civic responsibility and ethical professionalism. By systematically analysing students' reflections and experiences, we aim to further refine the integration of service-learning into translation curricula, ensuring it continues to bridge the gap between theory and practice, while effectively preparing students to navigate the complexities of the translator profession.

### **Acknowledgements**

Financial support for this study was provided by the Department of Interpreting and Translation through its Strategic Development Plan and by the University of Bologna through the Global South (2022) scheme. The authors would also like to thank Fondazione Cassa dei Risparmi di Forlì for funding Patrycja Stempniewicz's Doctoral project, and Dr Gaia Ballerini for her participation in the research and teaching activities described in this contribution.

# MEASURING FLEXIBLE FURNITURE IMPACT ON STUDENTS' AND TEACHERS' LEARNING EXPERIENCE

Giuseppina Cannella<sup>a</sup>

Wesley Imms<sup>b</sup>

Silvia Panzavolta<sup>a</sup>

<sup>a</sup>INDIRE, Italy; <sup>b</sup>Melbourne University

This study investigates Innovative Learning Environments (ILEs), focusing on flexible furniture and its effects on teaching and learning. ILEs, with adaptable spaces and diverse furniture, promote collaboration, creativity, and inclusion. The Italian replication of the “Vasse Study” highlights positive impacts on student engagement, group work, and inquiry-based learning in sample classes. Using mixed-method tools like classroom observations, teacher interviews, and student surveys, the study demonstrates how ILEs foster innovative pedagogy, enhance inclusion, and improve well-being.

innovative learning environment; school furniture; educational innovation

## INTRODUCTION

This paper explores the concept of innovative learning environments (ILEs), the innovative use of furniture, and how to measure the impact of these phenomena on teaching and learning. By ILEs, we refer to designs that promote a wider interaction of student-to-student, and teacher-to-student learning approaches. ILEs tend to be characterised as the opposite of ‘traditional’ classrooms where 30+ students sit at desks facing the front of a room, where teachers control what is learned and how (Byers et al., 2018). Instead, they have a variety of spaces – small break out rooms, large common learning areas, and a multitude of options between. They are also characterised by ‘changeability’ – that is, spaces can be quickly reconfigured to suit a particular learning task (Dovey & Fisher, 2014). In essence, ILEs allow students and teachers to have at their disposal the ideal space to suit a particular task at hand. Their impact is intended to still support very direct instruction from a teacher but also have the capacity of more student

involvement in their own learning and utilising the teachers as a co-learner or accessible expert (Morris et al., 2024). These qualities meet the demand around the world for graduates who are more creative, can communicate well, can utilise critical thinking, and have collaboration skills that the modern workforce is now requiring (Alterator & Deed, 2018). It is argued that such qualities are difficult to achieve in learning spaces that restrict student interaction and self-exploration. An obvious element of an ILE is the ‘affordances’, the characteristics of an object or space that encourages a particular behaviour (Young et al., 2019), and the more common affordance is the furniture that ILEs house. These, again, differ from ‘traditional’ set-ups that utilise one desk and chair (each the exact same as the others) per student that invariably occupies the majority of space in a typically-sized classroom. Instead, ILEs hold a variety of desk and table types, with a variety of seating arrangements from high and low stools, chairs on wheels, even sofas and ottomans.

The equity issue that such ILEs address is of individual capacity. Studies are now providing evidence that students with all manner of physical, neurological or ‘lived condition’ disabilities find the flexibility of choice contained in ILEs to be of immense value; see, for instance, Dargue et al., (2022) on autism and ILEs, and Morris and Imms (*in press*) on how furniture meets the needs of a variety of disability.

This is the broad context of this paper, but it also focuses on an important issue – how can we gather evidence of the impact of ILEs? This carries international implications; each country owns sets of restrictions on how spaces can be modified – from the political through to the physical. How can we develop measures that span issues such as how heritage overlays that limit physical alterations, as discussed below in the Italian context (Mahat et. al., 2020)? The answer is to replicate successful studies under ‘local’ conditions and select those evaluation techniques that ‘work’. INDIRE has engaged in such a type of replication study with an Australian team who have, for a number of years, developed and trailed a repeated measures design intended to explore the impact of differing furniture arrangements in schools. That study (Morris & Imms, 2020) focused on furniture – one affordance of a ILE that can be utilised in heritage-listed schools – in an attempt to see if its approaches carry similar benefits in an Italian setting.

## **1. WHAT ITALIAN DATA SAYS. THE REPLICATION OF THE “VASSE STUDY”**

The Manifesto of Learning Space of INDIRE led the research group to set up investigations about ILEs which has been defined according to the individuals who inhabit it, and the school context intertwined with the pedagogical-didactic component and with the other aspects that characterize the educational dimension such as comfort, well-being, quality of education, equity and inclusion (Carro, Tosi 2022). The research interest in this field is also due to the condition of many Italian school buildings: 70% of Italian school buildings were constructed before the 1970s, and often not originally designed as schools (Fondazione Agnelli, 2020).

INDIRE research about ILEs focused on research oriented towards evaluating the effectiveness of changing the organisational model of newly constructed learning environments or those subject to renovation. In terms of Post Occupancy Evaluation (Zimring & Reizenstein, 1980, p. 429) is “the examination of the effectiveness for human users of occupied designed environments” (Preiser, 2002 p. 142) “a process of systematically evaluating the performance of buildings after they have been constructed and occupied for a certain time.”

In this research field emerged that small changes in the furniture setting can have positive effects in the learning process and students’ well-being (Imms, Morris, & Grunseit, 2020). Extensive international literature reports on the positive effects of ILEs on student learning and engagement (Imms & Kvan, 2021).

To collect evidence about the effectiveness of the school furniture, a collaboration has been initiated between the University of Melbourne, Edith Cowan University in Perth and INDIRE to allow the international team the opportunity to compare and replicate the research protocol employed in the so-called “Vasse Study.” Observation protocol and related instruments have been adapted to be replicated in Italian context (Imms, 2018). The original design uses a quasi-experimental research method; in addition, the design calls for a repeated measures approach to isolate “school furniture” as the variable responsible for any changes in teaching practices or in student engagement. The research questions were: are students’ levels of perceived engagement in learning related to the types of furniture in their classrooms? Do teaching styles (pedagogies) change with the different arrangement of school furniture?). This research design, Single Subject Research Design, is a type of quantitative research that involves the detailed study of the behavior of a small number of participants, typically two to ten participants.

After a development stage to localise and adapt the research protocol to the Italian context, the observation sample for the first-year research activities was selected in an attainable context. Istituto Comprensivo Coverciano in Florence was selected by INDIRE research team and two classes in primary level were involved in the three phases of the replication of the research.

The project included a moment of reflection (generative workshop) with the teachers of the two primary classes involved in the research. The generative workshop aimed to engage participants to reflect on the physical and experiential elements of ILEs and to design activities to transform their teaching approach by also considering space as an element to be taken into account. The workshop used a design thinking approach to collaborate and create with the group. This technique requires group members to bring their own skills to the table to prompt behavioural evolution and empower teachers to transform their teaching practices.

The information generated from the workshop provided teachers with information on the explicit link between the teaching and learning process in ILEs; tools for soliciting teachers' intrinsic motivation for change; and tools for choosing the furniture configuration best suited to the teaching activities performed. The collected data allowed INDIRE to detect initial data on the effect of flexible furniture on teachers' behaviors. Preliminary results show a noteworthy change in teaching and organizational activities by orienting them toward non-occasional group work and an inquiry-based project approach. Regarding students, the data collected suggest that primary students' express preference for soft furnishings and relaxing spaces.

## **2. THE RESEARCH TOOLS**

The researchers employed tools addressing both teachers and students. The tools had a quanti-qualitative nature (questionnaires, interviews, classroom observation and photo elicitation).

### **2.1. The teachers' questionnaire**

Teacher mind frame is a conceptual tool developed by Hattie (2009) to help teachers reflect on their teaching approach and make evidence-based decisions to improve the quality of education. His 10 Teacher Mind-frames act as a lens through which teachers can examine their practice, and are statistically characteristic of high-impact teaching approaches. They consist of a set of considerations and questions that teachers should ask themselves

while planning, conducting lessons, and analysing the documentation of the implemented lessons. A subsequent Teacher Mindframe Survey (Murphy et al., *in press*) posed questions to teachers based on these “Teacher Mindframes”, made up of 46 items, relating to the 8 mindsets that, according to Hattie (2009) make a difference in the teachers’ thinking and, therefore, teaching practice. The first category is the “focus on learning and learning-related language”. This dimension emphasizes the centrality of student learning in teaching. Teachers should be oriented toward learning objectives and use language that prioritizes student learning (e.g., peer education, game-based learning, inquiry-based learning, problem-based learning, etc.), helping students better understand what they need to learn and why it is important. The second category is “evaluating the effectiveness of one’s teaching”: teachers should consistently reflect on the impact of their teaching practices on students. This involves assessing whether learning objectives have been achieved and whether there has been progress in students’ learning, basing their reflection on a range of indicators, observations, and evaluative practices (not solely relying on summative assessment). The third focus on “assessment as an informative tool for teaching”: assessment should be seen as a means to gather valuable information about students’ learning. Teachers should use assessment to better understand students’ needs and adapt their teaching practices accordingly (assessment for learning/assessment as learning). The fourth considers the focus on “building trusting relationships with others”. Building trusting relationships with students, colleagues and parents is essential for creating a positive learning environment. Teachers should strive to establish trust-based connections that foster learning and collaboration. Another area is the “balance between monologues and dialogues”. Classroom interaction should strike a balance between the time the teacher speaks (monologues) and the time students engage in discussions and dialogues (teacher’s talking time). This balance promotes active student participation and the construction of meaning. The sixth area is “collaboration among teachers”, which is essential for sharing ideas, resources, and experiences to collectively enhance student learning. Working as a team can lead to more effective solutions and the exchange of best practices. The seventh area looks at “providing timely feedback to students and ensuring its understanding”. This feature is crucial for their learning. Teachers should also ensure that students understand the feedback and can apply it to improve their performance. Finally, the eighth area takes into account the “role of innovator”, investigating teachers being willing to experiment with new strategies and approaches in teaching, which is key to

educational innovation. Teachers should remain open to new ideas and ready to adapt their practice based on the latest findings in educational research. In the Italian study, the tool was translated, back translated and adopted with no major changes.

## **2.2. Classroom observation with The LEASA tool and the teacher interview**

LEASA is a tool quantifying the teachers' behaviour across four dimensions: (1) the focus mode. The researcher observing the teacher had to select one or more of the modes being in place at a certain moment (i.e. teacher-centred, student-centred, informal, outside classroom) based on the control being played by one of the actors; (2) the pedagogies in action. The researcher observing the classroom dynamics had to select one or more of the pedagogies listed (i.e. facilitating, providing feedback, class discussion, etc.); (3) the learning community arranged in that moment, whether the focus was on individual, small group learning or the whole classroom; (4) the learning activities, meaning the kind of task being performed in that moment (i.e. assessment, application, creative activities, etc.). LEASA times the duration of each action within the modes, producing a set of descriptive statistics that characterised the nature of that learning activity. The four dimensions and the related vocabulary were the focus of face-to-face sessions among Australian and Italian researchers in order to share a common understanding of what each item would describe and what was to be expected.

A connected tool to the classroom observation was the structured interview. At the end of each term, teachers were interviewed on various areas related to the recently concluded period, by showing them histograms of their activities gathered by the LEASA tool. The areas taken into account were their self-assessment of teaching performance, their views on students' behavioural, cognitive, and emotional engagement, and their approaches to arranging and utilising classroom furniture.

## **2.3. The tools investigating students perceptions: the photo elicitation and the questionnaire**

Photo elicitation is a qualitative research method that involves using photographs to evoke deeper discussions and reflections during interviews or group discussions. By incorporating visual stimuli, this technique helps participants recall memories, express emotions, and share perspectives that might not emerge through verbal questions alone. The photos can be taken by the researcher, the participants, or sourced from other relevant materials. In the

Italian study, the pictures were taken from the researchers according to the preferences of furniture expressed by students on sticky notes. Students had to write on a sticky note their preferred piece of furniture, say why they had chosen that one and in what way they considered it a support in learning. Then, they had to stick the sticky note on the piece and researchers would take pictures of their choices. The photo elicitation was used in the B-mode only, when the innovation setting was in place.

Students were also asked to fill in a questionnaire in the three terms (traditional-innovative-traditional) focussing on their engagement in the classrooms. Two areas of the questionnaire were based on previously validated tools investigating engagement and student self-regulation (Maes & Gebhardt, 2021). One area focussed on their perception of furniture and was specifically added during the Vasse study (Imms, Morris & Grunseit, 2020). In the Italian replication study, INDIRE adopted the tool as it was.

# THE IMPACT OF SCHOOL FURNITURE ON STUDENTS' ENGAGEMENT. AN INTERNATIONAL SINGLE SUBJECT RESEARCH STUDY

Stefania Chipa<sup>a</sup>

Elena Mosa<sup>a</sup>

Julia Morris<sup>b</sup>

<sup>a</sup>INDIRE, Italy, <sup>b</sup> Edith Cowan University, Australia

The research hypothesis derived from the literature that this contribution seeks to address is that *small changes in the furniture setting can have positive effects on the learning process and students' well-being*. Most Italian school buildings were constructed before the 1970s and often were not originally designed as schools. Most students learn in small spaces with limited structural flexibility. INDIRE, the Italian National Institute for Educational Research, is working on a three-year research study together with the University of Melbourne and Edith Cowan University in Perth to explore the role of the school furniture in changing teachers' practices and students' engagement. The research used a quasi-experimental method with a repeated measures approach to isolate school furniture and understand how it impacts on student engagement and teachers' mindsets. In this contribution, we will focus on analysing the data obtained from photo elicitation and Classrooms observations through a digital tool called LEASA to understand whether the degree of student participation in classroom activities can change in the presence of an innovative setting compared to a traditional setting.

innovative learning environments, school furniture, post occupancy evaluation, single subject research, student engagement.

## **INTRODUCTION**

The research contribution falls within the realm of reflection internationally identified as Post Occupancy Evaluation (POE), defined as the “examination of the effectiveness for human users of occupied designed environments” (Zimring and Reizenstein, 1980, p. 429).

Extensive international literature reports on the positive effects that Innovative Learning Environments (ILE) have on both student learning and engagement and teaching practices (Imms, Kvan, 2021).

Most Italian school buildings were constructed before the 1970s and often were not originally designed as schools (Fondazione Agnelli, 2020). Most students learn in small spaces with limited structural flexibility.

INDIRE, the Italian National Institute for Educational Research, is working on a three-year research study together with the University of Melbourne and Cowan University in Perth to explore the role of the school furniture in changing teachers’ practices and students’ engagement. The study was conducted during the 2022/23 school year in two primary school classes (a fourth and a fifth grade) from two different buildings of the Istituto Comprensivo Coverciano in Florence.

As for the students, the following research questions guided the research:

- RQ1: Are levels of student engagement perception in learning correlated with the types of furniture present in their classrooms?
- RQ2: Does the time dedicated to student-centred pedagogies change in the presence of innovative furnishings?

## **1. METHODOLOGY**

The research used a quasi-experimental methodology with a repeated measures approach to isolate school furniture and understand how it impacts on student engagement and teachers’ mindsets. It is a single subject research (Fraenkel, Wallen, 2006) where participants serve as both the control and treatment group following an A-B-A design where A is the baseline (the traditional setting), B the situation changed (the innovative setting), and A is the returning to a nontreatment condition (the traditional setting).

The research employed research tools already validated in the context of primary schools in Australia: (1) Student Survey, (2) Photo Elicitation, (3) Classrooms observations through a digital tool called LEASA which measures the time dedicated to four dimensions (Focus mode, Pedagogies, Learning

Activities, Learning Communities); (4) The Teacher Mindframes questionnaire; (5) the Teacher interview.

Two classes from the fourth and fifth grades of an Italian primary school were involved as an instrumental case study.

Throughout the year, repeated tri-weekly measurements were taken to assess: (1) students' perceptions of their cognitive and behavioural engagement, (2) actions of the teachers in these classrooms (3) Photographs taken by students of the furniture they preferred, with annotations explaining their preferences; (4) the shift in the teachers' mindset due to furniture changes.

## **2. OUTCOMES**

### **2.1. Photoelicitation**

In this contribution, we will focus on analysing the data obtained from photo elicitation and LEASA to understand whether the degree of student participation in classroom activities can change in the presence of an innovative setting compared to a traditional setting. The photo elicitation was preferred as a tool to measure students' perceptions of their engagement. It is a visual method that engages the subjects more than the conventional interview. It was submitted during the innovative setting, five times, once at the end of each. Students were asked to choose an innovative piece of furniture, put a post-it note on it and write down their answers to two questions: 1) What did you like most about this piece of furniture? 2) How does this object help you learn more effectively? The researchers took the picture of the piece of furniture with the post it on it. The two questions had the goal to stimulate the students to reason around three aspects: 1) furniture choice; 2) the reason behind the choice; 3) the learning link, that is, how that furniture helped them learn better.

Fifth-grade students identified the relax area with soft seating (poufs) as the piece of furniture they found most conducive to learning. The bar table ranked second, followed by the niche in third place. In fourth place was the high desk with a stool; it is noteworthy how desks with a height greater than the standard (bar table and high desk) were highly appreciated by the students. Similarly, fourth-grade students also selected the relaxation area with soft seating (poufs) as the most favoured furniture element to support learning. Modular desks came in second place. The interactive whiteboard, despite already being present in the traditional setting, was the third most chosen element, perhaps confirming that this tool is perceived by students as facilitating learning. In fourth place, with an equal number of preferences, were the plant wall,

ergonomic chairs, and bookshelves.

The reasons expressed by fourth and fifth-grade students differed: for fourth-grade students, the primary reason was the possibility to relax (32% of responses), while for fifth-grade students, comfort prevailed (28%), closely followed by the affordance for learning (24%), which was also the second choice expressed by fourth-grade students, with 21% of responses.

Regarding the learning link, the one most frequently mentioned by fourth-grade students was 'supports different learning needs', followed by 'helps with reading' and 'helps with relaxation'. The types of furniture that students identified as best supporting diverse learning needs were poufs and desks. These furnishings:

- Promote well-being at school: "They help me learn better because I can relax and then feel more energized for lessons"
- Support cooperation: "The desks help me learn better because you can work together"

In fifth grade, the primary motivation was different: 'comfort and safety'. As with fourth grade, the second and third motivations were 'helps with reading' and 'helps with relaxation'.

The types of furniture that students found most comfortable and safe were the reading area and the sofa, because:

- It's comfortable and spacious: "The reading area is my favourite because it's comfortable and spacious, and it helps me read more like we used to in the old classroom, but above all, it makes me feel eager to read".
- Supports concentration: "The place where I can concentrate the most is the sofa because it's very comfortable and helps me read well".

'Helps with reading' was the second most cited motivation for both grades and was linked to poufs and the soft area. Students particularly appreciated the presence of this space because it is:

- Quiet: "The reading area is very useful for me to read, not only because it's very comfortable but also because it's the only quiet place".
- Useful for relaxing between activities: "I choose the reading area because when we need to wait for someone to finish something, we can go and read"
- Comfortable: "It helps me learn better because it's very comfortable for reading".

## **2.2. Class observation**

During the school year, 11 observations were conducted in the classes under study, divided as follows: 3 observations in phase A (traditional setting, Term 1), 5 observations in phase B (presence of innovative furniture, Term 2), and 3 observations in phase A, representing the return to the initial situation (Term 3). In this case, the furniture was the only independent variable. Each observation involved the presence of two researchers who tracked the duration of specific actions observed during lessons using a platform called Learning Environments Analysis Survey App (LEASA), developed by project partners (and adapted from Byers, 2016). The presence of two researchers aimed to compare their respective recordings and reach a consensus. The platform collects quantitative data on 4 dimensions (Focus Mode, Pedagogies, Learning Activities, Learning Communities), each organized into sub-items that were activated on the platform as soon as observed by the researchers and stopped at their conclusion, even recursively, as they occurred during the lesson. Naturally, before this observation phase, trials were conducted with the same classes to acclimate students to the presence of silent, non-intrusive observers and to establish interpretive agreement among researchers in coding the observed actions.

In this study, the significant results of the “Focus Mode” and “Learning Communities” dimensions are analyzed.

The first dimension, Focus Mode, highlights the amount of time dedicated to teacher-centered and student-centered activities. In the fourth grade, there is only a slight negative decline in teacher time during phase B (innovative setting, Term 2), with an average time of about 25 minutes per lesson (averaged across the three phases). The student-centered mode consistently remains at very high levels in Term 1, Term 2, and Term 3 (about 55 minutes per lesson, average across the three phases) with a slight increase in phase 2, the “innovative setting.”

The data for the fifth grade is much more dynamic. The time dedicated to teacher-centered activities significantly decreases from Term 1 (over 43 minutes) to Term 2 (about 21 minutes), only to rise again during the restoration of the traditional setting in Term 3 (about 42 minutes). Similarly, student-centered activities show a significant increase in Term 2 (about 43 minutes, compared to 36 in Term 1 and 20 in Term 3).

The Learning Communities dimension records class time based on the organization of students into individual work, small group work, whole-class

activities, or mixed groups. In the fourth grade, there is an increase in group work time at the expense of individual work, which decreases in Term 2. Group work time remains consistent in Term 3, even after restoring the traditional setting. This enhancement of group work can be attributed to a greater use of active teaching methods that focus on student-centered learning, as consistently observed in the “Pedagogies” dimension.

The fifth grade exhibits a different teaching behavior. The averages of the time dedicated to whole-class or individual activities indicate that these were the teacher’s predominant methods of instruction (the time averages remain constant across the three terms, at about 12 minutes for individual work and 40 minutes for whole-class activities). Interestingly, small group work, which was completely absent in Term 1, appeared for the first time in Term 2 with an average of over 28 minutes, and then decreased (without disappearing entirely) in Term 3 (about 5 minutes).

These initial results highlight how the mere introduction of innovative furniture in the classroom created a discontinuity in some previously established teaching activities and reduced the teacher-centered time in favor of activities that promote student agency. This suggests a transition towards more participative and less frontal teaching methodologies.

### **3. CONSIDERATIONS**

The main results of the research activity are:

- Students believed that their learning had improved due to innovative furniture.
- While measurements of student engagement levels did not change significantly in the presence of innovative furniture, students perceived that furniture had an impact on their learning.
- Students reported they tend to spend more time in readings and decreased levels of anxiety and stress in the presence of innovative furniture since concentration and focussing was scaffolded thanks to the new furniture.

As for the LEASA observations:

- Students-centered pedagogies increased in presence of innovative furniture
- The observations reflect a progressive reduction in the central role of the teacher, in line with the goal of shifting the focus to the students.

The use of internationally validated research tools permits the results obtained in the Italian context to be compared internationally.

#### **4. COMPARING ITALIAN DATA TO PREVIOUS AUSTRALIAN RESEARCH**

This study replicated research previously conducted in Australia (Morris & Imms, 2020, 2023). Despite significant contextual differences in infrastructure, policy and curriculum, we found very similar results in the Australian study when compared to the Italian data presented in this paper. The Italian data show how students perceive flexible furniture to have a positive impact on their learning. Their photographic data showed there are a range of furniture that students prefer, suggesting that choice of furniture give students agency to meet their personal preferences. This was similar to the Australian study, where students selected furniture to meet a range of physiological and behavioural needs (Morris & Imms, 2020, 2023). The Italian students also closely linked furniture to learning, particularly evidenced by the reading corner having a perceived positive impact on their reading habits and literacy skills. The specificity of this finding (i.e., a direct influence on reading habits) was not found in the Australian study, but could be a result of the Italian furniture intervention specifically including a reading corner which was not part of the flexible furniture arrangement in the Australian classrooms. It might also be the result of contextual differences in terms of focus areas for primary aged students across the two countries. There were other positive benefits to individuals too, with students explaining they like the flexible furniture as they perceived it decreased levels of anxiety and stress. Focus was also perceived to increase when working in more flexible environments. While stress was not mentioned in the Australian study, Australian students also reported they chose specific items of flexible furniture to support their concentration and focus (Morris & Imms, 2020, 2023). Teachers clearly changed their practices when working in flexible furniture arrangements. They were seen to engage in more student-centred pedagogies when working with innovative furniture, consistent with the Australian findings (Morris & Imms, 2020, 2023). While other patterns were found in the Italian data, such as flexible furniture seeming to support a move towards more collaborative activities, the move towards student-centred pedagogies remains a clear and consistent result that requires further exploration across both Italian and Australian contexts.

This snapshot of results from our study suggests there is a rationale for continuing to explore the influence of furniture on teaching and learning, and

how it supports the needs of all students, and this is work we are continuing to collaborate on. We must ensure that our spaces meet the needs of all students, and these data are evidence of the capacity of furniture to contribute to improving the experiences of students while they are at school.

# CAN INNOVATION AND INCLUSION CO-EXIST?

Matteo Di Pietrantonio

University of Bologna

The main international organisations and institutions are reshaping the educational system to facilitate the acquisition of 21<sup>st</sup> century skills. Thirty years after the Salamanca Declaration this research aims to explore if, according to the perception of school staff and students of four innovative high schools in Italy and Finland, ILEs can promote inclusive process for all

inclusion; innovative learning environments; high schools

## INTRODUCTION

In recent decades the main international organisations and institutions are debating the necessity to rethink, in a lifelong learning perspective, educational systems. According to their recommendations introducing Innovative Learning Environments (ILEs) can foster active and learner centred pedagogies, the use of new technology (ICT), and the acquisition of 21<sup>st</sup> century skills (Ananiadou & Claro, 2009; Schleicher, 2020) that respond to the needs of the job market and have citizens who are protagonists in their communities.

Thirty years after the Salamanca Declaration (UNESCO, 1994) this research, carried out in four high schools in Italy and Finland, is designed to explore if, according to the perceptions of school staff and students, ILEs can foster school inclusion for students, also those with Special Educational Needs (SEN).

## 1. THEORETICAL BACKGROUND

OECD (2013, 2017) defines ILEs as flexible, technological and multimedia, able to answer students' 21st century needs. They do not refer only to physical aspects: it is not possible to separate learning from context, as it is not just a matter of organizing space but also taking care of, for example, relations,

contents, teaching strategies and time. Spaces are not just empty boxes, but produce and shape social relations, and in turn social praxis influence the use and experience of space (Benade, 2019).

According to the International Classification of Functioning, Disability and Health (ICF) of the World Health Organization (2001) space is one of the factors that can limit or favour participation in different activities or constitute a barrier to full utilisation of educational opportunities.

Universal Design for Learning principles (Meyer et al., 2014) underline that diversity is normality and that each person has different characteristics: a generic approach may not necessarily meet the needs of those with SEN. Some need individualised programmes and resources, or quiet zones within traditional classrooms to recover from anxiety or overstimulation (Sandri & Marcarini, 2019).

For the success of innovative projects it is crucial to involve students and school staff in the design phase: this gives designers a better pedagogical understanding (Blackmore et al., 2011; Clarke, 2017), facilitates a positive change in school culture, the development of new skills in teachers and students, and the application of learner-centred teaching (Flutter, 2006).

### **1.1. ILEs in Italy and Finland**

In 2014 INDIRE (National Institute for Documentation Innovation and Educational Research) established “Avanguardie Educative”, a movement of innovative schools based on rethinking the organization of space and time, didactic methods, and relations with the community. Unfortunately the landscape of Italian schools is far from being innovative, as the Legambiente report<sup>1</sup> shows school buildings: old, falling short of safety standards, with seismic hydrogeological risks, low hygiene and health standards, in particular in the south where many students do not have the opportunity to study in a safe and accessible environment.

In 2014 Finland started a transformation plan aimed at building more than 100 new schools. According to Tapaninen it will be possible to see “ (...) lots of different kinds of furniture, lots of colours and, I would say, a lot of happy people” (O’Sullivan, 2017). The outdated vision of schools built as barracks with classrooms located along corridors and desks aligned in rows has been overtaken by more flexible, multifunctional, and informal spaces, resulting in

<sup>1</sup> [https://www.legambiente.it/wp-content/uploads/2021/10/rapporto-Ecosistema-Scuola\\_2021.pdf](https://www.legambiente.it/wp-content/uploads/2021/10/rapporto-Ecosistema-Scuola_2021.pdf) (accessed on 09/09/24)

welcoming, safe, and comfortable environments, conveying a sense of inclusion and well-being.

## 2. THE RESEARCH

This exploratory research was carried out with a qualitative and interpretative approach (Coggi & Ricchiardi, 2005). It is formed of four case studies of innovative high schools in Italy and Finland, aimed at understanding, according to the perceptions of students and school staff, if ILEs facilitate the use of active and learner-centred didactics and ICT, whilst promoting the inclusion and well-being of all the students, especially those with SEN. In Italy I selected two high schools (Licei) from the “Avanguardie Educative” of INDIRE as their Manifesto<sup>2</sup> includes some elements that characterise my research.

In Finland I selected two general upper secondary schools (Lukio)<sup>3</sup>. First, to define the parameters of my fieldwork I conducted:

- 5 focus groups with teachers (Italy);
- 27 semi-structured interviews with Head teachers, teachers and students (8 in Italy, 19 in Finland).

After this phase I observed how spaces were organised and whether they were conducive to student inclusion (e.g. placement of SEN students); if the spaces were functional for active teaching methods and how teachers related to them.

- In Italy: 70 lessons (4180 minutes)
- In Finland: 20 lessons (1500 minutes)

Finally, I administered (online) two questionnaires: one for the teachers, ‘Inclusive Processes Evaluation Scale’ (Cottini et al., 2016) on inclusive teaching and organisation of the school; one for the students, inspired by the Finnish Institute for Health and Welfare<sup>4</sup> questionnaire.

<sup>2</sup> <https://innovazione.indire.it/avanguardieeducative/il-manifesto> (accessed on 09/09/24)

<sup>3</sup> I chose Finland for my fieldwork because its school system is considered one of the best in the world, based on inclusion and well-being, with schools characterised by innovative learning spaces, learner-centred methodologies and the recognition of non-formal learning (Finnish Government, 2021; Karhu, 2018).

<sup>4</sup> <https://thl.fi/en/web/thlfi-en/research-and-development/research-and-projects/school-health-promotion-study?redirect=%2Fen%2Fweb%2Fthlfi-en%2Fresearch-and-development%2Fresearch-and-projects%2Fcurrent-research-and-projects> (accessed on 09/09/24).

## **2.1. Data analysis**

According to the perceptions collected it seems ILEs facilitate the use of learner-centred didactics and ICT, fostering both inclusion and well-being of students (and teachers). Following the architect Herman Hertzberg's vision of Learning Landscapes (2008) the four schools (especially in Finland) go beyond the traditional model in favour of a school designed as a city with squares, streets, and meeting points; spaces are welcoming, rooms are brightly coloured, halls and corridors are no longer mere places of passage but learning streets with sofas where it is possible to study alone or in groups, or to socialize with friends. The two Italian schools create innovative learning spaces by rethinking the traditional organization of furniture, making classrooms more functional for learner-centred didactics that in turn favour inclusion for all, for example through cooperative and experiential learning.

From the data it emerges that in the Italian school where desks are arranged as "learning islands" the use of cooperative learning and group work was more frequent, as well the inclusion and participation of all students (including the one with severe disabilities) in learning processes, as opposed to the classic classroom with desks in rows.

In the first case the student with disabilities sat with his classmates, taking part actively in classwork. In the second case the student with disabilities sat at the front of the classroom, with his SEN teacher at his side, with little opportunity to interact or participate fully in the lesson.

In the two Lukio the analysis of the data confirmed that ILEs facilitate the use of learner-centred teaching and ICT, encouraging higher levels of participation and inclusion in lessons, including of students with SEN.

Fig. 1. Desks in learning islands (Italy)

## 2.2. Some critical issues

Despite the positive impact of ILEs, several critical issues emerged that threaten to undermine their potential.

In recent years the trend is to merge small schools and build larger buildings. In Finland students and teachers believe that bigger schools can offer more educational opportunities; but this threatens the characteristics of the Finnish system<sup>5</sup>. Having a high student population risks undermining the “subject based classroom” system<sup>6</sup> and making it difficult to apply active and learner-centred teaching: the student questionnaire showed that it is not so rare (albeit less frequently than in Italy) to come across passive and boring lessons. Moreover this also makes it difficult to work well and give meaningful and lasting support, considering that each school has only one SEN teacher.

Another critical element is the increasing digitalisation of the learning environment. In the four schools students regularly use computers in class and in Finland e-books have replaced paper books. Technology can help teachers present and supplement their lessons (e.g. videos, images and diagrams), it can facilitate more interactive lessons improving the participation also of SEN students, offering different communication channels and learning paths.

However I found that the use of digital tools reduces teacher movement through

---

<sup>5</sup> The success of the Finnish system is based on a high quality curriculum, equity in education access, and the small size of schools. Most of them have less than 300 students, favouring strong inclusion and relations between teachers, students, families, and other institutions and organizations (O’Sullivan, 2017).

<sup>6</sup> In “subject based classrooms” systems each classroom is dedicated to a specific subject and subject teacher. Students move from one classroom to another according to scheduled lessons.

the classroom. This affects the quality of relationships, engagement, and opportunity to interact with students: the result is that students, especially those in the back row, spend most of their time playing video games, watching videos, or on social media.

As observed during online learning in the pandemic, relationships, physical contact and proximity remain irreplaceable in educational practice (Sandri & Di Pietrantonio, 2021).

According to teachers e-books are difficult to use due to their many inputs and distractions, have a negative impact on students' ability to concentrate, and on the quality of their learning. This makes reading less effective and creates cognitive overload, distracting rather than facilitating comprehension.

Other issues relate to the one size fits all approach of ICT: designed for standard users and does not take into account the differences of individual learners, particularly those with SEN. The risk is that of standardising teaching, and adapting student responses to the characteristics of programmes and not the other way round (Starks & Reich, 2023).

Smardon et al. (2015) point out that many innovative elements are promoted by the OECD, who pursue global economic interests. It is important to understand who is driving innovation and to what ends, and whether educational goals are still driven by pedagogical theories or are determined by market needs and interests. Ensuring quality education for the younger generation can contribute to the development and progress of society, but we must ask whether we all share the same idea of progress, and what this means for those that live on the margins of society.

Last but not least: ILEs can foster teaching that facilitates cognitive, metacognitive, and collaborative learning experiences as well as deeper learning (Imms & Kvan, 2021) but, as Hattie argues, "changing the shape of buildings does not lead to teachers teaching differently" (Page & Davis, 2016, p. 89).

Until last year it was not necessary to have pedagogical training to teach in secondary schools in Italy, so teachers often lack pedagogical, psychological and relational skills. Also SEN teachers often do not have specific training, as confirmed by the research (only 50% in the two schools investigated), making it difficult to realize a real inclusion for all.

### **3. CONCLUSION**

To conclude, it can be argued that, according to the perceptions of head teachers, teachers, and students, the four schools monitored are both inclusive and innovative: ILEs foster student inclusion and well-being. They are accessible, flexible, safe, beautiful, welcoming, and facilitate a learner-centred approach that actively engages students, including those with SEN.

Despite these positive impacts, the four schools are unable to ensure a real inclusion for all without a global rethink of the whole educational system. Italy has one of the most inclusive school models, which includes even students with severe disabilities in the mainstream system, ensuring co-evolutionary processes (Canevaro, 2015). However this is often a “theoretical inclusion” which struggles to activate truly inclusive and meaningful processes for students with SEN.

In Finland, despite pedagogical innovation and highly qualified teachers, the mainstream system is highly selective and competitive, resulting in a kind of ‘exclusive inclusion’. After comprehensive school the best students access Lukio, those with SEN end up in vocational schools where the students receive more individual attention, or in special schools, resulting in their marginalisation. Although the data cannot be generalized, 30 years after the Salamanca Declaration and subsequent recommendations on the subject, despite efforts, discriminatory mechanisms are still in place that make it difficult to realise inclusive rights for students with disabilities and access to quality education within mainstream schools.

## **THE “STUDENT VOICE” FROM “DANTE-CARDUCCI” SCHOOL IN PIACENZA (ITALY). WELL-BEING, INCLUSION AND LEARNING ENVIRONMENTS: WHAT THE STUDENTS THINK, LIKE AND DISLIKE?**

Mariagrazia Francesca Marcarini<sup>a</sup>

Francesca Lunardini<sup>b</sup>

Filippo Rebecchi<sup>c</sup>

Lucia Tagliaferri<sup>c</sup>

<sup>a</sup>ADi (Associazione Docenti e Dirigenti Scolastici italiani); <sup>b</sup> Scuola Secondaria di Primo Grado Dante-Carducci – Piacenza (Italy).

Dante-Carducci schools are in Piacenza (North-Italy) in two different buildings: Dante has all the classrooms occupied and there is mainly a “traditional teaching” methodology, but some teachers try as much as possible to use more innovative teaching, while the Carducci has fewer classrooms, large corridors, a large gym and a garden surrounding. The teachers, after a training, implemented a new organization: disciplinary/subject/thematic classrooms were created and assigned to the teachers, so the students reach them at the change of lessons instead of the reverse. This new organization methodology and didactic change aimed at responding to the many students with SEN (Special Educational

Needs) to guarantee person's centrality, developing an ethic of responsibility and building a sense of democracy, wellbeing, inclusion, and learning that are fundamental for the academic and educational success of all students in a multicultural vision (Garcia, 2018). The research is qualitative-quantitative, a questionnaire was given to the students in both schools and aimed to understand students' vision regarding Carducci school, how the students experienced this change, the positive and critical aspects. Regarding Dante school how they would like to reorganize and/or redesign school spaces (Woolner, 2015; Weyland, 2015).

Student voice; disciplinary/subject/thematic classrooms; innovative learning environments.

## **INTRODUCTION**

Dante-Carducci schools are in Piacenza (North-Italy), a city with 102,660 inhabitants and capital of the province of Emilia-Romagna region and they are located in two different buildings very close, in a residential neighborhood with public gardens and cycle paths frequented by the students of the institute even during school hours for nature observations or gym activities.

The students' families are characterized by good housing stability, the socio-economic physiognomy is heterogeneous: families with a high cultural level, situations of medium well-being and growing cases of marginality due to high immigration with reflection in the students' classes formation.

Dante-Carducci schools have common priorities and macro-objectives but referring to the building location characteristics and their catchment areas are different.

Dante school is in a more central position and is organized on three floors plus a basement, and has 26 classrooms all occupied, but it does not have other spaces and this partially precludes the possibility of testing new approaches teaching, so in this school there is mainly a "traditional teaching" methodology, but some teachers try as much as possible to use innovative teaching and didactic methodologies.

Carducci school is in a less central position, and it is organized on two floors plus a basement. It has fewer classrooms and large corridors, a wide gym and a garden surrounding the school. For several years the teachers have developed research for methodological inclusive solutions aimed at teaching differentiation to respond to the high number of students with SEN, especially NAI (New Arrival in Italy) students and students with heavy disability (Sandri, 2019).

### **1. RESEARCH OBJECTIVES**

New challenges have led new responses: in the Carducci school the teachers decided to design "new school organization" and, after a training, disciplinary/subject/thematic classrooms were created and assigned to the teachers so the students reach them at the change of lessons instead of the reverse and also new "learning environments" (Armenakis, et al., 1993; Biondi, Borri, Tosi, 2016; Marcarini, 2016).

Gradual methodological and didactic changes have led to a reflection among teachers and students to the "Vision of the Institute": centrality of the person, development of an ethic of responsibility and construction of a sense of legality

and democracy (Alexander, 2008). Well-being, inclusion and innovative learning environments are the fundamental aspects for the academic and formative success of all students, without exceptions to improve aspects related to learning (Barrett et al. 2015, Barret, 2022; Bannister, 2017; Baker, 2019).

It was decided to also involve Dante school's students in the research to understand what vision of their school they have and what their expectations and desires are.

This research investigates how to overcome the rigidity of the traditional learning environment (Morris, Imms, 2023b), how students adapt to a new organization of learning of their school spaces and what impact from the point of view of students' perception the new educational spaces have; the "student voice" (Grion, Cook-Sather, 2013; Quaglia, Corso, 2014) is at the center of this research and gives them the opportunity to explain their vision of school.

In fact, the objectives of the research are:

- The students "voice" to explain their vision on learning spaces, well-being, inclusion and how they learn.
- Their perception of being considered and respected as a "person" with their own unique characteristics.
- Understand how Carducci school students experienced the new organization and what they think about it.
- Understand how Dante school students think about their school, their expectations and desires.

## **2. METHODOLOGY**

The research has a qualitative-quantitative approach (Mertens, 2014; Trincherro, 2015; Jones, Smith (2016).

Based on previous reflections and starting from the analysis of the most recent literature, the data collecting strategies used are:

- Questionnaire to Carducci and Dante students.
- Focus group between Carducci teachers and students and final debate.
- Carducci teachers' considerations (Professor Lucia Tagliaferri and Professor Filippo Rebecchi).
- Dante teacher considerations (Professor Francesca Lunardini).

In particular:

- Dante school:
  - Total students: 621.
  - Students who answered to the questionnaire: 471; 75,85%.
  - Total students with SEN (Disability, Law n.104/92<sup>1</sup>, ADHD, SLD, NAI): 173; 27,85%.
  - Students with disability (Law n.104/92: people with Autistic Syndrome; Down Syndrome, ADHD, Intellectual, Sensorial and Physical disability, etc.): 31.
  - Students with SLD (Specific Learning Disorder): 70.
  - Students NAI: 33.
  - Students with other SEN: 39.
- Carducci school:
  - Total students: 374.
  - Students who answered to the questionnaire: 347; 92,78%.
  - Total students with SEN: 130; 34,75%.
  - Students with disability (Law n. 104/92): 37.
  - Students with SLD: 44.
  - Students NAI: 12.
  - Students with other SEN: 37.

The questionnaire has 18 questions, and it is divided into four parts.

*1<sup>st</sup> – My vision of school* (7 questions). The questions are about the vision of the school building, if the students like their classroom, which spaces they think are most necessary to increase the involvement and interest during didactic activity and if the physical spaces, the objects, the furnishings can influence and improve their learning and their well-being at school, and if keeping the desk for the professors is important for their prestige.

*2<sup>nd</sup> – School well-being* (2 questions). The questions are about the student's well-being, if they feel well or they don't at school and why, maybe for unwelcoming and inadequate school spaces, difficulties in socializing with

---

<sup>1</sup>Law n. 104, 5 February 1992, concerns the rights of social integration and assistance of the person with disability.

classmates, teaching methodologies that do not reflect their way of learning, difficult empathetic relationship with some teachers, poor interest in the study.

*3<sup>rd</sup> – The school and I, studying and learning* (3 questions). The questions asked if the students find school lesson boring and in which way they prefer teachers to do lessons: with oral explanations only, with group work, with oral explanations and with images and videos, in addition to explanations also involve the carrying out of some practical and real tasks, outside the school in various places in the city (museums, libraries, parks, offices, shops, artisans...) (Mottana, Campagnoli, 2020; Morris, Imms; 2023a).

*4<sup>th</sup> – Disciplinary/subject/thematic classrooms* (6 questions). These questions are a bit different because Carducci school changed organization, while Dante school have traditional organization. The questions are about what the students think about the school organization with this type of classrooms assigned to the teachers and if changing classrooms when lessons change would allow to have a moment of breakout and decompression; if they believe that this innovation could be more or less useful for improving their learning; if their well-being at school could be improved by the disciplinary/subject/thematic classrooms, if it could be possible to improve collaboration and socialization with their classmates, finally if they think that this organization could facilitate the inclusion of all their classmates, no one excluded.

## **CONCLUSION**

Regarding the results, the students' answers in the 1<sup>st</sup> – 2<sup>nd</sup> – 3<sup>rd</sup> parts of the questionnaire are very similar. In particular in the 1<sup>st</sup> part (Figure n. 1) the students of both schools believe that spaces influence both learning and well-being, it is important to have green spaces both inside and outside the school and the flexibility of the spaces with multimedia equipment is important. However, the answers regarding the teachers' desk are different: at the Carducci school they consider it important, at the Dante school they do not consider it necessary for the teachers' authority.

Figure 1. 1<sup>st</sup> part: My vision of school.

RESULTS QUESTIONNAIRE 1 <sup>st</sup> PART: MY VISION OF SCHOOL	
1. THE SCHOOL BUILDING; WHICH (SYMBOLIC) IMAGE DOES REPRESENTS YOUR DANTE SCHOOL?	ANSWERS: AGGREGATION CENTRE (1 <sup>st</sup> BOTH SCHOOL); HOSPITAL; HOME (3 <sup>rd</sup> FOR BOTH); PRISON (2 <sup>nd</sup> BOTH SCHOOLS); LABYRINTH
2. THE WORD THAT MOST REPRESENTS YOUR IDEA OF SCHOOL:	ANSWERS: FAMILIARITY(2 <sup>nd</sup> FOR BOTH SCHOOLS), BRIGHTNESS; WELL-BEING (1 <sup>st</sup> BOTH SCHOOLS); BEAUTY; FLEXIBILITY (3 <sup>rd</sup> FOR BOTH SCHOOLS)
3. I LIKE THE CLASSROOMS OF MY SCHOOL	ANSWERS: • ABSOLUTELY NOT; • NOT; • NEITHER YES NOR NO(1 <sup>st</sup> FOR DANTE); • YES (1 <sup>st</sup> FOR CARDUCCI); • ABSOLUTELY YES
4. WHICH SPACES DO YOU BELIEVE ARE MOST NECESSARY?	ANSWERS: • GREEN SPACES EQUIPPED FOR RELAXATION (1 <sup>st</sup> BOTH SCHOOLS); • SPACES OUTSIDE THE CLASSROOM WITH STATION FOR WORK GROUP; FLEXIBLE CLASSROOMS WITH MULTIMEDIA EQUIPMENT; • SPACES OUTSIDE THE CLASSROOM WITH STATION FOR INDIVIDUAL STUDY (2 <sup>nd</sup> BOTH SCHOOLS); • PERSONAL LOCKERS; • LIBRARY; • CAFETERIA/CANTEEN
5. DO YOU THINK THAT TO INCREASE YOUR INVOLVEMENT AND INTEREST DURING YOUR EDUCATIONAL ACTIVITY, IT IS NECESSARY TO HAVE:	ANSWERS: • CLASSROOMS WITH FLEXIBLE SPACES (AND MULTIMEDIA EQUIPMENT (1 <sup>st</sup> BOTH SCHOOLS); • MULTIMEDIA EQUIPMENT ONLY; • NONE OR ALL THAT BEFORE, ENOUGH FOR THE TEACHER TO KNOW HOW TO INTEREST THE STUDENTS
6. DO YOU THINK THAT THE PHYSICAL SPACES, THE OBJECTS, THE FURNISHINGS CAN INFLUENCE AND IMPROVE YOUR LEARNING AND YOUR WELL-BEING AT SCHOOL?	ANSWERS: • YES (1 <sup>st</sup> BOTH SCHOOLS); • NOT; • I DON'T KNOW
7. DO YOU THINK THAT KEEPING THE CHAIR FOR THE PROFESSOR IS:	ANSWERS: • NECESSARY TO DISTINGUISH THE TEACHER'S AUTHORITATIVE ROLE (1 <sup>st</sup> FOR CARDUCCI); • NOT NECESSARY BECAUSE THE TEACHER'S AUTHORITY CAN ALSO EXPRESS IN OTHER WAY (1 <sup>st</sup> FOR DANTE)

Figure 2. 2<sup>nd</sup> part: School well-being.

RESULT QUESTIONNAIRE 2 <sup>nd</sup> PART: SCHOOL WELL-BEING	
8. DO YOU THINK THAT TO FEEL WELL AT SCHOOL OR DO NOT FEELING WELL AT SCHOOL OR SOMETIMES FEELING WELL BUT SOMETIMES NOT FEELING WELL?	ANSWERS: • FEELING WELL AT SCHOOL (2 <sup>nd</sup> BOTH SCHOOLS: 137 CARDUCCI; 179 DANTE); • NOT FEELING WELL AT SCHOOL • SOMETIMES FEELING WELL AND SOMETIMES NOT FEELING WELL (1 <sup>st</sup> BOTH SCHOOLS: 190 CARDUCCI; 245 DANTE)
9. IF YOU DO NOT FEEL WELL IN SCHOOL, CAN YOU SAY WHY?	ANSWERS: • UNWELCOMING AND INADEQUATE SCHOOL SPACES (2 <sup>nd</sup> DANTE 4 <sup>th</sup> CARDUCCI); • DIFFICULTIES IN SOCIALISING WITH PEOPLE (ARGUMENTS, MISUNDERSTANDINGS, ISOLATION...) (1 <sup>st</sup> CARDUCCI; 1 <sup>st</sup> DANTE); • TEACHING METHODOLOGIES THAT DO NOT REFLECT YOUR WAY OF LEARNING (UNDERSTANDING (3 <sup>rd</sup> BOTH SCHOOLS); • DIFFICULT EMPATHETIC RELATIONSHIP (OF SYMPATHY--CONFIDENCE) WITH SOME TEACHERS (1 <sup>st</sup> DANTE; 2 <sup>nd</sup> CARDUCCI); • POOR INTEREST IN THE STUDY

Figure 3. 3<sup>rd</sup> part: I and school, studying and learning.

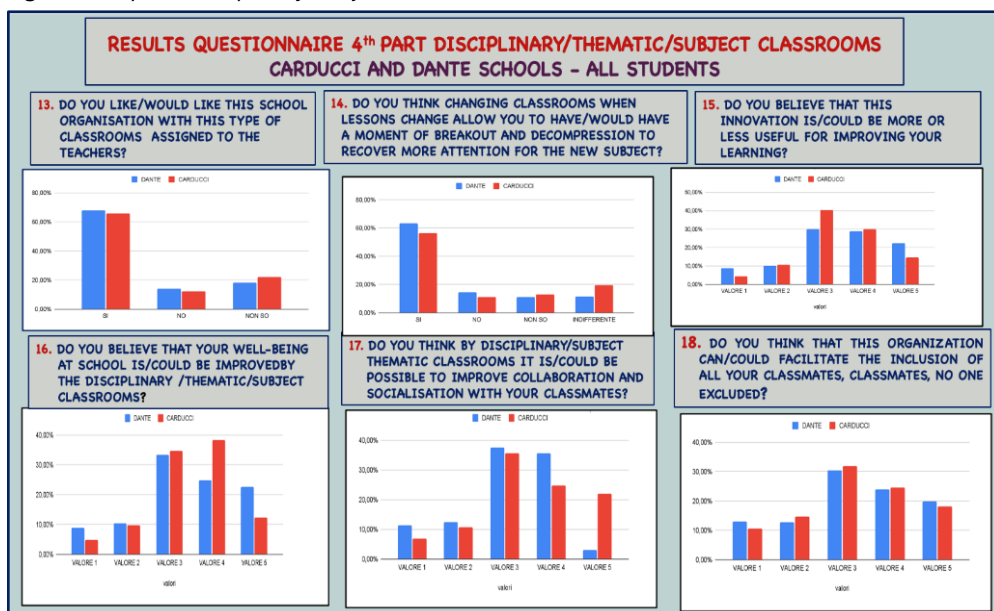

RESULTS QUESTIONNAIRE 3 <sup>rd</sup> PART: I AND SCHOOL, STUDYING AND LEARNING	
10. YOU GET TIRED AND FIND SCHOOL LESSONS BORING	ANSWERS: • VERY OFTEN (3 <sup>rd</sup> BOTH SCHOOLS); • OFTEN (2 <sup>nd</sup> DANTE); • SOMETIMES (1 <sup>st</sup> BOTH SCHOOLS); • RARELY (2 <sup>nd</sup> CARDUCCI); • NEVER
11. DURING LESSONS I GET CURIOUS AND I WOULD LIKE TO KNOW MORE THINGS	ANSWERS: • ABSOLUTELY NOT; • NOT; NEITHER YES NOR NO (1 <sup>st</sup> BOTH SCHOOL); • YES (2 <sup>nd</sup> BOTH SCHOOLS); • ABSOLUTELY YES.
12. DO YOU PREFER TEACHERS TO DO LESSONS:	ANSWERS: • WITH ORAL EXPLANATIONS ONLY (CLASSROOM-TAUGHT LESSON) • WITH GROUP WORK PROPOSAL (2 <sup>nd</sup> FOR BOTH SCHOOLS) • WITH ORAL EXPLANATIONS AND WITH IMAGES AND VIDEOS (3 <sup>rd</sup> FOR BOTH SCHOOLS) • WHICH IN ADDITION TO EXPLANATIONS ALSO INVOLVE THE CARRYING OUT OF SOME PRACTICAL AND REAL TASKS • OUTSIDE THE SCHOOL IN VARIOUS PLACES IN THE CITY (MUSEUMS, LIBRARIES, PARKS, OFFICES, SHOPS, ARTISANS...) (1 <sup>st</sup> FOR BOTH SCHOOLS)

Regarding the 2<sup>nd</sup> part (Figure 2) relating to well-being at school, the students of both schools believe that the discomfort at school is mainly due to difficulties in socializing, for the Dante school also for unwelcoming and inadequate school spaces and for the students of both schools, as a third important aspect, the teaching methodologies do not reflect their way of learning; for the students of the Dante school the difficult empathetic relationship with some teachers.

As regards the 3<sup>rd</sup> part of the questionnaire (Figure n. 3) in both schools the students do not consider the lessons too boring, however regarding the teaching methodologies, they would prefer lessons outside the school in various places in the city (museums, libraries, parks, offices, shops, artisans...) or group work proposal with oral explanations and with images and videos, also involve the carrying out of some practical and real tasks, so it is important the teacher transition to innovative teaching and didactic methodology (Imms, Kvan; 2022).

Finally, in the fourth part of the questionnaire, regarding the new organization implemented in the Carducci school, therefore for the students who are experimenting with it, as well as for the students of the Dante school, who are not experimenting with it but were asked to think about it, from the answers given by the students (Figure 4,) the results to the questions are very similar in both schools.

Figure 4. 4<sup>th</sup> part: Disciplinary/subject/thematic classrooms

In question n. 13, the majority of students like the organization of the classrooms assigned to the teachers and also agree (question n.14) in believing that with this organization they would have a moment of breakout and decompression to recover the attention for the new subject.

Regarding questions no. 15-16-17-18 (values are provided in ascending order from 1 to 5) the students of both schools believe (the most values are in 3-4-5):

- this innovation could be useful for improving the learning;
- their well-being at school could be improved by the disciplinary/thematic/subject classrooms;
- this organization could improve collaboration and socialization with their classmates:
- this organization could facilitate the inclusion of all your classmates, no one excluded.

### **Carducci teachers' considerations**

- Positive aspects:
  - new organization has stimulated teachers to use new teaching methodologies, in order to differentiate teaching also due to the presence of many students with SEN.
  - this made it possible to consider each student as a unique person, in his unrepeatability so that no one could be excluded;
  - moving from one classroom to another led students to develop a sense of responsibility and autonomy;
  - for each movement there was, in turn, a student who opened and one who closed the queue, with the responsibility of leading the class group, this made him feel important even if sometimes some difficulties emerged in managing the group;
  - during the path, students could have a break to focus their attention on the new subject;
  - this new organization has allowed to involve all students in a democratic vision of school and active citizenship.
- Critical issues:
  - some teachers who were not very responsible when changing space remained in the classroom and not in the corridor to check students;

- open and close lines do not have always respected by students but they learn the school rules
- cleaning of classrooms: janitors sometimes critical but after they explained to the classes the situation improved.

#### **Carducci students' considerations**

- they have more friendship because they meet more, with all the schoolmates so they could socialize much more;
- they don't have always respected the rule as group responsible, but at the same time, they felt important;
- backpacks is too heavy when moving from one classroom to another, especially on the stairs but the teachers then lightened our load;
- more control of timings: the lessons closes at the correct times to allow for movement;
- changing the classroom allows to refresh and return attention to the new subject;
- they learned the school rules and they became more responsible and conscientious.

#### **Dante teacher considerations:**

- Dante school is still a traditional school, but the feedback from students in the various areas (didactic-educational and well-being) is substantially positive;
- however, the majority of students would like to see a renewal of the spaces and teaching methodology;
- the Dante-Carducci comparison shows that the students of the Carducci school who were able to experience the new setting of the school gave decidedly positive feedback, especially from the point of view of well-being and socialization;
- the data from the two schools, however, are similar in the learning aspect.

Thanks to the training in which were involved almost all teachers and janitors of the Carducci school, the bridge-culture has developed (Sandrone, 2007), so it has been possible to implement this new organization: in the school there is a pedagogical vision shared among the teachers who characterize the school.

# WALL-LESS SCHOOLING AS A DEVICE FOR SOCIAL JUSTICE

Emilio Ruffolo<sup>a</sup>

<sup>a</sup>CamminaMenti Cooperativa Sociale

This article explores the educational and social potential of an innovative “wall-less” schooling project called Strade Maestre, where a regular school year is transformed into a nine-month, thousand-kilometer group walking journey. This contribution explores how Strade Maestre addresses three key dimensions of learning environments that promote social justice: appropriation, flexibility and inclusion. This exploratory investigation suggests that Strade Maestre promotes appropriation through symbolic rather than physical transformations, achieves flexibility through temporal management rather than spatial reconfiguration, and pursues inclusion through intentional biographical diversity and systematic observation of communication patterns. The analysis argues that these dimensions can simultaneously serve as design objectives for educational environments and as strategies for developing social justice competencies among participants. This theoretical contribution opens questions about how innovative learning environments like Strade Maestre can serve as devices to promote educational equity, suggesting the need for empirical research to understand their transformative potential.

innovative learning environments; social justice; outdoor learning; learning walks

## INTRODUCTION

Strade Maestre<sup>1</sup> is an innovative educational project that challenges traditional notions of schooling by replacing the school building with a long-journey itinerary. This “wall-less” school launched its pilot year (Year 0) on September 16, 2024, taking a cohort of 8 students (11th and 12th grade) from diverse

---

<sup>1</sup> <https://www.strademaestre.org/>

backgrounds<sup>2</sup> on a nine-month, thousand-kilometer journey across Italy, scheduled to conclude in June 2025. The students are engaged in group walking immersive experiences and a variety of pedagogical approaches including blended learning, service learning, outdoor education and project-based learning.

“Learning Walks” has already been described as walking-based approaches to socio-educational intervention. As implemented in several European countries, these walks represent short-term therapeutic interventions designed specifically for young offenders and at-risk youth, typically lasting from five days to three months (Koenig & Knospe, 2021). They feature either a one-to-one relationship between a youth and mentor or small groups with professional supervision, focusing primarily on behavioral change and social reintegration. In contrast, Strade Maestre emerges as a fundamentally different educational paradigm – a nine-month itinerant school project where walking serves as the primary pedagogical framework for a diverse group of mainstream high school students. While learning walks are conceived as targeted interventions for specific at-risk conditions, often featuring solitary journeys with individual mentorship (Koenig & Knospe, 2021), Strade Maestre represents a comprehensive educational program that integrates walking into a broader curriculum design. The temporal scope (days or months versus an academic year), participant profile (at-risk youth versus diverse student cohort), and fundamental objectives (therapeutic intervention versus holistic education) mark the key distinctions between these two walking-based approaches.

The journey-school traverses both urban and rural landscapes, with the learning community being hosted in a diverse array of settings including cultural and educational centers, municipal facilities, scout bases, hostels, and networks of diffused hospitality. The curricular activities are complemented by an extensive array of geographically-anchored extracurricular activities, where the specific locations along the itinerary provide unique learning opportunities tied to local contexts, resources and expertise. These place-based learning experiences are strategically integrated into the journey’s progression, creating a dynamic interplay between formal curriculum requirements and territorially-embedded

---

<sup>2</sup> In the Italian secondary school system (ages 14-19), students attend specialized upper secondary schools that offer distinct tracks: licei (academic high schools specializing in humanities, sciences, arts) and technical institutes (focusing on economics, technology). Strade Maestre participants come from different types of these schools, diverse geographical areas of Italy, and varied socioeconomic and cultural backgrounds, creating a heterogeneous learning community

educational opportunities.

Ultimately, Strade Maestre aspires to be a transformative experience that extends beyond its immediate participants to influence broader educational systems. By having both students and teachers leave their home schools for a year-long journey, the project creates what can be termed a “biographical break” (Koenig & Knospe, 2021) – an opportunity for profound personal and professional transformation. Upon returning to their original educational communities, participants bring back new and renewed competencies but also practical experience in innovative pedagogical approaches. This circular movement – from local schools to the journey and back – positions Strade Maestre as a potential catalyst for systemic change, where individual transformative experiences can contribute to the evolution of more inclusive educational practices within traditional school settings. The effectiveness of this ambitious approach in generating lasting institutional change remains to be empirically evaluated through longitudinal research.

This article aims to explore the educational and social possibilities, as well as the limitations, of Strade Maestre as an innovative learning environments, focusing on three key dimensions:

- appropriation: how does the dynamic succession of places in an itinerant school enable processes of appropriation?
- flexibility: what forms of flexibility are possible within an itinerant school structure?
- inclusion: how can inclusion be promoted within such unorthodox learning environments?

This exploratory study examines how Strade Maestre’s innovative learning environment offers insights for reimagining educational spaces through a social justice lens.

## **1. EPISTEMOLOGICAL AND LEXICAL PREMISES**

Drawing upon the Italian interactionist tradition and its epistemology of levels of reality (Salvini, 1998; Salvini, 2004; Salvini & Dondoni, 2011), this analysis establishes crucial distinctions between key concepts that shape our understanding of learning environments. Most fundamentally, from this perspective we can distinguish between “space” and “place” situating them on different epistemological planes.

Space can be considered as a collection of entities situated in monistic realism

(where reality is ontologically given regardless of the observer's cognitive categories) or hypothetical realism (where reality, although postulated as ontologically existing, remains unknowable). Places, on the other hand, are situated in conceptual realism, where reality does not exist ontologically but is constructed based on the categories of knowledge used to describe it as such. (Turchi & Della Torre, 2007)

This conceptual framework highlights both the relationship and the incommensurability between space and place – while they are interconnected, they exist on distinct epistemological planes that cannot be directly compared or reduced to one another. Furthermore, this perspective emphasizes that any space, regardless of its physical characteristics or intended purpose, has the potential to be transformed into a place through processes of social interaction and meaning-making.

Turning to Strade Maestre, this project necessitates specific lexical distinctions. In Strade Maestre, the traditional “school-building” is replaced by the “school-itinerary”. Spaces in Strade Maestre can be differentiated into two categories: “mobile-space” referring to all spatial elements that the walking group always carries with them (backpacks, their contents, and the services and tools accessed through their digital devices) and the spaces of the school-itinerary that the walking group traverses. I will employ these spatial distinctions in the analysis that follows.

## **2. APPROPRIATION**

Rioux et al. (2017) conceptualize appropriation as the process through which space is transformed into place. Their findings suggest that time spent in a setting alone does not lead to attachment; rather, it is these appropriating behaviors that mediate the relationship between time and place attachment.

Their research implicitly addresses appropriation within a defined space that is frequented recurrently over time. The *mobile-space* is the closest approximation to the space investigated by Rioux et al. (2017). Strade Maestre allows minimal but significant appropriating behaviors of the *mobile-space*, such as adding a patch to the backpack or choosing to leave behind something that is a burden to continue the journey. With respect to the spatial dimensions of the school-itinerary Strade Maestre promotes appropriation introducing rituals and recurring practices and by providing tools that enable the walking learning community to change them. The symbolic power of the school building is replaced by rituals and practices—such as morning briefings, school

assemblies, and notes on the shared virtual bulletin board. A cooperative approach both legitimizes and facilitates participation in and modification of these practices, thereby transforming the ever-changing space into place. This arrangement could promote equality by fostering acts of appropriation, but it could also fail by neglecting the materiality of this process. Documentation and analysis of this peculiar configuration could shed light on the dynamics of appropriation and its relative cultural value.

Strade Maestre invites reflection on the opportunity to distinguish between the appropriation of space as an instrument of social justice in education and the governance of appropriation experiences as an occasion to promote “appropriation competencies.” Walking could be described as a movement through a succession of spaces and places, the succession of spaces and places could be described as a succession of different appropriation experiences. Analyzing this process could promote a new perspective on appropriation that frames it also as a strategy aimed at promoting “appropriation competence”.

### **3. FLEXIBILITY**

The Strade Maestre school-itinerary configuration allows for ample time availability and relative flexibility of material resources (belonging to the “space”) as they depend on the location within the territory. This aspect is addressed by shifting the focus of flexibility from the construction of reconfigurable and redesignable space to designing a viable path for the learning communities. In other words, the walking group works in anticipation of the resources expected to be found in a given territory, using the available time as a tool to balance the potential rigidity of a certain “place”. By placing emphasis on the collective needs and the unique characteristics of each location, Strade Maestre challenges traditional notions of educational resources and invites to consider how flexibility can be achieved through proactive planning and adaptability.

In this case, documenting and analyzing these processes could be useful for identifying best practices to nurture flexibility, rethinking the relevance of school resources in favor of the relevance of the group’s resources and the territory opening to cost-effective solutions.

#### 4. INCLUSION

Rapp and Corral-Granados (2021) conceptualize inclusion and exclusion as continuous, interconnected processes constructed through communication at different societal levels. Drawing from Luhmann's systems theory, they argue that these processes operate through multiple social sub-systems within educational settings, where both formal institutional mechanisms and informal interactions create patterns of inclusion and exclusion. Their framework emphasizes how students can be simultaneously included in some contexts while excluded from others, as these processes are socially constructed through "binary codes that determine whether someone is inside or outside the system" (p. 10). This suggests that effective inclusive education requires continuous attention to communication patterns across multiple institutional levels.

Strade Maestre seeks inclusion through the construction of groups of students with significantly different biographies and through a strict program of observation by trained educators, supervised collective analysis of the social construction of inclusion and exclusion processes (Rapp & Corral-Granados, 2021), and the design of ad-hoc interventions informed also by the restorative justice tradition.

The diverse composition of the student cohort, coupled with the immersive nature of the learning experience, provides a unique opportunity for fostering inclusion and promoting social justice competencies. At the same time, despite intentional biographical diversity, pre-existing differences in cultural and social capital among participants may be exacerbated during the journey. This could lead to what Rapp and Corral-Granados (2021) identify as "persistent exclusion" (p. 2).

Just as with appropriation, flexibility and inclusivity can simultaneously be objectives in the design of a certain educational space and strategies for promoting social justice competencies. This perspective questions the evaluation of innovative learning environments with a set of dimensions to describe how much they foster social justice, broadening this evaluation to the ability of a certain learning environment to "promote social justice competences". Using 'appropriation' as an example, this perspective invites us to investigate the relationship between two distinct aspects. The first is appropriation as a dimension to fulfill (addressing questions like 'to what extent has a specific cohort of students appropriated a given educational environment?' or 'to what degree does a certain educational environment

enable appropriation?'), while the second is appropriation as a vector to promote social justice competencies (examining questions such as 'to what extent does a certain educational environment promote the ability to transform space into place informed by social justice values?'). This relationship has particular significance for Strade Maestre and analogous educational initiatives characterized by temporal discontinuity, such as academic mobility programs, given their inherently episodic nature in terms of spatial and social engagement and transformative ambitions. Moreover, this perspective holds broader relevance for all educational projects, as every educational endeavor inherently encompasses transformative objectives (Biesta, 2022).

## **5. CONCLUSION**

Research-based documentation of Strade Maestre is warranted to better understand how to innovate learning environments as social justice devices. This exploratory contribute has outlined the potential for this unorthodox educational project to promote appropriation, flexibility, and inclusion, while also highlighting the need for further research to assess its outcomes and limitations.

As educational institutions worldwide grapple with the challenges of preparing students for an increasingly complex and interconnected world, projects like Strade Maestre serve as valuable case studies for exploring innovative approaches to education. By documenting and analyzing the experiences of the students, educators, and communities involved in this unique learning journey, researchers can contribute to the growing body of knowledge on the design and implementation of transformative educational experiences that prioritize social justice and equity.

### **Acknowledgements**

Emilio Ruffolo is also the president of the Social Cooperative CamminaMenti implementing the Strade Maestre project. The author thanks Dr. Marco Saverio Loperfido for the numerous insights offered for this contribution.

# DOING RESEARCH WITH SCHOOLS, BRIDGING SPACE AND EDUCATION

Beate Christine Weyland<sup>a</sup>

Andrea Zini<sup>b</sup>

<sup>a</sup>Free University of Bozen-Bolzano; <sup>b</sup>University of Modena and Reggio Emilia

This paper examines the evaluation methods for participatory research projects in educational settings, with a focus on the EDENLAB research group's initiatives. The research integrates nature into school environments, enhancing pedagogical practices through the inclusion of plants in learning spaces. Utilizing a participatory approach, teachers and school communities actively engage in the research, ensuring the relevance and applicability of the findings. The study presents a comprehensive model for evaluating the impact of these interventions, categorizing outcomes into inclusive physical environments, personal resources, and social environments conducive to change. By employing a combination of qualitative and quantitative methods, including questionnaires and reflective logs, the evaluation captures the nuanced effects of these projects on educational practices and school communities. The findings demonstrate significant improvements in spatial use, professional development, and community engagement, highlighting the transformative potential of participatory research in fostering innovative educational environments.

participatory research, evaluation research, learning environments, pedagogical innovation

## RETHINKING THE SCHOOL AND ITS SPACES TOGETHER

A building always tells a story: the story of those who designed it and the story of those who live or will live in it. Especially when thinking about buildings used for education, the relationship between design and life is enriched by two disciplinary fields of reference: Architecture and Pedagogy. When the sciences of design and the sciences of the development of human potential enter into a dialogue with each other, the resulting buildings are more coherent, more generous and capable of absorbing the changes of the times. They are buildings

in which architecture can create spaces for educational life (Weyland & Attia 2015).

When designing a building, especially an educational building, two dimensions are always taken into account: the technical-functional aspect and the value and cultural dimension.

By ‘pedagogical living’ we mean projects in which the synthesis of the technical and cultural aspects enables the creation of spaces that welcome and empower the individual, places that open the eye to the appreciation of the surrounding landscapes and contexts. Pedagogical living is the pedagogical-architectural dialogue that gives rise to spaces that are both strong and discreet, capable of disciplining action and stimulating it at the same time. Combining the concept of living with pedagogy means, above all, combining the spontaneity of human action with intentionality, the spiritual dimension with the rational. According to Cesare Scurati’s thinking (1997), each discipline carries out the critical exercise of reason on reality under its own profile and the school adopts its perspectives aimed at the realisation of the integral human being.

Pedagogy and architecture are disciplines that not only observe the reality of the educational universe from different perspectives (abstract vs. material) but also share a common peculiarity: they have a heuristic and propositional soul. Both interpret and model reality and both formulate proposals for the development of human potential: being, doing, living and staying. Pedagogy to guarantee the conditions for an effective and authentic education, architecture to go beyond function. Both disciplines strive in different ways to offer scenarios of possible living, possible relating, possible learning.

In the landscape of this field of study (Weyland, 2024; Woolner et al., 2018; Zuccoli et al., 2021) a consensus is emerging on the idea that the design or rethinking of spaces can be an opportunity to promote the “development of the school” as a particular type of “learning organisation” (Schratz & Steiner Löffler, 1999/2001). On the other hand, it cannot be assumed that changes in the built environment can in themselves bring about a positive change in teaching and learning (Woolner & Stadler-Altman, 2021). This potential can be realised under certain conditions; above all, this includes choosing a participatory approach (Woolner et al., 2012; Weyland & Stadler-Altman, 2019).

Since 2019, several schools have joined action-research projects with the interdisciplinary research group converging on the EDENLAB laboratory (EDucational ENviroments with Nature – edenlab.unibz.it) with the aim of creating more comfortable environments that support an open, exploratory and

collaborative didactics focused on the development of human potential. In this projects, pedagogical living has been enriched by a form of closer micro-relationship with nature, in which plants become facilitators in the exploration of spaces and didactics (Weyland, 2022).

### **RESEARCH, ACTION AND TRAINING**

The EDEN LAB's "joint research" approach falls within the spectrum of participatory research, and integrates the components of research, action and training.

After initial exploratory experiences, the design of these projects becomes more structured with recurring phases. Before starting, external experts and agreements are presented to the school community, outlining objectives and activity plans. The process begins with forming research groups and defining the initial problem through contextualization and training activities, such as seminars and specific materials. Semi-structured tools like an online noticeboard and a questionnaire survey are used to gather participant characteristics and motivations. Researchers then support project development through regular meetings, facilitating group reflection and documenting processes with tools like participant logbooks. The final phase involves presenting and analyzing results, incorporating a second questionnaire, and considering the project's ongoing development.

There is a clear distinction between the active and reflective role of "practitioners" within their own context and the role of external researchers, which in participatory approaches is twofold: on one hand, acting as facilitators of the teachers' reflection and training process, and on the other, as researchers committed to producing knowledge both on the topics of shared research with the teachers and on their own training strategies (Losito, 2018, p. 67). This duality of roles and research agendas becomes particularly important when defining what constitutes a result of the research itself.

### **MEASURING AND APPRECIATING RESULTS**

The researchers who have joined forces in the EDEN lab aim to develop models and tools to recognise and examine the outcomes of different projects (Weyland & Zini, 2023). Methodological issues related to evaluating outcomes in participatory research have been explored (Agrusti & Dodman, 2021), focusing on the potential and limitations of evaluation approaches using indicators. Results are defined in terms of learning that "is not limited to the innovation

achieved but involves a transformation of the context and a change in the ways of doing and thinking of the actors” (Cardarello, 2018, p. 61).

A model was developed for classifying results (Zini & Weyland, in press, Zini, in press), which aims to evaluate effects by tracking changes in three critical factors: the physical environment, personal resources, and social environment. The model includes sixteen outcome categories and allows for relationships and feedback effects between different categories. It provides a framework for selecting appropriate indicators to measure outcomes without prescribing specific methods or tools.

Tab. 1. Factors and outcome categories.

F1. Inclusive physical environment that promotes active learning and well-being	
R1.1	Negotiation quality of spatial interventions
R1.2	Aesthetic quality and accessibility
R1.3	Perceptible and symbolic quality of spaces
R1.4	Pedagogical quality of spaces for learning purposes
R1.5	Pedagogical quality of spaces for teaching purposes
R1.6	Access and utilisation
F2. Personal resources, attitudes and behaviours conducive to educational innovation	
R2.1	Professional development
R2.2	Practices
F3 Social environment conducive to change in the school	
R3.1	Multiplication, implementation of further coherent measures
R3.2	Interpersonal transfer and broadening of the stakeholder base
R3.3	Training and design
R3.4	Organisation and Curriculum
R4.1	Building networks to support change
R4.2	Interaction with the local community
R4.3	Involvement of parents
R4.4	Involvement of technical staff

## CONSTRUCTION OF INSTRUMENTS AND FIRST APPLICATIONS

An initial data collection instrument was constructed in the form of questionnaire that was administered to a group of teachers in the final stages of one of the most recent EDEN LAB projects. Beate Weyland and Giusi Boaretto collaborated with the Monini kindergarten in Umbertide (Perugia) to appropriate the spaces of a new kindergarten in which two exploratory classrooms dedicated to the encounter with plants were to be created. Before the final meeting, a questionnaire was distributed in order to carry out a joint analysis of the data collected and derive indications on the sustainability of the process. Examples of open questions and structured questions can be found in Table 2.

Tab. 2. Examples of questions from the final questionnaire.

Examples of dichotomous and open questions.
Did the presence of the plants in the classrooms lead to teaching/educational activities or unexpected actions? (Yes/No) If yes, can you briefly list which ones or give an example? Have changes been made to the organisation and/or the pedagogical/didactic project? (Yes/No) If yes, can you specify which changes or give an example? Can you say how parents or other stakeholders in the area have frequented the spaces and/or supported the initiative?
Examples of questions on a four-point agreement scale with defined extremes (1. strongly disagree – 4. strongly agree).
The environments are easily accessible for all types of users. Teachers find the spaces and the design with plants helpful in planning and carrying out classroom activities. Children have a positive attitude towards the place (nurturing, bonding). I have enriched my repertoire of teaching strategies. I have observed changes in the attitude or practise of teachers who were initially less engaged (...). More interventions have been carried out in the school environment that are consistent with those carried out during the collaboration with EDENLAB. There was an exchange of experiences and thematic projects between the teachers of the school. Parents were involved in activities held in the spaces concerned in the EDEN project. Organisations or associations in the area actively supported the activities.

To obtain not only information on the individual indicators but also a summarised overview of the project's impact on the determinants, an internal consistency test (thresholds:  $\alpha > 0.70$ ; item-scale correlation  $> 0.40$ ) was performed on the item sets associated with the three factors according to the theoretical model, making it possible to construct reliable efficacy indices.

In a later study conducted with the kindergartens and primary schools of the Direzione Didattica "Aldo Moro" in Terni (Weyland, Ruzzante, & Zini, 2024), a series of questions were proposed in both the initial and final questionnaires to test the changes in teachers' beliefs regarding the presence of indoor plants in the school space and their potential in relation to different pedagogical intentions. Furthermore, to test the hypothesis that this element of innovation can trigger processes that lead to a general questioning of the quality of the educational space, a small number of indicators were selected from the literature on the assessment and improvement of the pedagogical quality of learning environments in early childhood educational institutions (Bondioli & Savio, 2018) and used with adaptations. In particular, a significant difference (measured with the non-parametric Mann-Whitney U test) was found between the distributions of scores for two items in the data collected at the beginning and at the end of the project:

- (1) Organisation of the school's spaces is the result of teachers' recent joint planning ( $p = 0.001$ );
- (2) The teachers observe how the children use the rooms in order to reorganise them ( $p = 0.012$ ).

## CONCLUSIONS

During the meetings and exchanges, the teachers show that they appreciate the path they have taken and recognise that they are developing skills both in the process of appropriating and transforming the spaces and teaching methods and in their relationship with the plants. The survey instrument was developed to make these changes visible with statistical data, which is also useful for objectively "measuring" the changes that are actually taking place. The presence of open-ended questions qualifies the instrument and provides important insights, both to validate the interpretation of certain structured questions and to gather further information on unexpected outcomes (positive or negative), obstacles or factors that facilitated the path.

In summary, the proposed model seems to provide an appropriate framework to reflect on the outcomes of each intervention at different levels (micro –

individual change, meso – change in organisations, macro – change in communities) and to bring together the data collected from the different experiences in a common research plan that the EDEN LAB will implement with the schools. The direct involvement of participants is in line with the participatory research model and the prominent formative function of evaluation, which aims to further develop the activated processes, even more than reporting.

# NONVIOLENCE IN EDUCATION FOR SOCIAL JUSTICE

Francesca Ursula Bitetto

Università degli Studi di Bari "Aldo Moro"

## INTRODUCTION

Social justice is today increasingly undermined by inequalities, conflicts, climate change and economic crises. Within this context of polycrises, education could be a democratic tool for social emancipation and improvement of life chances. But education can take on different meanings by virtue of the symbolic universes that fuel it by attributing specific purposes to the educational action. This panel intends to explore the close link between education and nonviolence (Capitini, 1967-68; Muller, 2002; Falcicchio, 2022). The emphasis on competition and individualism has repercussions in social life. Solidarity, cooperation, community are placed on the margins. Nonviolence is a concrete possibility of achieving coexistence with others, making peace among humans and with the planet (Langer, 2005). Listening, dialogue and mutual understanding temper opposing fundamentalisms, stereotypes and prejudicial closures. In our relationship with others, we can get involved or close ourselves into defensive approaches fostering polarization or doing something else to break the circle of violence.

Governance disposals in education tend to separate deserving and undeserving minors, to be rewarded or punished, ending up reproducing educational inequalities and recognizing rights to some while depriving others of opportunities and trust. Surveillance and punish or educate about rights, freedom, nonviolence? Freedom does not have the same meaning for all men if to have rights it is necessary to be strong (Resta, 1996; Rodotà, 2013).

While the war grammar and propaganda invade the media and influence policies, any alternative and non-dichotomous point of view is silenced, reduced to ridicule and marginality. It is precisely at this moment that a choral reflection on how to change the rules of language, of domination, of success, and to resume considering as values what the dominant thought continues to consider as waste, collateral victims, minor damage, becomes urgent (Butler,

2020). Expulsions, stigmatisation, rejections, deaths caused by retaliation, violence, cannot be justified and normalised. The world we know has shown its faults and responsibilities that urge us to new rules and new meanings and alternative possibilities of life for all, including the possibility of nonviolent struggle against social injustice and discrimination (Falcicchio, Taurino, 2023). The panel therefore sets out to add its collective contribution to this reflection, going to the roots of the interconnections between education to and for nonviolence with the foundations of justice, democracy, power, ecology (Langer, 1996) and civil defence (Langer, Gülcher, 1995; Lawson, 2022).

## **EDUCATION FOR SOCIAL JUSTICE**

What does it mean to educate? Behind every conscious educational action there should be a conception of it. I tried to formulate a nonviolent idea of education.

Educating is the necessary awareness of the limit that allows us to coexist with the other. Education helps us not to hurt the other, to respect diversity and sensitivities. Education works for peace. Education opens up horizons of realization for people who can positively represent themselves through it. Positive self-representation is possible when others give us a positive image of ourselves. (Luhmann, 2002) Deviant careers are born with labeling that starts a path in which negative self-representations follow one another and build negative identities, limiting social contacts to those equally stigmatized subjects who can offer recognition in deviant subcultures. How can we offer young people paths of inclusion and recognition that do not push them to distance themselves from society by choosing not to study, not to work and to withdraw from a one-dimensional life, which imposes only one possibility and grammar of integration based on a meritocratic ideology, individualism, competition and the fight for self-affirmation at all costs?

The school does not always work on the construction of subjects but is too worried about schedules or discipline. It has a finalistic conception of security, which is not seen as a means but ends up becoming an end in itself.

Young people are sometimes not considered citizens of the present but citizen of the future, this determines their lack of responsibility as young people, and creates golden reserves but also segregations which widen the distances among generations and among youth and institutions. The scarce habit of participating causes one to lose the taste for participation and distances one from politics.

Education is a channel of communication between generations when it works. Education can only be active; one cannot teach those who do not want to learn. It is not control, threat, humiliation, punishment, but attention, openness, illumination, creative power.

However, in reality, educational action is not always nonviolent. The disparity of power between those who judge and those who are judged, the power of the teacher to define reality, conditions young men and women who are formed differently in relation to their learning experiences. Symbolic violence places them in a social position and sometimes forces them into marginal roles. School is the privileged place of socialization in which a society can educate subjects in minority conditions to participate and to be fully citizens, but it is also the place in which power is exercised by stigmatizing behaviors that are not desired or socially approved.

Today we witness many forms of aggression and violence. The relationship with otherness is often exasperated, identities are sometimes shielded and polarized. Hate narratives dominate social media and television or film productions, video games, the cultural industry. The relationship with otherness is not studied and cultivated enough. Information irritates the viewer with high-sounding headlines capable of attracting their attention. The angry citizen becomes a resource for the political consensus of populist parties and new moral entrepreneurs who use moral panic to propose themselves as a reassuring response to growing fears. Violence, even institutional, sometimes attacks defenseless subjects who give life to movements to reaffirm the rights of minorities (*Black Lives Matter*). Citizens attack teachers and doctors, venting their resentment and putting at risk the relationship of trust that is the basis of the teaching or care relationship.

Violence is only possible when the other is dehumanized, for this reason we believe that an education that is a vehicle of social justice must pass from an education to a nonviolent relationship with otherness. Must identity necessarily be based on sacrifice, on the exclusion and sacrificial killing of the different? Or is an identity free from the anxiety of differentiation and demonstration of one's superiority possible? We could practice knowing the other and his symbolic universe rather than demonizing, labeling, caricaturing him. The evaluation applies the judgment criteria of the person who evaluates or of the institutions to which the evaluation system refers. The democratic school must be aimed at the participation of all, avoiding reproducing social distances, hierarchies and power relations. Working in a circle, giving everyone a say, asking many

questions reverses the frontal and hierarchical relationship between those who teach and those who learn and provides for a situation of mutual learning. The maieutic method helps to find the answers within oneself, to express them, to activate oneself.

The proposal that Martha Nussbaum advances for the benefit of a truly democratic political and social system starts from a rereading of the figure of Socrates, recognizing how the development of certain abilities is fundamental for the maintenance of democracy, first and foremost the ability to critically judge oneself and one's own beliefs. The dialogical practice, is crucial at an educational level.

My educational experience in primary school and University has allowed me to experiment with non-authoritarian approaches and nonviolence in school and higher education. Franco Cassano, Eligio Resta, Maria Solimini led us to learn about the nonviolent approach by reversing the dynamics of power and making us protagonists of "exercises of approximation of the other" through the use of maieutics during the lessons that often went on well beyond the time dedicated to this to open up to discussions and walks that prolonged the reflection indefinitely. Teaching became a journey based on the deconstruction of stereotypes and mutual listening, in which the teacher who asked was so attentive to our point of view that he or she ran the risk of changing his or her mind.

### **Acknowledgements**

I would like to thank Gabriella Falcicchio, Luisa Santelli and Daniele Taurino for their contribution on the call and the organization of the panel.

# NONVIOLENT RELATIONSHIPS TO CHANGE THE CULTURE OF VICTORY AND DOMINATION: EXPERIENCES AND PRACTICES AT SCHOOL

Annabella Coiro

Rete EDUMANA – Educazione Umanista alla Nonviolenza Attiva

The educational context, both formal and informal, plays a crucial role in perpetuating a violent culture rooted in patriarchal, vindictive, individualistic, and dichotomous elements, causing widespread suffering. Adult education often unknowingly legitimizes domination as a relational mode, maintaining rigid, asymmetrical patterns. Education is commonly seen as guiding children toward predefined goals (Dolci, 1987), leading adults to impose their vision, which reinforces violence as a norm. Awareness of these dynamics is essential for establishing nonviolent educational relationships (Patfoort, 2012). This article explores authoritarian modes in education, contrasting them with nonviolent alternatives. It reports on experiences of elementary school teachers in the Edumana network, following a three-year action research evaluated by the University of Milan-Bicocca. The activities focus on cultivating nonviolence at personal, interpersonal, and social levels (Muller, 1980), helping adults explore implicit violence in educator-educand relationships. Practices include replacing punishment with dialogue and promoting reciprocity and interdependence among human beings (Morin, 2020). Participation is emphasized, involving pupils in decision-making and fostering circular communication among teachers, parents, and children. This creates a welcoming, dialogic environment that offers children a daily experience intended to be a reference for envisioning a possible equitable society and manage conflicts, at all levels, with nonviolence.

dialogue; relationship; nonviolent education; awareness; practices

## INTRODUCTION

The culture of victory and domination, deeply embedded in educational systems, reflects and sustains broader societal structures rooted in patriarchy, hierarchical power dynamics, and vindictiveness. This culture often manifests in schools through implicit forms of coercion and control, prioritizing compliance over participation and stifling the development of egalitarian relationships. A nonviolent approach to education offers an alternative paradigm, seeking to replace these dynamics with practices that promote equality, cooperation, and inclusivity, as outlined by Law 107/2015, UNESCO, and the UN 2030 Agenda. Education often functions as a mechanism for perpetuating societal hierarchies, sustaining implicit violence through asymmetrical relationships between educators and students (Patfoort, 2012). Vigilante (2014) critiques conventional pedagogical practices for unintentionally reinforcing domination, presenting adults as authoritative figures and students as passive recipients. Similarly, Dolci (1987) highlights how traditional teaching approaches promote a singular worldview, undermining the plurality of perspectives necessary for critical thinking. According to Adorno (1969), the prevention of violence represents a primary goal of education. However, despite this perspective, a systematic strategy remains absent: education for nonviolence is often relegated to the personal initiative of a few individuals. It is crucial to overcome the fragmentation of educational practices by integrating anti-violence measures comprehensively into curricula.

The ED.UMA.NA (Educazione Umanista alla Nonviolenza Attiva) experimentation is grounded in active nonviolence, extending beyond merely fostering a violence-free school environment to transforming the culture of violence into a humanist perspective (Silo, 2000). This approach necessitates the development of creative and cooperative personalities, essential for peace and psychosocial well-being. As noted by Dewey (1916), the continuity between micro-social and macro-social behaviours underscores the importance of intervening in children's daily relationships, offering educational experiences that model a complete rejection of violence.

Nonviolent education requires concrete experiences that foster listening, communication and dialogue (Montessori, 1949; Dolci, 1988; Capitini, 1967). Nonetheless, there is still a lack of widespread awareness capable of generating a repudiation of violence comparable to that developed around environmental issues. Cultural transformation hinges on adopting methods that promote

egalitarian and cooperative relationships, encouraging teachers, parents, and students to explore a nonviolent dimension. The adopted educational model emphasizes direct experience and the appreciation of cultural diversity, tracing connections between *Ubuntu*, new humanism, and contemporary pedagogical movements (Freire, 2014; Morin, 2020; Aguillar & Bize, 2018). Violence is a cultural construct, not a biological inevitability (Adams, 1989), and education can play a central role in developing a “relational grammar” of nonviolence necessary to transcend coercive models unconsciously perpetuated. Thus, the school becomes a microcosm of sustainable citizenship, where students can engage in experiences of cooperation and nonviolent coexistence, cultivating personal and social competencies vital for safeguarding the planet’s future, nurturing an environment where students can grow as active citizens capable of enacting social change. The ED.UMA.NA project embodies these principles by introducing nonviolent practices into schools through dialogic methods, participatory decision-making, and circular communication between teachers, parents, and students.

## **2. THE ED.UMA.NA PROJECT: IMPLEMENTATION AND EXPERIENCES**

### **2.1 A Participatory Approach to Educational Change**

The construction of the project started with the involvement of a diverse team of educators, psychologists, pedagogists, parents, and activists to collaboratively design and implement nonviolent practices in schools. Supported by the Municipality of Milan, the initiative created a citywide network of stakeholders, developing a shared framework for integrating nonviolence into everyday educational practices. The project’s participatory process addressed challenges such as entrenched cultural norms and resistance to change, demonstrating the feasibility of nonviolence in diverse school settings. At the end of the first year of studying and sharing practices, a network of schools willing to undertake the experimentation was formed (the network was called ED.UMA.NA). Participation was planned for first classes only for a 3-year cycle; class councils were identified among those who joined with 75% of the teachers. Six classes out of 12 joined.

### **2.2 The classroom as a microcosm of Nonviolence**

The project reimagined the classroom as a microcosm of an inclusive, nonviolent society (Dewey, 1916). Activities were designed to enhance socio-relational skills, encourage cooperative learning, and empower students to actively engage in decision-making processes. The focus on dialogue and

shared responsibility not only transformed classroom dynamics but also extended to interactions with parents and the wider community. The physical and social organization of classrooms was adapted to promote collaboration and autonomy. Educational practices emphasized conflict resolution, self-assessment, and participatory problem-solving, demonstrating the interconnectedness of personal, interpersonal, and societal dimensions of nonviolence (Muller, 1980).

### **2.3 Challenges and transformations in educational relationships**

One of the primary objectives of ED.UMA.NA was to identify and address implicit violence within traditional educational relationships. Adults were encouraged to reflect on their behavioural patterns and recognize how punitive or judgmental actions undermined nonviolent principles. This reflection fostered a shift toward dialogic and reciprocal interactions. Teachers played a pivotal role, undergoing extensive training to adopt nonviolent methodologies in their classrooms. The training programs equipped teachers, parents, and school staff with practical tools for implementing nonviolent practices. These included role-playing exercises, cooperative learning techniques, and conflict resolution strategies (Galtung, 2000). Such competencies were essential in transforming educational relationships from hierarchical to collaborative (Cambi, 2021; Coiro & Gallotta, 2024; Sclavi, 2020). Despite these successes, challenges persisted. Resistance from some educators and parents, structural barriers, and the disruptions caused by the COVID-19 pandemic highlighted the complexity of cultural change within schools.

### **2.4 Evaluating impact: achievements and challenges**

The University of Milan-Bicocca<sup>1</sup> conducted a qualitative evaluation of the ED.UMA.NA project, identifying several positive outcomes:

- Enhanced teacher competence: educators reported increased confidence and skill in implementing nonviolent methodologies.
- Transformation of the educational relationship: an element of constant concern is the recognition of children's active role and autonomy in the educational space
- The strength of the training group: teachers recognized the strength of the training group and of sharing experiences among different schools

---

<sup>1</sup> Cristina De Michele, Doris Ginevra Valente, *Report di valutazione 2020 progetto ED.UMA.NA.*, Dipartimento di Scienze della Formazione dell'Università degli Studi di Milano-Bicocca

- However, the evaluation also highlighted persistent challenges, including:
- Relational barriers among adults: difficulty fostering genuine collaboration between educators and parents.
- Resistance to change: structural and cultural barriers often impeded efforts to shift power dynamics within classrooms.
- Time constraints: limited time for training and collaboration was a recurring issue.

### **3. EXPANDING AND IMPLEMENTING NONVIOLENT PRACTICES**

#### **3.1. Adaptations in implementation**

The COVID-19 pandemic significantly impacted the project, disrupting in-person activities and exacerbating stress within school communities. However, these challenges spurred innovative adaptations, including:

- Class Tutors: introducing a class tutor to facilitate generative relationships and improve communication during formal meetings between teachers and parents.
- Collaborative training: peer-to-peer training sessions among educators and workshops for parents during class assemblies.
- Community building: organizing inclusive meetings involving teachers, students, and parents to foster mutual understanding and collaboration (Fig. 1).
- Enhancing training content: the content of training programs evolved to emphasize the importance of cultivating a nonviolent mindset among adults; this included practices for group facilitation, tools for conflict resolution, and self-assessment frameworks co-designed with students; the production of practical resources, including classroom materials and self-assessment tools, further supported the integration of nonviolent practices.

Fig. 1. Parents, teachers and children during a community meeting. Massaua Primary School in Milan, Italy. Source: Network EDUMANA (2018)

### 3.2. Key Areas for research and development

- The role of educators in nonviolent transformation. Teachers play a central role in fostering a culture of nonviolence within classrooms. Training programs emphasized the importance of recognizing and addressing implicit violence, developing skills in observation and dialogue, and rejecting punitive disciplinary methods. These strategies aimed to create an environment of trust and respect that empowers both educators and students.
- Improving communication among educating adults. Long-term training for teachers and parents aimed to build a shared understanding of nonviolence. While structural difficulties occasionally hindered progress, trust gradually developed through collaborative practices. Class tutors facilitated circular communication, addressing ingrained habits of top-down interaction.
- Innovative pedagogical approaches. Nonviolent pedagogical methods played a critical role in community-building and the development of transversal skills. Cooperative learning, reciprocal maieutic, and self-assessment practices were implemented to promote critical thinking, creativity, and resilience against a culture of domination.
- Children's participation in decision-making. Children's participation, a core principle of nonviolence, was emphasized in alignment with Article

12 of the CRC and Hart's (1992) Ladder of Participation. Participation was understood not as tokenistic inclusion but as genuine involvement in decision-making processes. Starting in third grade, students engaged in initiatives aimed at transforming their environments, involving parents and community members in realizing their visions (Bordin et al., 2021).

Looking forward, the ED.UMA.NA project seeks to institutionalize nonviolent practices within educational systems, integrating them into curricula, policies, and teacher training programs. Achieving this requires sustained investment in professional development, parent engagement, and systemic support to overcome logistical and cultural barriers.

## CONCLUSION

The ED.UMA.NA project illustrates the transformative potential of nonviolence in education, offering a viable alternative to traditional hierarchical models. By fostering awareness, empathy, and cooperation, it equips students, educators, and communities with the tools to challenge the culture of domination and envision a more equitable society. As global crises and polarization intensify, the principles and practices of nonviolence gain renewed relevance.

Education, as a cornerstone of societal development, holds the potential not only to grow the knowledge but to cultivate critical thinking and democracy.

### Acknowledgements

I would like to thank all the people—especially teachers, principals, and students—who are committed daily to the pursuit of nonviolent educational practices, even in the face of inevitable challenges. I also thank those who have preceded me in this research and those who will carry it forward after me.

# NONVIOLENT THEORY AND PRACTICE IN ALDO CAPITINI: THE INTERNATIONAL SEMINAR ON NONVIOLENT TECHNIQUES (PERUGIA, 1963)

Emanuele Follenti

<sup>a</sup>Liceo Scientifico Lorenzo Respighi, Piacenza.

This paper examines Aldo Capitini's pedagogical theory of nonviolence, particularly as it was practiced and discussed during the "International Seminar on Nonviolent Techniques" held in Perugia in 1963. Contrary to the common misconception that nonviolence merely implies the absence of violence, Capitini conceptualized it as a dynamic and continuous struggle against social and personal injustices. His idea of nonviolence encompassed a deep commitment to social transformation, requiring both inner and collective struggles for freedom, truth, and openness. This paper explores Capitini's philosophy, focusing on his application of nonviolent principles through various actions, such as promoting conscientious objection, supporting religious freedom, and advocating for democratic participation. The Seminar, which hosted theorists and activists like Danilo Dolci and Peter Cadogan, addressed themes that anticipated some of the social movements of the late 1960s, such as civil disobedience, respect for the animal world, and peace-oriented education. Following the Seminar's success, Capitini dedicated himself to the Italian Movimento Nonviolento, aiming to create a legacy that persists in educational and activist circles today.

nonviolence, Aldo Capitini, conscientious objection, democratic participation, peace education

## INTRODUCTION

Aldo Capitini, often called the Italian pioneer of nonviolence, brought Gandhi's principles into an Italian context, establishing a distinct framework for nonviolent action. Capitini was a multifaceted figure: a philosopher, educator, activist, and, crucially, an advocate of "open religion" and a political theorist of

nonviolence. His work often challenged the entrenched values of Italian society, particularly the culture of political “Machiavellianism” and authoritarianism. Inspired by the principles of nonviolence, Capitini sought to establish nonviolent practices in Italy, organizing the first Perugia-Assisi March for peace and creating the Italian Movimento Nonviolento<sup>1</sup>.

The 1963 seminar, held in Perugia from August 1st to August 10th, marked a defining moment in this effort. By gathering national and international pacifists and thinkers to discuss and refine nonviolent strategies, Capitini created a platform for a profound and enduring exchange of ideas that would influence Italian and global peace movements.

This analysis employs a multidisciplinary approach, drawing on historical, pedagogical, and theoretical perspectives to understand Capitini’s contributions to nonviolent thought. Primary sources include archival materials from Movimento Nonviolento, along with audio recordings and transcriptions of seminar sessions, which provide a window into the discussions held in 1963.

This study also integrates pedagogical theories of nonviolence and nonviolent political theory to explore how Capitini’s philosophy influenced the development of Italian social movements. By examining both Capitini’s writings and secondary sources on nonviolence, this paper underscores his enduring impact on peace education, civil rights, and democratic participation.

## **1. ANALYSIS OF CAPITINI’S NONVIOLENT THEORY**

Aldo Capitini’s nonviolent theory offers a radical rethinking of social and political structures, reimagining them in terms of inclusivity, ethical responsibility, and shared agency. Capitini’s vision of nonviolence extends beyond the mere avoidance of conflict; it embodies a continuous struggle against injustice, both within society and within the self. His philosophy, as stated in *Il problema religioso attuale*, interprets nonviolence as a “continuous struggle against existing circumstances, laws, others’ habits, and one’s own tendencies” (Capitini, 1948, pp. 57-58). This profound commitment to ethical transformation reflects his belief that true nonviolence requires active engagement and personal sacrifice.

A central element in Capitini’s philosophy is “compresenza”, or spiritual co-

---

<sup>1</sup> Founded on January 10, 1962, established alongside a group of sympathizers who had accompanied Capitini on his path toward nonviolence, the movement would occupy a position of utmost importance in the philosopher’s activism, especially following the Seminar, when he fully dedicated himself to it.

presence, which expands the notion of community to include not only the living but also the dead, future generations, and non-human beings. This concept underpins his vision of a “reality of all” (*la realtà di tutti*), in which every life form is seen as part of an interconnected moral and social web. Capitini’s emphasis on *compresenza* aligns with his commitment to fostering a society where every individual is valued and empowered to participate in shaping communal life.

Capitini’s theory of nonviolence is inseparable from his educational philosophy, which he saw as essential to the development of a just society. As described in *L’atto di educare* (1951), Capitini viewed education as a transformative force that enables individuals to develop autonomy, empathy, and critical thinking (Capitini, 2022b, p. 129). His educational model emphasized open discussion and critical engagement, contrasting with authoritarian teaching methods and encouraging students to become active participants in society. By fostering ethical awareness and civic responsibility in young people, Capitini sought to lay the groundwork for a new generation committed to nonviolent change.

The 1963 International Seminar on Nonviolent Techniques held in Perugia provided a concrete setting to explore these principles with other thinkers and activists. This seminar brought together individuals committed to examining practical applications of nonviolent strategies, allowing Capitini to present his ideas on localized empowerment and democratic engagement. At the seminar, his emphasis on “power from below” was evident in discussions about his Centres for Social Orientation (C.O.S.), which served as experimental spaces for civic engagement and grassroots governance<sup>2</sup>.

Later in his life, Capitini further articulated these ideas in the concept of “omnicrazia”, or “the power of all.” Coined from the Greek *kratos* (power) and Latin *omnis* (all), “omnicrazia” envisions a system where power is shared among all citizens, transcending hierarchical structures and promoting decentralized, direct democracy. This idea, introduced in *Il potere di tutti*

---

<sup>2</sup> After the liberation of Perugia on July 17, 1944, Aldo Capitini launched his first major political experiment: the Centre for Social Orientation (Centro di Orientamento Sociale, C.O.S.). This was conceived as a forum for the “free and periodic examination on administrative, social, political, cultural, and educational issues,” functioning as a laboratory for grassroots and direct democracy. Within the C.O.S., public authorities and citizens engaged in dialogue on social and cultural matters and collaborated to secure essential goods in the context of post-war poverty and reconstruction. The C.O.S. represented Capitini’s concrete response to two decades of dictatorship, embodying a sense of hope and enthusiasm for the future amidst severe economic and social emergencies. The project was successful and was soon replicated in other Italian cities, such as Bologna, Florence, and Ferrara, through the efforts of Capitini’s friends and collaborators. These open assemblies were held twice a week: one session focused on political and administrative issues, while the other addressed ideological and cultural topics.

(1969), reflects Capitini's belief that democracy must continually evolve toward inclusivity and grassroots participation (Capitini, 1999, pp. 160-162). His notion of power from below, exercised through localized institutions such as the C.O.S., provided a practical framework for engaging citizens in the governance process, allowing them to exercise "accurate information, constructive criticism, and progressive planning" (Capitini, 1999, p. 160).

Another important dimension of Capitini's thought is his ecological and ethical awareness, which emphasizes respect for all life forms. As outlined in *Educazione aperta*, he advocated for a society that values non-human life, recognizing the interconnectedness of environmental and social justice issues (Capitini, 2019, I, p. 55). This ecological consciousness was a forward-thinking component of his nonviolent philosophy, anticipating contemporary movements for animal rights and environmental sustainability<sup>3</sup>.

Capitini's contributions to nonviolence culminate in his belief in "liberated reality", a concept that transcends individualistic or static social models. For Capitini, liberation is achieved through practical actions directed toward value creation and ethical engagement with others (Capitini, 2022b, pp. 76-78). This liberated reality reflects his ideal of a society that actively works to overcome violence, exclusion, and injustice, moving toward a vision of communal well-being and spiritual openness.

Through these concepts—*compresenza*, open education, *omnicrazia* and the liberated reality—Capitini's nonviolent theory offers a holistic and visionary approach to social transformation. His work remains an enduring challenge to the status quo, calling for continuous personal and communal efforts to build a world grounded in justice, compassion, and interconnection.

## 2. CAPITINI'S INFLUENCE ON SOCIAL AND POLITICAL MOVEMENTS

### 2.1. The impact of 1963 Seminar

Aldo Capitini's influence on social and political movements also extended beyond Italy, but his impact was felt most acutely in the nonviolent activism that developed domestically through his initiatives. The 1963 International Seminar

---

<sup>3</sup> The third day of the seminar focused on the connection between nonviolence and love, exploring whether love is an innate human trait or shaped by education. Discussions addressed embracing diversity—cultural, political, or religious—and the ethical limits of care for animals and plants. Vegetarianism was highlighted as a potential nonviolent technique, with Edmondo Marcucci, a pioneer in Italy, contributing insights on its theoretical foundations and international practices, as well as its prominence among War Resisters' International (WRI) activists (Follenti, 2023, pp. 139-146).

on Nonviolent Techniques in Perugia stands as a critical moment of engagement for Italian and international leaders and thinkers. Capitini meticulously organized the Seminar to facilitate a dynamic exchange of ideas and practical strategies, combining theoretical discussions with sessions on specific nonviolent techniques. The Seminar was attended by prominent activists, including Danilo Dolci, who was recognized for his social activism in Sicily, and Peter Cadogan from the UK, among others who were drawn to Capitini's vision of nonviolent social change (Follenti, 2023, pp. 86-93).

Each day of the seminar was structured to address both philosophical underpinnings and practical applications of nonviolence. Capitini opened the sessions with discussions on *compresenza* and "reality of all", emphasizing the need for nonviolence to recognize the interconnectedness of all beings. Participants then explored nonviolence as a tool for social reform, delving into topics such as conscientious objection, civil disobedience, and community organization. Capitini used examples from C.O.S., describing how they functioned as grassroots hubs for civic engagement, where individuals could directly participate in decision-making processes that affected their communities. This model of "control from below" underscored the seminar's theme of democratizing power, inspiring attendees to consider similar structures in their own contexts (Follenti, 2023, pp. 27-28).

One of the seminar's distinctive features was its format, which encouraged participant interaction and collaborative problem-solving. Capitini intentionally avoided a hierarchical structure, instead fostering an open forum where all voices were equally valued. This structure reflected his commitment to *omnicrazia*, the "power of all," and aimed to model the inclusive society he envisioned (Follenti, 2023, pp. 192-194). Through group discussions, workshops, and role-playing exercises, attendees experimented with techniques of non-cooperation and peaceful resistance, examining scenarios ranging from protests against oppressive policies to everyday acts of moral integrity. For Capitini, these sessions were not only educational but also spiritually significant, as he viewed nonviolent action as a form of ethical and moral expression that connected individuals to a higher purpose of unity and justice.

## **2.2. The Seminar's Lasting Legacy and Relevance**

The 1963 Seminar in Perugia left a profound legacy on both Italian and international movements for peace and nonviolent resistance. In fact, the seminar marked a shift in the Italian Movimento Nonviolento by creating a space

for collaborative learning and international solidarity (Follenti, 2023, pp. 161-165). Participants carried Capitini's principles of nonviolent activism and community-based action into their work, applying these methods across various social movements. The Seminar's focus on civil disobedience, conscientious objection, and local governance resonated particularly with young activists, who viewed these strategies as effective responses to the political tensions of the 1960s.

In Italy, Capitini's Seminar reinforced the importance of integrating ethical education and civic responsibility into nonviolent practices. The discussions on "compresenza" and the "reality of all" inspired Italian educators and activists to incorporate these ideas into schools and community programs, creating a foundation for peace education that has influenced subsequent generations (Follenti, 2023, p. 175-186). Internationally, the seminar strengthened ties among nonviolent movements, fostering cross-cultural exchanges that enriched the theoretical and practical approaches to activism.

The seminar's legacy also extends into contemporary discussions on environmental ethics and social justice. Capitini's ecological perspective, emphasized during the seminar as an essential aspect of nonviolent philosophy, anticipated modern concerns about sustainability and intergenerational justice. By viewing all forms of life as interconnected, Capitini's approach to nonviolence laid the groundwork for an inclusive environmental ethic that aligns with current global movements advocating for animal rights and environmental protection.

## **CONCLUSION**

Aldo Capitini's 1963 International Seminar on Nonviolent Techniques was a significant event for the development of an independent Italian nonviolent movement and for the dissemination of nonviolent theory, demonstrating the transformative potential of ethical engagement and inclusive social structures. Through his emphasis on compresenza, omnicrazia, and grassroots empowerment, Capitini articulated a vision of society that transcends traditional hierarchies and advocates for shared agency among all individuals. The seminar's impact can still be seen in the continued influence of Capitini's ideas on peace education, environmental consciousness, and democratic participation.

Today, Capitini's legacy endures as a powerful reminder of the ethical and communal foundations of nonviolent action. His principles of

interconnectedness and collective responsibility challenge contemporary movements to pursue justice in ways that honour the dignity and contributions of every being. The Seminar in Perugia stands as a testament to Capitini's lifelong commitment to creating a "reality of all", inspiring future generations to build a compassionate and inclusive world grounded in the principles of nonviolence and democratic empowerment.

# CIVIC EDUCATION TO SUPPORT NONVIOLENCE AND DEMOCRACY

Sabina Langer

Free University of Bolzano/Bozen

A nonviolent, democratic approach could shape the classroom environment, promoting peaceful coexistence among individuals. However, school dynamics often tend to be competitive and hierarchical, mirroring the broader societal interactions. In Italy, civic education has recently been reintroduced (Law 92/2019) to foster active citizenship and encourage full participation. The author views this as an opportunity for pedagogical innovation, adopting a democratic, nonviolent, transformative, and participatory approach. Consequently, a prototype curriculum was constructed, using Educational Design Research, and implemented in three middle school classes in Northern Italy. To shift from a traditional, transmission-based model to a dialogic one, the curriculum incorporates talking circles and role assignments. This article will highlight how classroom dynamics have become more democratic and nonviolent, as well as the challenges faced during implementation. The conclusions emphasize the need for greater support for teachers to ensure that nonviolent, democratic methods take root in schools, fostering participation and active citizenship.

civic education; nonviolence; democracy; participation

## INTRODUCTION

Children and teens have the right to participate, the right to express their opinions on matters that concern them (UN Convention, 1989; Hart, 1992). Consequently, adults have the responsibility to listen to these perspectives and give them due consideration (Lundy, 2007). Despite the existence of national and international frameworks (e.g., Agenda 2030, 2015; Indicazioni Nazionali, 2012), children and teens are consistently marginalized in decision-making

processes, even though they demonstrate significant interest and competence in addressing systemic crises, as evidenced by *FridaysForFuture* and anti-war protests offering alternative viewpoints to contemporary systemic challenges.

A nonviolent, democratic approach could characterize the classroom and thus foster peaceful coexistence between people of different cultures, genders, social backgrounds, ages... Pupils could experience nonviolent decision making and grow as “mediators, bridge builders, wall jumpers, border explorers” (Langer, 1994). However, usually the dynamics at school are competitive and prevaricating, reflecting the typical interactions of our society.

The introduction of civic education through Law No. 92 of 20 August 2019 (hereafter Law 92/2019) has reignited the debate in Italy concerning the role of schools within society. Adopting a democratic (Dewey, 1916), nonviolent (Dolci, 1988), transformative (Freire, 1970), and engaged (hooks, 1994) pedagogical framework, the author posits that schools bear a political responsibility to contribute to the creation of a more peaceful and democratic society. In line with this perspective, she has devoted her PhD research to develop a civic education curriculum for middle schools, aimed at fostering democracy and participation. The classroom is thus conceptualized as a laboratory for participatory democracy, empowering children to become “radical agents of change” (Fielding, 2001).

Following a brief overview of the research (Section 1), this paper will focus on how the use of talking circles and assigned roles can support the principles of democracy and nonviolence (Section 2), and it will conclude with reflections on the necessity of increased teacher training.

## **1. THE RESEARCH AND THE CURRICULUM DIRE FARE PARTECIPARE**

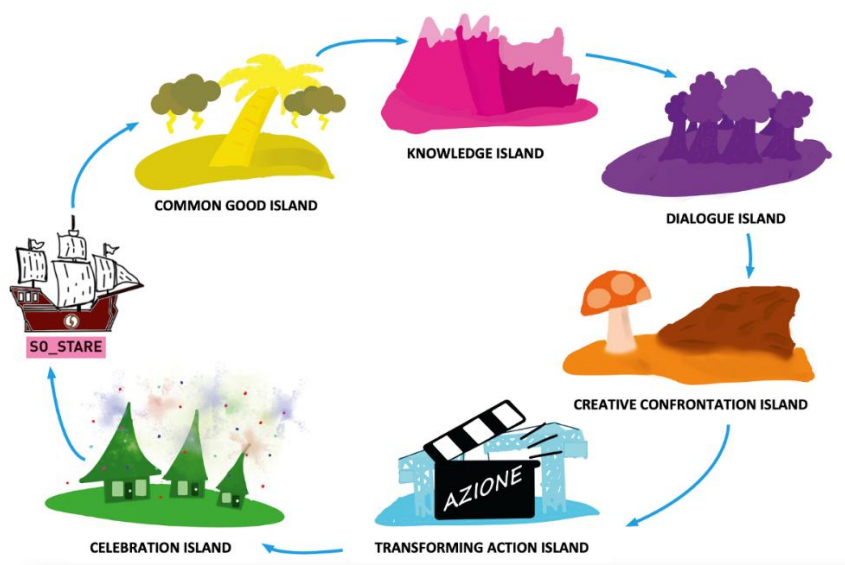

The Law 92/2019 mandates that civic education in Italy be developed through cross-disciplinary pathways, comprising at least 33 hours per year, jointly managed by teachers in a class council. The author’s PhD research (Langer, 2024 a/b/c) sought to position dialogue and shared decision-making as both a means and an aim, supporting the development of a nonviolent and democratic society, starting from the classroom.

This research is grounded in Educational Design Research (EDR), which has the dual objective of improving educational contexts and producing generalizable theoretical knowledge (McKenney & Reeves, 2019). In the first phase of EDR—*Analysis & Exploration*—the state of the art was outlined, and the design requirements for a democratic civic education curriculum for middle schools (in

alignment with Law 92/2019) were developed. These requirements include: centering democratic competencies, promoting co-design among teachers and between teachers and students, and fostering reciprocal, dialogic learning.

In the second phase—*Design & Construction*—the first prototype was developed with three key elements: (1) meetings with/among teachers (initial training and ongoing meetings); (2) nonviolent and democratic practices aimed at making peer and intergenerational dynamics more equitable, with the goal of turning teachers and students into the crew of the *Nonviolence Ship*; and (3) the *Dire Fare Partecipare* pathway, comprised of an archipelago of six islands (Fig. 1).

Fig. 1. The archipelago *Dire Fare Partecipare* illustrated by Jan Torrani.

In the third phase of the research—*Evaluation & Reflection*—the curriculum was piloted and formatively evaluated. Three classes from a middle school in the outskirts of a large city in Northern Italy were involved. To ensure that formative evaluation was both inclusive and democratic, both student and teacher voices were collected through structured forms, completed during the process by pairs of students and by teacher teams. Midway and at the end of the process, students and teachers participated in semi-structured focus groups. These tools were designed to gather data on the curriculum, the practices being tested, and the expected enactment processes (peer dialogue, participation,

teacher-student dialogue and co-design, and teacher collaboration). This large amount of data was systematically organized, described, and analysed using a system of categories (concept-driven and data-driven) constructed through Qualitative Content Analysis (Schreier, 2012).

## **2. TALKING CIRCLE AND ROLES: TWO NONVIOLENT AND DEMOCRATIC PRACTICES**

In each class, students and teachers became the crew of the *Nonviolence Ship* and explored each island of the *Dire Fare Partecipare* archipelago to develop a shared and participatory pathway through pair, group, and class activities. The crew had to learn new relational modalities: departing from traditional setting, they arranged in a circle, engaging in a “humanizing dialogic practice” (Veloria & Boyes-Watson, 2014) that fosters horizontal relationships. Furthermore, each participant assumed a role to enhance group belonging and ownership of the common endeavour.

The following paragraphs briefly summarise the findings of the data analysis of the categories related to these practices.

### **2.1 Findings Concerning the Talking Circle**

The talking circle is designed to enhance mutual listening and promote participation, as well as to challenge the dynamics of traditional frontal lessons. The data analysis revealed the following findings.

Initially, both teachers and students perceived as significant changes even the act of physically forming a circle (instead of using desks and chairs arranged by someone else), sitting in a circle, and the possibility of making eye contact with everyone. This new setting, characterized by agitation the first meetings. However, slowly the confusion diminished, and a sense of well-being increased. The students began to develop a positive and proactive attitude (e.g., Tew et al., 2007). The groups required nearly the same amount of time to learn how to efficiently rearrange desks and chairs as they did to understand how the circle facilitated more egalitarian relationships, and a more democratic dialogue (Veloria & Boyes-Watson, 2014).

The participants experienced how, everyone can interact, be seen, and see others (instead of only seeing the teacher and mostly the backs of mates). The circle also facilitates classroom management and ensures everyone’s involvement: students discovered that sitting in a circle helps overcome shyness, encourages them to speak up, and helps to feel comfortable with their

peers. The circle promotes also collaborative knowledge-building, and the exchange of ideas (Dolci, 1988): each group went through several moments of shared decision-making and knowledge exchange, and the circle facilitated to consider the opinions of others (expressed verbally or through posture and facial expressions).

## **2.2 Findings Concerning the Roles**

In line with the literature (e.g. Johnson & Johnson, 2013; Matini, 2019), the roles served to facilitate the sharing of responsibilities. Both students and teachers experienced interdependence, collaboration. Furthermore, while typically in school the teacher sets the pace, according to the students, the roles made them feel more responsible, they collaborated and organized better, and they felt useful. However, in some cases, particularly due to a lack of conviction among the teachers, the roles were superficial (“tokenism” – Hart; 1992). In the final focus groups, the teachers stated that it is better not to adopt the roles at all if there is no intention to initiate (and sustain!) a process of sharing, empowerment, and coexistence.

## **2.3 Group Dynamics in the Classroom Become More Democratic**

According to both teachers and students, thanks to the talking circle and the roles (in addition to the overall process), a climate of mutual understanding gradually developed. Teachers learned to listen more and to see each student as an individual: they humanized each other.

At first, the teachers were too much like teachers. They were too tied to the role of being teachers, and we, too, were too much like students and only saw them as teachers. (M., 12 years old)

The dynamics became less judgmental, allowing students to feel freer to speak up and express their opinions.

When we are in regular classes, we don't talk as much; we can't do what we think is right. We talk and do more in civic education. We speak freely and share our opinions. (Y., 12 years old)

Through dialogue and the sharing of decision-making processes, the power relations in the classroom changed (at least within the context of the civics education project).

Before, we were like subjects and the emperor; now, we are more like sitting at the round table... Or even better: we have gone from being subjects to

becoming parliamentarians. The emperor gives orders, but in a parliament, things are discussed. (F., 13 years old)

## **CONCLUSIONS: SUPPORTING TEACHERS IN THE PARADIGM SHIFT**

It can be argued that the practices described facilitate more democratic and nonviolent dynamics, but it is important to consider how to pursue this change. As part of the curriculum's prototype, an initial teacher training is planned, alongside a toolkit of practices and activities. However, during the experimental phase, and for the purpose of data collection, the researcher accompanied the processes with initial teacher training, ongoing meetings, and in-class support. So she could observe, how teachers, and consequently students, struggled to ritualize the practices, to establish a fixed structure for the circle, and to consistently use assigned roles. It was not easy for the teachers to find a balance between guiding the students to perform their roles with dedication and consistency and giving them space and time to learn through trial and error together.

The rules of the circle and the roles' tasks were also not always clear and shared between teachers and pupils. The discussion and sharing of the rules are an exercise in democracy, and thus in citizenship. In fact, in a community based on pluralism and democracy, dialogue is essential for recognizing common rules that enable collaboration and reciprocity (Cambi, 2010).

Another recurring challenge for teachers was remembering that the teacher is also part of the circle, holding an important role but not a central one: the circle is egalitarian, and the teacher is one person among others, though tasked with facilitating the circle.

Therefore—at least at the beginning—teachers should be supported with ongoing supervision to facilitate the paradigm shift, moving from a transmissive form of education to a dialogical one, fostering generative relationships and creating a democratic environment in the classroom.

During the prototyping phase, the initial training was considered sufficient to provide an understanding of the curriculum and its features (functional to co-designing among teachers and between teachers and students), in order to achieve what Habermas (1981) calls “instrumental learning”, aimed at improving the effectiveness of one's actions and addressing short-term needs. However, teachers were not yet fully proficient in dialogical practices and interactive, horizontal teaching methods; a deeper level of learning was required to enable co-designing among colleagues, activate dialogical teaching, and co-

design with students. The foundations needed to be laid for more dialogical and egalitarian relationships, which are uncommon in Italian secondary education (both lower and upper levels). A “communicative learning” was needed, aimed at understanding others to reach consensus and address long-term needs. Consequently, the co-design and sharing meetings planned among teachers effectively became moments of training and supervision (both educational and instructional), based on discussions of the classroom experiences. For some teachers, this led to “transformative learning” (Mezirow, 1991), a change within the frames of reference through which they were accustomed to constructing meanings, understanding experiences, and guiding their actions. Those frames of meaning were no longer valid and needed to be transformed to make them more inclusive and suited to the new co-designing requirements, to create contexts for (intergenerational) dialogue where participation is supported, and to begin to see students as people with whom shared solutions can be found (Laffi et al., 2021).

The implementation of the curriculum during the research shows the relevance of supporting teachers in the paradigm shift by adding ongoing supervision to the initial training. Such support is useful not only for the curriculum’s implementation but also, and most importantly, for the democratization of intergenerational dynamics.

# SCHOOL DROPOUT IN THE PERSPECTIVES OF PARENTS: INSIGHTS FROM A QUALITATIVE STUDY IN A PERIPHERAL NEIGHBOURHOOD IN MILAN

Anna Chinazzi<sup>a</sup>

Alessandra Mussi<sup>a</sup>

<sup>a</sup>University of Milano-Bicocca

School dropout is a multidimensional and multifactorial phenomenon, influenced by endogenous and exogenous factors. Addressing this issue therefore urges a holistic, multidisciplinary and systemic approach, involving multiple stakeholders. In increasingly super-diverse educational contexts, a lack of effective communication and collaboration between schools and families often undermines the quality of young people's educational experiences. This impact is particularly pronounced for vulnerable families with migratory backgrounds, whose children may face an elevated risk of dropout. The paper draws on the results of a study inside the AFIM 3867 project: Reinventing Citizenship: Paths of Empowerment for Networks and Social Groups in the San Siro Neighbourhood<sup>1</sup>. The study explored families' perspectives on their children's schooling experiences, focusing on a specific secondary school in the San Siro neighbourhood of Milan, Italy. Data were collected through two focus groups and four in-depth interviews, involving a total of 36 parents. Thematic analysis of the data highlights parents' perceptions of school dropout, school-family relationships, and intercultural dynamics.

school-family relationship; students' wellbeing; intergenerational dialogue; Super-diversity

## INTRODUCTION

School dropout is a multidimensional and multifactorial phenomenon (Colombo, 2010), requiring a holistic (Bronfenbrenner, 1989), multidisciplinary and systemic approach (AGIA, 2022). Particularly urgent is the need to centre

---

<sup>1</sup> You can read the complementary paper by V. Cotza, *Peer Tutoring to Prevent School Dropout: The Case of a High School in San Siro*, which was developed based on the same research project.

the perspectives of migrant families, whose voices are frequently marginalised or misunderstood within educational institutions. By amplifying these narratives, researchers can more deeply comprehend the exogenous factors influencing educational trajectories and disengagement.

Our paper draws on the results of a study conducted within the AFIM 3867 project: Reinventing Citizenship: Paths of Empowerment for Networks and Social Groups in the San Siro Neighbourhood. The study tried to shed light on the perspectives of families in relation to their children's schooling experiences, with reference to a specific pilot secondary school within the multicultural neighbourhood of San Siro in Milan, Italy.

## **1. CONCEPTUAL FRAMEWORK**

Family involvement and participation are crucial factors in children's school experience since the ECEC settings. As exemplified by Epstein (2001)'s Overlapping Spheres of Influence Model, the greater the overlap between the spheres, from a shared-responsibilities perspective, the greater the likelihood of building strong relationships and coherent educational projects. Such collaboration is essential for promoting both children's wellbeing and academic success. However, there is no singular model or uniform approach to parenting in relation to the school experience. They are influenced by a complex interplay of situational factors, contexts, orientations, beliefs, and cultural backgrounds (Bove, 2020). In the case of families with a migratory background, it is essential to enhance opportunities for exchange, dialogue, and negotiation between the symbolic and cultural universes that inform the behaviours of all actors involved. This approach aims to strengthen ties, networks, and connections within the community, fostering a supportive environment for these families. Such efforts are crucial in a context where many individuals experience social invisibility, marginality, and exclusion.

Research indicates that parental involvement significantly impacts children's academic performance and overall wellbeing (Bove, 2020). In particular, when families actively engage in their children's education, it not only enhances the children's learning experiences but also promotes their integration into the school community.

Nevertheless, within the scholarship on effective practices for enhancing school-family relationships, there is less clarity regarding strategies applicable to secondary schools. In these settings, adolescents increasingly assert their autonomy from their families, which can lead to a widening gap between home

environments and the external social context—particularly for students with migratory backgrounds (Moro, 1998).

## **2. “REINVENTING CITIZENSHIP” WITH PARENTS**

Our study was part of a wider action conducted inside the project Reinventing Citizenship, that aimed to promote citizenship key competences in order to prevent and tackle school dropout in students with migratory background (Bove, & Zecca, in press). Inside WP4 Task 1 – Mapping the socio-educational and didactic needs and resources of students with migratory backgrounds, families/caregivers, teachers (Cotza, & Mussi, in press) a qualitative in-depth study was developed inside a high school of San Siro. The school later also served as the site of two pilot experimental interventions<sup>2</sup> (Mussi, Cotza, Zecca, & Bove, 2024).

Our study involved the parents of the students attending the institution. The objectives were:

- to give voice to parents regarding their children’s school experience and concerning critical issues, resources, and improvement perspectives from their viewpoint;
- to explore their opinions and students’ experiences at school, particularly concerning the themes of dropout, school wellbeing, and the school-family relationship;
- to create contexts for discussion among parents within the school;
- to lay the groundwork for a generative dialogue involving teachers, parents, and students.

### **2.1 Methods and methodology**

Framed within the research-action-training paradigm (Traverso, 2015), the research employed two qualitative data-gathering methods:

- Two focus groups were conducted with a total of 36 parents. The focus group method was chosen not only for its heuristic value but also for its (trans)formative nature (Baldry, 2005; Bove, 2009). To leverage this affordance, the meeting took place online, allowing a more significant number of parents to participate.

---

<sup>2</sup> One of them is described in detail in Cotza’s essay.

- Four in-depth interviews were conducted in-person or remotely (depending on the participant's availability) with some volunteers among focus group participants.

Interviews and focus groups were recorded, transcribed verbatim and coded using Nvivo. Data analysis was based on a thematic approach (Braun, & Clarke, 2021). Research insights highlighted some emerging themes, related to: parents' representations of school dropout and its factors, the relationship between school and families and intercultural encounters.

### **3. PARENTS' PERSPECTIVE. KEY AREAS OF FINDINGS**

#### **3.1 School dropout**

Parents included in the study tend to associate "school dropout" with very specific personal experiences involving people they know, such as classmates of their children who have either dropped out or considered leaving school. Some students, they say, may remain "parked" in their studies, merely aiming to complete compulsory education, and exhibiting sporadic attendance. Various interrelated dimensions emerged from participants' discussion on school dropout:

- The level of students. In the participants' view, students associated with school dropout exhibit particularly problematic behaviours in the classroom, have disorders such as ADHD, or are simply disinterested in school and are just waiting to reach the age of 16. Classroom dynamics can further exacerbate this issue; as one participant noted: "We also have a class with disruptive students, and so even those who want to engage, focus on being attentive during class, this is often not possible".
- The family level. Some parents dwell on the description of cases of early school leavers with complex family situations, "inadequate" parents who do not "educate" their children properly.
- The school level. Several parents express concern that educational institutions could do more to assist both students and their families. There is a perception that the school is not adequately addressing the needs of at-risk students.
- The macro level. Finally, some parents also connect the dropout phenomenon to broader societal factors. Particularly, they observe a cultural inclination towards seeking simpler rewards and immediate

gratification rather than encouraging perseverance and effort toward sustained goals.

Regarding endogenous factors related specifically to the school environment, parents frequently describe schools as “confused” and “confusing”, creating challenges for both children and families in navigating their educational journeys.

Teachers are often described as inadequately trained, unmotivated, and unable to motivate the youngsters. Some of them, on the other hand, are described as “empathetic,” “knowing how to listen”, but the constant turnover effects negatively teachers-students relationship:

Until recently, every week the school schedule would change (...) so discontinuity. (...) [It means] unfortunately having to start again every time to get to know the teacher, to be known, to create a team, that... that trust, that bond, that relationship that there must be between student and teacher. (...) However, the teachers she [the daughter] had were very helpful, very empathetic teachers. So from that point of view then there is always the exception.

In the view of some parents, the school’s role is crucial in addressing exogenous factors related to students and their families. Parents believe that family and contextual difficulties could be alleviated if teachers committed more to supporting families. However, they also recognise that the school’s ability to prevent dropout diminishes as students mature, fostering their autonomy and increasing their responsibility for engagement.

### **3.2 School-family relationship**

The research participants, who are parents deeply involved in their children’s education, unanimously acknowledge the importance of their active participation in school life. While they place varying emphasis on the level of autonomy to be granted to their children, they all view the school-family relationship as one characterised by open and continuous communication, along with active involvement and participation.

Some parents evoke the image of a “net”, among parents and between parents and school, so that it would be possible to help each other and, at the same time, help the school:

It’s really in high school that families, the school, the kids have to be cohesive. (...)

It's obvious that the goal is autonomy. The network is what saves, though. Cohesion is what helps you. Support is what facilitates.

Parents themselves tell us how, however, not all families share this way of conceiving the relationship with the school. They witness, in fact, a gradual disengagement by other families, especially looking back to previous school grades (“Parents in high school leave the kids... the youngsters, because: ‘They’re grown up and that’s it, my job is done here’”). In addition, many of the participants report that the school does not create the conditions to encourage all parents’ participation.

Various communication channels have been established to facilitate asynchronous school-family interactions; however, many parents find them unclear or difficult to navigate. Opportunities for face-to-face meetings with teachers are limited to interviews and assemblies.

### **3.3 Interculturality**

Research participants recognise the great heterogeneity that characterises the school and its classes and many of them express a favourable opinion on classrooms’ “super-diversity” (Vertovec, 2007): they consider it as an opportunity for growth for their children, who learn to interact with people from very different backgrounds.

At the same time, differing opinions coexist on the school’s effectiveness in fostering interculturality. Some parents think that the school welcomes children with migratory background adequately, while others think there is little integration inside the school, because teachers care more about cognitive learning rather than social learning, including the development of intercultural skills. Others refer to what Portes and Zhou (1993) describe as “segmented integration”, where children with migratory backgrounds are integrated within the school environment but remain excluded outside of it.

Perhaps these different positions are due to the fact that the daily coexistence inside school informally fosters interaction between children with different backgrounds to varying degrees. At the same time, it seems to suggest a lack of conscious adoption of an intercultural pedagogical approach among teachers and of adequate teachers’ training (Fiorucci, 2020).

Fewer interactions take place between the families of children who come from different countries, and several parents report how there is widespread discrimination against non-Italian parents. The distance between families is described as a missed opportunity for parents to integrate, which will

necessarily affect their children (“Integrating kids is nice, but they are already more or less integrated. (...) Then they go home, and they take it all apart. Then you have to integrate the parents more than the kids”).

#### **4. CONCLUSIONS**

The research insights suggest the urgent need for enhanced communication and collaboration between families and schools, particularly for families with migratory backgrounds. The research also emphasises that effective engagement strategies must adapt to the complexities introduced by students’ growing autonomy at this educational level.

In the project, a “virtual” dialogue among teachers, parents, and students is presented, reflecting a pedagogical vision where the school-family relationship is framed as a “triangular” dynamic. In this perspective, teachers, parents, and students are considered equal partners, engaging in stable, direct, and institutionalised exchanges. These insights informed the co-design of the Yards of Dialogue initiative (Mussi et al., 2024), which aims to create innovative dialogue spaces within schools. Artistic and embedded languages are used to promote meaningful interactions among teachers, students, and parents, thereby enriching the educational experience for all involved.

#### **Acknowledgements**

Financial support for this study was provided by the AFIM Grant 2014-2020 (Project Num: 3867). The project was coordinated by Prefecture of Milan (Coordination: Tripodi, Management: Manzo) with the scientific support of: Polytechnic University of Milan (PI: Cognetti), Bocconi University (PI: Miedico) and University of Milano-Bicocca (PI: Bove and Zecca). Comunità Nuova, Milano Mediterranea, Itinerari Paralleli were partners too. We would like to thank the Lombardy Regional School Office, in particular Stampini and Ferraro, and all the parents, students, teachers and the Principal of IIS Galilei-Luxembourg.

# PROJECT EVALUATION OF “OLTRE I CONFINI. UN MODELLO DI SCUOLA APERTA AL TERRITORIO” – AGAINST SCHOOL DROPOUT: AN INTEGRATED APPROACH

Rebecca Coacci<sup>a</sup>

Walter Moro<sup>b</sup>

<sup>a</sup>Milano Bicocca University; <sup>b</sup>C.I.D.I. di Milano

School dropout is a multifaceted issue tied to student discomfort during their educational journey, manifesting in various behaviours (Gulli, 2008). Influenced by socio-economic, cultural, and institutional factors, it negatively impacts individual and collective growth (Batini, 2016; Zecca, Passalacqua, Ribis, 2020). The project “Oltre i confini. Un modello di scuola aperta al territorio,” led by C.I.D.I. di Milano and selected by Con i Bambini, involved 70 entities, including 45 schools across 9 networks, to combat educational poverty. It aimed to foster collaboration between schools, public institutions, and the third sector, enhancing student engagement and reducing dropout rates through innovative teaching methods (Martini & Trivellato, 2011; Giosi, 2011). The evaluation, conducted by Università di Milano Bicocca, utilized a qualitative approach involving interviews, focus groups, targeted samples, and multiple case studies, by using Grounded Theory (Charmaz, 2014) guiding data gathering and analysis. Preliminary results highlighted that integrating schools with local communities and employing innovative practices enhanced student engagement and reduced inequalities, despite challenges in geographic allocation, teacher turnover, and scalability. These findings align with the National Recovery and Resilience Plan (PNRR) objectives to combat dropout and underline the importance of scaling successful practices.

school dropout; project evaluation; school and territory

## INTRODUCTION

School dropout can be defined as a heterogeneous set of phenomena manifested through students' disengagement, withdrawal, or abandonment of their educational path (Gulli, 2008). It cannot be traced back to a single cause, but rather results from the interplay of personal, relational, and environmental factors, and it negatively affects both individual and collective development (Batini, 2016; Zecca, Passalacqua, Ribis, 2020). The most recent data on the Italian situation (Eurostat, 2024) show some improvement, though the overall picture remains complex. In 2023, school dropout in Italy fell to 10.5% (down from 11.5% in 2022), approaching the European target of 9% by 2030. At the same time, the so-called "implicit dropout"—the share of students who, despite completing their studies, acquire inadequate competencies—has dropped below pre-pandemic levels, showing initial positive signals after the challenges posed by the Covid period. Nonetheless, concerns remain: Italy is still among the European countries with the highest dropout rates, territorial disparities persist, and significant effort is still required to recover competencies in key subjects such as Italian and mathematics.

The project "Oltre i Confini. Un modello di scuola aperta al territorio" (Beyond Borders: A Model of Schools Open to the Territory), led by C.I.D.I. di Milano, was selected as part of the Fund for Combating Educational Poverty in Minors—an initiative arising from an agreement among banking foundations, the National Forum of the Third Sector, and the Government, and implemented through the social enterprise Con i Bambini. Its central objective was to prevent and counter school dropout by adopting a systemic vision of educational intervention.

The qualitative evaluation of the "Oltre i Confini" project, conducted by the University of Milan-Bicocca in collaboration with C.I.D.I. di Milano, utilizes a Grounded Theory approach (Charmaz, 2014) to identify qualitative indicators of the project's effectiveness. The aim is to provide empirical evidence useful for guiding future interventions and policies, in line with the resources and priorities outlined by the PNRR (Ministerial Decree 24-06-2022; Investment 1.4 of the PNRR), with the goal of promoting inclusive and sustainable educational practices on a broader scale. This article presents the preliminary results of the thematic analysis of focus groups conducted with teachers, offering insights into how the "Oltre i Confini" project has impacted various school contexts involved in this experience.

## 1. THE “OLTRE I CONFINI” PROJECT

Launched in 2018 and completed in 2023, the project involved 70 entities, including 45 schools (24 Comprehensive Institutes and 21 Upper Secondary Schools), 20 Third Sector Organizations, universities (Università Statale and Bicocca in Milan), and additional partners. These were organized into 9 territorial networks nationwide, reaching over 14,000 students aged 11 to 17.

The project took place within the complex context of the pandemic and post-pandemic period, during which school closures in the 2019/20 and 2020/21 academic years exacerbated inequalities and learning loss, especially among the most vulnerable groups. The funding made it possible to test innovative educational models, strengthen teachers’ professional skills, and introduce new learning environments. The project’s structure was articulated into 9 integrated actions:

1. Establishment of 45 educational hubs.
2. Management of the 45 educational hubs.
3. Direct action in support of the target population.
4. Support network for families.
5. Training pathways.
6. Structure and management processes.
7. Communication and dissemination of results.
8. Monitoring and evaluation.
9. Impact evaluation.

Within the “Oltre i Confini” project, action 3 was central to the qualitative impact evaluation, as it directly focused on students at risk of dropping out. This provided the empirical basis for gaining a better understanding of the changing educational practices. Over five years, this action involved 45 schools aimed at supporting preadolescents and adolescents aged 11 to 17. Action 3 was centred on a variety of remedial courses, conducted both in lower and upper secondary schools, to address gaps in basic competencies and contribute to the recovery of at-risk students, as shown in Tab. 1. All data relating to student numbers were collected by C.I.D.I. di Milano in the third report titled “The School, the Territory, and Third Sector Organizations: A Strategic Alliance to Combat School Dropouts”, edited by Prof. Walter Moro.

Tab. 1. Number of students involved in Action 3

Academic year	Students	Lower secondary	Upper secondary
2018/19	1,346	611	735
2019/20	1,007	351	656
2020/21	2,491	1,014	1,477
2021/22	2,464	1,090	1,374
2022/23	978	338	640
TOTAL	8,286	3,404	4,882

Overall, 8,286 students were involved, with a relatively balanced distribution between lower and upper secondary levels. However, the results show a higher concentration of interventions in the first two years of upper secondary school, where the risk of dropping out is greater.

Tab. 2. Results of the students involved in Action 3

Academic year	% of student passed	% of student failed
2018/19	85.30%	14.70%
2019/20	97.20%	2.80%
2020/21	89.40%	10.60%
2021/22	90.90%	9.10%
2022/23	89.10%	10.90%
TOTAL	90.05%	9.95%

The overall data show a 90.05% pass rate among students who participated in the remedial courses (Tab. 2). Although these were considered “fragile” students or at risk of dropping out, the results suggest that the strategies implemented had a positive impact. This underlines the significance of Action 3 as a privileged area of observation for understanding the changes made in teaching practices and in the organization of educational pathways.

## 2. THE QUALITATIVE EVALUATION OF THE “OLTRE I CONFINI” PROJECT: PRELIMINARY RESULTS

### 2.1. Evaluation Research Methodology

The participatory and qualitative evaluation research aims to delve into the processes and perceptions of the impact of the “Oltre i Confini” project two

years after its conclusion, focusing on Action 3 from the perspectives of involved principals, project-referent teachers, and students who participated in the courses. The choice to adopt a participatory approach stems from the awareness that educational interventions cannot be rigidly predetermined without risking a loss in effectiveness (Lisimberti, Montalbetti, Orizio, 2021). Data analysis was conducted following the principles of Grounded Theory (Charmaz, 2014) through an initial thematic coding phase aimed at identifying qualitative indicators and understanding the diverse experiences that emerged. The research involves the entire population, with the selection of certain criteria based on continuity in project coordination. A total of 31 schools—68% of the total—were selected, each of which had a principal who ensured operational continuity for at least two years during the project’s implementation.

## 2.2. The Teachers’ Voices

This contribution presents the preliminary results that emerged from the analysis of focus group transcripts, starting from teachers’ perceptions, to identify the professional knowledge and skills that continued to influence educational intentionality and pedagogical practice. In this regard, reference is made to studies on teachers’ professional development and Shulman’s reflections, which recognize the teacher’s thought process as the driving force of didactic action (Shulman, 1987).

The objective is to understand whether and how the introduced teaching and learning methodologies have been integrated into teaching practice after the intervention ended. The attempt is therefore to grasp, through the collection and analysis of teachers’ voices, how these innovations have become ingrained in professional practice.

Tab. 3. Composition of the Teachers’ Focus Groups

Focus group code	Geographic area	School type	N. of teachers
FG IC NORD	Northern Italy	IC	7
FG IIS NORD	Northern Italy	IIS	6
FG IC SUD	Southern Italy	IC	2
FG IIS SUD	Southern Italy	IIS	4

Data were collected through focus groups divided by school type, Comprehensive Institutes (IC) and Upper Secondary Institutes (IIS), and by major geographic area, Northern and Southern Italy (Tab. 3). This distinction aims to explore similarities and differences in the perceptions and teaching practices adopted, considering territorial and organizational specificities.

### **2.3. Thematic Analysis of the Voices Emerging from the Focus Groups**

This chapter presents a thematic analysis of the focus groups conducted with teachers from various schools involved in the “Oltre i Confini” project. The analysis takes a thematic approach and is based on several key concepts that emerged in the core category called “Activities or methodologies integrated into the school at the end of the project”

A strongly recurring aspect in the teachers’ words is the “stable dissemination of a laboratory-based teaching approach” within their daily practices. No longer isolated initiatives, but a lasting transformation:

We, as an institute, are now absolutely oriented towards a more hands-on, laboratory-based teaching approach, in all transdisciplinary subjects, focusing on competences and developing transversal competences. (FG IC NORD).

One teacher clearly highlights the impact of this approach on groups of struggling students:

We have worked mainly with a particularly challenged class group that responded very well to active, laboratory-based teaching, while showing far less appreciation for the traditional, lecture-based approach. (FG IC NORD).

This integration not only facilitated the learning of disciplinary competences but also enhanced individual potential, as emerges from the following: “With many activities that put the kids at the center, each with their own potential (...) each one found themselves valued for what they did best. “ (FG IC NORD). The testimonies converge in showing a sedimentation process of a teaching method that is no longer negligible or sporadic, but fully integrated into the curriculum: “This is a way of operating that has become part of the work of all the class councils. “ (FG IIS SUD).

The analysis of the focus groups reveals that ICT has become a structural resource in the teaching-learning process, bringing to the fore the theme “Use of ICT and the Digital Approach”. One teacher highlighted: “Now that we have monitors in every classroom, we’ve continued to use them. “ (FG IC SUD). Other

teachers emphasize the value of ICT in offering personalized and motivating instruction: “Learning digital skills that just three years ago seemed unthinkable (...) has also allowed ICT to enter teaching as a normal practice, a habit, a good practice. “ (FG IIS NORD). The widespread adoption of tablets in class, the presence of interactive screens, and the implementation of digital learning spaces have thus accelerated a change in perspective, turning digital tools into levers for a more dynamic, inclusive teaching approach, aligned with the competences required by teachers and students in today’s context.

The third theme that emerged is “Competency-Based and Uda (Learning Unit) Planning” Among the most significant changes emerging from the interviews, competency-based planning and the use of Learning Units (Uda) have played a central role. Placing the student at the centre and encouraging active engagement and the personalization of interventions. One teacher underscores the value of the UDA as a meaningful, lasting experience:

My experience with the UDA... I am so happy I did it, but most importantly, I’m happy that I did it personally... Leading the students forward, I found myself very much at ease, so much so that (...) I continued working this way. (FG IC SUD).

Thus, curriculum development is no longer viewed as the mere frontal transmission of content, but rather as a design process that integrates disciplinary and transversal competences, promotes co-construction of knowledge, and enhances student motivation. In this sense, competency-based and Uda planning, supported by meaningful real-world tasks, has redefined the teacher’s role as a facilitator, contributing to a more inclusive, dynamic formative approach oriented toward the academic success of all students. The introduction of Uda methodology appears particularly significant, as it suggests that teachers may not have engaged in systematic planning prior to the project. Integrating structured, competence-based design into their professional practice not only enhances the quality of their pedagogical approach but also contributes to a more reflective and intentional form of teaching, ultimately benefiting both teachers and learners.

Although these are preliminary results and limited to the population involved, they suggest the potential for an increase in educational and teaching practices that, if consolidated over time and coherently integrated into curricula, could contribute to improved engagement and educational outcomes, particularly in more vulnerable contexts.

The preliminary findings here investigated indicate positive changes in teaching practices and the development of inclusive, competency-based approaches, but some critical aspects remain. These may include challenges in ensuring the sustainability of new methodologies over time, as well as difficulties in providing ongoing support and training for all involved teachers. These points of tension will be further explored and discussed with the teaching staff during the next phase, when project results are presented and collectively reflected upon.

### **3. PROSPECTS AND DEVELOPMENT LINES**

The preliminary results presented in this contribution suggest a scenario in which the “Oltre i Confini” project experience has triggered significant changes in how teaching is perceived and practiced, particularly from the teachers’ perspective. The initial qualitative analysis highlighted some emerging thematic categories, outlining a scenario in which the adoption of active methodologies, the reorganization of learning environments, attention to inclusion, and the prevention of early school leaving now appear to be firmly established as essential dimensions of educational action.

These results align coherently with current educational policies, especially with reference to the guidelines and resources provided by the PNRR. The National Recovery and Resilience Plan places at its center the goal of reducing school dropout rates through inclusive, equitable, and high-quality education. The emerging perspective is that of a school which, supported by effective methodological approaches, can expand and scale these experiences, incorporating them fully into the widespread professional culture among teachers.

# PEER TUTORING TO PREVENT SCHOOL DROPOUT. THE CASE OF A HIGH SCHOOL IN SAN SIRO

Valeria Cotza<sup>a</sup>

<sup>a</sup>University of Milano-Bicocca

In 2023 the University of Milano-Bicocca was a partner in the FAMI project “Reinventing Citizenship. Paths of capacitation of networks and social groups in the neighbourhood of San Siro”. UNIMIB oversaw the WP4, “Key citizenship competencies for the prevention of school dropout and exclusion”, an integrated capacity-building action aimed at teachers from schools in the neighbourhood. The paper presents the results of the experimental action, concerning the strategy of peer tutoring. The peer tutoring activities involved 17 students and were aimed at students in the first-grade classes. The process included initial training of peer tutors, welcoming laboratories, and the opening of a listening and mutual aid space. The research supported these activities with 23 observational reports and 5 focus groups, 3 with tutors, 1 with teachers, and 1 with educators. The focus groups were audio-recorded, transcribed and analysed through thematic analysis. The students’ voices bring out the awareness and skills they acquired in the role as tutors, true reference figures, returning a picture of peer education as a strategy for preventing dropout and social exclusion.

school dropout; capacity-building; peer tutoring; focus groups; thematic analysis

## INTRODUCTION. THE FAMI PROJECT “REINVENTING CITIZENSHIP” IN SAN SIRO

The “quadrilateral” of San Siro is one of the largest Public Residential Housing areas in Milan and has a high concentration of fragile population. 48.6% are of foreign origin, with 85 different nationalities and a prevalence of people from Egypt (37.2%), Morocco (10.4%) and the Philippines (9.5%). These communities express discomfort related to difficult intercultural relations and fatigue caused by living in compromised residential and public spaces (Grassi,

2022). Neighbourhood schools are fundamental headmasters in guaranteeing access to education in pathways to citizenship. These schools often suffer from a widespread negative perception of their educational offer linked to the presence of minors of non-Italian origin ranging from 65% to 90%, even though they constitute spaces for combating school drop-out (AGIA, 2022). Here this phenomenon reaches rates of 19.4% of minors dropping out before high school diploma and 4.3% before the end of lower secondary school, percentages twice as high as the city average (ISMU, 2017).

The FAMI project “Reinventing Citizenship. Paths of capacitation of networks and social groups in the neighbourhood of San Siro” (2023) aims at developing a citizenship model in San Siro starting from the valorisation of its endogenous resources within innovative paths of social, educational, and territorial intervention.<sup>1</sup> The University of Milano-Bicocca oversaw the WP4, “Key citizenship competencies for the prevention of school dropout and exclusion”, an integrated capacity-building action addressed to teachers and educators of schools in the neighbourhood (Bove & Zecca, 2024), in order to strengthen: (1) the skills to detect and analyse the needs and resources of young people; (2) the capacity to implement actions to counter school drop-out and exclusion. The research, from an ecological and systemic perspective (Bronfenbrenner, 1979), had a circular course: from a “macro” level, which involved all 12 schools taking part in the project (comprehensive institutes and high schools), it moved on to a “micro” level with two experimental actions, to finally return again to a “macro” level, in a formative perspective for all participating schools.

## **1. RESEARCH METHODOLOGY AND PEER TUTORING ACTION**

The methodological approach followed the Professional Development Action-Research (Charlier, 2005; Zecca, 2018) and favoured a qualitative approach of a participative type. After a mapping phase on school drop-out and social exclusion (Cotza & Mussi, 2024), which involved the network of 12 schools in the neighbourhood, two experimental actions (“cantieri di dialogo” and peer tutoring; Mussi et al., 2024) were co-designed and implemented within a pilot

---

<sup>1</sup> The project, financed by the Asylum and Migration Integration Fund 2014–2020 (FAMI 3867), coordinated by the Prefecture of Milan (contact person: Alessandra Tripodi, coordination: Miria Manzo), involved the scientific coordination of three Universities: Politecnico of Milan (PI: Francesca Cognetti), Bocconi University (PI: Melissa Miedico) and University of Milano-Bicocca (PI: Chiara Bove and Luisa Zecca). The following Third Sector entities were partners: Comunità Nuova, Milano Mediterranea, and Itinerari Paralleli. You can read the complementary paper by A. Chinazzi and A. Mussi, School dropout in the perspectives of parents: Insights from a qualitative study in a peripheral neighbourhood in Milan, which was developed based on the same project.

school, the Galilei-Luxemburg Institute of Upper Secondary Education, finally proceeding to a formative analysis and dissemination of the results at the enlarged network level.

The pilot action that is the subject of this contribution, i.e. the peer tutoring action, was developed in light of the results that emerged from the qualitative mapping, in order to:

- Build a tutoring device to accompany students in “risk” conditions by enhancing their resources and skills;
- Involve teachers to promote the acquisition of know-how of innovative methods for preventing and combating school drop-out and exclusion.

The action was implemented by the Cooperative Comunità Nuova in Milan and was co-designed in collaboration with the teachers and UNIMIB, which supervised the entire process. It was divided into three phases: 1) Co-design; 2) Action; 3) Verification. The first phase consisted of 6 co-design meetings (April-November 2023). The second one comprised:

- Identification of tutors, 17 in all, from the third, fourth and fifth grades;
- Tutor training, with the objective of creating the working group and developing life skills useful for peer tutor work (September 2023);
- Welcome laboratories aimed at 10 first classes, in which activities were proposed that worked on cooperation between classmates by encouraging the creation of a group dimension, to enable students to experience the school environment to the fullest (October-November 2023);
- Implementation of an in-school space for students, called “Galileo Ascolta”, run by the tutors themselves (supervised by at least one adult), which took the form of a space for mutual help, listening and homework help.

During this second phase, 23 observational reports were produced (Cardano, Manocchi, & Venturini, 2011) to document the ongoing process. In the third phase a monitoring and evaluation path was proposed, mediated by qualitative tools: 5 focus groups were conducted (November 2023; Baldry, 2005), 3 with peer tutors (22 participants in total); 1 with 8 teachers of the classes in which the laboratories were held; and 1 with 5 educators from Comunità Nuova.

The focus groups were recorded, transcribed *verbatim* and analysed using a thematic approach (Braun & Clarke, 2008), based on the analysis of significant transversal nuclei. The findings presented here are the result of the analysis of focus groups conducted with students and the critical reading of reports.

## 2. FIRST RESULTS. THE VOICE OF PEER TUTORS

The peer tutoring action was aimed at implementing an educational strategy at school to activate a natural process of passing on knowledge, experiences and emotions from some members of a group to other members of equal status (Antonietti et al., 2003). In fact, peer tutor activities:

can generate positive changes and enable participants to develop aptitude for initiative, goal setting and goal achieving, time and emotion management as well as empathy and the ability to establish relations with others. In particular, tutors indicated the improvement of key skills like the ability to establish relations with peers, to work hard at their goals, to take over responsibility and the ability to manage relations, rights and duties when working with others. (Schir & Basso, 2018, p. 237)

The discussion that developed from the focus groups with the peer tutors made it possible to start a process evaluation of the action, which seems to corroborate what the scientific literature states about the potential of this strategy, which was experienced by the tutors as new, interesting, formative, useful, authentic, curious, nice, unexpected, although at times stressful, demanding and challenging.

### 2.1. New awareness and skills: The construction of the peer tutor role

According to the tutors, the activities generated in them a greater ability to relate to others and empathise, fostering peer interaction and communication:

Challenge and courage, more like the challenge of standing in front of a group of people, right? *Being able to dialogue with people you don't know* can seem like a challenge anyway, so you must have courage accordingly. And support, because in any case for these classes I have been more or less a support, that is, *I helped them to understand more or less the dynamics they are going to encounter on this path.*

Formative, because I learnt not only how to do group work with more people but also how to talk more, be more open, make myself understood.

It was also very pleasant to have helped some of the guys in the class, because there are some who are shyer than others and *we made sure that they could interact with the rest of the class.*

The activities undertaken enabled them to make use of their individual resources, such as knowledge of a language – e.g. Arabic, the mother tongue of many students in the school – which helped first-year students to feel

understood and accepted:

I did this course for a reason: for the guys in the same course, *I went there to help them with the language as well*. So, it was interesting, because there were a lot of guys in the course who spoke Arabic, there are a few words they don't understand, so I have to speak Arabic.

Interesting, because *I explain to them what they have to do, how to study, why it's important to speak Italian, to learn how to write*.

The development of soft skills was accompanied by a transformative process that led tutors to overcome the anxiety and embarrassment of speaking in front of an audience of students. It was a challenge met with courage:

I'm quite a shy person, so *I was afraid* that I wouldn't be able to call attention to myself, make myself heard, but in the end everything went well because *I took courage*, even seeing that they were actually more embarrassed than I was.

The course seems to have raised a progressive awareness both of their own role and of their own prejudices and preconceptions. Most of them acknowledged that they had stereotyped the school's addresses, coming up against a much more complex reality:

It was interesting to see how the addresses are stereotyped (...). I mean, I liked the graphics class more than the health and social class, usually you think that graphics class is messier than health and social class, but this time, in my experience, it was the opposite.

I had a class of electrics, and I had this very strong stereotype because in our class they are considered the ones who make a mess, who break things... there were also some thefts last year and the first thing they thought was "it was the electrics". Now, I take my blame, and I also realise that I stereotype this a lot.

## **2.2. Beyond criticality: Peer tutors as reference figures**

In general, the tutors were faced with difficult situations, which challenged them and did not always see them recognised in their role as tutors, especially due to young age and communication problems:

*I many times did not feel respected as a tutor*. Because I was not seen as a tutor, I was seen as the girl in fourth grade, that is, *I was seen as a pupil*, not as someone who can give you something.

Challenging because *I was not always faced with people who were easy to talk to, easy to interface with, easy to understand, but if you put your mind to it, you manage to conclude, to something positive.*

Nevertheless, as is also evident from the previous quotation, the balance of the experience seems to be positive. The intervention of the tutors helped to improve the dynamics of the class group and they were often seen as authoritative figures, guides to be relied upon:

*They took us very seriously, I mean in the sense as tutors, even when they needed us they came more to us guys than to C. [educator at Comunità Nuova], so I saw them very keen, I mean to see us as authority figures.*

*The second meeting we started talking (...) a lot of questions came up, I saw them very engaged and also very concerned about being able to bring a very, very high level to the exam; so, I was very pleased about that.*

Carrying out peer education activities seems to have activated important metacognitive skills in the tutors. Indeed, they reflect on their own responsibility towards younger pupils and thus on the importance of assuming the awareness of being reference figures:

*We have a responsibility, because we are talking to younger people who may interpret what we say in another way, so we have to have, let's say, an eye on.*

*Not everyone can do this, because as much as you can understand the teachers' point of view, you still have to keep in mind that we are there to give not an example but a reference figure, and in our class many wanted to do this experience but in my opinion not all of them were adequate, and in fact were not advised by our teacher.*

During their focus group, the teachers themselves say that the tutors were able to make the students think – for example, about rules – from another point of view, and add that “it was interesting because it wasn't the professor giving an explanation (...), but an older student”. In addition, the teachers themselves perceived the peer tutor as “intermediary figure” between teachers and pupils, a “link between the adult world and their world”.

### **3. CONCLUSIONS AND DEVELOPMENT PERSPECTIVES**

These first results lead to the drafting of some points that seem crucial for the prevention of school dropout in multicultural and multi-problem contexts:

- Involve students in an active manner, by leveraging their skills, dreams, talents, as well as their vulnerabilities in a democratic citizenship perspective;
- Build heterogeneous groups of students among the different classes to expand the dimension of social relations and exchange beyond all diversity;
- Give students specific roles in a project so that they feel themselves to be social actors, stakeholders, and responsible for the success of the action beyond the logic of power and role asymmetries within the school institution;
- Invest in the transformation of space to foster a sense of belonging to the school, ensuring alternative and protected spaces for the students to allow their freedom of expression and to enable them to participate competently and reflectively in heterogeneous dialogue spaces shared with adults.

Looking ahead, thinking about the development of peer tutoring as a strategy to prevent school dropout, the analysis of focus groups and reports suggests implementing the role of peer tutors as cultural and linguistic mediators, having tutors work in classes that have the same study field as them, and finally, as told by the tutors themselves, devoting more time to debates on sensitive topics for students.

# FOR THOSE WHO FALL BEHIND: EXAMINING LANGUAGE AND CULTURAL ENHANCEMENT PRACTICES IN MILAN'S EXTRA-SCHOOL SERVICES

Lefterov Petar Vasilev<sup>a</sup>

<sup>a</sup>University of Milano Bicocca

This study explores the educational needs of a diverse urban neighbourhood, focusing on after-school programs and their role in supporting multilingual children. Through a qualitative method and an Ethnographic methodology 30 observations were done in 14 after-school services revealed significant gaps in the training of practitioners, particularly in teaching Italian as a second language (L2) and utilizing strategies to value students' home languages. This research highlights the urgent need for professional development in multilingual pedagogies to empower practitioners to leverage students' linguistic and cultural resources. Such training can create more inclusive, dynamic learning environments, improving outcomes and reducing dropout risks. While preliminary, these findings provide a foundation for rethinking after-school programs as spaces of inclusion and academic growth for multilingual youth in urban contexts.

school dropout; migration; multilingualism

## INTRODUCTION

Although early school leaving conjures up an image of an escape from the school system, a definitive end to one's study path, the term transcends this one-sided view and adopts a pluralistic perspective (Besozzi, 2006). Early school leaving is a multifaceted phenomenon that doesn't result only in the extreme act of not getting a diploma, but it has to do with episodes of compulsory school evasion, repeated failures, irregular attendance, transfers and low performance (Zurla, 2004). Hence, the phenomenon of school leaving may take two distinguished forms: an explicit one, defined by the non-achievement of a lower secondary education diploma, and an implicit one,

portrayed by individuals who finish compulsory education without obtaining the necessary skills to thrive in today's society.

Whichever form does this hardship adopt, early school leaving bursts from variables well-known for quite some time (e.g. Rumberger & Lim, 2008). The vast literature on the subject clusters the different variables into three main groups: Socio-economic variables (Turner & Thiede, 2018), such as educational level of parents, belonging to single-parent families, and geographical segregation; school endogenous variables (Wolley, Kol, & Bowen, 2019), like peer relationships and teacher relationships; individual variables (Rumberger, 2011), mental health and special educational needs.

In the Italian context, among those who are more susceptible to these variables, students with migrant background are three times more at risk. In 2023, 26.9% of students with a migrant background experienced some form of early school dropout compared to 9% of natives (ISTAT, 2024a). Furthermore, if one were to consider implicit dropout, namely underachievement and low school performance, students with a migrant background are more prone to the phenomenon than their Italian peers. According to the INVALSI 2024 data in second year of primary school, first generation migrants score 18.8% points lower in Italian tests than their non-immigrant peers and for second generations the difference is 14.3%. In fifth grade the gap narrows but the results remain worrying: First generations overall score 13.5% lower than their non-immigrant peers and for second generations the difference is 9.2% (INVALSI, 2024).

Migrant pupils' greater risk of early school leaving paired with the increase of 4.9% of students with a non-Italian citizenship and the 2% decrease of Italian citizens in schools (ISTAT, 2024b) triggers a new emergency in education: achieving a fair and equitable education, which succeeds in implementing actions to prevent school dropout of children with migrant background, by implement a pedagogy of listening, which stems from children's personal experience (Dewey, 1938) and values their cultural and linguistic heritage (Gibson & Bejinez, 2002).

## **1. RESEARCH CONTEXT**

Therefor it is important to design school dropout combat interventions in neighbourhoods with high percentage of pupils with migrant background. This study focuses on the San Siro area, with particular attention to the quadrilateral Selinunte. This portion of the city is characterised by a marked social and territorial heterogeneity, reflecting a mosaic of different and contrasting urban

realities. On the one hand, there are residential neighbourhoods frequented predominantly by middle and upper classes, well served and maintained, defined by a well-kept urban environment and quality housing; on the other, there are areas of public housing, often marked by situations of structural and social decay.

This contrast generates a clear polarisation within the neighbourhood, distinguishing a 'upper-class' San Siro from a 'working-class' San Siro. The latter area is characterised by the strong presence of foreign communities, which make up about 37.3% of the resident population. Multiculturalism is evident not only in the percentages, but also in the extraordinary variety of origins: there are about 85 different nationalities, with a prevalence of people from North Africa.

Despite its urban criticalities, San Siro also stands out for some positive and significant demographic trends. In contrast to the general decline in the number of young people in the 0-18 age group, found in many of Milan's neighbourhoods, San Siro's forecasts a population growth of 19.1% by 2030 (Milan 2030, 2017). This perspective makes San Siro the 'womb' of the new Milanese generation, a place of youth renaissance that could influence the city's future.

However, this demographic potential must be accompanied by targeted policies and strategic interventions to ensure that the growth of the youth population represents an asset rather than becoming a source of difficulty. In fact, there are several extra-school educational services in the neighbourhood that seek to support children in their studies. In this regard, bearing in mind the theoretical assumptions described above, it seems necessary to understand whether the extra-school services succeed in guaranteeing an education that draws on the children's linguistic and cultural background in order to create a more meaningful learning.

## **2. STUDY DESIGN**

To achieve its exploratory objectives a qualitative method (Creswell, 2003) and an ethnographic methodology tailored to educational contexts (Bove, 2019) was carried out in the school year 2022/23 for a total of 30 observations. In alignment with these methodological principles, data collection was carried out using multiple qualitative tools designed to capture a diverse range of information. Participant observation was a central component of the research, enabling the researcher to engage directly with the environment, fostering a nuanced understanding of the dynamics at play. This approach was

complemented by visual data collection through photography, which allowed for the documentation of physical spaces, interactions, and other contextual elements that might escape verbal descriptions.

Additionally, audio recordings were employed to capture conversations, ambient sounds, and other auditory aspects of the environment, preserving the richness of oral exchanges and ensuring accurate transcriptions for subsequent analysis. To further support the data collection process, detailed handwritten notes were taken using pen and pencil, providing immediate reflections, contextual insights, and annotations that might not be captured through other means.

### **3. RESULTS**

For the analysis of the data collected, content analysis was employed, as it is particularly well-suited for examining verbal and textual material of low complexity (Gianni, 2007). By breaking down the material into manageable units – such as themes, patterns, or recurring ideas – content analysis facilitates a deeper understanding of the underlying meanings and trends within the data. Through the analysis process three themes have been identified.

#### **3.1 District Profiling**

During the reporting year, 14 after-school services were considered in the mapping analysis. These services varied significantly in terms of structure, governance, target users, and weekly frequency, ranging from a minimum of one meeting per week to a maximum of five, for a combined total of 63 hours of school support per week. It is important to note that after-school programs organized directly by and within schools were not included in this analysis since they were voluntarily organized by teachers and weren't included in any official report. In fact, observations in two specific after-school sessions – one held at the Paravia school and the other at the Don Gnocchi school – revealed that some teachers voluntarily stayed beyond their regular working hours to coordinate and support these programs.

Paravia School 11/05/2023

P: 'Good morning, my name is P., I have an appointment with L. from the afterschool.'

School Reception: 'Which afterschool? On Thursdays there are 8 after-school activities.'

Don Gnocchi School 19/05/2023

P: 'Hi, what are you doing here at this time, do you have some kind of school meeting?'

A: 'No, no, I volunteer extra hours to help the children with their homework.'

From a logistical perspective, 5 of the 14 after-school programs were conducted within school building, while the remaining 9 took place in out-of-school settings. Among the out-of-school programs, 3 were managed by social cooperatives, 1 by a non-profit organization, 3 by a university, 1 by a voluntary association, and 1 by the municipality. For the school-based after-school activities, 1 was organized by a cooperative, 3 by the municipality, and 1 by a voluntary association.

The enrolment records indicate that a total of 475 children were registered across the network of after-school programs. However, field observations revealed a significant discrepancy between the number of children officially enrolled and those actually attending. Practitioners confirmed these inconsistencies, though they were often unable to provide precise attendance figures during observations. Furthermore, approximately 75% of the attendees were identified as Arabic speakers. The remaining 25% represented a variety of cultural backgrounds, with no Italian children observed attending any of the sessions. It is important to note that this demographic data is incomplete, as not all children were present during the observations, and their personal information was not always available for review.

### **3.2 Language and Cultural Background**

The use of children's home languages varied depending on the setting. In out-of-school contexts, the use of native languages was generally not discouraged. For instance, children were observed speaking in their home language freely, except in one case where two boys were scolded for allegedly swearing in Arabic during a play session. Conversely, in school-based after-school programs, children did not use their home languages and those with limited Italian proficiency remained largely silent, which highlighted their discomfort or lack of engagement.

Despite the occasional spontaneous use of home languages in out-of-school settings, there was little evidence that practitioners leveraged this linguistic diversity as a resource for engagement or learning. Home languages were actively used by practitioners in only a few observed instances and in all these cases the usage lacked an educational purpose. For example, at one

afterschool program, a practitioner casually asked a child to teach him the names of colours in Arabic, but this interaction remained superficial and did not translate into a learning opportunity (See Fig. 1).

Fig. 1. Home language use – observation 18.04.23

### 3.3 Challenges and Implications in Pedagogical Practices

The limited use of children’s linguistic and cultural backgrounds in the educational process points to a broader issue: the lack of professional training among practitioners, particularly in teaching Italian as a second language, as it is highlighted by the diary written on the 11<sup>th</sup> of April: *‘I wonder if the operator has followed training courses on teaching Italian L2 since I only offered dictation activities during the hour.’* Observations raised concerns about the effectiveness of the pedagogical approaches employed in these after-school programs.

31.05.2023

‘The staff does not seem to me to have any specific skills to conduct an after-school activity: they are very attached to the text of the books, they feed the answers, they make people read out loud. The activity takes the form of classic repetitions, conducted by people of good will, passionate, but without any knowledge of the study method or the teaching of Italian L2.’

Common activities included dictation, reading aloud, completing worksheets, or practitioners directly doing homework for children. These practices, while prevalent, were often misaligned with the goal of fostering meaningful learning and engagement, particularly for students struggling with Italian language proficiency.

The observed weaknesses in pedagogical strategies and the underutilization of children’s linguistic and cultural assets significantly limit the effectiveness of

after-school programs. For some children, these activities risk becoming mere extensions of the school environment, offering little in terms of tailored support or meaningful engagement. This lack of innovation reduces the potential impact of after-school programs and risks transforming them into ‘parking lots’ rather than effective educational resources. To truly support children’s learning and development, greater emphasis must be placed on integrating culturally responsive teaching methods and enhancing practitioner training in second-language instruction. Without these improvements, the quality of school support provided by after-school programs remains inconsistent and, in some cases, inadequate.

#### **4. CONCLUSIONS AND DISCUSSION**

Over the past two decades, a growing body of theoretical and empirical research has demonstrated the benefits of multilingual education in fostering deeper and more comprehensive learning experiences (e.g., Carbonara & Scibetta, 2020; Cummins, 2021). Multilingual practices can contribute to the development of critical academic skills, such as the development of critical thinking, the acquisition of technical vocabulary, and a deeper understanding of the subjects. Moreover, multilingualism supports the creation of a more inclusive and serene learning environment. Allowing students to use their home languages freely not only reduces stress and anxiety but also fosters a stronger sense of identity and belonging. This, in turn, increases their motivation and engagement with the learning process, which are essential factors in preventing school disengagement and dropout.

Thus, this first exploratory research of the neighbourhood’s needs has highlighted the necessity to train practitioners in the didactics of Italian as a second language, but also in mother tongue valorisation strategies. Training practitioners in multilingual pedagogical strategies would not only enhance the quality of after-school programs but also empower educators to build on students’ linguistic and cultural resources as tools for learning, strategies that might guarantee a more equitable education and help in the prevention of early school leaving among migrant students.

# STRENGTHEN THE SCHOOL-FAMILY-SERVICES PARTNERSHIP THROUGH THE IMPLEMENTATION OF THE P.I.P.P.I LEPS

Claudia Marcellan<sup>a</sup>

Paola Milani<sup>b</sup>

<sup>a</sup>University of Padua; <sup>b</sup>University of Padua

The phenomenon of school dropout is defined by those who don't gain either the necessary skills to live in society or high school qualifications (Council of the European Union, 2011). It is often linked to a condition of socioeconomic disadvantage, coming from environments with a low level of education, school rejection, factors of labour market attraction, and/or a combination of social, psychological, educational problems. Investing in education, therefore, is essential to break the "cycle of disadvantage" (European Commission, 2013); it is why is necessary an early and multi-disciplinary approach (AGIA, 2022). In this contribution, we intend to present the first phase of a participatory research-action-training to promote the success of every child, a new action within the Italian P.I.P.P.I. programme. The research aims to promote the active involvement of kindergarten teachers in the prevention and early recognition of situations of family and social vulnerability, with an integrated and shared approach with social, educational-school, and socio-health services. It will be held during the years 2024/25 through the collaboration between sectors, following a co-educational approach, to develop early recognition strategies of vulnerabilities. Monitoring tools will include the RPMonline digital platform.

P.I.P.P.I. programme; prevention; co-education; integration

## INTRODUCTION

The school drop-out phenomenon can take two shapes. The explicit one is defined by Early School Leavers (ESL) or Early Leavers from Education and Training (ELET), those who aged 18-24 and who leaved the education system with at most a lower secondary education qualification. The implicit one, more

difficult to identify, is represented by those who finish compulsory education without gaining the essential skills needed to participate in the XXI century society (Council of the European Union, 2011). In 2023, based on Eurostat data (Eurostat, 2023), ELET in Italy were more than 11%; the EU-level target for 2030 should be less than 9%. Students “implicitly dispersed”, in Italy in 2019, were 7,1%, measured by INVALSI (Ricci, 2019). By aggregating the two percentages, the school dropout in Italy is around 20%.

This phenomenon impacts societies, countries and personal life of people, feeding the “cycle of disadvantage”: poverty and low levels of education could lead to becoming parents with lower income, cultural and educational attainments, resulting in a lower quality of education both within families and educational services, increasing school dropout rates and learning difficulties, reducing the number of university students, and leading to greater vulnerability, more poverty, and higher welfare spending. Similarly, in parent families with low income, cultural and educational levels, children develop a greater chance of school dropout (Milani, 2018; Garcia and Heckman, 2022), compromising their well-being, their life potential and life’s opportunities. Promoting and encouraging school-educational success, investing in education, in early childhood, means to break the “cycle of disadvantage” ensuring more equity in opportunities and full realization of each potential, for smart and inclusive growth (European Commission, 2013).

As school drop-out is a complex and multidimensional phenomenon, it needs to be faced in the same way, through an evolutionary and systematic perspective, involving the whole community in the entire life cycle (AGIA, 2022). In this contribution, we would like to introduce a new and innovative research-action within the national P.I.P.P.I. programme, that would want to enforce an early, holistic and multidisciplinary approach, facing the dropout phenomenon, through the implementation of the school-family-services partnership.

## **1. THE SCHOOL DROPOUT PHENOMENON AND THE PERSPECTIVE OF SUCCESS**

The problem’s complexity results by a combination of personal, social, economic, educational, gender and family-related factors. It is linked to situations of cumulative disadvantage, often originated in early childhood, feeding the “cycle of disadvantage”.

Children are more exposed to poverty or social exclusion than the rest of the population; children growing up in such conditions have fewer opportunities than their luckiest peers to succeed in their studies, enjoy good health, and fully realize their potential as adults (European Commission, 2013, 5).

J. Heckman (2012) emphasizes the significant advantages of investing in the early and equitable development of human potential, to build a more skilled, productive and valuable workforce that will benefit the future generations. Therefore, it is essential for the growth of the countries' economy and social cohesion, leading to more democracy, less unemployment, inequalities and poverty (European Commission, 2013). Early childhood interventions are the most effective because of the more brain plasticity of the first life's years, the early emergence of cognitive, emotional, executive, social, etc. functions and the role of interactions, that determine the futures way of life (Tamburlini, 2014). Building on these assumptions, to tackle the school dropout is fundamental to adopt an early, holistic, and multidisciplinary approach that keeps together the entire school community and extends to the broader community in an ecological and preventive perspective, looking the children in a developmental way (Guryan et al., 2008; Council of the European Union, 2015; Milani, 2022). Indeed, the absence of services, as a support network for growth, creates a lack of stimulation and resources, leading to negative impacts on the social, cognitive, emotional skill's development of young people (AGIA, 2022).

## **2. THE PARTICIPATORY RESEARCH-ACTION-TRAINING**

### **2.1. The national P.I.P.P.I. programme**

P.I.P.P.I. (Intervention Programme to Prevent Institutionalization) embodies the approaches and the perspectives outlined up to this point. It is a national programme born in 2011 and, in 2021, it has been recognized within the LEPS (Essential Level of Social Benefit) to prevent the phenomenon of out of home children. It promotes innovative practices of intervention towards families in which children experience neglect and vulnerability situations, aiming to avoid the emergence of risk conditions that could lead to early school leaving too. The described approach is reflected by the integration of social, health and educational-school sectors, which works together to co-create a unified and personalized plan with, not on, the child and the parents. The effort is to generate a cross-sectoral community based on an ecosystemic approach to the family (Milani, 2022).

## **2.2. The family-school-services partnership**

One of the four actions made available to each family participating in the programme, is the family-school-service partnership, that

can prevent and counteract the effects of vulnerability on children's development, to ensure the academic success of every child growing up in a vulnerable family situation, also providing teachers with the possibility of implementing affective-emotional and social interventions integrated into teaching-learning processes, in line with the objectives of the design defined in the multidisciplinary team (EM) (Serbati and Milani, 2022, 44-45).

The aim is to work at an early stage, realizing coherent and timely actions between sectors, involving the family and the community, helping a better comprehension of children needs and supporting parenting resources (MLPS, 2017; Milani, 2022). Cooperation between different sectors, in the P.I.P.P.I. programme, is built through a digital platform called "RPMonline", designed in a community and participatory perspective, used by practitioners, involved in the care of families, to communicate, cooperate, share, document, assess, plan the common project.

## **2.3. "P.I.P.P.I. AT KINDERGARTENS – Three-year training program for FISM kindergartens in the West Veronese area"**

### *2.3.1. Objectives, methods and participants, and expected outcomes*

The participatory research-action-training, subject of this contribution, develops itself from a long experience in P.I.P.P.I. of the social area of Verona West: indeed, in October 2023, the social's practitioners and the research group in charge of P.I.P.P.I. started a three-year training addressed to about 400 teachers and/or coordinators of the local territory's kindergartens. It has the objectives to make known P.I.P.P.I. approach, as a common way to work with families, and to increase knowledge and trust among the different professionals and sectors.

Specifically, the objectives of the participatory research-action-training project, started in the Veronese area, are:

- to promote and to integrate the professional agency of teachers in the multidisciplinary teams;
- to strengthen the school-family-services partnership, in order to improve enabling inclusive ecosystems;

- to develop an awareness of the potential of technologies in prevention and in socio-educational-school-health collaboration;
- to promote the active involvement of teachers in early recognition and support of vulnerability situations.

As a participatory action-research-training, it looks at teachers/coordinators and social services as co-researchers and active participant in the research. The training methodology assumes a reflective and dialogic perspective, and the techniques are speech and simulation based, starting from the teachers' experience to co-create a common language with social services and in relationship with families. The research tools are RPMonline, initial and on-going training, questionnaires, focus groups, interviews.

The final expected outcomes are:

- the innovation of teachers' practices to address the needs of children and in their relationships with families;
- the knowledge's improvement, by teachers, of early recognition of families living in situations of vulnerability;
- the consolidation of a timely and integrated support partnership between teachers and local service providers;
- to develop more confidence with technologies in a community and social intervention perspective (RPMonline in particular).

### *2.3.2. Schedule*

In this first year, from October 2023 to May 2024, in collaboration with representatives of the ASL as trainers, we realized the in presence-training phase to about 100 kindergartens' teachers/coordinators. From March to June 2024, we carried out an in-depth online training with a subgroup of them (17), to experiment the practical design in RPMonline starting from the real families' situations reported by teachers, to test observative and assessment tools. It took place in a mostly workshop format of active group learning, using simulative techniques, case analyses and autobiographical accounts to encourage reflection, experimentation, comparison and negotiation of meanings. In summary to learn a method of co-construction and shared project for/with each child and family in situations of vulnerability.

After and thanks this initial training, teachers will be invited to be protagonist in the identification (for 2024/25 year) of 10 families to support within P.I.P.P.I. multidisciplinary teams.

### **3. FIRST RESULTS AND DISCUSSION**

In these phases of initial active training, we could observe a high motivation by teachers, that reflects also the high responsibility that they feel regarding families and children. These represent strong points in the work with them. Based on the initial questionnaire, submitted them before the beginning of training, the priority motivation to attend the training, as well as getting to know better the programme, is to acquire new tools, skills and methods to work with families in vulnerable situations, to improve the ability to relate with them; moreover another priority motivation is to implement the collaboration with services in the local area, considered fundamental for the previous purpose. The motivation and sense of responsibility have also emerged during the training, in each different group activities, relied on their professional experience with families and children: there was a big emotional involvement, that request more time to reflect on the situations and to support them. Teachers have manifested trust, toward us, and great expertise in their work: they got involved, feeding and enriching discussions, showing the skill to question themselves, their professional practices with desire to learn and curiosity. We submitted, to teacher, also an intermediate and a final questionnaire. The various answers showed excitement and satisfaction, for example “Finally a clear and defined support to accompany fragile families”, “The importance of prevention and networking, of the triangulation between school, family and other institutions”, “Awareness of how to ‘take’ and get in touch with a family that is experiencing any social, personal, emotional distress, etc. Personal awareness of my role as a teacher”.

In relation to our objectives, it seems to be an improvement in the school-family-services partnership and their wish to early recognize and prevent emergency situations, to be concretely developed in the integrated care of families in P.I.P.P.I. Based on these assumptions, there may be an effective promotion of teachers’ professional agency in inclusive human and technological ecosystems created in concert with socio-educational-health sectors.

### **4. CONCLUSIONS**

School drop-out can be fought by schools as social elevators to promote more equity. As school drop-out is a complex and multidimensional phenomenon, it needs to be faced in the same way: acting before the first day of school, investing in early childhood and in an evolutionary and systematic perspective. Starting with these purposes, we planned a participatory research-action-training

project, in collaboration with services of West Veronese, addressed to private kindergartens' teachers.

In the initial training teachers showed involvement and motivation, trust towards services and sense of responsibility towards families and children, strong points for next steps. The challenge will be the use of RPMonline as a platform aims to share, cooperate, communicate and document, despite the daily workload, lack of time and digital inexperience. The use will be fully supported by ongoing training.

This research, as a new and innovative action within the national P.I.P.P.I. programme, would like to be a starting experience to promote the active involvement of teachers in the multidisciplinary team and in the prevention of risk conditions that feed the “cycle of social disadvantage”, so the school dropout too.

# PREVENTING AND COMBATING EARLY SCHOOL LEAVING SINCE EARLY CHILDHOOD. TOWARDS A DYNAMIC, SITUATED AND ECO-SYSTEMIC APPROACH TO PROMOTE EQUALITY, SOCIAL COHESION AND JUSTICE

Luisa Zecca<sup>a</sup>

Chiara Bove<sup>a</sup>

<sup>a</sup>University of Milano-Bicocca

## INTRODUCTION

Despite a decline in early school leavers' numbers (Eurostat, 2024), the phenomenon of school dropouts is gaining increasing prominence on national and international political agendas, becoming a paradoxical topic in public policy analysis (Berthet, 2023). Hence, even though Countries are conveying a decline in percentage in early school leaving, the concern about the dropouts is drastically raising. This increase might be due to the fact that today's society is knowledge based, a society in which the role of knowledge assumes, economically, socially and politically, a fundamental centrality in life, and which bases its growth and competitiveness on knowledge, research and innovation. Thus, since living in a society that bases its principles on education, it is no wonder to witness an increase in policies aimed at combating and preventing early school leaving.

The Treaty of Lisbon marked a significant step in combating early school leaving by emphasizing education as a central pillar of the labour market and promoting lifelong learning to boost employability. Adopted in 2000, the Treaty sought to address disparities in access to education and ensure equal opportunities for all. Further advancing this agenda, the 2007 Lisbon Report on Growth and Jobs included specific recommendations to lower national early school leaving rates. Following the Lisbon Strategy, the Europe 2020 Strategy tackled the issue of early school leaving directly by clearly stating the need to reduce the share of early school leavers to 10% from the current 15% and increase the share of the population aged 30–34 having completed tertiary from 31% to at least 40% by

2020. One year after Europe 2020, to solidify Europe's position in the 'war' against early school leaving the European Union published the Council Recommendation of 28 June 2011 on policies to reduce early school leaving. In the document not only the importance of reaching previously set benchmarks was stated but also flagship initiatives, with a specific focus on preventive actions were proposed.

Europe managed to reach the desired goal by reducing the rates of early school leavers to 10% by 2020, however in many Countries, including Italy, the school dropout quota exceeded the set threshold. Recognizing the need for continued progress, the European Union released the Council Resolution on a strategic framework for European cooperation in education and training towards the European Education Area and beyond, in which the new target level was set to be less than 9% by 2030.

However, despite these actions, early school leaving still pervades today's society. It is a multifaceted issue encompassing all forms of "loss" within the educational system (Besozzi, 2006), that is associated with factors such as delays in academic progress, missed learning opportunities, and failure to obtain qualifications (Batini & Bartolucci 2016). In Italy, this phenomenon is defined as the sum of different conditions, such as marginalized or poor families, lack of access to early childhood services, early school leaving, repetition rates, interruptions and irregularities of various kinds. Moreover, school dropout reflects the broader complexity of society (Tuè, 2003) and impacts various domains, including family, social relationships, and peer groups (Morgagni, 1998).

On this regard, the latest analyses by AGIA, the OECD and national and international literature (Rumberger, 2020; Mussi et al., 2024; Zecca, Fredella, & Cotza, 2023) reveal that to prevent and combat early school leaving it is necessary to adopt a multi-levelled and multi-dimensional approach, which can effectively tackle the school dropout issue from an integrated perspective: one that can take into account various interconnected dimensions, including socio-economic, cultural, institutional, personal, and school endogenous (Cingolani & Premazzi, 2016; Rumberger & Lim, 2008). Thus, within this theoretical framework the contribute presents five empirical research-based articles aimed at, one hand, enriching the contemporary academic debate on the topic of early school leaving and, on the other, to disseminate practical actions intended to prevent school dropout. The panel aims to discuss teaching strategies and policies that could prevent or counteract early school leaving risks at the

mesosystemic level of relationships in the school community. This includes promoting social cohesion processes such as accessible and quality childcare services, improving family-school relationship, and supporting young newcomers in their integration process. Furthermore, the five articles will engage in a discussion on multicultural and multilingual alternative teaching strategies, as well as integrated and inter-institutional actions (welfare policies, education policies, school policies, urban policies, job policies, home policies). The research proposed by Cotza shares results of the experimental action of peer tutoring, that took place at one high school in Milano. The action research, which involved 22 participants, explores the strengths and challenges of this intervention, emphasizing the importance of student voices in co-creating educational strategies. Through focus groups and observations, it is underscored the role of collaborative efforts between schools, third-sector organizations, and universities in preventing school dropout.

Lefterov delves into the experiences of migrant students, who face disproportionately high risks of school dropout due to intersecting socio-economic, institutional, and personal challenges. The study investigates how language and cultural valorisation practices in extra-school services might enhance educational equity and engagement. Using ethnographic methods, it reveals both successes and gaps in these initiatives, proposing a pedagogy rooted in cultural and linguistic appreciation.

Colleagues Marcellan and Milani present a model of integrated governance aimed at fostering collaboration between schools, families, and social services. By involving preschool teachers, families, and service providers, this study emphasizes the importance of co-constructed approaches to identifying and addressing vulnerability early, thereby creating more cohesive educational and social systems.

In the evaluation of the project *Oltre i Confini*, which integrates schools with local communities to combat educational poverty and prevent school dropout, Coacci and Moro highlight the challenges of scaling community-based initiatives and their relevance within broader educational reforms, such as those outlined in the PNRR.

Lastly, Chinazzi and Mussi explore parental perspectives on school dropout, focusing on families in a multicultural neighbourhood in Milan. Using focus groups and interviews, the chapter sheds light on the challenges faced by parents, their views on school-family relationships, and their suggestions for improvement. The authors advocate for creating spaces for systemic dialogue

between parents, teachers, and students to foster mutual understanding and collaborative problem-solving.

In conclusion, these studies aim at discussing teaching strategies and policies that could prevent or counteract early school leaving risks at the mesosystemic level of relationships in the school community. This includes promoting social cohesion processes such as accessible and quality childcare services, improving family-school relationship, and supporting young newcomers in their integration process. By highlighting successful interventions and identifying persistent challenges, the studies suggest that effective strategies require coordinated efforts between schools, families, communities, and policymakers, creating a supportive ecosystem that addresses students' academic, emotional, and social challenges.

## INTRODUCTION

The issue of inclusion has been crossing the public debate for many decades, developing on several levels: political, economic, legal, social, etc. The definitions of social inclusion are many and polychrome. For Taylor (1994), it expresses the need to recognize all forms of cultural difference and to create public spaces in which these differences can be expressed and valued. Bauman (2001) defines it as belonging to supportive communities characterized by relationships of reciprocity. Sennett (2012) refers to creating contexts that enable people to actively experience their sociality. Ricolfi (2018) highlights the prerequisite for social inclusion: equal access to goods, services, and opportunities that enable individuals to be protagonists in the social, cultural, and economic life of communities and to be able to develop their full potential. The desired effects of any inclusive process are dense in meaning and particularly topical (Gray, 2000; Young, 2000; Coakley and Donnelly, 2002).

## 1. INTERSECTION BETWEEN SPORT AND SOCIAL INCLUSION

In the late 1990s, reflections on sport and social inclusion intersected (Frisby and Ponic, 2013; Pegg and Compton, 2004): 1) the universalism of sport, its ability to reach anyone – at least on a symbolic level – can help people overcome physical, social, cultural, and generational barriers, while at the same time contributing to improved health, self-esteem, emotional management, and relationships with others (Carless and Douglas, 2004; Carless, 2007); 2) the extreme plasticity of its practice, adapting structures and settings. Sport has appeared able to build social contexts, public spaces, and supportive communities, to welcome and enhance diversity, thus initiating inclusive processes (Bianchi, 2022).

International sports systems have seen a process of increasing expansion and differentiation since the 1970s (Pirone, 2019). Spectacle sports and commercial opportunities, opposed to ‘Sport for All’ movement, promoting social inclusion. A more spontaneous and less organized sport, aimed at a different public, largely made up of people belonging to vulnerable populations. Sport is beginning to enter more and more into the areas of disability (motor, intellectual, psychic, and relational), social vulnerability, addictions, and criminal justice. “Sport for all” and “in the measure of each individual” (Cei, 2003) aim to redesign sporting practice by assigning individuals the possibility of contributing and participating in the game, each in their own way, each according to their possibilities. How to do this is already an open question, and it raises relevant questions on who the excluded are and what requirements sport itself must have to be truly inclusive.

## **2. DIRECTIONS OF RESEARCH**

Policies and practices – yet experimented or theorized – in terms of social inclusion through sports and physical activities are still, in particular in school, are still less studied.

Significant topics for social science research within school contexts, emphasize the intersection of education, physical activity, and societal influences. Cross-cultural comparisons of physical education (PE) and sport explore how different cultures implement these programs, shedding light on varying educational priorities and societal values while revealing the role of sport in fostering identity and social cohesion. The study of youth disaffection and re-engagement focuses on understanding why young people disengage from PE and sports and identifying strategies to motivate and include them, addressing broader issues of equity and lifelong participation in physical activity.

Research on the rights of the child in sport and the incorporation of youth voices examines how children’s rights are upheld within sporting environments, tackling concerns around safety, access, equality, and young people’s agency to influence their experiences. Additionally, investigating PE and sport as settings for formal, informal, and non-formal learning highlights their educational potential beyond traditional academics, encompassing structured knowledge, social skills, and experiential development. Collectively, these areas emphasize the critical role of PE and sports in addressing educational, cultural, and social challenges in schools, offering pathways to promote inclusion, well-being, and holistic development among students.

Health and body pedagogies focus on how schools and sports programs teach young people about health, wellness, and body awareness, shaping their understanding of physical well-being and promoting lifelong healthy habits.

The study of dis/ability examines how physical education and sports address the needs of individuals with disabilities, exploring strategies to foster inclusivity, accessibility, and equitable participation while challenging stereotypes and societal barriers. In this regard, several research studies highlight that there are two key dimensions for an inclusive process to lead to the desired benefits: the co-participation in the same sport activity by people with and without disabilities (Hansen et al. 2023; Emmers et al. 2023) and the accessibility to sport activities of this target audience (Robinson et al.2023; Jiménez-Monteagudo et al. 2023; Stanojevic et al. 2023). Among the benefits most often reported by this research is an improvement in self-esteem (Schluchter et al. 2023). In particular, in settings where there is co-participation of people with and without disabilities, it emerges how changes to the physical activity setting, made inclusive, left the physical benefits for normotypically developing individuals unchanged but, the same time, significantly increased the self-esteem levels of those with disabilities.

Innovation in and through sport emphasizes the role of creativity and new approaches in enhancing the educational, social, and cultural impact of sports. This includes developing novel methods, technologies, and practices to engage participants and address contemporary challenges in sports and physical education. Professional development for teachers and coaches highlights the importance of equipping educators and mentors with the knowledge, skills, and tools to effectively guide students and athletes. It underscores the need for continuous learning to adapt to changing educational landscapes and diverse participant needs.

Together, these topics underscore the transformative potential of physical education and sports to drive progress in health, inclusion, innovation, and professional growth, fostering more dynamic and equitable learning environments.

# SOCIAL JUSTICE AND AGEING: OLDER LEARNERS AS ACTIVE CITIZENS IN A COMPLEX SYSTEM

Vanna Boffo<sup>a</sup>

Laura Formenti<sup>b</sup>

<sup>a</sup>University of Florence; <sup>b</sup>University of Milano Bicocca

The call for this panel was based on the need to reflect on active ageing as a fundamental framework for late-modern societies, in order to address the challenges related to longevity. The thesis is that learning and education are main resources in guaranteeing justice, meaning, and well-being at all ages. Later life needs to be prepared in advance, by building the life skills that will sustain all citizens in the last part of their lives. Interdisciplinary research on education and learning, with a special attention to pedagogy and older adults' education, could sustain policies and practices better aligned with the Active Ageing framework.

*Age-it* is an interdisciplinary national program aimed at mainstreaming ageing in the Italian system. The convenors of this panel are part of it and members of the Learning Education and Active Ageing (LEAA) Board, with the task to address education and learning issues and possibilities across the program. This is the first step of a process that aims to sustain Italian studies on longevity and active ageing through interdisciplinarity (750 researchers involved, from health to technical studies), and build an economic and political vision based on knowledge. The LEAA Board represents education and learning across disciplines, with a special regard for pedagogy, sociology, and psychology; this inspired our call for this panel, to answer the conference question: how can we develop a more democratic society through learning?

Being an older citizen means risking being “othered”, i.e. labelled as vulnerable and marginalized. This is truer for certain categories, that are more likely subjected to stigma and unseen by policy makers: women, not least as family caregivers, disabled older people, poor citizens, migrants, and/or with lower levels of education, technological competence, health literacy. Yet, older adults can also be privileged, richer than the younger generations. The panel wants to interrogate this complexity and the emerging learning needs of older citizens,

informal caregivers, professionals in communities and agencies, where formal, informal and non-formal learning develops.

The paradigm of active ageing (WHO, 2001, 2002) should inform policies to accompany our society towards a new balance between generations; in fact, longevity is a very influent factor that will have increasing impact on individual and family lives, economy and organization of health policies, housing, job market, and of course the welfare system. At a microlevel, becoming older means to live a transformation that requires the capacitation of life-skills that are undervalued by our society (Boffo, 2022). At a meso level, a society of older citizens requires adaptation and calibration of many aspects of community life, new services and practices, the development of a culture of care that should avoid dispossession and marginalization. At a macro level, we need new policies but also awareness of the discursive frameworks and normative narratives that impact the larger system (Formenti, 2022).

In defining the determinants, challenges and policy answers of active ageing, the WHO identified four key pillars – health, lifelong learning, participation, and security – to sustain older people’s potential for well-being. In Italy, however, there is a delay in the implementation of this model, especially when it comes to lifelong learning as a leverage for well-being. Besides, health is interpreted as an individual good and in medical terms, neglecting that well-being emerges from a complex system of interdependent variables.

The international literature on active ageing brings special attention on the four Pillars of the Active Ageing Index (UNECE, 2021). An overview of this literature (Boffo, 2006; Boffo, 2022) shows the role of *educational care* in contrasting fragility by offering help and support in the transition to a new phase of life. This panel presented a panoply of studies focused on education and learning in different contexts, aiming at prevention as well as support in the developmental processes of growing adult and older.

We want to stress here the construct of *transition*, not least from the labour market to retirement (ILO, 2020). A critical reflection on what we mean by transition entails a new understanding of the non-linear pathways between work and quiescence, and the life skills that are useful for prevention and support. The LifeComp framework is a set of ‘personal, social and learning-to-learn’ competences that can be applied to all the spheres of life (Sala et al., 2020). These competences, that can be built through formal, informal and non-formal education, can help citizens to cope with longevity.

Individual trajectories across work and life contexts have a fundamental role to

play in the ongoing building of active aging skills; they cannot be invented from scratch in later life. This is why the topic is so important and urgent now: in order to guarantee wellbeing, and social, personal, cultural care (Boffo, 2022) for a better life, we must prepare the conditions that make it possible. We are facing here the multiple links connecting learning processes, civil society, workplace learning, with the strategic vision of guaranteeing proper educational pathways for all. The whole professional and personal life of an individual has to be interpreted in the light of continuing learning and education, as a catalyst of Active Aging strategies and policies. The translational and transversal power of learning and the life skills acquired through working, family, civic participation, leisure, will improve individual wellbeing and civic awareness in the long run. We can summarize our results in some final tips:

- The culture of aging is still weak, maybe too linear and charged of hidden ageism;
- Life skills are relevant at all ages and need early investment to ensure good transitions in later life;
- Technological innovation and digital tools can sustain good transitions, if they are designed, assessed, and improved with citizens' participation;
- Many older people are committed in the production of cultural services and knowledge; there seems to be a correlation between cultural volunteering, life skills development, and predictive factors of good transitions.

Our society is facing a challenge: building a culture of aging, not only for the older people, but to ensure care in the whole society. We have just begun studying the social responsibility and impact of all sectors in sustaining active ageing. It will be important to invest on policies, at a national and regional level, and keep an open dialogue with different agents and institutions, in the health system, labour market, third sector, with the providers of non-formal and formal education and learning, and with the larger cultural system.

# ACTIVATING THE POTENTIAL OF OLDER ADULTS: EDUCATION AND ACTIVE AGING IN ITALY

Michele Bertani<sup>a</sup>

Donatella Bramanti<sup>b</sup>

Sara Nanetti<sup>b</sup>

<sup>a</sup>Ca' Foscari University of Venice; <sup>b</sup>Università Cattolica del Sacro Cuore, Milan

As societies age, the need for innovative approaches to aging becomes critical. This study focuses on Italy, where a rapidly aging population reveals opportunities for rethinking aging as a phase of active engagement. It examines the role of education and lifelong learning in empowering older adults to maintain active societal roles and foster intergenerational solidarity. Through the “Promising Practices for Education and Active Aging” questionnaire, the research highlights successful initiatives that enhance skills, confidence, and community involvement. These programs promote individual well-being, challenge stereotypes, and strengthen social cohesion. The study provides a framework for policymakers and educators to harness the potential of older adults, advocating for an inclusive and resilient future.

Active aging; Lifelong learning; Intergenerational solidarity.

## INTRODUCTION

Old age is often portrayed through the lens of decline, with physical frailty and cognitive deterioration dominating societal perceptions. Such views perpetuate ageist stereotypes that marginalize older adults, limiting their opportunities for meaningful engagement in society. These narratives fail to account for the immense value that older individuals bring, rooted in their wealth of experience, resilience, and unique perspectives. Far from being a burden, seniors represent a vital resource capable of enriching social, economic, and cultural life.

In Europe, Italy provides a striking example of the demographic challenges associated with aging. Nearly 24% of its population is 65 or older, making it one of the world's fastest-aging nations (ISTAT 2021). This demographic

transformation has been likened to a “silver tsunami,” reflecting the profound and sweeping impacts of aging populations on institutions, communities, and economies. As a “super-aged” society, Italy faces the pressing need to develop innovative strategies to address the implications of this shift. The challenge lies in mitigating the strain on social systems while capitalizing on the opportunities an aging population presents.

This paper contends that education and lifelong learning are pivotal for achieving this balance. Structured educational programs provide older adults with opportunities to acquire new skills, broaden their knowledge, and maintain an active role in society. Education can empower older individuals to contribute in diverse ways, from participating in the workforce to engaging in civic life and mentoring younger generations. Such initiatives can also help dismantle ageist stereotypes by showcasing the capabilities and contributions of older adults (Baschiera 2019, European Commission 2012).

Moreover, lifelong learning fosters intergenerational solidarity, encouraging dialogue and collaboration between different age groups. By promoting shared experiences and mutual understanding, these programs strengthen the fabric of society and lay the groundwork for enduring social cohesion. In Italy, where family ties and community connections are deeply valued, such efforts resonate strongly with cultural norms and priorities (Bramanti, Meda 2018).

The overarching goal of this study is to explore how education can empower older adults, contributing to their well-being and societal integration. Specifically, the research aims to:

- Identify and analyze current educational practices targeting older adults in Italy.
- Highlight promising practices that promote active aging and intergenerational learning.
- Offer actionable recommendations to maximize the potential of older adults and shift societal perspectives regarding their roles.

## **1. THE IMPORTANCE OF LIFELONG LEARNING**

Lifelong learning is increasingly recognized as an essential pillar for promoting active aging and addressing the challenges posed by aging populations. It involves continuous, voluntary, and self-motivated pursuit of knowledge for personal or professional development (European Association for the Education of Adults, 2011). Research underscores that engaging in lifelong learning yields

numerous benefits for older adults, ranging from cognitive health to social inclusion. Cognitive benefits include the maintenance of memory, problem-solving skills, and overall mental agility, which are crucial in combating age-related cognitive decline and delaying the onset of neurodegenerative diseases such as dementia (Formosa 2019).

Educational opportunities for older adults extend far beyond traditional academic settings, reflecting a shift towards more inclusive and accessible forms of learning. Vocational training programs enable older adults to adapt to evolving labor markets, maintaining their employability and financial independence. Personal development initiatives, such as art classes, language courses, and mindfulness workshops, encourage creativity and self-expression, enriching the quality of life. Additionally, community-based educational programs focus on fostering connections within local settings, emphasizing inclusivity and collaboration. These diverse forms of learning affirm the potential of older adults to adapt, contribute, and thrive in a rapidly changing world.

### **1.1. Intergenerational Learning**

Intergenerational learning represents a dynamic approach to bridging the generational divide, fostering mutual understanding, and promoting collaboration between age groups. These programs create shared learning environments where older and younger individuals come together to exchange knowledge, skills, and experiences. By facilitating these interactions, intergenerational initiatives combat ageism, challenge stereotypes, and highlight the capabilities of older adults.

For older participants, intergenerational programs provide opportunities to share their expertise, mentorship, and cultural knowledge, affirming their role as valuable contributors to society. Reciprocal learning is a key aspect of these programs, as both age groups benefit from exposure to different perspectives and skill sets. For instance, digital literacy workshops often pair tech-savvy youth with older adults eager to learn about new technologies, fostering collaboration and mutual respect (Unesco 2020).

Intergenerational initiatives also strengthen community bonds and promote social cohesion. Joint projects, such as community gardening, storytelling events, and cultural exchanges, provide meaningful opportunities for collaboration while addressing shared challenges. By fostering connections across generations, these initiatives contribute to a more inclusive and harmonious society.

## 1.2. Active Aging Frameworks

The concept of active aging, as defined by the World Health Organization (WHO), emphasizes the importance of optimizing opportunities for health, participation, and security to enhance quality of life as people age. This holistic framework shifts the narrative of aging from one of dependency to one of continued growth and contribution. Central to the active aging model is the recognition that older adults can and should remain engaged in social, economic, and cultural life (World Health Organization 2002).

Education is a cornerstone of the active aging framework, serving as a powerful tool for empowering older adults to lead fulfilling and autonomous lives.

In Italy, where nearly a quarter of the population is aged 65 or older, active aging frameworks are particularly relevant. Policies and programs that promote active aging can address the challenges of a rapidly aging population while leveraging the opportunities it presents. Education-focused initiatives within this framework not only enhance individual well-being but also contribute to broader societal goals, such as reducing healthcare costs, increasing social inclusion, and strengthening intergenerational ties (Ministero dell'Istruzione, dell'Università e della Ricerca 2012).

By examining the intersections of lifelong learning, intergenerational collaboration, and active aging frameworks, this literature review highlights the transformative potential of education in unlocking the capabilities of older adults. These approaches provide a roadmap for fostering active, engaged, and resilient aging populations in Italy and beyond.

## 2. METHODOLOGY

This study employed an exploratory design, leveraging a questionnaire on “Promising Practices for Education and Active Aging” to collect data from stakeholders involved in educational initiatives for older adults in Italy<sup>1</sup>. The questionnaire comprises 45 items across nine domains, capturing a comprehensive overview of projects, participants, and outcomes.

- Aim: Mapping and analysis of the ‘Promising Practices’ in Training, Learning and Education for Active Ageing
- Technique: WEB questionnaire, consisting of 47 items (of which 42

---

<sup>1</sup> The study was designed and implemented by the members of the Learning, Education and Active Ageing Board of the National Research Program Age-It “Ageing Well in an Ageing Society”. More details at: <https://ageit.eu/wp/en/board-apprendimento-e-formazione-per-linvecchiamento-attivo/>.

closed-ended and 5 open-ended)

- Main topics of analysis:
  - Profile of the institution/organization
  - Profile of the target population
  - Typology of intervention
  - Teaching methodology
  - Main critical issues

Data Collection: December 2023 – March 2024. Data were collected from a diverse range of stakeholders, including government agencies, non-profits, educational institutions, and community organizations. The questionnaire included both closed-ended and open-ended questions, allowing for quantitative and qualitative analysis.

The analysis of the questionnaire was performed using SPSS Statistics v29. In the results presented, variables are described as frequency and relative frequency.

### 3. RESULTS

Forty-three organizations completed the web questionnaire and fifty practices for training and education for the purpose of active ageing were collected. The main results are summarized in Table 1.

Tab. 1 – The fifty practices at-a-glance.

Geographical area	● Northern: 23	Collection of practices from the Northern and Central Italy are balanced, while data collection in the South and Island was more difficult
	● Central: 21	
	● Southern and Islands: 6	
Typology of organization	● Public administration: 13	Data received predominantly from the NGO's
	● Firms: 7	
	● NGO's: 30	
Beneficiaries: target age (years)	● Public administration: 70-79	As expected, firms tend to engage older workers

	<ul style="list-style-type: none"> <li>Firms: 50-69</li> </ul>	while public administration and NGO's pensioners
	<ul style="list-style-type: none"> <li>NGO's: 70-79</li> </ul>	
Participants per project/activity (mean)	<ul style="list-style-type: none"> <li>Public administration: 250</li> </ul>	The public administration tends to involve more participants
	<ul style="list-style-type: none"> <li>Firms: 100</li> </ul>	
	<ul style="list-style-type: none"> <li>NGO's: 100</li> </ul>

	<ul style="list-style-type: none"> <li>Firms: 4 out of 5</li> </ul>	
	<ul style="list-style-type: none"> <li>NGO's: 18 out of 30</li> </ul>	
Project/activity targeted to women (n)	<ul style="list-style-type: none"> <li>Public administration: 7 out of 12</li> </ul>	Another key aspect included in the practices collected
	<ul style="list-style-type: none"> <li>Firms: 1 out of 5</li> </ul>	
	<ul style="list-style-type: none"> <li>NGO's: 23 out of 27</li> </ul>	
Learning themes	The main macro-themes are:	Rich proposal in terms of programs
	<ul style="list-style-type: none"> <li>Health and wellbeing</li> </ul>	
	<ul style="list-style-type: none"> <li>Culture (museum, painting, choir, etc.)</li> </ul>	
	<ul style="list-style-type: none"> <li>Digitalisation</li> </ul>	
Didactic methods	<ul style="list-style-type: none"> <li>Participative: 18</li> </ul>	Primarily 'participative' didactic methods
	<ul style="list-style-type: none"> <li>Laboratory: 12</li> </ul>	
	<ul style="list-style-type: none"> <li>Interactive: 5</li> </ul>	

	<ul style="list-style-type: none"> <li>• Others (mixed, frontal): 8 on the total of 43</li> </ul>	
--	---	--

NGOs are the prevailing typology of involved organizations in terms of projects realized. Most projects have an intergenerational quality and/or are targeted to older women. The public administration – here represented by a heterogeneous group of municipalities, universities, adult schools and local health services – on average involve 250 participants per project.

#### 4. CONCLUSION

The demographic shift toward an aging population in Italy is a transformative force that demands innovative and inclusive responses. While challenges such as accessibility barriers, economic constraints, and pervasive ageism persist, this paper has demonstrated that education and lifelong learning hold immense promise in activating the potential of older adults. By equipping seniors with skills, knowledge, and opportunities for engagement, these initiatives can transform perceptions of aging and unlock the significant contributions older adults can make to society.

The educational practices analysed in this study reveal a diverse and impactful landscape of programs, from vocational training and digital literacy to cultural enrichment and intergenerational collaborations. Success stories like *Digital Bridge*, *Generations in Dialogue*, and *Active Arts* illustrate how well-designed initiatives can empower older adults, foster creativity, and promote meaningful connections across age groups. These examples serve as models for expanding similar programs nationwide, showcasing the potential for scalable, adaptable solutions that address the diverse needs of aging populations.

Policy and practice must now rise to the occasion, addressing the systemic barriers that limit participation and inclusivity. Expanding accessibility, whether through improved transportation, affordable programming, or digital equity efforts, is essential. Simultaneously, targeted campaigns to combat ageism and foster intergenerational solidarity can help reshape societal attitudes, creating a culture that values and celebrates aging as a period of growth, contribution, and renewal.

This research advocates for a paradigm shift in how society perceives aging, urging a transition from seeing older adults as passive recipients of care to recognizing them as active agents of change. In a nation as culturally rich and historically interconnected as Italy, older adults embody a wealth of experience and wisdom that, when mobilized, can strengthen communities, enhance

cultural vitality, and drive social innovation.

As Italy faces a relevant growth of the aging population, the need for policies and programs that promote active aging is more urgent than ever. By leveraging education and lifelong learning, Italy has the opportunity to not only address the challenges of an aging population but to harness its potential as a catalyst for social cohesion, economic vitality, and cultural enrichment. The insights from this study underscore the necessity of investing in inclusive, forward-thinking strategies that empower older adults, ensuring that they remain integral contributors to a more equitable, dynamic, and resilient society.

The findings underscore the need for policies that prioritize lifelong learning and active aging. Key recommendations include:

- **Expand Accessibility:** Develop inclusive programs that accommodate diverse needs, including those of individuals with disabilities or limited resources.
- **Promote Intergenerational Solidarity:** Scale up initiatives that foster collaboration and mutual learning between age groups.
- **Combat Ageism:** Launch public awareness campaigns to challenge stereotypes and highlight the value of older adults' contributions.

This research advocates for a shift in societal perspectives regarding aging. By recognizing older adults as valuable contributors rather than passive dependents, communities can create environments that celebrate diversity and foster inclusion.

# ELDER ACTIVE CITIZENS AND COMMUNITY ENGAGEMENT

Giulia Biagi<sup>a</sup>

Giovanna Del Gobbo<sup>b</sup>

Francesco De Maria<sup>c</sup>

Cristina Banchi<sup>d</sup>

Sofia Marconi<sup>e</sup>

<sup>abcde</sup>University of Florence

Ageing populations represent both a critical societal challenge and an untapped resource. As Europe and other regions of the world face rising life expectancy and declining birth rates, the question of how best to engage older citizens in social, economic and cultural life becomes increasingly urgent. In rural and mountainous areas such as the Casentino region of Italy, older adults are essential custodians of traditional knowledge and practices that contribute to the sustainability and vitality of their communities. This paper explores the role of active older citizens in building social capital and contributing to community engagement in the Casentino region, with a focus on their ability to generate professionalisation processes that enhance community resilience (Del Gobbo & Federighi, 2021). Social capital, understood as a collective resource based on social relationships and trust (Bourdieu, 1980; Putnam, 1995), is a crucial determinant of a community's ability to adapt to and manage change (Kilpatrick & Abbott-Chapman, 2005). We examine the contributions of older individuals, highlighting the interplay between their life experiences and skills, and the broader social and cultural dynamics of the local area.

active ageing, biography, inland areas, community development, social capital

## 1. THEORETICAL FRAMEWORK

The concept of social capital has gained considerable traction in the field of community development, particularly in understanding how communities respond to challenges and opportunities. Social capital, as conceptualised by Bourdieu (1980) and Putnam (1995), originates in micro-level interactions between individuals, which must then be embedded within meso- and macro-

level social structures to have an impact. It is through such interactions that trust, reciprocity, and collective identity are built, enabling communities to act collectively in pursuit of shared goals (Del Gobbo, 2024). According to Falk and Kilpatrick (2000), social capital is context-dependent; it depends on the characteristics of a specific community and on how well the human capital within that community is leveraged. The concept of “community efficacy,” as discussed by Kilpatrick and Abbott-Chapman (2005), is closely linked to social capital and refers to a community’s capacity to manage change and influence its own future. This theoretical lens is particularly relevant when examining the role of older citizens in Casentino, where a combination of demographic challenges and rich cultural heritage creates both risks and opportunities for local development. The notion of active ageing further complements this framework by emphasising the agency of older individuals in contributing to societal processes (World Health Organization, 2015). Older adults possess valuable knowledge and skills that can support the social, cultural and economic fabric of their communities. By understanding how these individuals contribute informally to community life, we can begin to recognise the potential for professionalisation processes that translate these informal contributions into more structured and impactful roles (Neyer & Andersson, 2008).

## **2. THE CASENTINO REGION AND METHODOLOGY**

The Casentino is a mountainous rural area in the Tuscan Apennines, renowned for its tangible and intangible cultural heritage. It is an area marked by demographic decline, with an ageing population and limited economic opportunities, yet it also exhibits interesting flows of incoming post-retirement mobility (Regione Toscana, 2022).

Designated as a pilot area within Italy’s National Strategy for Inner Areas (MIUR, 2013), Casentino offers a valuable context for studying the dynamics of community-based regeneration, particularly as they relate to the involvement of older citizens.

The Casentino’s rich cultural landscape includes practices, traditions and local knowledge that have been handed down through the generations. These elements are not only central to the community’s identity, but also represent a potential asset for fostering sustainable development. The REACT project, which aims to regenerate cultural landscapes by enhancing human and social capital, serves as the backdrop for this research, exploring how local resources can be leveraged for community-led development.

In Work Package 2 (WP2), which aims to construct a knowledge framework for the Casentino, the REACT project is studying the territory across four thematic areas:

1. Agro-food and forestry heritage and local craftsmanship
2. Traditions and social practices
3. Landscape and territorial networks
4. Settlements, public spaces and buildings

On the basis of ten thematic focuses, 33 representative case studies from the Casentino were identified and analysed, allowing the researchers to understand both inhabitants and places through field analysis. This led to an interdisciplinary SWOT analysis of all the cases in order to reach a comprehensive understanding and interpretation of the thematic areas. For this particular contribution, three of the 33 case studies were selected for their strong community engagement, all of which originated from participatory community activation processes:

1. **The Casentino Ecomuseum:** The Ecomuseum was created as a participatory project that involves the local population, institutions and associations in managing the cultural heritage of the locality. It is explicitly designed to activate and engage the local community. The Ecomuseum represents an innovative model of heritage valorisation that goes far beyond a mere exhibition space, and is conceived as a dynamic process committed to the continuous research and promotion of intangible heritage and best practices, and the development of sustainable tourism while protecting the land. The Ecomuseum demonstrates valuable opportunities for growth, such as the potential for the further professionalisation of processes and the establishment of a more stable structure. It constitutes the main participatory process from which the other two case studies emerged, showcasing the dynamic and changing nature of community engagement.
2. **The Territorial Educational Pact of Casentino:** Promoted by the Union of Municipalities of Casentino under the scientific direction of the FORLILPSI Department of the University of Florence, this community engagement process began in 2020. The network formed through the Ecomuseum and was tailored to local needs, aligning with regional legislation n.32 of 2002. The pact involves a network of stakeholders, including businesses, public bodies, schools, private entities and the tertiary sector, in order to facilitate inclusive territorial governance. The

use of a pact-like structure has proven to be an effective tool to activate and make visible the social capital expressed by the community.

3. **The Heritage Community:** Heritage communities are organised forms of civil society that foster social networks and human capital relating to intangible heritage, with the aim of encouraging sustainable development (Faro Convention, 2005). The Ecomuseum has collaborated with a number of groups and associations representing heritage communities active in issues related to ritual traditions, the aim being to establish a pact that allows revitalisation and innovation in the transmission of this particular form of local heritage. The organisation of heritage communities is driven by a bottom-up logic; actions taken have no predefined objectives and are strongly desired by the participants. In Casentino, these heritage communities partly emerged from the Ecomuseum network, which is formalising a community engagement process through a pact. This formalisation seeks to give a name to existing informal networks surrounding local traditions, particularly those related to rites of passage.

The three processes described above constitute activators of citizenship and local networks. Interestingly, approximately 90% of the individuals actively involved in these processes are over 50, and more than 60% are retired, in line with local trends. The evidence collected highlights certain contextual factors and conditions that contribute to the definition of professionalisation processes (Federighi, 2021) which can influence the creation of social capital. The REACT research highlighted the role that citizens over 55 can play when they decide to make the skills they have acquired through their experience of life and work available for the development of their community.

The Casentino Ecomuseum guides these community engagement processes and embodies a hybrid professionalism that plays a role in education and care for the local area. The complexity of these community activation processes means they require someone to guide and instigate them, and this allows examination of the professional skills necessary to manage participatory processes that have a significant impact in terms of active citizenship but need to be activated, managed and mediated.

The informal contributions of older adults often mirror professional roles, such as those of cultural mediators, educators, and 'community dynamisers'. However, these hybrid professional figures are typically not acknowledged or formalised, and this limits their potential impact. By identifying and formalising

these roles, it is possible to enhance the contributions of older citizens, ensuring that their skills and knowledge are more effectively utilised for the benefit of the community.

The concept of professionalisation involves the acknowledgement and legitimisation of the informal skills and abilities that individuals acquire through their life experiences (Del Gobbo & Federighi, 2021). In the case of the Casentino, professionalisation processes could help to transform the informal contributions of older citizens into structured roles that are integrated into local development strategies. This could include the creation of new professional figures in the fields of education, cultural heritage management, and community development tailored to the specific needs and characteristics of the locality.

### **3. CHALLENGES AND OPPORTUNITIES**

While the Casentino benefits from a rich reservoir of social capital, there are also significant challenges that must be addressed in order to fully leverage the potential of older citizens. One of the main challenges is the limited institutional support for community-led initiatives, which often rely on the voluntary efforts of a small number of individuals. This lack of support can hamper the sustainability of such initiatives and limit their ability to generate broader community benefits. Another challenge is the low level of youth participation in community activities, which threatens the continuity of social capital across generations. To address this issue, it is essential to encourage intergenerational collaboration and create opportunities for young people to engage with the community. This could involve the development of educational programmes that focus on local heritage and traditions in an innovative way. The context appears to constitute a laboratory for the observation of professionalisation processes with the potential to define new professional education-related roles in territorial contexts characterised by a high population of over 55s, who are an important local resource. Moreover, the Casentino's cultural heritage is a valuable asset that can be leveraged to attract visitors and generate economic opportunities. By incorporating the contributions of older citizens into local development strategies, it is possible to create a more inclusive and resilient community that values the skills and knowledge of all its members.

## CONCLUSION

This paper seeks to highlight the transformative role that older adults play in activating and sustaining social capital within the Casentino community, and in the management and conservation of its cultural landscape. Initiatives such as the Casentino Ecomuseum, the Territorial Educational Pact and the Heritage Communities illustrate how older citizens have the potential to foster networks of trust, facilitate the circulation of local knowledge, and bridge generational gaps. By acknowledging and valuing their contributions, and by addressing the systemic barriers that limit their involvement, it is possible to unlock the potential of ageing populations to drive sustainable rural regeneration. Education plays a crucial role in supporting the active engagement of older citizens and in fostering community development. Lifelong learning opportunities can help older adults to continue developing their skills and to remain active participants in society, helping to combat depopulation and becoming catalysts for social innovation and resilience.

# EDUCATION, LEARNING AND SKILLS FOR ACTIVE AGEING: AN ITALIAN RESEARCH ON GOOD PRACTICES

Vanna Boffo<sup>a</sup>  
Debora Daddi<sup>a</sup>  
Christel Schachter<sup>a</sup>

<sup>a</sup>University of Florence

The literature review examined the main studies on the topic of active ageing in relation to the construction of educational care to contrast the fragility of the older person and the individual transition to a new phase of their life. Starting from this consideration, the transversal scientific committee *Learning, Education and Active Aging*, set up within the *Age-It Programme*, is conducting national research aimed to collecting Good Practices for understand the processes linking learning, education and work in active ageing, in order to build a map of them at national level. The mixed research design has seen the active involvement of the Programme's stakeholders, in particular medium and large sized companies and social enterprises, both public and private. The analysis of the quantitative data identified several categories capable of guiding the selection of the Good Practices considered most representative, in terms of population, actions and socio-educational impact. Consequently, in-depth interviews were conducted to explore the intentions and the level of planning underlying the educational action proposed on the territory. The results provided a clear vision of the presence and diffusion, on the territory, of educational and learning processes aimed at the wellbeing of the population in transition and at the development of those *life skills* capable of supporting entry and remaining in the old age phase.

active ageing; retirement; good practices; lifelong learning

## 1. AN INTRODUCTION TO PEDAGOGICAL MODELS FOR ACTIVE AGEING

The transversal Scientific Committee *Learning, Education and Active Ageing*, set up within the *Age-It programme*, has launched a national research aimed at

collecting existing good practices with the objective of mapping the research and projects that have a connection with the themes of Learning and Education, understood as learning and training processes both of the population and of professionals working in contexts of intervention or promotion of Active Ageing (services, administrations, public, private, health, local, regional institutions)

Education and learning entail and support reflection on the need to shape one's life through the development of the personal self and through the multiplicity of cultural and social forms that constitute man's ecological environment (Dewey, 1899; 1916). Living in an ageing society implies not only preparing for old age, preventing illnesses and taking care of personal, social and collective development, but also training professionals, volunteers, family caregivers and politicians to become more aware of the processes needed to be able to support the wellbeing of all, with a vision oriented towards inclusion and social justice. Based on these premises, learning and participation in formal, informal, non-formal, integrated and embodied educational processes (Knowles, Swanson & Holton III, 1990) constitute the reference points of Board *Learning, Education and Active Ageing*.

Educational research also focuses on the construction of a self-care that extends into a care for the other and for the world, in order to prevent the spread of human frailty resulting from an educational poverty that increasingly manifests itself in adulthood, causing illness, social degradation, forms of loneliness and isolation. Such factors often lead to depression and the progressive abandonment of one's human form (Foucault, 1984; Nussbaum, 2010; 2011).

Learning and education, therefore, are categories that derive vitality from the acts of care that people bring to bear within educational and training processes. Care gives dimension to learning processes because it gives them a sense of direction. Care is, moreover, a reflective practice, which implies critical action and consciously responsible thinking (Mezirow, 1991; Schön, 1987; Tronto, 1993). Lifelong learning is the main instrument for building educational care and for promoting well-being in the future of a long-lived society and for ensuring social justice (Rawls, 1971; Nussbaum, 2010; 2011). This model does not only support the needs of an ageing society, but also contributes to the creation of more inclusive and just communities in which education acts as an engine for equity and social progress.

## 2. RESEARCH DESIGN

Starting from the theoretical assumptions outlined above, *mixed method research* was conducted with the very aim of exploring existing practices within the national context, promoted by the Associations and Bodies of the sector<sup>1</sup>. The choice of adopting the mixed method methodology proved to be the most appropriate for the study and in-depth study of this educational phenomenon, with an interdisciplinary and multi-perspective outlook (Creswell and Plano Clark, 2007).

In particular, the research was divided into four distinct phases a first phase, carried out by the Professors and Researchers of the Transversal Scientific Committee Learning, Education and Active Ageing, involved the elaboration of a semi-structured questionnaire and its relative administration through Google Forms<sup>2</sup>; a second phase involved the analysis of the data, aimed at the construction of the second research tool, i.e. the outline of the semi-structured interview; a third phase involved the administration of interviews to a privileged sample of respondents to the questionnaire and, finally, an awareness-raising action was carried out on the territory through the organisation of a dissemination event at national level<sup>3</sup>.

Regarding the first part of the research, i.e. the semi-structured questionnaire, the latter consisted of 47 items of which 42 were closed-ended questions and 5 open-ended questions. A total of 50 good practices were collected, divided as follows: 30 from the Third Sector, 13 proposed by the Public Administration and, finally, 7 carried out by private enterprises. Going into greater detail regarding the analysis of the sample, it is important here to highlight the geographical distribution, which saw a complete extension from the north (18) to the south, including the islands (4), with particular involvement from central Italy (20).

From this sample 12 realities were subsequently selected (between Associations and Bodies) to which a semi-structured interview composed of 20 questions was administered, with the aim of provoking reflection on the theme of active ageing and exploring the training and educational activities promoted

---

<sup>1</sup> The research involved Associations and Organisations on the list of Stakeholders collaborating within the *Age-It* Programme, *Ageing Well in Ageing Society*.

<sup>2</sup> The Transversal Scientific Committee *Learning, Education and Active Ageing* availed itself of the support of the Social Enterprise and University Spin-off *MoCa Future Designer* for the following actions: contacting the Associations and organisations, administering the questionnaire by telematics or telephone interview, first draft of the re-elaboration of the data that emerged and analysis and analysis of the critical aspects of the survey instrument.

<sup>3</sup> Please refer to the dedicated section within the *Age-It* site, *Ageing well in an ageing society* available at the following link: National Conference Board LEAA Florence 2024 - Age-It (25.11.2024).

in the area, understanding the presence (or not) of an educational project that guides this action.

As can be seen in the table below, once again the Third Sector confirms itself as the most responsive entity, with an involvement of realities extending in size from the mega to the micro level.

Tab. 1. Distribution of the sample of interviewed realities. Edited by the authors.

Entities	Level	Part of Italy
Third Sector	Mega Level (1)	Central (Lazio)
	Macro Level (2)	Central and South (Tuscany and Calabria)
	Meso Level (2)	North and Central (Veneto and Tuscany)
	Micro Level (5)	North and Central (Lombardia and Tuscany)
Public Administrations	Meso Level (2)	Central and Islands (Tuscany and Sardinia)

In the following section, a brief restitution will be made regarding the common and divergent elements emerging from the good practice analysis, with a focus on the second phase of the research.

### **3. QUALITATIVE RESEARCH: MAIN RESULTS ON EDUCATIONAL PROCESSES AND LIFE SKILLS**

As underlined above, the semi-structured interviews carried out by the Transversal Learning, Education and Active Ageing Scientific Committee highlighted the explicit, and above all implicit, characteristics of the good practices existing on the national territory. The common dimensions that emerged from the questionnaire mainly revolve around three areas of reference: *A) Personal care and Well-being; b) Social care and Well-being; c) Learning Policies*. Within these dimensions, personal empowerment and integration emerge as relevant, fostering personal inclusion in support of frailty, individual vulnerability and exclusion; the promotion of self-care aimed at supporting autonomy, awareness and personal growth; and, finally, social inclusion and

intergenerationality, encouraging the ‘social health’ of all and not only of the elderly.

Distinctive elements concern the content and scope of practices, as each proposal focuses on specific areas; the teaching methodologies, such as training programmes, artistic activities, sports or practical support services; the dimensions, as some proposals operate at the local level, while others have a broader scope and may involve several municipalities or regions; and, finally, the different partnerships.

The textual and narrative analysis of the interviews, done using the Atlas.ti 24 software, produced 112 codes and 22 code groups, from which an interpretative process was initiated, expanding on what the questionnaire returned, and which can be summarised as follows:

Tab. 2. Categories and codes emerged through analysis with Atlas.ti 24. Edited by the authors.

Category 1 – Role of territorial networks and sustainability for Active Ageing		
Codes’ Group	Relevant Codes	Major National Entities
Organisational sustainability Economic sustainability Lifelong Learning partnerships and networks	Lack of a strategic dimension and a solid organisational structure Excessive bureaucracy Limited budget and lack of external funding Co-organisation with other local authorities	AUSER Calabria CPIA 4 Oristano, Sardinia
Category 2 – Building a Culture of and for Ageing		
Codes’ Group	Relevant Codes	Major National Entities
The development of active citizenship Creation of a common language Fragility and Vulnerability of the Elderly Population	«Young» elders, «upcoming» seniors Depression, loneliness, social isolation	Association for the Rights of the Elderly (ADA), Milan National Association of All Ages Active in Solidarity (ANTEAS), Venice

Category 3 – Educating to Educate. Caring for oneself, others and the community		
Codes' Group	Relevant Codes	Major National Entities
Care for transitions Intergenerationally and Sense of community Reflexivity and metacognition Sense of social self-concept	Self-care and Care of the Elderly Process Public History: memories and stories of places Promotion of intergenerationally Intercultural Dimension Maintaining a social role	Association for the Rights of the Elderly (ADA), Venice Anchise Group, Milan
Category 4 – Formative and Educational Processes for Lifelong Learning		
Codes' Group	Relevant Codes	Major National Entities
Learning courses (bottom- up) Non-formal activities Peer to peer activities (by members for members) Evaluation and monitoring	<u>Types of activities:</u> Awareness- raising and prevention, orientation, reflection and writing, cultural- artistic <u>Areas/themes of activities:</u> Computer and digital literacy, ecological-environmental transition, nutrition, etc Absence of evaluation by the funding entities, no continuity of activities	Free-age University, Florence AUSER, Tuscany Nestore Association, Milan
Category 5 – «Seniors» and work		
Codes' Group	Relevant Codes	Major National Entities
Skill Recognition/Certification Using members' expertise Mentoring/accompaniment for transition to/from work	Previous professional career Seniors as a resource	AttivaMENTE Association, Florence Third Sector Forum, Lazio
Category 6 – Learning Policies		
Codes' Group	Relevant Codes	Major National Entities
Employability opportunities for older people Upgrading and re-skilling the worker Reconsidering the role of the volunteer Creation of an institutional network	Retiree 'condition'/status change Decline of volunteers at national level Relationship between public and private social sector	Third Sector Forum, Lazio

Culture emerges as an implicit fact of the formal, non-formal and informal actions that a country produces for its inhabitants. Moreover, evaluation and monitoring are informal and unstructured, through the perception of spill-over effects in terms of engagement and involvement in the territory. Few respondents have an explicit theory of education and learning in later life, its personal, social and cultural implications, and the pedagogical framework that would support the design, implementation and evaluation of learning outcomes and impact.

#### **4. CONCLUSIONS AND FUTURE PERSPECTIVES**

The research conducted highlighted the variety and unevenness of the initiatives promoted by the Third Sector, the Public Administration and the private sector in the field of active ageing. The methodological approach adopted, based on a *mixed method*, made it possible to collect both quantitative and qualitative data, thus offering a multidisciplinary view useful for delving into the complex dynamics of this phenomenon.

The results indicate that good practices focus on three key dimensions: a) personal and social well-being; 2) inclusion and self-care; 3) educational policies for lifelong learning. Although the practices adopted are diverse in terms of the content proposed as well as the dimensions and methodologies adopted, a common goal is emerging: promote active ageing that fosters autonomy, intergenerational relations and personal growth. However, the research also highlighted certain shortcomings, in particular the lack of a shared pedagogical vision to guide the design and evaluation of the proposed activities.

The qualitative study, carried out by means of semi-structured interviews, highlighted the crucial role played by territorial networks together with the need to build a culture that not only meets the needs of the elderly but also encourages their active involvement in society. The character of educational actions is aimed at developing one's reflexivity and conscious action in support of an active citizenship that encourages individual responsibility. The research also emphasised the importance of organisational and economic sustainability, highlighting the need to overcome bureaucratic and financial barriers that limit the effectiveness of the proposed initiatives.

Although the research has provided valuable insights into existing practices in the field of active ageing, it is clear that work in this area is still developing and requires constant and continuous efforts to consolidate an integrated, systemic and multidisciplinary vision. This perspective is fundamental in order to take

care of the needs and requirements of an increasingly long-living population, taking into account cultural, social and economic diversities, as well as specific territorial needs, developing educational and training policies and practices that are truly inclusive and aimed at countering forms of social injustice and building a culture of longevity.

# EMPOWERING ACTIVE AGING WITH LIMITED AUTONOMY: A TRAINING PROPOSAL TO ENHANCE THE SKILLS OF HOME CAREGIVERS FOR FRAIL OLDER PEOPLE

Elisa Bruni<sup>a</sup>

Elena Luppi<sup>a</sup>

Aurora Ricci<sup>a</sup>

<sup>a</sup>University of Bologna, Italy

Current demographic changes highlight the urgent need for active, collective strategies that span the entire lifespan. These strategies aim to encourage the participation of older individuals in social life and foster a culture of solidarity, recognizing them as valuable resources within an age-integrated society. Maintaining quality of life at home has become a crucial generational issue across EU countries, particularly during the pandemic. Many countries should develop recognized accreditation programs to train caregivers and service professionals, aiming to improve the quality of life and home care for frail older adults, especially those with dementia. Given the current situation and future prospects, it is essential to reassess the needs of home care services and reconsider the training and skills of professionals providing them. This requires action on three levels: fostering a personalized and proactive approach to aging at the micro level; enhancing training for home care professionals with a focus on resilience and life skills at the meso level; and ensuring welfare system sustainability at the macro level. This contribution presents the “Qavad Project”—an Erasmus Plus initiative aimed at enhancing support for maintaining autonomy and assisting professionals in home care. Grounded in a theoretical framework that incorporates key pedagogical and psychosocial perspectives on older adult care, the transnational partnership developed a training model to innovate and support the training of home care professionals. The model consists of 8 modules, adaptable to the target audience. The outcomes of the piloting phase of the training modules will be discussed.

active ageing, quality of life at home, ageing in place, home care services, training and skills development.

## INTRODUCTION

Current demographic shifts underscore the need for active, collective strategies that span the entire lifespan. These strategies aim to foster the participation of older adults in social life and cultivate a culture of solidarity, recognizing this demographic as a valuable asset within an age-integrated society. (Gasperi, 2013).

Within this framework, the pivotal role of active ageing, in a critical intersectional perspective, in addressing the challenges of aging becomes even more significant when considering the care needs of frail older individuals. The decreasing reliance on the traditional institutionalization model has shifted focus toward approaches that support individuals aging in their own homes, aligning with the well-being framework promoted by the WHO (2002). Ensuring the quality of life within the home environment has emerged as a critical concern across EU countries, a concern that was particularly highlighted during the pandemic.

As highlighted in the Care Needed Report (OECD, 2018), most countries should establish accredited training programs for caregivers and service professionals, equipping them with the necessary skills in care provision and social support. Such initiatives are essential for improving the quality of life and home care for frail older adults, particularly for those living with dementia.

Given the current context and future challenges, it is imperative to reassess the requirements of home care services and reevaluate the training and competences of the professionals who provide them. This process necessitates the establishment of a robust foundation at multiple levels: at the micro level, fostering a paradigm shift in individual thinking and practices, enabling older adults to shape their later years in a highly personalized way, while maintaining a proactive approach and a sense of purpose in their experiences (Deluigi, 2008); at the meso level, strengthening the training systems for home care professionals by prioritizing the development of life skills, coping strategies, and resilience (Boffo et al., 2023); and at the macro level, contributing to the sustainability of welfare systems by aiming to reduce public expenditures on social and health care interventions.

The “Qavad Project,” an Erasmus Plus initiative, was designed to improve the quality of life for older adults living at home by providing tailored training to professionals and families engaged in home care services.

## 1. PROJECT AND TRAINING PROGRAM

The Erasmus Plus Project “Qavad – Qualité de vie à domicile”<sup>1</sup> began in September 2019. The pedagogical model adopted promotes a paradigm shift (Baltes & Baltes, 1990; Baltes & Brim, 1979; Feil, 1993; Jones, 1999; Kitwood, 1997), moving beyond the adult-centric perspectives to focus on individual needs and fostering quality of life in aging. It acknowledges that, for older adults, quality of life is intrinsically linked to active participation in decisions on the living environment, care plans, and activities, both individually and collectively. This goal demands a rethinking of professional training to better support and enhance such processes (Altieri & Santangelo, 2021; Sala et al., 2020).

The project developed initiatives and best practices leveraging home care to enhance the quality of life for older adults, including a training model for professionals in home care settings. The program comprises eight modules (120 hours) and can be adapted to the target audience. The modules are structured with a transversal and multidisciplinary approach, to be tailored to the specific audience: family caregivers, volunteers, or professionals. Moreover, the topics and contents can be addressed both from the perspective of professionals, focusing on practical tools to be implemented, and of managers, with an emphasis on the development and application of risk prevention strategies.

- *Models, Methods, and Knowledge of Care.* This module focuses on care models and methods, emphasizing person-centered care. It addresses normal and pathological aspects of aging and encourages reflection on professional care experiences. Exploring the relationship between care and home care, it promotes a relational approach within a multidimensional framework to meet all fundamental individual needs.
- *Know-How: Care Activities and Non-Medicinal Activities at Home.* This module provides participants with the knowledge and skills necessary for home care, focusing on strategies and procedures that respect individual identity, foster autonomy, and promote well-being with dignity and support.
- *Professional Tools for Investment and Spatial Planning.* This module imparts knowledge and skills to support independent living at home, emphasizing the creation of environments that respect both the individual’s habits and the surrounding environment. It promotes

<sup>1</sup> Coordinated by Etcharry Formation Développement. Partners: Laguntza Etxerart (FR), Gaves and Bidouze Association (FR), Department of Educational Sciences of the University of Bologna (IT), Cefal (IT), Solco Insieme (IT), Matia (ES), Nazaret (ES), FIOH (FI), Foibekartano (FI).

autonomy and participation in daily activities while preserving the dignity and abilities of the person receiving care.

- *Technology for Care.* This module examines the ethical aspects of welfare technologies in care for older adults, exploring current and future trends. Participants learn about available technologies and their impact on caregiver-client relationships, while understanding how these innovations empower older individuals, enhance their quality of life, and foster societal inclusion.
- *Caregiver Well-Being and Coping Strategies.* This module aims to strengthen caregivers' role modelling by developing skills to manage stress and prevent burnout. Participants explore strategies to improve their well-being, effectively address caregiving challenges, and maintain a healthy work-life balance.
- *Communication and Interaction.* This module promotes ethical communication and empathy in caregiving, emphasizing the importance of considering cognitive and physical abilities when interacting with individuals. Participants learn to manage conflicts in caregiving and foster respectful, life-affirming written communication. It also highlights the value of diversity and equity in all forms of communication and interaction.
- *Management.* This module aims to develop strategies for effective management that enhance well-being in the workplace, improving communication between caregivers, individuals, and their families, as well as using digital technology to facilitate team communication. Participants explore methods to prevent psychosocial risks and improve work organization to create supportive and efficient care environments.
- *Coordination, Partnerships, Networks in a Territory.* This module aims to raise the visibility and empower older adults living at home. It shares knowledge, skills, and experiences to enhance their quality of life. It emphasizes the importance of collaboration and the development of local networks to support older individuals within their communities.

To ensure the modules' effectiveness and adaptability, project partners piloted them in their local contexts, selecting modules based on regional needs. A blended learning approach, using an online platform, was adopted due to COVID-19. This phase provided feedback and assessed content effectiveness, enabling continuous program improvement.

The piloting addressed the needs of field caregivers, volunteers, and family

members through the foundational modules, with the management-focused module reserved for future initiatives involving coordinators and leaders. For these reasons, the piloting phase did not include Module 7.

In France, Modules 5 and 6 were piloted, focusing on caregiver well-being and ethical communication. In Italy, Modules 1, 3, 4, 5, 6 were tested, reflecting a comprehensive approach that included foundational caregiving models, interior space organisation, technology for care, caregiver well-being, and communication. Spain focused on Modules 1, 2, 5, 6, emphasizing care models, practical activities, and caregiver-centered support. Finally, Finland piloted Modules 4 and 6, with a particular focus on technology and communication.

Tab. 1. Expectation Dimension. Source: elaboration by the Authors

EX-ANTE	EX-POST
1. I expect the course to be engaging	1. The course was engaging
2. I expect the course to be interesting	2. The course was interesting
3. I expect the time to fly during the course	3. Time flew by in the course
4. I expect the course to be easy to concentrate on	4. It was easy to maintain concentration in the course
5. I expect to feel involved during the course	5. I felt engaged in the course

Tab. 2. Satisfaction Dimension. Source: elaboration by the Authors

1. The interaction with the trainer
2. The interaction with the other training participants
3. The teaching methods used by the trainer
4. The level of trainer preparation
5. The teaching materials used
6. The training setting
7. The training in general

The evaluation design for the training activity followed a pre-experimental design with a group, utilizing only pre-test and post-test assessments (Gay et al., 2009). The modules were assessed through an online questionnaire administered at two stages: ex-ante (T1) and ex-post (T2). The questionnaire explored two key dimensions: expectations and satisfaction (Tab. 1 & 2). The expectations dimension (T1 Cronbach's  $\alpha=,751$ ; T2 Cronbach's  $\alpha=,882$ )

examined the respondent's agreement with five statements on a scale from 1 to 5. The satisfaction dimension (T2 Cronbach's  $\alpha=.834$ ) measured the respondent's level of satisfaction with the course, using seven statements rated on the same scale.

## **2. CONCLUSIONS**

The data collected through the questionnaire offer insights into the effectiveness of the proposed training model. A summary of the key results provides an overview of the course outcomes.

The sample consisted of 83 respondents, with 53% professionals with prior training in care, 16% professionals without previous training in care, and 57% female participants. Additionally, 40% of the respondents held an Upper Secondary School diploma.

The results are based on the questionnaire administered across all modules, reflecting participants' expectations and satisfaction levels throughout the course. On the expectations dimension, a significant difference was observed in the item 3, "The time to fly during the course" (M: T1=3,60; T2=4,29), indicating a positive shift in expectations over the course duration.

In the satisfaction dimension, significant scores were recorded in several items: Item 1, "The interaction with the trainer" (M=4,55); Item 3, "The teaching methods used by the trainer", (M=4,53); Item 4, "The level of trainer preparation", (M=4,63); and Item 7, "The training in general", (M=4,57). These results suggest high levels of satisfaction with the interaction, teaching methods, trainer preparation, and overall training experience.

It is interesting to further explore the results for Modules 3 and 4, which deserve particular attention due to lower mean scores in specific areas. Item 2, "The interaction with the other training participants" (M=3,25), suggesting that participants felt the interaction with peers could have been more engaging or effective. Additionally, Item 6, "The training setting" (M=3,50), indicating that the environment in which the training took place may not have fully met the participants' expectations or needs. The lower scores may be due to the blended learning format, which, due to COVID-19 restrictions, limited in-person interactions. Specifically, Modules 3 (Professional Tools for Investment and Spatial Planning) and 4 (Technology for Care) could have benefited from more interactive, practical experiences and discussions, which were hindered by the reduced face-to-face contact (Mali & Lim, 2021; Steenkamp & Chipps, 2024). These factors likely affected the overall training environment and participant

engagement.

The results of the Erasmus Plus Project “Qavad – Qualité de vie à domicile” show the potential of the training model in enhancing the skills of professionals and caregivers in home care for older adults. Despite COVID-19 pandemic, which limited in-person interactions and may have affected participant engagement and satisfaction, the overall feedback indicates positive outcomes regarding the relevance and effectiveness of the training content. The blended learning approach, while impacted by the pandemic, offered flexibility and adaptability, enabling participants to engage with the material and apply key concepts in their professional contexts. However, the results highlight areas for improvement, particularly in fostering higher interaction among participants and optimizing the training environment. A more dynamic, interactive approach focused on enhancing peer collaboration and better adapting the training setting to participants’ needs would be beneficial. Future research could explore the long-term impacts of the training model on professional practice and the quality of home care services for older adults. Additionally, studies could investigate the effectiveness of different delivery formats and examine how contextual factors, such as cultural differences and technological infrastructure, influence training outcomes. In conclusion, the project highlights the value of continuous professional development in the field of home care for older adults, offering valuable insights for further refinement and scaling of the training model.

# ACTIVE AGEING FOR CULTURAL SERVICES: FOCUS ON ELDERLY POPULATION IN INLAND AREAS

Giovanna Del Gobbo<sup>a</sup>

Sofia Marconi<sup>a</sup>

Cristina Banchi<sup>a</sup>

Giulia Biagi<sup>a</sup>

Francesco De Maria<sup>a</sup>

<sup>a</sup>University of Florence

In the last twenty years, the concept of local heritage has changed and expanded, with a general convergence towards the unity of natural, cultural and social dimensions (Del Gobbo & Galeotti, 2018). The current debate also confirms the shift towards people-centred approaches (Auclair & Fairclough, 2015), suggesting a focus on bottom-up processes in cultural policy and heritage governance, involving diverse stakeholders and dynamic networks for heritage management and use. This paradigm shift influences the day-to-day activities of cultural institutions and third sector actors providing access to, use and preservation of local heritage (UN, 2022; Gordon & Beilby-Orrin, 2007). This article presents the results of a pilot study conducted in the Casentino valley, a mountainous region in the centre of Tuscany with a high age index. A mixed methods approach was used to identify the active participation of the over 55s in the provision of cultural services and the benefits of active ageing through the enjoyment and use of cultural heritage. The study is original in it aims to highlight the fundamental role of the older population in ensuring access to and use of cultural heritage by tapping the potential for informal and non-formal education opportunities.

active ageing; cultural heritage; community wellbeing; ecosystem services; inland areas

## INTRODUCTION

This paper presents the results of a study carried out in the mountainous region of Casentino in Tuscany (Italy), focusing on the active participation of the over

55s in the provision of cultural services. In particular, it examined the extent to which cultural heritage valorization activities promote active ageing among the over 55s and to which these individuals, generally acting within local cultural associations, foster a knowledge of the values and traditions of the mountainous region in which they live.

The literature points out that volunteering, in this case in the cultural sphere, contributes to the sustainability and well-being of local communities (Zaidi & Stanton, 2015). Therefore, volunteering can also be associated with favorable processes of active ageing in territories where it is practised and widespread (Boerio et al., 2023; Jongenelis et al., 2022). Active ageing refers to a category based on three pillars, as proposed by the Active Ageing Index<sup>1</sup>: health, participation and security. Cultural volunteering and related activities promote the well-being of the over-55s, while volunteers' participation in the local community strengthens and defines their role. The creation of solidarity networks through the mechanism of volunteering not only combats ageism<sup>2</sup> but also creates social security, especially when supported by inclusive measures (Zaidi & Stanton, 2015).

In the case in point, mediated by associations active in the territories and their volunteers, cultural heritage promotes active ageing processes, playing an intrinsic educational role, and promotes the development of social skills and competences such as critical action, greater autonomy, self-control and empowerment (Marconi, 2024; Fancourt & Finn, 2019). Participation in heritage-related activities promotes overall social wellbeing, particularly among the over 55s, and improves cognition, the quality and quantity of relationships, and a sense of closeness and belonging (Bone & Fancourt, 2022; Goulding, 2018; Dadswell et al., 2017).

The approaches outlined above see cultural heritage as a valuable resource for active ageing, the well-being of individuals and local communities. They refer to models that are people-centred and not just about heritage preservation (Auclair & Fairclough, 2015), and are thus able to incorporate intangible, natural and social aspects alongside tangible ones (Del Gobbo & Galeotti, 2018) by adopting a holistic perspective (Del Gobbo et al., 2018).

In particular, the epistemological approach of ecosystem services, which was used as a reference for the present study, emphasises the fact that culture and

---

<sup>1</sup> <https://unece.org/population/active-ageing-index>

<sup>2</sup> According to the World Health Organisation (WHO), ageism refers to stereotypes (the way we think), prejudice (the way we feel) and discrimination (the way we act) against others or ourselves on the basis of age.

cultural activities can be considered as community services that generate non-material benefits, such as learning or spiritual enrichment, and contribute to the overall well-being and development of individuals and communities (MA, 2005). At the same time, the theoretical approaches described encourage a rethinking of cultural heritage management. Only through the active involvement of different stakeholders of different ages and the existence of dynamic networks can local cultural heritage, with its specific characteristics and attributes, be managed effectively and sustainably.

## 1. BACKGROUND

The Casentino valley is a particular subject of the National Strategy for Inner Areas<sup>3</sup> (S.N.A.I.) as it is a mountainous area at risk of marginalization. Specific funds are allocated to this territory for the improvement of services and the promotion of activities that can improve the local economy. Despite the phenomenon of depopulation and demographic ageing, the Third Sector and local associations are active in Casentino, with a total of 154 organizations registered in the Third Sector Single National Register<sup>4</sup> (RUNTS), offering informal and non-formal learning opportunities.

## 2. RESEARCH QUESTIONS

The hypothesis underlying the present research in Casentino is that the cultural third sector fosters processes to improve social capital and community well-being (Atkinson, et al., 2017), being able to nurture social relations, create or improve territorial services and promote active citizenship (UN, 2022; Krlev et al., 2021). In particular, volunteers over the age of 55 engaged in cultural associations in Casentino give their time and knowledge to their local community and are important actors in the processes of transmission, hybridization and cultural creativity that can emerge in territories, especially in mountainous areas (Viazzo & Zanini, 2014). The questions guiding the research were twofold: 1) Do the over 55s in Casentino play a role as producers of cultural services, and do they promote access to and the dynamic preservation of the region's cultural heritage? 2) Is there a recognizable relationship between

---

<sup>3</sup> <https://politichecoesione.governo.it/it/politica-di-coesione/strategie-tematiche-e-territoriali/strategie-territoriali/strategia-nazionale-aree-interne-snai/>

<sup>4</sup> The Third Sector Single National Register (RUNTS) is a tool to get to know non-profit organisations, containing basic information about the characteristics of registered organisations, further to Article 45 of the Law on the Third Sector (Legislative Decree No. 117 of 3 July 2017)

cultural volunteering and active ageing?

### **3. METHODOLOGY**

Case study. The research design used to investigate the relationship between the over 55s, active ageing and cultural heritage is qualitative-quantitative (mixed and multi methods), correlative and observational, with an exploratory objective to describe and interpret an ongoing phenomenon that has been little studied from an empirical point of view. What is described in the article is a digital form that was created with a set of survey dimensions that could be freely compiled by the contact persons of the cultural associations surveyed. The main dimensions of the organizations surveyed were: the type of activities carried out; the number of people active in the organization; the youngest, oldest and average age of people active in the organization; the ageing of the population and strategies for generational change.

#### **3.1. Convenience Sampling**

Between March and May 2024, 154 associations in the Casentino region were identified via the Third Sector Single National Register (RUNTS). Of these, 38 were contacted, as they could be categorized as cultural. During the contact process 5 organizations could not be contacted, while 33 associations confirmed their willingness to participate in the study. In the end, 27 associations actually took part in the survey, with 26 cultural organizations returning the completed form by e-mail and one organization preferring to submit their data by telephone.

### **4. RESULTS**

The data on the 27 participating associations provided useful information on the type of cultural activities and services promoted by the different organizations surveyed, as well as on the profile of their members. The six main areas of activity of the cultural associations appear to be archaeological and historical research, organization of exhibitions and festivals, management of libraries and craft workshops, maintenance of village decorum, promotion of tourism and food culture, and promotion of sporting activities. The cultural associations in Casentino that took part in the survey have a total of 1988 members, 1021 of whom are volunteers. The average age of members is 60, with a top age of 90 and a low of 6. The spokespersons of the associations interviewed stated that the over 55s are very much involved in the proposed activities, in terms of

organization, leadership and commitment to the region, and that these people have strong ethical and civic values. Furthermore, 20 of the 27 respondents believe that the progressive ageing of the population in Casentino threatens the sustainability of the cultural activities they currently propose in the territory. In particular, four associations are very concerned that without a generational change, they will close within a few years, which could have a negative impact on the cultural heritage of Casentino. To address this issue, 17 of the 20 associations state that they have already launched initiatives to involve young people more in Casentino, although the results of these strategies cannot yet be assessed. Youth participation seems to be crucial for the operational sustainability of the cultural associations surveyed.

## **5. CONCLUSIONS**

The strong presence of the over 55s in the various cultural activities promoted by the cultural associations surveyed in Casentino emphasises their important role as producers of cultural services and as a source of experience and knowledge. The lack of specific and wide-ranging initiatives to address the impending impossibility for the older population of Casentino to continue to provide many cultural services in the area and to actively involve younger generations represents a major challenge for Casentino and its cultural heritage. This area is facing a profound demographic, social and cultural shake-up. Currently, a significant proportion of the cultural associations interviewed in the study are kept alive by mostly older members who are only sporadically able to create synergies and collaborate with younger people.

The study also highlighted the strong values and solidarity among the over 55s. In addition to their role in the region's cultural associations, they also benefit from cultural activities as a way to stay active. This suggests that cultural associations can serve as a platform for intergenerational processes (Baschiera, 2013), for inclusion and for the creation of a safe and cohesive social environment for the over 55s and, more generally, for the entire local community. Despite the challenges for the Casentino valley related to the ageing of the population and the management and sustainability of the cultural services currently in place, we emphasise the fact that this territory is characterized by a diverse and vibrant panorama of cultural projects and research initiatives. It is therefore possible and desirable that ongoing social and cultural transformations are able to create "empty" spaces (Viazzo & Zanini, 2014) from which creativity and cultural innovation can emerge.

# LEARNING IN LONGEVITY: A CRITICAL ECOSYSTEMIC APPROACH TO RESEARCH AND INTERVENTION

Laura Formenti<sup>a</sup>

Davide Cino<sup>a</sup>

Francesca Romana Loberto<sup>a</sup>

<sup>a</sup>Università degli Studi di Milano Bicocca

This paper discusses the need for a paradigmatic shift in research and intervention on longevity, a field dominated by linear definitions, policies, and practices. Complexity allows to understand how individual, organizational, and socio-cultural dimensions are interconnected in the process of ageing. A critical ecosystemic approach de-centres attention from the individual learner to the environment and considers the co-evolution of individuals in contexts, processes, relationships, and materiality. A critical literature review on complexity, ageing and care informs a study focusing the processes of transition related to ageing in six geographic areas and communities.

longevity; complexity; lifelong learning; interdependence.

## INTRODUCTION

Increased life expectancy presents unique challenges and opportunities for individuals, communities, and societies. Longevity not only extends biological life but changes our relationship to the world, demanding adaptations that entail new attitudes, emotions, and identities. It also changes the relationships and social landscape of a community or country that is ‘growing older’. The dominant idea of adult learning related to work and skills weakens, and the relevance of lifelong learning – i.e. any activity or experience in formal, non-formal, or informal contexts that produces new attitudes and knowledge – takes unexpected turns. As educational gerontology has started to address, the experience, learning and possibilities of growing older reframe learning as *long life* (Whitnall, 2011). The individual-istic definition of learning appears too narrow and inadequate to address these challenges, especially if we consider

the inequal distribution of resources for different categories and territories, and pervasive hidden ageism that reduces older people to ‘patients’ or ‘service consumers’. Education and learning depend on many intersecting factors. Age, gender, income, education, family structure and composition, care-giving and receiving, migration, neighbourhood, digital competence, health literacy are among the predictors of well-being, inclusion, and agency in later life. Recognizing the role of these factors in people’s lives requires systemic transformative learning that affects individuals, groups, communities, and environments (Formenti and Hoggan-Kloubert, 2023).

Transforming perspectives (Formenti and West, 2018) from the linear model to a critical ecosystemic model (Braithwaite et al., 2017; Hynes et al. 2020) would enhance our capacity to ensure justice, well-being, and meaning for all, at all ages. Learning in longevity is a systemic process of co-adaptation, where older adults are not isolated or passive recipients of care and services, or self-directed learners eager to ‘acquire new skills’, but active participants in living, meaning-making, problem-solving, and identity-building. Interactions are the basis for the co-creation of knowledge, informed decisions, good enough integrated care, and the system’s capacity to cope with changing dynamic situations, but they can also perpetrate structural violence, disrespect, and worsen the quality of life of all the involved people, since they depend on each other.

New narratives can fuel our capacity to tackle with longevity. Hachem (2023) analysed the evolution of narratives about older learners in educational theories, showing a divide between emancipatory theories where older adults appear powerless and needy (and educators as saviours) and the neoliberal myth of free, empowered, and active citizens (with educators as life coaches). A more complex idea would combine critical social theory and transformative learning to recognize the heterogeneity of older adults, the complexity of their identities and trajectories, and the unprecedented levels of agency and economic power that some of them may have in late modernity. If we define older adults in these terms, the main learning task in later life is reflexivity – on one’s life, habits, and choices, and how to pursue self-actualization and emancipation. Educators would be facilitators of self-reflexivity or enablers of “*transitional educational processes*” (Alheit, 2021, 120). Alheit’s concept of *biographicity*.

means that we can continually reinterpret our life in the contexts in which we (must) spend it, and that we experience these contexts as ‘formable’ and

'shapeable'. It is important to decipher the excess meaning of our biographical knowledge, and that means: to perceive the potentiality of our 'unlived life' (p. 120).

## **1. COMPLEXITY: A 'DESPERATELY NEEDED' CHANGE OF PARADIGM**

Research and intervention on complex adaptive systems (Axelrod and Cohen, 2000; Morin, 2008; May, Johnson, and Finch, 2016) are increasingly used to illuminate interactions and interdependence in human lives.

The science of complex adaptive systems provides important concepts and tools for responding to the challenges of health care in the 21st century. Clinical practice, organisation, information management, research, education, and professional development are interdependent and built around multiple self-adjusting and interacting systems. In complex systems, unpredictability and paradox are ever present, and some things will remain unknowable. New conceptual frameworks that incorporate a dynamic, emergent, creative, and intuitive view of the world must replace traditional 'reduce and resolve' approaches to clinical care and service organization (Plsek and Greenhalgh, 2001, 625).

A "desperately needed" change of paradigm (Greenhalgh and Papoutsis, 2018) would enable researchers to recognize tensions and multiply their perspectives to generate insights and wisdom. Complexity-based research has the power to "illustrate the plurality of voices inherent in the research and phenomena under study (...) to produce a rich, nuanced picture of what is going on and why" (Table 1, 3). Researchers and professionals, as lifelong learners, can learn to accept uncertainty and unpredictability, and develop a mindset that recognizes the "pattern which connects" (Bateson, 1979, 8) the different parts of a dynamic system. Complexity is not focused on problem-solving, but problems-setting: it interrogates the criteria used by different observers to define a 'problem'. Since tensions and paradoxes are unavoidable, researchers should explore the unexpected and embrace "creative, reflexive and collaborative ways of working and thinking" (Greenhalgh and Papoutsis, 2018, 5). Interdisciplinarity and disagreement require critical theoretical and methodological pluralism. The turn to complexity invites to fix new standards for research quality and praises interpretation as a way to transformative learning and adaptation.

Interdependence, circularity, and self-organization are the constitutive features of adaptive systems that characterize learning as a cross-cutting process, framing individuals (citizens, family members, health professionals, local administrators, and designers of tools and services) as parts of more-than-

human worlds where technologies, landscapes, artefacts, and procedures bring effects. Learning can be read at different levels: macro (Hawe, 2015); meso (Axelrod and Cohen, 2000); and micro (Formenti, West, and Horsdal, 2014). *Biographicity* (Alheit, 2021), *cooperative education* (Formenti, 2018), and *time and rhythm in emancipatory education* (Alhadeff-Jones, 2017) are concepts that help understanding the co-evolution of individual and environment.

## **2. RESEARCHING COMPLEXITY, LEARNING AND CARE**

Long life learning can be illuminated by co-evolution. At the microlevel, learning is weaved with care in the personal strategy developed to cope with ageing, not necessarily aligned to normative 'active ageing'. The person's capacity for self-care and meaning-making depends on previous trajectories and the present context, where the needs for dignity, recognition and slowing down are not always met. Caring about oneself, the others and the environment nurtures awareness of lights and shadows, and shows the dilemmas of longevity: autonomy/heteronomy; safety/risk; continuity/discontinuity; ageing-in-place/moving. A critical reading may then open new interpretative possibilities to investigate emancipation, respect, equality, meaning, and wisdom.

A critical review of 62 papers on complexity (Formenti, Cino, and Loberto, 2025) has identified three learning contexts: informal, formal and technology mediated care. The informal system of care entails learning for the older persons and their partners, children, grandchildren, companions (Suárez Vázquez et al., 2022). In this regard, *transition* is an emerging concept that brings attention to the intrinsic relationality and dynamicity of this phase of life; it became the main focus of our research. New meaning and identities are shaped by interactions among family members of different generations and by the material and symbolic weaved in space and objects (Roux et al., 2019). The complexity of care is testified by the presence of dilemmas and polarities, as well as the positive and negative sides of shared decision making, communication, and knowledge. The interplay of social factors and intersectionality of gender, income, ethnicity, education, relativize the role of age in the process.

In formal care, learning is mainly seen in relation to professional work: learning about the circularity of care, the discursive construction of ageing in language and practices, the relevance of health literacy in decision making, and issues of communication, collaboration, and integration of practices. Finally, also technology-mediated care is an educational process, with a contrast between

top-down and bottom-up approaches, where older adults can be involved as experts in designing and assessing tools. The dominant paradigm tends to reduce older adults to passive consumers of services and overlook their agency, self-determination, and contribution.

In this literature, mixed and participatory methods are used to involve insiders (Majón-Valpuesta et al. 2022); to investigate co-evolution in dyads (Berg and Upchurch, 2007); to highlight diversity of experiences and trajectories (Keating et al. 2019); and to achieve deep analysis of contexts (McCormack et al. 2002) and practices (Nowak & Hubbard, 2009).

### **2.1. Doing participatory research in territories**

Age-It is a national research program that aims at doing research to build “an inclusive society for all ages” (<https://ageit.eu/wp/en/>). Within it, our study titled *Aligning the new health and social care policies to emerging needs: a bottom-up community-based systemic approach* implements a territorial approach within 6 municipalities in 3 geographical areas: the foothills of Piacenza’s Apennine (Morfasso and Vernasca), the Susa Valley in Piedmont (Meana and Mattie), and the sub-Vesuvian area (Liveri and Terzigno).

Our work, involving researchers from education, social gerontology, family sociology, economy and technology, addresses transition as a complex process. Transitions are manifold in longevity: from paid work to retirement, from driving to being not-driven, from good health to physical fragility, from social life to more solitude and isolation. In-depth interviews with older adults are used in this study to illuminate how biographies affect meaning and identity in later life, and the role of relationships in it. Following the interviews, participatory research involves groups of older people, caregivers, decision makers, and relevant stakeholders to reflect on representations, experiences, emerging needs, or desires, and possible answers. The study aims at creating a rich representation of the specific features of each territory, resources and limits due to geographical, social, cultural, and economic factors. We are especially interested in uncovering local pockets of social injustice, unequal access to services, but also in participatory research to sustain the collective construction of meaning and value.

## **CONCLUSIONS**

A critical approach to longevity, based on complexity theories, can open new possibilities for research and intervention. The role of education and learning is

pivotal in later life, a phase that poses new questions and seeks new answers, with positive and negative outcomes. So, doing research that creates spaces for self-narration and reflection, participation and dialogue, is a way to overcome ageism and marginalization, contrasting ways of doing, policies, and languages that reduce the older persons to their vulnerability, calling them ‘patients’ and acting *on* instead of inter-acting *with* them. Or treating them as ‘service consumers’. Seeing the older person as part of a larger system of interactions, in space and time, in a material context, embedded in a community that evolves and grows older too, is a perspective that can inspire policy makers, professionals, and researchers to embrace complexity.

# ACTIVE AGEING AND THE CHALLENGES OF DIGITALISATION. EXPERIENCES FROM THE SOCIAL RESEARCH ACTIVE.IT

Giulia Melis<sup>a</sup>

Dario Pizzul<sup>b</sup>

<sup>a</sup>University of Milano-Bicocca; <sup>b</sup>University of Pavia

Digital transformation impacts every sphere of private and public life, including public administration (PA). Particularly, it affects different social groups, with the older population being among the most vulnerable. Even with efforts to increase their digital skills, there remains a significant risk of older adults being excluded from many aspects of social life when digital technologies are involved, including access to public services—an issue contradicting the active ageing principles. This contribution investigates the relationship between older people and digital technologies, with a focus on digital public services. It draws on two research streams from the ACTIVE-it project: respectively, semi-structured longitudinal interviews that explore older adults' digital practices during the COVID-19 pandemic, and participant observation within the environment of a digital literacy course. Our findings indicate that, to harness the opportunities and mitigate the risks of digital transformation, it is essential to provide institutional learning opportunities tailored to the specific needs of older age groups. Furthermore, these interventions must be supported by public institutions to address this issue systematically. Ensuring widespread dissemination and accessibility of solutions is crucial in the face of such extensive and radical societal transformations.

active ageing; older people; digital public services; peer-to-peer; digital practices

## 1. INTRODUCTION

In Italy, only 19.3% of people aged 65-74 possess at least basic digital skills, a percentage that drops to around 4.6% when considering the over-75 age group (Eurostat, 2023). In a society increasingly transformed by the diffusion and use of digital technologies in the most diverse contexts (Floridi, 2017), the risks of a digital revolution that does not adopt an intergenerational approach, which

takes into account the differences in terms of access, propensity and mode of use, is still visible. Indeed, older age groups are often excluded from the digitisation processes of different areas of social life, including public services (Pihlainen et al, 2021; Walsh et al., 2021).

This phenomenon contradicts the extensive evidence in support of active ageing, which advocates older adults' participation and contribution within societies (WHO, 2002; Zaidi & Howse, 2017). Drawing on this literature, two key themes emerge: the need to develop digital competences among older people (Gatti et al., 2017; Pihlainen et al., 2021), especially with regard to DPS; and the need to focus on older digital users, putting the peculiarities and heterogeneity of digital practices in older age back at the centre. However, this literature discusses how active ageing policies often place the responsibility for keeping up with social changes on the older population itself, rather than reframing the digital divide and the resulting risk of exclusion as a public issue (Boudiny, 2013).

Our contribution originates from the ACTIVE-it project, a social research carried out in the Lombardy region adopting a multi-method approach, which investigated the relationship between elderly people and digital technologies – first and foremost, the use of smartphones and the most commonly used apps in everyday life, including those of the PA. In this contribution, we first describe the ongoing debate on the digitisation of society and its implications on the ageing process, referring in particular to the literature on active ageing.

Focusing on the experiences with some among the main digital public services, we will then discuss some results from our two research experiences: firstly, we will discuss older adults' interest and motivation in learning digital skills, especially related to public services; secondly, we aim to shed light on our participants' difficulties in using such services. Hence, from this point of view, we aim to document how the refusal to interact with digital services, a typical stereotype about older generations, does not often correspond to the subjects' disinterest in digital technologies but is rather a choice forced upon them by the lack of access.

The lack of support in developing digital competences is thus at the centre of our attention. As we will discuss, these findings document the need to integrate digital training experiences for/with older age groups on a systemic level.

## **2. THE ACTIVE-IT RESEARCH PROJECT**

ACTIVE-it, funded by Fondazione Cariplo, studies the ageing population in Italy

within a post-pandemic context. It is a multi-methods social research, with the main goal to explore the profound challenges that the digitisation produces with respect to the well-being and social inclusion of older adults. By drawing on the key principles of the active ageing framework, i.e. well-being and social participation, we discuss how Covid-19 measures adopted since 2020 have challenged these principles, with negative repercussions for older adults. In particular, lockdowns encouraged a digital acceleration at an unprecedented pace, creating unexpected opportunities to social and economic life but also generating further risks of digital exclusion. This contribution discusses two distinct case studies of the ACTIVE.it project, both conducted in the Lombardy region in Italy. The case studies are, respectively, a longitudinal qualitative research conducted in the Lodi area, and a participatory digitalisation course conducted in the Monza and Brianza areas. As we will discuss in the following sections, where we will describe more deeply each of the case studies, in the two research we aim to directly involve the population, through interviews, participant observation and the delivery of a co-constructed digitisation course, adopting a micro sociological perspective. At the same time, in refocusing on the specific experience and needs of older people, we aim to extend the discussion to meso and macro contexts, addressing the crucial role of institutions and the third sector in facilitating (or limiting) social participation in physical and digitised contexts.

### **2.1. Older people digital practices in the everyday context**

The ILQA-19 research is a longitudinal case study, started in 2020, that focuses on the quality of life of older adults during the Covid-19 pandemic, in the first municipalities in Italy affected by the red zone as of February 2020. The study participants are a heterogeneous panel of men and women, aged between 65 and 80 (in 2020), differing in social background, marital status, social capital and digital skills. Each stage of the research was also conducted remotely, adopting innovative protocols to include participants with minimal or no digital skills (Melis et al., 2021). Each year, the study participants undergo a semi-structured video-interview conducted remotely, on different topics: the changes in everyday life during and after the pandemic, the social and digital resources to face social transformations, along with the role of digital technologies in shaping a post-pandemic society. The interviews are all fully transcribed, anonymised and archived (Sala et al., 2020; Sala et al., 2021).

The literature underlines how the older population, apart from age homogeneity, is a complex and heterogeneous set (Hargittai & Dobransky, 2017). Similarly,

the ILQA-19 panel appears diverse with respect to digital skills, preferences and practices. During the pandemic years, the drive to maintain social activities and relationships increased participants' use of digital technologies. In particular, social networks (e.g. Facebook) and communication apps (e.g. WhatsApp) often played a key role in reconstructing that everyday familiarity long suspended by public regulations to contain the spread of the virus (Melis et al., 2021).

There were numerous governmental proposals that made use of digital technologies for the management of the pandemic – e.g., the Immuni App, the platforms for vaccines reservation or, consequently, for obtaining and showing the Green Pass certificate – but also for encouraging the economic recovery. While, on the one hand, the experience with digital technologies has produced diversified types of experiences (Carlo & Nanetti, 2024), a lack of systemic support emerges across the interviews. Empirical data show how the exchange of digital skills takes place within informal, intergenerational, and family networks but also among peers; in the case of DPS, further support comes from the third sector, although not without limits: as recipients and/or providers of voluntary activities, some of our participants underline the lack of organicity of digital support interventions. It should not be forgotten that volunteering in Italy is mainly supported by the contribution of older adults, who benefit in terms of active contribution in their communities and active ageing (Boccacin, 2016) but, in the absence of adequate training of their members, are subject to the same digital difficulties as the older population in general.

In conclusion, the interviews demonstrate how our panel is often aware that the failure to keep up with society's digital transition is instead part of a broader exclusion carried out by institutions, that do not take responsibility for older people's integration and "digital autonomy" in handling their own everyday requirements. In fact, the request to activate digital procedures appears to be directed solely to social and registry groups that are already familiar with digital use practices, without offering support to those that need it the most. However, an intergenerational approach (very common when talking about older adults' informal digital support) is rarely considered when it comes to DPS enactment.

## **2.2. Peer-to-peer digital education**

The second case study assesses the impact of a digitalisation course for people over 65 on digital skills and their well-being. The course was co-constructed in partnership with Auser Monza-Brianza, 'an association of voluntary work and social promotion, committed to promoting the active ageing of older adults and

enhancing their role in society' (Auser, 2024).

The digital education course focused on the use of smartphones and useful applications in everyday life. It adopted a peer-education approach, in which people over 65, who are more experienced in the use of digital technologies, give lessons to groups of other people over 65 (Pizzul et al. 2024). Among the methodologies adopted (ibid.), one of them was participant observation during the lessons. Referring specifically to the aspects most related to the digitisation of PA, which are the ones of most interest here, the observation yields two main aspects.

Firstly, digital public services aroused more interest among participants than other topics, e.g. online shopping. The electronic health record is undoubtedly a service to which participants devoted a great deal of attention, despite the fact that some were already using it. Engaging with the digital social security service platform (INPS) also interested many, despite the fact that it seems to be less well-known than the previous platform: both raise the same concerns related to digital skills. Secondly, a significant difficulty emerged for several participants in learning the procedure to access these services independently. The main problems, however, are not so much related to the platforms themselves, but rather to their authentication systems, such as Spid or the Electronic Identity Card (CiE).

### **3. CONCLUDING REMARKS**

Digital transformation and an ageing population are two contemporary macro-phenomena affecting several Western societies, including Italy. At the intersection of these two important evolutions arise opportunities and risks for the older part of the population. This contribution sheds light on the implications that the digitisation of public services has on the elderly population and on active ageing processes – starting from the discussion on two distinct research lines of the ACTIVE-it project.

In order to embrace the opportunities and prevent the risks in this transitional phase, it is urgent to monitor the relationship between different age groups and technologies. To do so, it is necessary to critically address the exclusive individualisation of the issue, characteristic of the more neoliberal approaches to active ageing (Rubinsten & de Medeiros, 2015; Stephens, 2017); secondly, it is advisable not to fall into an 'institutional paternalism' that takes it for granted that older people are not inclined to use digital technologies; finally, digitisation measures are not accompanied by specific support to bridge the digital divide

for certain categories, such as older people.

The ACTIVE-IT project draws a possible path between these two, equally problematic, extremes, that provides a different perspective to look at the phenomenon of digital skills in the third age. In the longitudinal case study, the interviews shape an older population that, when stimulated as during the pandemic, shows a greater ability to experiment with digital practices. This interest, however, is not encouraged by institutions that do not propose systemic and tailored forms of digital learning. In the digital peer education course, participant observation showed that the interest in developing one's digital skills is well present among the older participants involved in our courses, who, when put in a position to improve themselves and master digital services independently, show initiative and the ability to self-determine their own learning path.

In conclusion, the needs expressed are to have learning places and contexts tailored to the needs of this age group, which, as the literature shows, displays digital cultures and practices specific to its generation. It is precisely at this level that the commitment of public institutions should be inserted so that learning processes can be facilitated, perhaps through peer education, in a more systemic manner.

# ENHANCING WELL-BEING AND AUTONOMY IN ACTIVE AGING: A MONTESSORI PERSPECTIVE. THE CASE STUDY 'G. PALENA'

Patrizia Palmieri  
Università di Foggia

This study explores the implementation of the Montessori method within a geriatric context, specifically through an experimental project at RSSA Fondazione 'G. Palena'. By fostering a carefully structured educational environment and engaging residents in meaningful activities, significant improvements were documented in cognitive, behavioral, and emotional well-being. The approach emphasizes individualized intervention, characterized by respect, sensitivity, and recognition of the autonomy of aging individuals. By redefining the understanding of aging, this method challenges the prevailing notion of the elderly as passive or vulnerable, instead highlighting their capacity for growth and active participation.

Montessori Method, Active Aging, Geriatrics, Lifelong Education, Well-being

## INTRODUCTION

The aging of the Italian population, one of the fastest among industrialized nations, has only recently been recognized as a priority by institutions and social actors. The rise in unemployment among older workers and their low participation in the labor market, previously neglected, have now become critical indicators. This phenomenon represents a complex transformation with social, cultural, and economic implications, making the management of demographic transition a strategic priority for the country (ISTAT, 2024).

The enhancement of the elderly population is essential for a nation's progress and competitiveness, necessitating a perspective that regards aging not only as a demographic challenge but also as a social opportunity. Older adults are a valuable social resource, particularly those who are healthy and vital, who

require the ability to live in “full citizenship” through inclusion in policies that promote access to continuous education and training. Such educational pathways not only contribute to updating basic skills but also enhance the overall education level of those over 65, a category where current levels remain unfortunately low (ISTAT, 2024).

According to the most recent statistics, 71.9% of Italians over 65 have only elementary education or no formal qualifications, while just 24.8% have completed high school, and only 3.3% hold a university degree. In total, 87.7% of this population segment has not attained a secondary education diploma, highlighting the need to strengthen education for the elderly (ISTAT, 2024).

The permanence and quality of employment among older workers are directly influenced by their level of education and opportunities for professional development. Studies indicate that rather than age itself, it is the lack of updated skills that limits the productivity of this group of workers.

The increase in longevity has led to a profound transformation in the organization of old age, which can no longer be viewed as a uniform phase of life. Today, this period is divided into at least two or three distinct phases. The term “third age” refers to the decade between 70 and 80 years, while the “fourth age” encompasses those over 80, often characterized by increased vulnerability and functional limitations. Additionally, some authors identify a “fifth age,” referring to conditions of extreme fragility and total dependence (Baroni, 2003).

The use of terms such as “young elderly” or “senior adults” to describe active and dynamic individuals over 65, contrasted with “older elderly,” reflects a more complex and diversified approach to aging. This distinction underscores that aging is not a linear process but one marked by significant heterogeneity, related both to residual capacities and socio-environmental conditions.

## **1. AGING BEYOND STEREOTYPES**

The concept of the third age is a broad and complex set of individual and collective experiences influenced by biological, health, and personal factors. Aging is an adaptive process requiring the construction of meaning and future goals, leading to diverse life paths (Iori, 2020). This variability underscores the need to view aging as a dynamic phenomenon shaped by individuals’ abilities to respond to the challenges of advancing age.

Historically, old age was marginalized socially, relegated to a form of “clandestinity.” Although it is now a topic of general interest, it remains bound by cultural restrictions, often portrayed in a sanitized manner that limits a true

expression of its complexities (Gilleard & Higgs, 2013). Where old age once signified rest, today older adults are encouraged to maintain vitality, often depicted as resilient examples of a “happy age” (Granier, 2012).

This shift reflects new social expectations, demanding that older adults not only display happiness but also demonstrate sustained vitality. Nevertheless, this perspective accompanies a social need to categorize old age under cultural guardianship (Tramma, 2000). Consequently, portrayals of aging oscillate between vulnerability and success, creating anxieties for both older individuals and the young (Martinson & Berridge, 2015).

Age-related stereotypes remain potent and affect interpersonal relationships, shaping attitudes and values despite lifestyle changes that suggest otherwise. These stereotypes can stigmatize older adults, distorting perceptions of their capabilities. Many still view old age as a time of physical decline, lethargy, and unenthusiastic daily routines, which can result in a passive existence (Luppi, 2020).

However, aging does not inherently imply inactivity. With a suitable lifestyle, cognitive abilities, especially when continuously exercised, can endure despite physical decline. Recent decades have seen increased focus on active aging, with initiatives emphasizing renewed social and health engagement. In 2002, the World Health Organization’s “Active Ageing” initiative highlighted the importance of the elderly’s social inclusion, aiming to enhance their irreplaceable role in the community through policies promoting participation and well-being. The discipline of lifelong education is rooted in classical pedagogical traditions. Comenius’ *Pampaedia* advocated lifelong education for all, while Kant emphasized the value of discipline and learning by example. Dewey’s active schooling in the United States and Montessori’s contributions in Italy offer a vision of lifelong learning as an active, continuous process.

Effective educational interventions are essential in promoting autobiographical recognition and creating stimulating environments for older adults. Such interventions, resonant with memories and senses, support the elderly in maintaining a sense of purpose despite advancing conditions (Mortari, 2019). Upholding the rights and dignity of frail older individuals revives the Montessori pedagogical model, equipping caregivers with tools to appreciate the latent potential within the elderly (De Serio, 2014).

## **2. THE MONTESSORI PERSPECTIVE AS A NEW AVENUE OF INQUIRY**

A re-examination of Maria Montessori's thought has enabled connections to be drawn with current pedagogical challenges, which have had significant implications in contemporary pedagogy and psychopedagogy.

A highly promising intervention, already used in several studies (van der Ploeg et al., 2013) with subjects experiencing cognitive decline due to multiple neurodegenerative conditions, is the Montessori Method.

The relevance of Montessori pedagogy lies in its core element—the documented and repeated observation of the educated subject within an educational context progressively organized according to emerging needs. In this way, education becomes a means to support the expansion of life in its various dimensions: intellectual, affective, social, emotional, and more (Trabalzini, 2013).

The Montessori method employs structured educational programs developed to promote learning through key elements. These include adapting tasks to the competence levels of the subjects, breaking down tasks into smaller components, categorizing elements by difficulty, and using guided repetition.

These principles have been adapted to provide personalized stimulation for different types of subjects, involving meaningful activities, and requiring significant attention and effort, particularly when applied in geriatric settings.

The Montessori method encourages considerable engagement, requiring that residents in care facilities, who suffer from cognitive decline, engage in tasks with increasing levels of difficulty—whether motor, linguistic, mnemonic, or tasks involving attention and repetition of gestures (Camp, 1999; Camp et al., 2006).

## **3. EXPERIMENTAL PROJECT AT RSSA FONDAZIONE 'G. PALENA'**

Building on this theoretical framework, an experimental educational project was launched at the RSSA Fondazione "G. Palena" in Foggia, involving a sample of 45 residents with moderate to high cognitive abilities, representative of the 76 total residents. A key focus of the research was creating an enriched environment to support hypothesized outcomes and confirm or challenge existing international studies on the subject.

A harmonious environment was meticulously created, emphasizing order and functionality. Warm wall colors, simple and familiar furniture, and minimal superfluous stimulation helped eliminate distractions and create an orderly atmosphere. Observational reports, completed by educators before and after

each session, focused on attention span, agitation levels, muscle tone, interaction with the operator and environment, mood, short- and long-term memory, concentration, familiarity with the material, and interest in activities. The observations were recorded over nine months of experimentation.

The activities were designed to engage procedural memory, which tends to be better preserved than verbal memory (Squire, 2004), minimizing linguistic demands and providing external cues to compensate for cognitive deficits. Unstructured materials, inspired by familiar objects (e.g., clothespins, kitchen utensils, string), allowed educators to demonstrate their arrangement in sequences or by color. This enabled participants to actively engage with the material, feeling empowered and capable. Each material served as a stimulus to the senses, promoting concentration, logical thinking, manual coordination, and verbalization (Benetton, 2019).

Educators presented the activities, providing examples to ease the cognitive demands required, and subsequently handed over the objects to participants, encouraging them to work independently—a key tenet of Montessori’s philosophy of learning by doing. During the experimentation phase, a consistent effort was made to adhere strictly to Montessori principles, ensuring a truly Montessori-inspired educational project. Materials were varied over time to maintain engagement, while the environment was kept quiet, orderly, and serene, with timelines tailored to individual needs.

The Montessori approach, which does not rely on lexical or semantic linguistic skills, but instead uses highly structured tasks and materials, demonstrated its potential to assist residents with neurodegenerative conditions and communication challenges. Montessori-based activities evoked high levels of engagement and enjoyment among RSSA “G. Palena” residents, consistent with findings from other studies involving nursing home residents with dementia (Camp et al., 2006). These activities also led to a modest but significant reduction in agitation scores, as shown in a broader study utilizing predetermined activities (Lin et al., 2009).

In the current study, data analysis comparing agitation levels and behavioral symptoms before, during, and after personalized Montessori-based activities indicated an overall improvement in the residents’ well-being. Observations confirmed a strong alignment with Montessori’s pedagogical principles, evident in the presence of key elements relating to methodology application, the organization of the educational environment, and the preparation of both structured and unstructured materials.

## CONCLUSIONS

The Montessori educational approach in geriatric care prioritizes the dignity and well-being of elderly individuals within a systemic framework. It demonstrates both scientific rigor and unique methodology, emphasizing “humanizing” interventions rooted in the experiences, desires, and expectations of the individual, ultimately fostering autonomy and making the elderly active participants in their environment (Musaio, 2021).

Applying Montessori principles to geriatric settings values the life history of the elderly, integrating personal narratives into a meaningful educational process that aims to activate residual capabilities, even amidst cognitive decline (Trabalzini, 2015). This approach creates an environment in which older adults feel respected and supported, ensuring their identity is preserved. Activities designed to recover autobiographical memory can significantly improve the sense of belonging and continuity, reinforcing the individual’s perception of being an active community member (Scocchera, 2020).

Engaging in personalized activities based on individual history has been shown to enhance mood and reduce problematic behaviors (Camp et al., 2006). These activities allow elderly individuals to recognize familiar elements, bolstering their sense of identity and preserving cognitive and social abilities. The approach goes beyond supporting residual capacities, fostering a dialogue between the past and present, thus honoring the uniqueness of each person (Cives, 2019).

Active listening, both verbal and empathetic, plays a crucial role in this methodology. It fosters trust, security, and a deeper understanding of the individual’s needs, affirming the Montessori approach’s effectiveness in delivering personalized and humanizing interventions (De Serio, 2021). Promoting individualized interventions that honor the nuances of aging challenges the prevailing paradigm of viewing the elderly as static and vulnerable.

The ongoing reflections on the Montessori approach’s enriching potential in creating a supportive learning environment, as demonstrated in the Foggia project, prompt further exploration of its application in broader geriatric settings. Expanding investigations could clarify the extent of Montessori principles’ use in elderly care and how they align with recent findings on neuroplasticity.

# SOCIAL PARTICIPATION, EDUCATION AND HEALTHY AGEING IN ITALY

Paolo Pasetti<sup>a</sup>

Loris Vergolini<sup>a,b</sup>

<sup>a</sup>University of Bologna; <sup>b</sup>FBK-IRVAPP

In this paper we aim to analyze the relationship between social participation and education among elderly people in Italy. Social participation, that is a key dimension of active ageing, is divided into three sub-dimensions: cultural participation; socio-political participation and social contacts. Our main research question focuses on the role played by education that can be linked to social participation in at least two ways: i) education may directly influence the acquisition of certain lifestyles and cultural tastes that lead individuals to conduct a more active social life; ii) education can also have an indirect effect through economic resources and health condition. To answer these research questions, we analyze ISTAT data (*Aspetti della vita quotidiana*, 2013-2021) by means of regression (OLS and logistic) and mediation models. Our findings corroborate our hypotheses showing that education has a strong influence on social participation and that the mediation effect is particularly relevant only for social contacts.

Italy; Ageing; social participation

## INTRODUCTION

It's well-known that the Italian demographic dynamic is characterized by high levels of life expectations at birth (Caselli et al., 2021) and by low fertility (Billari, 2022) that have led to an increase in the share of elderly population. This change poses new challenges in terms of active ageing and healthy ageing. Our work tries to contribute to this literature focusing on social participation – intended as cultural consumption and socio-political participation – and social contacts, that can be considered as possible dimensions of active ageing (WHO, 2002; Principi et al., 2023) as well as social cohesion (Vergolini, 2011). We aim to contribute to this literature focusing on the role played by education trying to estimate its total effect as well as the mediating effect of economic resources

and health status. The paper is organized as follows: the next section presents the hypotheses that will guide our analysis. The second section is devoted to the description of the data and methods used in the analysis which results are presented in section 3. The final section provides concluding remarks.

## **1. THEORETICAL FRAMEWORK AND HYPOTHESES**

The aim of this paper is to identify the role played by education in shaping socio-cultural participation and in reducing social isolation. From a theoretical point of view, education could have an impact on these outcomes in at least two ways. Firstly, it can act through a direct channel: education could push to the acquisition of lifestyles and cultural tastes that lead individuals to conduct a more active social life (Jensen & Skjøtt-Larsen 2021). In fact, highly educated people tend to have higher cultural consumption and are more active in social participation (van Hek and Kraaykamp, 2013). At the same time, having an active social life will also mechanically increase social contacts, thus reducing isolation. From this discussion, we can derive our first hypothesis:

H1: educational level is directly and positively related to socio-cultural participation and social contacts.

The second channel through which education can work is an indirect one. It has to be taken into account that social participation is a costly activity and people have to invest time and/or money to play an active role in community life (Yang & Konrath 2023). Therefore, education could have an indirect impact through the attainment of remunerative occupations. Another aspect to consider is the state of health. Older adults often devote significant time to leisure activities, like joining organized events and going out, but as people age, chronic health issues tend to increase, often implying a reduction in sustain social engagement (Galenkamp and Deeg, 2016). It is known that education has an impact on health status (Vilhelmsson & Östergren, 2018), that can be attributed to factors like the higher incomes typically associated with higher education and greater general literacy, which enable more educated individuals to make more informed decisions about their health and to be more active in prevention (Braveman et al., 2011). From this discussion, we can derive our second hypothesis:

H2: the impact of education is moderated by economic resources and health status.

## 2. DATA, VARIABLES AND METHODS

### 2.1. Data and variables

The database comprises several waves (2013–2021) of the ISTAT *Aspetti della vita quotidiana* (AVQ) survey, which is conducted annually and is representative at the regional level. This survey examines various aspects of social life among Italian households, covering the entire Italian population across all age groups. For this study, the final dataset was constructed by harmonizing and merging the cross-sectional waves, focusing solely on individuals aged 55 and over. This selection yielded an analytical sample of 113,289 statistical units.<sup>1</sup>

We rely on AVQ survey since it has all the information that we need to test our hypotheses (see Table 1 for the descriptive statistics). As anticipated in the previous section, we are interested in the effect of education on socio-cultural participation and on social contacts. More precisely, our focus is on the following dimensions: cultural consumption, socio-political participation and social contacts. For what concerns cultural consumption, we use a set of items that considers the following activities:

- Going to:
  - theatre.
  - cinema.
  - discotheque or dance hall.
  - classical music concert, going to a concert of another type of music.
- Attending sporting events.
- Visiting a:
  - museum or an art exhibition.
  - monument or an archaeological site.

These items are all measured on a scale of the frequency with which the indicated behaviour was carried out during the last 12 months. This scale ranges from 1 ('never') to 5 ('more than 12 times'). To derive a synthetic index of cultural consumption<sup>2</sup>, we employ a factor analysis to compute factor scores.

Socio-political participation is measured according to the following set of items:

---

<sup>1</sup> These are the individuals for those we observe all the variables considered in the analysis.

<sup>2</sup> The Cronbach's alpha for these items is 0.607.

- Participation in:
  - political party meetings.
  - trade union meetings.
  - voluntary associations.
  - ecological or civil rights associations.
  - cultural or recreational associations.
  - professional associations.
  - political public speech.
  - political parade.
- Listening to a political debate.

These nine items concern the performance of activities pertaining to the sphere of participation in the political life of one’s own community and, more generally, participation in social activities (cultural, civil rights, professional associations, etc.). All these items are dichotomous, taking value ‘1’ when that certain behaviour has occurred in the last 12 months, and value ‘0’ otherwise. Also in this case, we apply a factor analysis to compute a synthetic index of socio-cultural participation.<sup>3</sup>

Tab. 1. Descriptive statistics (N=113,289). Source: *Aspetti della vita quotidiana (2013-2021)*.

Outcomes		
	Mean	Std. dev.
Cultural consumption (standardized)	0.000	1.000
Socio-political participation (standardized)	0.000	1.000
Social contacts (meet)	0.498	0.500
Social contacts (count on)	0.599	0.490
Main independent variables		
Education	%	
No title	6.2	
Primary	30.1	
Lower secondary	28.2	
Upper secondary	26.0	
Tertiary	9.5	

<sup>3</sup> The Cronbach’s alpha for these items is 0.794.

Economic resources	%
Good	63.3
Insufficient	36.7
Health status	%
Good	87.6
Bad	12.4

---

Social contacts are measured exploiting two variables: the frequency of meeting friends and the existence (or not) of friends you can count on. In the first case, the frequency of meeting friends is measured by a scale ranging from 1 ('I meet friends every day') to 7 ('I have no friends'). It has been coded as a dummy variable turning values from 1 to 3 into '1' and values from 4 to 7 into '0'. As far as the variable friends I can count on is concerned, it is basically already dichotomous, except for the possibility of the answer option 'I don't know', which we considered equivalent to the negative answer.

Our main independent variable is the educational level coded in five categories: 'no title', 'primary school', 'lower secondary school', 'upper secondary school', 'tertiary degree'. The other main independent variables are those that could play a mediating role: the economic resources available to the household and the self-perceived health status. Regarding the first variable, it measures the availability of economic resources for the family with reference to the last 12 months, by means of a 4-category scale ranging from 1 ('very good resources') to 4 ('absolutely insufficient resources'). We dichotomised this variable by combining the first two categories (1-2='good economic conditions') and the last two (3-4='bad economic conditions'). Similarly, self-reported health status, initially on a 5-point scale (1='very good' to 5='very bad'), was recoded as dichotomous by merging the first three categories (1-3='good health') and the last two (4-5='poor health').

## 2.2. Methods

The analytical strategy of the paper is based on a two-step analysis. The first step is the estimation of the total effect of education on the outcomes (i.e., cultural consumption, socio-political participation and social contacts). As for statistical computations, we opted for two different models that relate the educational level to variables with different measurement scales. In the first two cases, those relating, respectively, to the indexes of cultural consumption and

socio-cultural participation we used an Ordinary Least Squares (OLS) model since these variables are quantitative. In the other two cases, those relating respectively to the variables meeting with friends and friends you can count on, which are dichotomous variables, we used a logit model and to facilitate the comparisons we present average marginal effects (Mood, 2010). We use the same set of control variables that include gender, age, marital status, employment status, citizenship, living alone, size of the city, region and the year the survey was conducted.

The second step of our analysis involves the attempt to identify the mediating role played by economic resources and self-perceived health. To do this we employ structural equation modelling (Cain, 2021) to estimate the indirect effect, that is interpretable as the share of the total effect of education that is mediated by economic resources and health status.

### **3. EMPIRICAL RESULTS**

#### **3.1. Does education matter?**

Table 2 shows the results of the first step of our analysis (i.e., the identification of the total effect of education). All the models present average marginal effects using

the tertiary level of education as a reference category.<sup>4</sup> In general, lower levels of education are associated with significant reductions in cultural engagement and socio-political participation, with effect sizes increasing as educational attainment decreases. The effects of education appear more pronounced for Cultural consumption than for Socio-political participation. Across all educational levels below tertiary, the coefficients for cultural consumption are larger in magnitude than those for Socio-political participation, indicating that lower educational attainment has a stronger negative impact on cultural engagement than on socio-political involvement. For example, having only primary education, as opposed to tertiary, is associated with a reduction of 1.034 standard deviations in Cultural consumption, compared to a 0.565 standard deviation reduction in Socio-political participation. This pattern suggests that education level influences cultural engagement more strongly than socio-political participation, potentially highlighting a greater dependency

---

<sup>4</sup> The first two outcomes are quantitative variables that have been standardized, meaning that the coefficient can be interpreted in terms of standard deviations. The other two outcomes are dichotomous variables, and the coefficients are then interpretable in terms of percentage points (pp) differences.

of cultural activities on educational attainment.

Regarding social contacts, lower education levels are associated with higher social isolation. For example, individuals with no formal education have a 13.7 pp lower probability of meeting friends compared to those with tertiary education, while this reduction amount to 25.2 pp in the likelihood of having someone to count on. Moreover, the emerging pattern suggests that lower educational attainment has a greater negative impact on the availability of reliable social support (count on) compared to simply meeting friends or acquaintances.

All in all, these results bring sound empirical evidence in support of our first hypothesis: education is a strong driver of social participation and help people in maintaining durable social connections.

### 3.2. The mediation effect of economic resources and health status

Table 3 reports the mediation effect of economic resources and health status. Our findings show that the mediation effects of both economic resources and health status are relatively modest for both cultural and social participation. This suggests that while economic resources and health do play a role, they are

not major pathways through which education influences participation in cultural and social activities. This might indicate that education’s impact on these types of participation is more direct or mediated by other factors, such as personal interests, social norms, or intrinsic motivations related to educational level.

In contrast, economic resources and health status have a far stronger mediating effect on contacts, particularly in the context of meeting with social contacts (38 pp for economic resources and 20.3 pp for health) and, to a lesser extent, on relying on social contacts (14.7 pp for economic resources and 3.5 pp for health). This indicates that economic and health resources are more crucial for maintaining and relying on social contacts, likely because these relationships may demand more resources—both financial (for travel, social activities) and health-related (physical ability to engage socially).

The evidence shown so far only partially corroborates our second hypothesis since a relevant mediating effect is in act only for social contacts.

Tab. 3. Mediation effect of economic resources and health status (N=113,289). Source: *Aspetti della vita quotidiana (2013-2021)*.

	Cultural consumption	Socio-political participation	Social contacts (meet)	Social contacts (count on)
Economic resources	3.7%	2.4%	38.0%	14.7%
Health status	0.7%	0.9%	20.3%	3.5%

#### 4. CONCLUSIONS AND DISCUSSION

In this paper we have analyzed the role played by education in shaping socio-cultural participation and social contacts of elderly people in Italy. Our results emphasize the positive role of education and show how it is mediated by economic resources and health status. In particular, cultural and social participation appear less dependent on economic and health resources, perhaps because they can be pursued individually or in more accessible, community-based contexts. In contrast, maintaining social contacts, especially face-to-face meetings, relies heavily on the availability of both financial and health resources. This distinction implies that educational attainment might facilitate social integration differently: it promotes cultural and social participation through pathways other than financial and health resources, while it supports social contacts more significantly through these resources.

# DEVELOPING AGE-FRIENDLY CITIES FOR PROMOTING ACTIVE AGEING: STATE OF THE ART IN EUROPE

Maria Grazia Proli  
University of Florence

The growing elderly population in society is considered an issue that needs to be addressed systematically to manage unescapable social and economic effects (Istat, 2023). Demographic ageing poses both a challenge and an opportunity in a society that is changing because of people's changing needs, and current expectations regarding longevity and quality of life (Boffo, 2022; Formenti, 2022). For this reason, the possibility of rethinking living spaces, public and private, as places that promote well-being and active ageing, defined as the process of optimising opportunities for health, participation and safety in order to improve the quality of life of older people, assumes great importance (World Health Organization, 2002). Within this horizon, the contribution proposes some reflections on the state of the art outlined through a narrative literature review referring to the topic of 'active ageing' in the European context, in relation to the redevelopment and rethinking of urban contexts in an 'age-friendly' key (World Health Organization, 2023).

active ageing; 'age-friendly cities', 'learning cities', lifelong learning, urban regeneration.

## INTRODUCTION

Population ageing is one of the main demographic challenges that Europe has long been facing. According to projections by the World Health Organization (WHO), by 2050 the proportion of people aged 65 and over will account for more than a third of the population in many European countries, and 68% of people will live in urban areas, compared to 55% today<sup>1</sup>. This trend, which has already been underway for at least two decades, highlights the need to 'form ageing'

---

<sup>1</sup> <https://www.who.int/activities/creating-age-friendly-cities-and-communities> (11/2024).

(Boffo, 2022), rethink urban and social policies to support active ageing, and re-create 'age-friendly' cities that facilitate healthy, independent and socially inclusive living for all age groups (Buffel et al., 2012). From the pedagogical point of view, the challenge of ageing poses the need for a profound reflection on active ageing as a central theme in Adult Education, where the lifelong learning dimension becomes the paradigm of reference to support individuals, groups and communities within the ongoing transformation processes, at social and environmental level (Boffo, 2022). In this trajectory, the concept of the age-friendly city was born with the aim of promoting an urban environment that not only meets the needs of older people, but also promotes social inclusion and active participation in community life. This approach focuses on interventions to improve the accessibility and safety of public spaces, transport efficiency and infrastructure for social wellbeing (Phillipson, 2011).

Starting from these considerations, the aim of this paper is to outline the salient features of the state of the art in relation to research on age-friendly cities in Europe, focusing on initiatives and policies that are emerging as best practices to promote ageing. Understanding the evolution of city and community patterns in favour of longevity and active ageing is crucial to building a future in which every citizen can age in dignity and actively, with full participation in community life (Beard and Petitot, 2010).

## **1. METHOD**

The literature review undertaken (Ghirotto, 2020) moves from what was developed by the World Health Organization (WHO, 2010) in connection with the Global Network for Age-Friendly Cities and Communities. The objective is to explore research experiences in the field of Adult & Continuing Education (cf. Egetenmeyer, Boffo and Kröner, 2020) in tune with processes of urban regeneration aimed at overcoming the structural fragilities of contemporary cities by looking at the model of learning cities (UNESCO Institute for Lifelong Learning, 2014).

The framework of the review is based on a broad investigation question that intends to bring out the models of cities in support of longevity and active ageing that have been widespread in Europe over the last two decades. The related objectives concern the possibility of intercepting the main factors that have driven the debate on the creation of older adult-friendly cities in order to highlight their limits and opportunities, and to bring out possible options for the evolution of social policies focused on the needs of the elderly population in

European urban areas.

The method implemented is the narrative literature review approach, which here takes the form of an initial approach to the study of the phenomenon, with the assumption of a source search strategy based on clusters of key words referring to the subjects under investigation ('older people' 'older learners' 'eldest'), the context ('community/ties'; 'city/ties' 'urban development'; 'regeneration from below'), the phenomenon ('active ageing') and the intervention model ('age friendly'). These keywords were combined into search strings via the Boolean operators 'AND' 'OR' within the Eric, Scopus, WoS, Emerald Google Scholar databases. Leading international journals in the pedagogical and multidisciplinary fields were also considered, with access to numerous contributions consistent with the review question.

## 2. RESEARCH RESULTS

### 2.1. Evolving the city idea for active ageing

The idea of 'active ageing' was originally developed during the United Nations' Year of Older People in 1999 and further elaborated by the World Health Organization (2002). The same idea was further developed in 2006, when the WHO launched the research project 'Global Age-friendly Cities'. On this occasion, focus groups involving older adults, caregivers and stakeholders in the service area and the third sector were conducted in 33 cities on all continents to identify the factors that make urban settings 'age-friendly'. Eight key issues emerged from the discussion round tables that need to be taken into account in order to make cities 'friendly for all ages' and not only 'friendly for the elderly' (Fig. 1). The results of this research led to the development of the WHO Age-Friendly Approach outlined in the 2007 document *Global age-friendly cities: a guide*, where active ageing is focused on as a framework for age-friendly cities.

Fig. 1. Age-friendly city topic areas. Source: Jackisch J. et. al. (2015), p. 109.

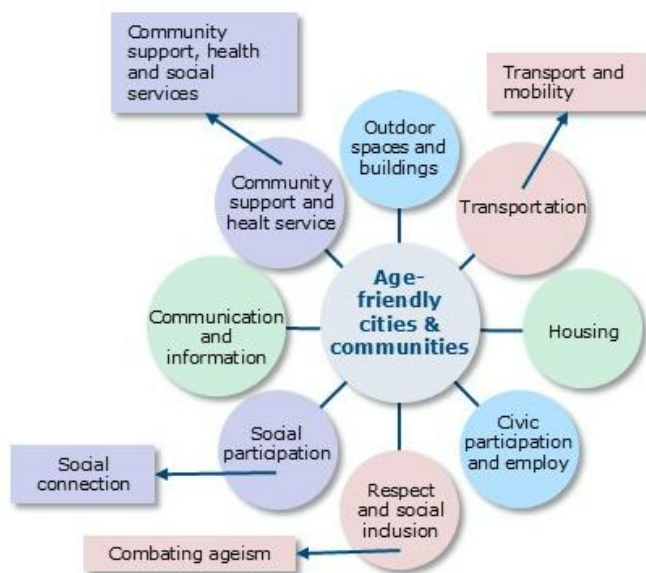

Subsequently, in response to requests for support from cities and national governments, the WHO launched the *Global Network of Age-Friendly Cities* (2010). The mission of this Network is to stimulate and enable cities, and other sub-national levels of government, around the world to become increasingly 'age-friendly'. It can be argued that the WHO Guide published in 2007 and the creation of the Global Network for Age-Friendly Cities in 2010 were milestones in providing support for three key themes: older people and development; lifelong health and wellbeing; and environments that enable and support the health and wellbeing of all, across the lifespan. In 2018, the WHO publishes a report to provide a global overview of the progress made by the Global Network of Age-Friendly Cities and Communities: from the 47 cities initially involved, after eight years, this has increased to 760 participating cities and communities globally. At this time, three years after the launch of the 2030 Agenda for Sustainable Development, it is now clear that the creation of age-friendly cities and communities is a priority, and that the attribute 'age-friendly' no longer applies only to cities, but also to communities, underlining the urgency of involving society at all levels, from the micro to the macro level (WHO, 2018).

In 2020, the United Nations General Assembly declares 2021-2030 as the 'Decade of Active Ageing', identifying as a priority action to support communities that foster capacity-building for older adults, recognising the importance of rethinking cities and communities as contexts where everyone can live well and longer. An important point to note is that with the 'Decade of Active Ageing' (2021-2030), the United Nations aligns the theme of active ageing with the Sustainable Development Goals of the 2030 Agenda to improve the lives of older people, their families and the communities in which they live. In 2023, a new 'Guide to National Programmes for Age-Friendly Cities and Communities' was published, which represents further progress towards the evolution of cities that promote health and wellbeing also in old age, built with this 'street-by-street, neighbourhood-by-neighbourhood' purpose (WHO, 2023).

Starting from the two 'Guides to Age-Friendly Cities and Communities' of 2007 and 2023, it is possible to define the factors that make urban contexts 'age-friendly', based on structural characteristics, environmental care, services and policies that reflect the determinants of active ageing (Fig. 2).

Fig. 2 Age-friendly cities and communities topic areas. Source: WHO, *National Programmes for Age-friendly Cities and Communities: A guide*, 2023, p. 6

In particular, the Guide published in 2023 emphasises the issue of involving older adults in the development and maintenance of age-friendly environments as a crucial goal for social policies.

## 2.2. Age-friendly city models

In accordance with this synthesis of the evolution of the studied topic, which urban model can intercept the demands of ‘age-friendly’ cities? In this regard, Lido, Osborne and colleagues (2016), in the context of research on the importance of learning for older adults carried out in the city of Glasgow, approximate the model of ‘ageing friendly’ cities formulated by the WHO (2007), to the model of cities for lifelong learning. This investigation collected 1,500 questionnaires completed by families of residents with the aim of drawing a ‘three-dimensional’ picture of lifelong learning in the urban context of Glasgow. In addition, 1,300 of the families involved included 377 older adults. The data from these participants provided insight into the engagement of older learners in formal, non-formal and in-formal learning contexts. The results of the survey indicate that, in the participant group, older people involved in lifelong education and training processes, often characterised by the intergenerational dimension, were more likely to take care of themselves and to enjoy better health overall. Furthermore, long-term disabilities in the elderly were found to

be associated with lower engagement in non-formal learning activities. At the end of the research, Lido, Osborne and colleagues consider the ‘learning cities’ model as an urban model for learning in a holistic dimension, which therefore also takes on the ‘age-friendly’ dimension. According to the UNESCO Lifelong Institute, in fact, a ‘learning city’ is a city that effectively mobilises its resources in every sector to promote inclusive learning from basic to higher education; revitalise learning in families and communities; facilitate learning for and in the workplace; extend the use of modern learning technologies for all; improve the quality and excellence of learning; and promote a lifelong learning culture (Boffo and Biagioli, 2023). Such a city model aims to strengthen individual empowerment and social cohesion, economic and cultural prosperity and sustainable development, setting itself as an important reference also for age-friendly cities and communities, combining the active role of space in both shaping the individual and promoting well-being.

### **3. CONCLUSIONS**

It is now clear that ‘good’ ageing is not only a health issue, but has a broader social profile and requires investment in prevention, general risk reduction, and education at a systemic level (Togni, 2021). This requires the development of new forms of solidarity and intervention that promote intergenerational cooperation based on mutual support and exchange of experiences and skills (Chianese and Cornacchia, 2022).

The literature review conducted highlights intergenerational dialogue as a foundational element in the development of age-friendly cities. For instance, intergenerational participation within educational and training processes in/for bottom-up regeneration plays a key role in ensuring that such regenerative phenomena are inclusive, sustainable and representative of diverse community needs (cf. European Parliament, European Council, 2011; Lido, Osborne, Livingston, et. al. 2016), as confirmed by the international debate on the ‘learning city’ model (Osborne e Piazza, 2023). For this reason, research on ‘age-friendly’ city models can only be interconnected with the investigation of community strategies, starting with good practices for active ageing, in the lifelong and lifewide learning perspective substantiated by the centrality of competences for life, through which it is possible to face the challenge of ageing.

# “UNIVERSITÀ DELL’ETÀ LIBERA” FOR ACTIVE AGEING. FOSTERING WELL-BEING AND SOCIAL INCLUSION THROUGH LANGUAGE LEARNING IN LATER LIFE

Inmaculada Solís García<sup>a</sup>

Valentina Antonina Pipicella<sup>a</sup>

Davide Bonaiuti<sup>a</sup>

<sup>a</sup>University of Florence

This study investigates how foreign language learning fosters active ageing, focusing on a case study of the University of the Third Age in Florence. Grounded in the LifeComp model, it investigates the educational and cognitive impact of language courses on older adults at the University of Florence’s Language Center. Semi-structured interviews with three participants, conducted before and after a Spanish language course, revealed a predominance of learning-to-learn competencies, alongside personal and social skills. Key factors such as cross-generational dynamics, personalised teaching, and a supportive environment emerged as transformative elements. The findings confirm that language courses support self-regulation, metacognition, and active citizenship, contributing to cognitive engagement, emotional well-being, and inclusion. This study highlights the potential of lifelong learning to promote successful ageing and active participation in later life.

active ageing; lifelong learning; languages learning; life-comp; U3A

## INTRODUCTION

This study explores the role of foreign language learning in later life, focusing on educational processes that promote active ageing (Boffo, 2022) and develop life skills through the LifeComp model (Sala, Punie, Garkov & Cabrera, 2020). It centres on a unique case study of the University of the Third Age in Florence, a service yet to be thoroughly examined. The research aims to investigate how participation in language courses can facilitate the transition to retirement

(Cachioni et al., 2021), foster social inclusion and active citizenship (Togni, 2022), and deepen participants' awareness of LifeComp competencies. By framing language learning as a tool for lifelong development, the study also highlights its potential in addressing the challenges of ageing populations in contemporary society. Grounded in the LifeComp framework, the study analyses the socio-demographic profiles and autobiographical narratives of retirees participating in language courses at the CLA (Language Center of the University of Florence), in collaboration with the University of the Third Age (Università dell'Età Libera, UEL). The analysis seeks to uncover how these educational experiences influence the development of key competencies for active ageing, while emphasising the transformative potential of language learning for personal and social growth.

## **1. STATE OF THE ART**

This section provides the conceptual framework that situates the key elements of this study. Within the broader demographic trend of population ageing, this research focuses on exploring the educational processes involved in learning a foreign language in later life. A significant aspect of this context lies in the role of universities of the third age (U3As), which offer older adults opportunities for lifelong learning and social engagement. As highlighted by Balboni (1996) and Cachioni et al. (2021), U3As play a pivotal role in fostering active participation and well-being among older learners. The current demographic revolution demands a radical shift in how ageing is perceived, moving from an association with decline to an emphasis on active engagement and lifelong learning (Formosa, 2021). This shift is echoed in the United Nations Economic Commission for Europe (UNECE) guidelines (2021), which emphasise the integration of ageing as a core policy objective. In this context, educational interventions are powerful tools for promoting cognitive, social, and emotional well-being. According to Boffo (2022), lifelong learning is not only a personal responsibility but also a societal opportunity for growth and development. In particular, language learning emerges as a pivotal activity, enhancing cognitive flexibility and fostering social engagement among older adults (Serra Borneto, 2007; Cardona & Luise, 2018). The European LifeComp framework (Sala et al., 2020), which organises competencies into personal, social, and learning-to-learn domains, provides the theoretical foundation for this study. This model is particularly relevant for ageing populations, as it addresses cognitive decline while fostering a proactive approach to ageing care. The growing interest in foreign language courses among older adults is well-documented. Gómez

Bedoya (2008) and Villarini & La Grassa (2010) identify motivations such as self-fulfilment, cognitive engagement, and adapting to multilingual societies, while Yi-Yin (2011) highlights the importance of personal growth and meaningful engagement in education later in life. Building on these foundations, this research investigates how language learning fosters active ageing and develops competencies aligned with the LifeComp framework. This approach addresses Togni's (2022) critique of the limited public discourse on the role of education in supporting longevity. By situating this study within the broader discourse on ageing and education, it contributes to the growing body of evidence on the transformative potential of lifelong learning. Language learning, in particular, is highlighted as a dynamic and impactful context for promoting well-being, inclusion, and active participation among ageing populations (UNECE, 2019; Formosa, 2021).

## 2. RESEARCH METHODOLOGY

The research methodology focuses on the qualitative analysis of data collected through semi-structured interviews with three students enrolled in the Spanish courses at CLA/UEL. This approach, well-suited to educational-linguistic research, combines structural rigour with flexibility, facilitating the exploration of emergent themes and capturing the intricacies of learning experience. The interviews, conducted both pre- and post-course, were analysed through the lens of the LifeComp model. Each excerpt was examined to identify which competence indicators the informants explicitly mentioned in their narratives.

This approach provides a deeper understanding of LifeComp-related categories within the context of autobiographical accounts, enabling insights into the learners' experiences, their competencies, and the transformative impact of the language course.

An example of annotation is:

E.g. (1): SPK\_1 – Ok. Tornando al corso che sta seguendo adesso, perché ha scelto lo spagnolo?

SPK\_2 – Allora io potevo scegliere l'inglese, però ho questa sensazione, non so se giusto o sbagliata (P1.1 + P1.2), che il mio cervello ha raggiunto la saturazione nell'apprendimento dell'inglese (L2.1), cioè quello che dovevo imparare l'ho imparato (L2.2) e non si va oltre (L1.3). Invece mi piaceva cimentarmi con lo studio di una lingua che non avevo mai studiato (P1.1 + L3.1),

perché più nuova (L3.1), e quindi pensavo che anche il mio cervello fosse meglio disposto (L1.1 + L1.2)<sup>1</sup>.

The abbreviations (e.g., P1.1., L2.1) represent the areas of the LifeComp model: personal (P), social (S), or learning to learn (L), with numerical indices indicating specific competencies and descriptors<sup>2</sup>. In some fragments, multiple LifeComp elements were observed, leading to the application of multiple labels when necessary. A decrease in occurrences was noted in the final interviews compared to the initial ones, likely due to the different focus of the interviews: the initial ones provided detailed descriptions of the participants, while the final ones concentrated on the learning process, without reiterating previously covered data.

The analysis of annotations and the overall text interpretation allowed for the profiling of the participants' competencies and an exploration of their potential evolution after the language course. To better contextualise the findings, we first present an overview of the participants' profiles, which form the basis of the qualitative analysis.

### 3. SAMPLE PROFILING

This section outlines the participants' professional and educational backgrounds, alongside their current engagement in language learning. The profiles reveal shared characteristics such as age, retirement status, and enrollment in A1-level Spanish courses at the CLA, while also highlighting their unique educational and professional trajectories. These insights provide a solid foundation for understanding the participants' motivations and experiences throughout the learning process. The three subjects in the analysis sample were selected as participants in the Spanish courses offered by the CLA.

The three informants are retired women aged 70-71 with diverse professional and educational backgrounds. Informants A and B hold degrees in architecture and worked as architects, while Informant C has a degree in pharmacy and is currently pursuing a bachelor's in art history at the University of Florence. All

---

<sup>1</sup> SPK\_1 - Ok. Going back to the course you are currently taking, why did you choose Spanish?

SPK\_2 - Well, I could have chosen English, but I have this feeling—I'm not sure if it's right or wrong—that my brain has reached a saturation point with learning English; I've learned what I needed to, and I can't go further. Instead, I liked the idea of trying to study a language I had never studied before, because it was new to me, and I thought that my brain would be more receptive.

<sup>2</sup> The indicators refer to the structure of the LifeComp model, which, for the sake of brevity, is not included in this analysis. For further details, please refer to the full text of the model available at the following link: [https://joint-research-centre.ec.europa.eu/lifecomp\\_en](https://joint-research-centre.ec.europa.eu/lifecomp_en).

three studied French at different points in their lives; informants A and B for personal or professional reasons, and Informant C for academic purposes.

Additionally, they all speak English and are currently enrolled in an A1-level Spanish course at CLA. These profiles reveal a common predisposition towards structured learning environments, likely influenced by their educational and professional backgrounds. This predisposition aligns with the strong emphasis on learning to learn competencies observed in the participants, as their prior academic and professional experiences seem to have fostered a metacognitive approach to learning.

The following section presents the results of the LifeComp indicators identified in the narratives. The participant profiles outlined above provide a foundation for interpreting the data and understanding the trends in LifeComp awareness.

#### **4. DISCUSSION OF THE DATA**

Regarding the profiles of our informants, we observe that there aren't substantial idiosyncratic differences in the LifeComp indicators present among the three interviewees. All informants demonstrate competence across the three areas of the model, with a clear predominance of Learning to learn skills. The figures illustrate this distribution, with the competencies organised in groups of three, corresponding to the personal, social, and learning to learn domains, as defined by the LifeComp framework.

The first figure (fig. 1) illustrates the relationships between the profiles of the three informants and the performance of the competences based on the initial interview results. In contrast, the second figure (fig. 2) highlights the data gathered during the final interview, providing a comparative perspective on the findings. These findings reflect the socio-familial characteristics of the subjects, such as a high level of schooling, a professional life enabling an adequate pension, and a supportive family context that allows time for self-development. These attributes suggest a conscious, informed, and active ageing process. Analysing the first indicators present in the interviews helps describe the profiles of the informants and identify trends in LifeComp awareness before and after the language course. Notably, students over 55 tend to emphasise more positive aspects of the learning environment than younger students, as supported by literature (Gómez Bedoya, 2008). Participants expressed high appreciation for the lecturer, who fostered a relaxed and positive teaching climate. Moreover, the presence of young students in the group, initially perceived as a source of stress, was ultimately recognized as an enriching

experience. Beyond individual differences, the core competencies remained consistent across interviews, with peaks predominantly in Learning to learn skills. Notable peaks also appeared in P1.1 (self-regulation), a key indicator of active ageing. High self-regulation competence likely explains the participation of these individuals in actions aimed at ageing care, such as foreign language courses. This competence reflects a greater awareness of emotions, thoughts, and behaviours, as well as the ability to manage them effectively, which contributes to successful ageing. The prevalence of Learning to learn skills – encompassing growth mindset, critical thinking, and managing learning – may stem from the participants’ academic and cultural backgrounds, which foster a metacognitive approach to learning. The profiles of the informants embody the essence of lifelong learning.

Fig. 1: Relationship between the profiles of the three informants and evolution of the indicators during the first interview. Edited by the authors.

Examining the evolution of LifeComp indicators after the course, we note that L2.1 (critical thinking) decreases in all final interviews. While unexpected, this reduction might reflect increased confidence in the learning process, leading participants to articulate competencies less explicitly. However, alternative explanations, such as differences in interview focus or participant adaptation to the context, cannot be excluded. This nuance underscores the importance of further investigation to deepen our understanding of how learning experiences shape the expression and awareness of competencies over time. The analysis highlights consistent patterns in competencies and learning dynamics, offering valuable insights into the transformative potential of language courses for active ageing.

Fig. 2: Relationship between the profiles of the three informants and evolution of the indicators during the second interview. Edited by the authors.

## 6. CONCLUSIONS

The findings confirm the initial hypothesis that foreign language learning fosters a prototypical profile of active ageing, characterised by strong self-regulation and learning-to-learn competencies. Participants benefited from a combination of personalised teaching, cross-generational interaction, and a supportive learning environment, which enhanced their cognitive and emotional well-being. These factors collectively highlight the transformative potential of language learning not only as an educational activity but as a tool for improving quality of life and promoting lifelong engagement. While social competencies were less prominent, the study underscores the broader potential of language learning to foster inclusion, personal growth, and resilience in later life. Notably, the presence of younger learners, initially perceived as a source of stress, evolved into an enriching dynamic, suggesting that intergenerational interaction within educational contexts deserves further exploration. As an exploratory study with a small, context-specific sample, its findings are not broadly generalizable. However, they provide a foundation for future research, which should aim to expand the sample size, include participants from diverse cultural and socioeconomic backgrounds, and adopt mixed-method approaches. Incorporating longitudinal designs or assessing the long-term effects of language learning on active ageing could further elucidate the enduring benefits of such interventions. Additionally, integrating quantitative metrics alongside

qualitative insights would enable a more nuanced understanding of the relationship between language learning, competency development, and ageing well.

# AUTOBIOGRAPHY AND QUALITY LONGEVITY

Fabio Togni<sup>a</sup>

Vanna Boffo<sup>a</sup>

<sup>a</sup>University of Florence

What role do autobiographical narratives play in the process of longevity? Can life stories contribute to fostering and activating potential in late adulthood? This study seeks to answer these questions by reflecting on the formative and educational outcomes that recounting one's past experiences can trigger throughout the lifespan. Drawing directly from the perspective of Narrative Gerontology, a field of study that uses narratives to gain a deeper understanding of aging, this paper aims to establish a connection between autobiographical narratives and the goals of a pedagogy of longevity. The objective is to identify new pathways for research and educational action that promote Active Aging and respond to the social transformations we are witnessing.

longevity; autobiography; active ageing

## 1. THE HUMAN ACT OF NARRATION AS A LIFELONG ASSERTION OF SELF

It is widely acknowledged that the reality in which humans live possesses a profound and immersive narrative dimension (Ferraro, 2020). The act of narration represents one of the cornerstones of human *Physis*, having historically facilitated the essential connections that built communities and enabled the creation and transmission of culture. Moreover, narration penetrates the most intimate levels of an individual, influencing thought patterns and the fundamental structures of identity, to the point where one can speak of a 'narrative identity' (Ricoeur, 1991).

Thus, the formative process itself, fuelled by the human desire to achieve a sense of form from a state of current incompleteness, is also narrative in nature, allowing individuals to assert themselves throughout their lives. For these reasons, there is no distinction between formation—understood as a process of subjective shaping—and narration—understood as a process of acquiring

meaning through self-assertion.

Pedagogy has extensively emphasized the virtuous link between narration and formation (Gennari, 2014). The autobiographical perspective, in particular, has received significant attention, primarily because it is recognized as a tool for self-care. As highlighted by Demetrio (1996), narrating one's life allows individuals to 'become other' than themselves, activating a process of giving meaning and re-signifying their lived experiences. This enables individuals to revisit pivotal events in their journeys, which might initially appear fragmented and disconnected, in order to trace a coherent thread that provides direction and meaning. Additionally, it can restore value to seemingly ordinary moments that may conceal a hidden and unexpected wealth of meanings. This reflective weaving unfolds across various dimensions of a person's life—such as familial, social, and professional—promoting self-development.

However, the process inevitably involves confronting the pains and losses that characterize every life trajectory, opening the possibility of mending what represents fractures and ruptures in the fabric of one's life. Autobiographical narration can thus outline a possible horizon of orientation, where, by looking back at the past, individuals can navigate the uncertainties of the present and future.

This potential becomes even more urgent and essential for those living in the disenchantment of postmodernity (Cambi, 2006), who have witnessed the disintegration of the grand 'Metanarratives' long regarded as reliable compasses for guiding individual development. Telling one's story becomes a way of 'centring oneself', attributing meaning to oneself, and, above all, embarking on a journey that is transformative and therefore formative.

In narrating one's life, an individual decides to share their truth: a truth that, while rooted in a strictly subjective perspective, acquires precious value as a testimony of one of the many diverse realities of human experience. By weaving together the biographical threads of another person's self-narrative, one gains a glimpse into new landscapes to explore, each carrying values and meanings that can be drawn upon, granting deeper understanding of the uniqueness of every existence. It is for this reason—and for the inevitable and fascinating 'beyond' inherent in human life—that research has developed biographical and autobiographical methodologies to investigate what might otherwise remain undetected. The autobiographical-narrative approach, carefully collecting life stories, has thus become a scientific pathway to explore the often-hidden and unspoken nuances of humanity (Poggio, 2004).

## 2. THE PEDAGOGICAL IMPLICATIONS OF NARRATIVE GERONTOLOGY

Among the various fields of study that have integrated narratives into their research trajectories, Gerontology stands out as particularly illustrative. During the last decade of the 20th century, *Narrative Gerontology* emerged (Kenyon & Randall, 1999), a perspective aimed at recognizing the scientific and cognitive value of life stories in late adulthood. Many of these stories would otherwise risk going unheard, leading to the loss of the wealth of experiences they embody (Blix, 2017). This approach seeks to emphasize the diverse ‘internal viewpoints’ within the aging phase of life, making them privileged witnesses whose narrated experiences can offer new ways of understanding the specificities of the aging process.

In this sense, Kate de Medeiros describes Narrative Gerontology as “a lens through which to see aging, specifically through how experience is put into story form and what those stories say” (2017, 15). From this description, a spectrum of opportunities emerges for pedagogy—not only as a discipline accompanying individuals in acquiring new forms throughout their existential trajectory but also in its reflective function regarding the formative processes inherent in narrative acts, particularly autobiographical ones.

One could envision a pathway branching out from the *macro* level into *meso* and *micro* levels, unveiling stimulating (albeit perhaps utopian) pedagogical implications of Narrative Gerontology. These implications contribute to centring longevity as a crucial category in discussions about aging, reaffirming the importance of consistently fostering existential planning at every age. Promoting quality longevity, linked to the widely discussed and emphasized theme of Active Aging, necessarily involves addressing the dominant representations and narratives of late adulthood, which often impoverish the view of this stage by neglecting some aspects while overemphasizing others (de Medeiros, 2016).

By rejecting a complex image that acknowledges the myriad facets each individual embodies, society opts instead for prejudiced stereotypes—such as the myth of elderly wisdom or the spectre of entering an undesirable period of decline and loss, inevitably leading toward an end. These representations are further shaped by the sensationalized narratives of extraordinary feats achieved by older adults, portrayed as so exceptional and unrepeatable that they distance the concepts of strength, agency, and capability from daily life and ordinariness. Such social images, inevitably influencing the self-representations individuals construct, may lead to the rejection and non-acceptance of aging (Moscato,

2014), directly compromising the capacity for existential (re)planning that underpins every formative process. A fundamental objective of a pedagogy of longevity could thus be to deconstruct these dominant, simplistic, and often demeaning representations of old age. This could be achieved by promoting new narratives that restore the multifaceted complexity of this phase, drawing from the experiences recounted by its direct protagonists.

With quality longevity goals in mind, and moving toward micro and intrapersonal dimensions, autobiographical narration in late adulthood can serve as a valuable tool for fostering a culture of self-care (Cambi, 2010). This approach activates cathartic processes that enhance awareness of one's trajectory, still in progress and constantly evolving, opening it to countless opportunities and possibilities for planning.

The theme of self-care, which should be a core category of every educational journey from childhood onward, becomes in this context a pedagogical and educational guideline accompanying an entire lifetime. It underscores the importance of developing and disseminating autobiographical narrative skills for constructing one's past, present, and future story. These skills, complementing the life skills outlined in the *LifeComp* framework (Sala et al., 2020)<sup>1</sup>, can help individuals face the challenges, transitions, and uncertainties typical of the present age.

This is particularly relevant to old age, keeping in mind the objectives of Narrative Gerontology while simultaneously pursuing the utopian aim of pedagogy: to support the journey toward new forms of self-realization by providing tools to counter and overcome opposing forces, which, in this context, are predominantly represented by the disabling effects of aging.

### **3. PEDAGOGY OF LONGEVITY: AUTOBIOGRAPHICAL NARRATION FOR THE 'ACTIVE' CARE OF AGING**

“It is observed that difficulty in narrativizing one's life experience can lead to severe depression or even a decision to commit suicide” (Ferraro, 2020, 27). With these words, the discussion on the importance of fostering a daily narrative dimension continues, emphasizing its beneficial and healing effects, which, in the specific context of late adulthood, can counteract otherwise paralyzing and

---

<sup>1</sup> The framework was developed by the European Commission in 2020 and outlines the competencies deemed necessary to navigate the fluidity of today's world. The nine *life competences*, divided into three areas (personal, social, and learning to learn), are: self-regulation, flexibility, wellbeing, empathy, communication, collaboration, growth mindset, critical thinking and managing learning.

depleting tendencies. The risk of ‘narrative atrophy’ (Randall, 2019, 86), stemming from the lack of opportunities to share one’s story or from the absence of listeners, becomes particularly acute in later life, especially in situations marked by profound loneliness (Florenzano, 2022)<sup>2</sup> or by changes often experienced as biographical ruptures brought about by the passage of time. Consider, for instance, the transition from work to retirement, a pivotal moment that may be greeted with enthusiasm or with deep anguish at the closure of a life chapter. Alternatively, reflect on the inevitable losses faced, which grow more frequent with advancing years. Given these circumstances, the pedagogical perspective must shift from a focus on absence to a focus on presence, highlighting and promoting what narration can ‘offer’.

Evidence suggests that encouraging the recollection and sharing of autobiographical events in late adulthood is associated with an increase in positive emotions (Cappeliez et al., 2008) and enhanced resilience (Randall, 2013)—resources that are undeniably valuable for navigating the challenges of aging. As discussed earlier, the narration of one’s experience emerges as a tool with both formative and educational functions, creating optimal conditions for individuals to continue their journey autonomously.

As education and training professionals and scholars of the human life cycle, we are called to act on multiple fronts. On one hand, from a social and preventive perspective, we must promote a culture of longevity starting from early life stages, leveraging insights from Narrative Gerontology. On the other hand, we should design educational pathways that foster skills for telling and retelling life stories.

Finally, to establish continuity, it becomes imperative to reflect on how to ensure spaces and times dedicated to the storytelling of others, so they never feel that their story has reached its conclusion. This can be achieved through an act of decentring—fully embracing the narratively articulated life experience that the other shares with us. This goal should guide the construction of effective educational relationships with children, adolescents, and undoubtedly adults of all ages: a genuine ‘I care’ that drives every educational action. Such an objective aligns with the aspirations of a pedagogy for Active Aging in an increasingly long-lived society.

---

<sup>2</sup> As highlighted by Florenzano, in Italy, an increasing number of people over 75 live alone, and their numbers appear to be on the rise.

#### 4. CONCLUSIONS

Acknowledging the central role that narration plays in the daily lives of individuals—and its potential to improve their quality of life—opens new avenues for exploration, including direct engagement with adults and the older people. For instance, studying their perceptions of the presence or absence of a narrative dimension and its effects in their reality could increase awareness of its importance, activating reflective processes that lead to positive changes in habits.

This direction could be pursued through autobiographical methodologies, elevating narration to a meta-level: a *narrating the narrated* approach that promotes the development of new competencies for longevity.

This is just one of the emerging and promising perspectives in the field of pedagogical research, an opportunity to be seized promptly given the ongoing transformations of our time.

# SOCIAL MEDIA REPRESENTATIONS OF DISABILITY. A STUDY ON ITALIAN INFLUENCERS

Antonia Cava<sup>a</sup>

Fabrizia Pasciuto<sup>a</sup>

Maria Angela Galizia<sup>a</sup>

<sup>a</sup>University of Messina

This qualitative study aims to explore the role of disability influencers on social media, delving into the challenges they encounter and the positive aspects emerging from their interactions with followers. This study also aims to emphasise the transformative impact of disability influencers on the traditional narrative, challenging stereotypes and promoting a more authentic and inclusive image of people with disabilities. In terms of methodology, the study is based on semi-structured interviews involving three Italian influencers. The study explores various key themes, such as understanding how these influencers navigate the landscape of social media, a detailed examination of the instances of online hatred they have faced through their journey as influencers and their perspectives on sexuality — often a particularly sensitive topic, especially when associated with disability.

Disability; Social Media; Digital Society; Sexuality; Social Inclusion

## INTRODUCTION

In the contemporary landscape, technological evolution has sparked an extraordinary revolution in communication and social interaction. Social media are at the core of this transformation and, in recent years, their exponential growth has significantly shaped society, influencing lifestyles, opinions and economic models. In this context, Social Media Influencers (SMIs) have emerged as undisputed protagonists, playing a key role in shaping the perceptions and decisions of big online audiences. SMIs are generally divided into four categories based on the number of followers they have: nano-influencers have between 1k and 10k followers; micro-influencers have between 10k and 100k followers; macro-influencers have between 100k and 1

million followers; and mega-influencers tend to have more than 1 million followers (Social Studies 2022). The role of disability influencers is a crucial aspect that has very recently gained increasing relevance. This article aims to explore the revolutionary role played by social media, with a specific focus on the voice of disability influencers and how they contribute to shaping the public perception of disability. To understand this phenomenon, researchers conducted semi-structured interviews with three Italian influencers who have been providing glimpses into their daily lives on their social accounts. This research adopts a theoretical approach rooted in Disability Studies. In contrast to the conventional medical paradigm, which frequently views disability as a condition necessitating correction or cure, our positioning aligns with a social and critical perspective. We view disability as a social construct, extending beyond its purely biological or medical dimensions. The theoretical framework of Disability Studies provides us with the conceptual tools necessary to explore disability as a social construct, extensively influenced by cultural, political and economic factors (Beacom & Kendall 2016). This approach enables a nuanced analysis of power dynamics, structural inequalities and social representations that significantly shape the experiences of individuals with disabilities. The disadvantages commonly attributed to the disabled are no longer seen as a form of biological difference, but rather as the product of specific social processes. The traditional dichotomy of norm/deficit becomes obsolete, shifting the focus towards disabling conditions caused by society (Pasciuto, Cava & Falzone 2023). This study also aims to emphasise the transformative impact of disability influencers on the traditional narrative, challenging stereotypes and promoting a more authentic and inclusive image of people with disabilities. Special attention has also been paid to the realm of sexuality, an integral part of every human being's life but often ignored when discussing individuals with disabilities. Addressing barriers related to sexuality is crucial in our society, where representations of sexuality are pervasive – in the media, in advertising, art and elsewhere – but become an immediate taboo when discussing disabled bodies. By fostering a more open approach to the intersection of sex and disability, these influencers play a crucial role in encouraging followers to understand that sexuality is an intrinsic aspect of everyone's life.

## **1. THE ROLE OF DISABLED INFLUENCERS ON SOCIAL MEDIA**

Among the many voices that manage to emerge online today, disability influencers have emerged as the promoters of a crucial transformation in the perception of disability, challenging stereotypes, breaking down barriers and

encouraging a more inclusive and authentic representation of disabled people. The diversity of the experiences represented is helping to dismantle the monolithic idea of disability, emphasising the uniqueness of each person and demonstrating that disability does not define their identity. The presence of disability influencers on the web is proving invaluable in challenging the dualistic and polarised portrayal of disability, a clear trend in mainstream media representations (Worrel 2018). Despite advancements, disability remains inadequately represented in the media (Melchior 2023) and, when it does feature, it often conforms to a narrative casting disabled protagonists either as exceptional heroes endowed with extraordinary strength and courage or as victims in need of salvation (Ellis & Goggin 2015). This narrative tends to accentuate the emotional dimension associated with disability. Furthermore, as highlighted by Foster and Pettinicchio (2022), representations of disabled individuals in sectors such as advertising and fashion — domains significantly influenced by social media — have garnered notably positive responses from consumers. This appears to forge new pathways in shaping broader socio-cultural norms and values. However, presenting a realistic perspective on disability remains imperative. Even within the realm of social media-mediated marketing, there is a persistent tendency to portray disabled individuals as a source of inspiration based exclusively on their disabilities (Shelton & Waddel 2021). This perpetuates what has been termed “inspiration porn” (Young 2012), referring to stereotypical representations of people with disabilities. Inspiration porn has the potential to turn the everyday lives of people with disabilities into a show. For Young, by frequently neglecting, this narrative contributes to a distorted and superficial perspective. It is crucial to acknowledge that disability is a complex and multifaceted issue that intersects with various aspects of human life. Disability can present itself in various forms, involving both conspicuous indications and subtler yet equally impactful hurdles. On the one hand, there are obvious disabilities, which may involve noticeable physical or sensory conditions. These constitute tangible challenges, readily observable by external peoples and often fostering heightened awareness and understanding within society. On the other hand, there are invisible disabilities, which may encompass cognitive, neurological and mental health challenges. These conditions are often not immediately apparent to others, rendering the experience of disability more complex and occasionally challenging to convey. With regard to sexuality, the negative perception of disabled people’s sexuality is linked to the process known in Disability Studies as disablement. Moreover, this perspective posits that society labels individuals as truly disabled through

actions that categorise them as different from the norm. In the context of disablement, it is noteworthy to observe instances of online hatred targeting disabled individuals, especially influencers who reach higher visibility on social media (Hollomotz 2013). Therefore, the social-media presence of disability influencers who openly share their own experiences with disability, or that of a family member, plays a crucial role in today's society. In contrast to inspiration porn, which reduces disability to a mere symbol of courage and determination, influencers who discuss their own disabilities or those of their loved ones offer a complete and human picture, showcasing the complexity of life with a disability. Therefore, despite the persisting challenges, particularly among young people (Borgström, Daneback & Molin 2019), social media has undeniably created extensive opportunities for individuals with disabilities. These include enhancements in their quality of life, improved access to education and the positive reinforcement of their interpersonal relationships (Bonilla del Rio et al. 2022).

## **2. METHODOLOGY**

The semi-structured interview methodology was chosen for this research study. This approach was selected because it allows for the integration of predefined structural elements with the flexibility needed to explore participants' responses thoroughly. We interviewed three Italian influencers, representing a variety of perspectives and experiences. These interviews offered valuable insight into how disability is represented and addressed in digital contexts. Among the nano-influencers, we met a deaf girl and LIS performer, who shares her experiences on LinkedIn and Instagram; among the macro-influences, we interviewed a girl with an upper limb malformation, who reaches a large audience on TikTok and Instagram through her always self-ironic approach, and the father of a child with a neurodegenerative disease, who openly shares his experience, offering an insight into the parenting experience. The thematic areas explored during the interviews covered various aspects, including:

1. Exploring the genesis of their interest in social media, its impact on their lives, and the nature of their relationships with followers.
2. Investigating their perception of disability through social media, including any experiences of misperceptions or stereotypes leading to online hostility.
3. Examining their attitudes toward sexuality and whether they engage in discussions about it with their followers.

### 3. RESULTS

The interviews offer a glimpse into the initial strides these influencers undertook, shedding light on their initial steps, challenges, and triumphs. While some started their social profiles for leisure, amusement or to alleviate boredom, others, turned to social media from the outset seeking assistance and solidarity from those experiencing similar conditions, specifically grappling with the disability of a child:

I embarked on this journey because, at the time, my wife and I were utterly bewildered by the new world we found ourselves in upon learning about the challenges we were about to face with Tommaso (...) I thought, perhaps, by narrating our story in a light-hearted manner, we might catch the attention of someone more knowledgeable about disability than we were, and in the process, learn something. So it was more a call for help in response to a gap in society. (F.)

The social media experience proved to be extremely positive for all three influencers interviewed, teaching them how to live with a disability, love and accept themselves. Primarily, this was made possible through the overwhelming support and approval received from thousands of followers, as well as those who shared similar experiences. However, visibility on these platforms also brought its challenges. Despite the influencers' preference for different platforms none of them was exempted from being targets of hatred. Nevertheless, it has been observed that hate speech tends to be more violent in the context of physical disabilities, given their immediate visibility. One of the interviewees shared with us how she used to create content on TikTok with her boyfriend, and their love story became the target of judgment, labelled as *undeserving* due to her physical disability. This notion of merit reflects deep-seated and conspicuous prejudice and stereotypes in our society, overlooking the complexities and depth intrinsic to personal relationships. The concept of merit in this context varies widely according to cultural and social beliefs and is often rooted in a distorted framework of human value and dignity.

In the early days, during one of my live shows where I was sharing my story, I mentioned having epilepsy and not having a driving licence. A girl started to make senseless comments, saying things like, 'There are so many beautiful girls who get dumped for no reason, and you're engaged. I don't think you deserve it.' Later, I came across a comment on another video that said, 'No one would ever get involved with a cripple.' It hurt me deeply, and I couldn't help but cry. Subsequently, I created a video responding to that comment,

and, unfortunately or fortunately, let's say, all my followers — more like virtual friends — rushed to her profile and really destroyed her! (S.)

Hate speech directed at individuals with disabilities can manifest in various forms, including insults, discrimination, harmful stereotypes and the spread of misinformation that undermines their dignity and integrity. The delegitimisation of those within the targeted group occurs when the experiences, voices and validity of individuals with disabilities are either denied or ridiculed. This may involve the denial of rights, downplaying the challenges faced, or devaluing their perspectives and contributions. Such online delegitimisation can have severe consequences, hindering the active participation of people with disabilities in digital spaces and more broadly in society. Another element that amplifies the expression of hatred on social media is the prevailing sense of impunity that individuals seem to feel when engaging in inappropriate behaviour online. Those who act with a sense of impunity and disinhibition often overlook the diminishing divide between our online and offline lives.

In my opinion, it's a kind of impunity, though one has to be cautious nowadays. If someone sends me a message, it takes very little time for me to trace them, even if their social media profile is not entirely filled out. It doesn't take more than fifteen minutes with Google. I just need to cross-reference some data or find a post they forgot to delete, or a location they visited, and I can locate them even without expertise. So, there is this sense of impunity, which is not just that, but also a lot of frustration. There are many dissatisfied people in the world, and what better way to release your frustrations than engaging in something where you believe you won't face consequences because you think you're not traceable, even though you actually are. (F.)

Furthermore, an important factor contributing to the evident online hatred is a widespread lack of knowledge about disabilities, highlighting a pressing need for education and awareness. The deaf influencer, for instance, shared that she became the target of individuals who, unaware of what a hearing impairment entails, questioned the authenticity of her disability.

I was not involved in any specific actions of online hatred. I can say that I faced *indirect* insults when content about Sanremo's accessibility was posted on Facebook. Some people claimed that I wasn't truly deaf because, as they pointed out, I can speak. This, however, was deeply hurtful to me. In the initial years of Sanremo, reading those comments and criticisms was genuinely painful. (M.)

This view of disability, rooted in prejudice and stereotypes as previously discussed, becomes even more pronounced when addressing the sexuality of disabled individuals. A disabled body is often unfairly perceived as asexual and unattractive, particularly in the context of physical disabilities. Conversely, those with intellectual disabilities are frequently treated like children, deemed in need of control and considered incapable of expressing their desires — in terms of both relationships and sexuality. This stresses the importance of the narratives of influencers in this space; by sharing their personal experiences, they provide authentic insights into their perceptions of sexuality. One of the interviewees, for instance, highlighted a generational difference in attitudes, noting a greater openness among younger audiences toward discussions about sexuality. Meanwhile, her older followers tend to label such conversations as “vulgar” and something to be concealed in public.

Yes, I address it in a humorous manner through an ironic video, but I also strive to convey to young people that sex exists and discussing it is crucial. It’s essential to have open conversations, whether in schools, at home, or within the family. Nowadays, even 12–13-year-olds are already engaging in sexual activities, so they need to be informed about the existence of condoms, the contraceptive pill, and the potential consequences if they don’t take necessary precautions, such as the risk of contracting diseases or getting pregnant. (S.)

The topic of sexuality was also broached with the father of the child with a degenerative disease. He expressed great openness towards the professional role of a sexual assistant and the non-profit Lovegiver Association, established to promote and support these professionals.

Sexual assistance extends beyond emotional support. It involves becoming familiar with one’s own body. Understanding one’s body isn’t just about fulfilling sexual needs—just as any person thinks about sex, there’s no reason why someone with a disability couldn’t do the same. What’s often overlooked is a crucial aspect: by learning about my body, I also learn about the limits, and I can also understand if someone is abusing me. It’s an issue which is rarely discussed, but it has happened many times! (F.)

The reflection highlights the crucial error made by those who feel uncertain about interacting with people with disabilities: the assumption that there is only one approach that fits all. The pivotal shift starts with prioritising the person over their disability.

### 3. CONCLUDING REMARKS

Social media facilitate the forming of relationships, fostering a previously unexplored depth of connection. In this role, social media work as catalysts for meaningful offline connections, which is particularly resonant with individuals with disabilities. For them, these platforms work as avenues to cultivate friendships and establish bonds that transcend physical and temporal barriers, offering opportunities for inclusiveness. From this standpoint, the rise of figures such as influencers, particularly those addressing disability, highlights the influential role of social media as a powerful communication tool. It works as a platform to inform about and narrate a wide array of disabilities, even those often overlooked by mainstream media. Not only do these influencers contribute to increasing the visibility of disability and sparking more open discussions, they also act as inclusive agents, providing individuals with the means to authentically showcase their daily lives, free from taboos and fears. In doing so, they challenge paradigms that have historically sought to conceal and silence disabilities. This perspective redirects attention from an individual with a disability to a context that can work as a *disabling tool*. In this social perspective, disability is reframed not as an intrinsic attribute but as an outcome of the interplay between an individual and society.

# UNLEASHING POTENTIAL: EXPLORING THE ROLE OF NON FORMAL EDUCATION IN DIGITAL TRANSFORMATION FOR SOCIAL INCLUSION

Nadia Crescenzo  
University of Salerno

This contribution explores the integration of digitalization into youth work – a practice of non formal education aimed at supporting the personal and social development of young people – as a key strategy for promoting the social inclusion of young people, especially those from marginalized backgrounds. It highlights how traditional youth work is evolving to incorporate digital tools and platforms to improve access to educational resources and promote digital literacy. European policies support these efforts by emphasizing the importance of digital skills and media literacy as a basis for young people’s full participation in society. Existing research shows that digital youth work can significantly increase engagement, especially for vulnerable young people, by overcoming barriers to participation and promoting social cohesion.

youth work; non formal education; digitalization; social inclusion

## INTRODUCTION

Promoting social inclusion is widely acknowledged as essential for fostering individual well-being and societal cohesion, as it enables individuals to actively contribute to and benefit from various dimensions of community life. In Europe, the social inclusion of young people is unevenly felt, experienced and distributed, with young offenders, migrants and refugees, single mothers, ethnic minorities and poor or disabled people being among the most vulnerable sectors at risk of social exclusion (Buntinx & Schalock, 2010; AbuJarour & Krasnova, 2017).

The rise of digital technologies has further complicated these issues, creating both new opportunities and challenges for social inclusion. According to the

Youth Knowledge Book “Young people, social inclusion and digitalisation” (EC-CoE, 2021), digital exclusion has emerged as a significant barrier for young people from marginalized backgrounds, limiting their access to essential services and reducing their opportunities for full participation in society. The digital divide adds a layer of complexity to social exclusion. For young people, especially those from vulnerable groups, limited access to digital resources such as the internet, computers, and digital literacy skills can significantly hinder their ability to participate fully in educational, social and economic activities. The COVID-19 pandemic underscored these challenges, as reliance on digital tools for education, communication and work increased dramatically, leaving behind those without adequate digital infrastructure or skills. The European framework advocates for the inclusion of digital skills and online engagement as essential components of social inclusion strategies, highlighting the need for policies that provide equitable access to digital technologies and promote digital literacy (Siurala, 2020; Vermeire & Van den Broeck, 2024).

Furthermore, digital inclusion is not just about bridging the technological gap but also about fostering trust and community participation in online spaces. Without adequate access to digital tools and the necessary skills to navigate them, young people from marginalized communities may feel excluded from digital platforms, limiting their ability to engage with civic life, participate in community activities, and access crucial information.

The integration of digital dimensions into the concept of social inclusion is therefore crucial. It not only addresses the need for equitable access to digital resources and education but also highlights the role of digital literacy and online engagement as essential components of full social participation. Policies and interventions must address both the structural barriers of digital access and the social barriers of digital skill gaps, thus fostering a more inclusive society where digital participation is not just a privilege for some but a fundamental right for all (Beel & Wallace, 2023).

Looking ahead, it is essential to explore how youth work – a practice of non formal education aimed at supporting the personal and social development of young people – can serve as a crucial tool in bridging these gaps. In particular, the emergence of digital youth work, supported by the policies of both the Council of Europe and the European Commission, highlights innovative approaches to tackling exclusion. By using both traditional and digital methods, youth work not only promotes young people’s active participation in society but

is also in line with broader European efforts to create inclusive and equitable opportunities for all.

## **YOUTH WORK AND DIGITAL YOUTH WORK: KEY TOOLS FOR THE SOCIAL INCLUSION OF YOUNG PEOPLE**

The term “youth work” is defined as socio-educational activities of a multifaceted and diversified nature, situated at the boundary between the formal education system and informal socialization practices (European Commission, 2009; Morciano, 2021). Youth work encompasses the various methods through which young people acquire and convey knowledge, including comparison, dialogue and self-reflection. These methods are undergoing a gradual transformation in response to structural shifts in society, including unemployment, poverty and changes in the labour market. Additionally, they are evolving in conjunction with the evolving meanings expressed by youth cultures, their representations and lifestyles, which are often influenced by the use of new digital media and the internet (Coppola & Crescenzo, 2022).

In this context, the Council of European Union adopted the “Council Conclusions on Smart Youth Work” (Council of the European Union, 2017) emphasizing the significance of digital youth work – a form of youth work that integrates digital technologies into its practices to better engage young people and respond to their evolving needs – for fostering social inclusion. Furthermore, the Council acknowledged the potential of digital technologies and media to enhance young people’s future employability and career prospects, while also recognizing the necessity to address the digital divide and to mitigate digital risks. These conclusions are primarily based on the report “Developing digital youth work” (European Commission, 2017), which provides an in-depth analysis of the essential elements of digital youth work and smart youth work.

It is noteworthy that the Commission’s proposal for a new EU Youth Strategy (2019-2027), entitled “Engaging, Connecting and Empowering Young People” begins with the assertion: “young people enrich the EU’s ambitions. This generation is the most educated ever and among the most creative in the use of information and communication technologies and social media” (European Commission 2018: 1). The advent of the virtual world has revolutionized young people’s lives and it is incumbent upon policy-makers to consider the opportunities and challenges presented by this new reality. They must seek to harness the potential of social media, to equip young people with the requisite digital skills and to promote critical thinking and media literacy. Youth work

must use technologies and pedagogical practices to enhance accessibility and equip young people with the skills to navigate digital environments (Fernández-de-Castro et al., 2023).

Through the strategic use of digital technologies, it is possible to develop activities that respond to young people's emerging needs, provide tools to help them navigate the complex technological landscape and turn digital risks into opportunities for growth and inclusion. Key initiatives include digital citizenship courses that teach young people how to navigate the online world responsibly, addressing issues such as privacy, cybersecurity and critical awareness in the use of social media. These are complemented by media literacy workshops, which are essential for understanding and countering phenomena such as fake news and digital manipulation, and for developing critical thinking and decision-making autonomy. Digital youth work also encourages the creation of digital content such as videos, podcasts and storytelling projects, which not only stimulate creativity but also provide a platform for young people to express themselves and raise awareness of relevant social issues. Similarly, the use of educational games and virtual experiences facilitates learning through play and promotes skills such as problem solving and teamwork.

Digital technologies also open new frontiers for intercultural participation and virtual exchanges, allowing young people to connect with peers from other countries to work on joint projects, share experiences and develop language and intercultural skills. At the same time, digital platforms promote youth activism, enabling young people to organize awareness-raising campaigns and actively contribute to social and environmental issues. Finally, digital youth work also focuses on equal access to educational opportunities by offering online courses on innovative topics such as coding, digital design and entrepreneurship. These tools make it possible to reach those young people who may be excluded from traditional learning pathways, breaking down geographical and social barriers. Digital also facilitates psychological support and online mentoring, ensuring continued support even in the most challenging situations.

## **EXISTING WORK IN THE AREA**

A review of studies conducted at the European level have highlighted how the use of digital technologies in youth work activities promotes greater participation of young people, especially those belonging to vulnerable categories who are often excluded from traditional educational and

socialization pathways. For example, pilot projects in Finland<sup>1</sup> and Estonia<sup>2</sup>, pioneering countries in the field of digital youth work, have shown how online platforms enable young people to access educational and psychological support services more easily, thus helping to promote equal opportunities.

Furthermore, findings on media literacy programmes in Germany and Ireland also highlight their effectiveness in improving digital literacy among young people. In Germany, various government-organised media literacy campaigns<sup>3</sup> have aimed to close the digital divide by educating the public on responsible digital media use and improving digital skills across different socio-economic groups. Similarly, in Ireland, projects<sup>4</sup> have shown significant impact, particularly in improving critical thinking skills and the ability to identify fake or manipulative content online. These initiatives are funded by national agencies and EU grants, reflecting a strong commitment to promoting digital literacy and inclusion.

In addition, the report “Exploring new, appealing, inclusive and engaging practices for online services in digital youth work”, published in 2023, provides insights into how digital services can enhance youth work across Europe, making it more accessible, inclusive and safe. Based on a survey conducted in 14 EU Member States through the Erasmus+ Youth National Agencies, the report highlights the importance of ensuring that these services are designed to meet the diverse needs of young people from different backgrounds and experiences, while prioritizing accessibility, safety and inclusivity. Notwithstanding the considerable potential of digital youth work, significant challenges remain. The digital divide continues to preclude some young people from gaining access to technologies. Moreover, the use of commercial platforms, despite being a crucial means of reaching young people, gives rise to concerns pertaining to data security and sustainability. In order to address these issues, the report puts forward the proposition of investing in open-source platforms and more targeted training for practitioners.

Moreover, virtual exchange experiences have furnished further evidence of the added value of digital youth work. Initiatives such as Erasmus+ Virtual

Exchange<sup>5</sup> have demonstrated that young participants develop intercultural competencies, enhance their communication skills and establish international networks that facilitate social inclusion.

Finally, the RAY DIGI project<sup>6</sup> emphasizes the pivotal function of digitalization in advancing social integration among younger demographics. The project examines the potential of digital tools and online platforms to facilitate non-formal education, thereby enhancing accessibility and inclusiveness. The project identifies digital inclusion as a vital element for ensuring that all young people, regardless of their background or socio-economic status, can access educational resources and participate actively in society. Digital inclusion in RAY DIGI is addressed through policies that emphasize the creation of supportive learning environments online, encouraging co-creation and participatory methods where young people can shape and lead digital activities. This approach not only fosters inclusivity but also enhances the relevance and impact of digital youth work.

## CONCLUSIONS

To conclude, the integration of digital technologies not only enhances accessibility and engagement for young people, especially those from marginalized groups, but also helps bridge the digital divide and promote equality. However, it is essential to address the associated risks, such as digital exclusion and concerns over privacy, which could undermine the benefits of digitalization if left unchecked. A balanced approach, which maintains the core values and objectives of youth work, is necessary to reconcile the benefits of digitalization with its potential drawbacks. This involves ensuring equitable access to digital resources, promoting critical media literacy and fostering an inclusive digital environment where all young people can participate fully and equitably (Moxon et al., 2021).

We cannot keep digitalization out of youth work. Instead, we should – with a critical mind – build a conscious, structured and balanced way to integrate digitalization in our practices with its ambiguities, interests and approaches, in a way which is based on:

<sup>6</sup> For more information: [https://www.jint.be/sites/default/files/2023-06/RAY DIGI\\_Vermeire-Van den Broeck\\_2023 Report.pdf](https://www.jint.be/sites/default/files/2023-06/RAY DIGI_Vermeire-Van den Broeck_2023 Report.pdf)

- The ethos, values, objectives and competences of youth work.
- The objectives of our own youth work organization.
- The constantly changing challenges from young people.
- Responsiveness to new digital opportunities and risks.

Youth work as an educational practice has to find ways of improving young peoples' critical media literacy to help them face the opportunities and threats of digitalization. It is not easy and it is not a silver bullet, but it belongs to the big questions of today and the future.

# THE TRIANGLE P+: A TRANSMEDIA CATALYST FOR FAMILY INCLUSION IN PARENTING EDUCATION

Arnau Erta-Majó<sup>a</sup>

Eduard Vaquero<sup>a</sup>

Aida Urrea-Monclús<sup>a</sup>

Maria Àngels Balsells<sup>a</sup>

<sup>a</sup>Universitat de Lleida

The integration of technology into daily life presents opportunities to advance social justice, particularly in extra-school contexts, where social learning often occurs through technological platforms. This study introduces Triangle P+, an innovative transmedia tool designed to promote family inclusion in parental education. Transmedia education leverages media convergence, participative culture, and collective intelligence to foster dynamic and interactive learning. It enables learners to become co-creators of knowledge, enhancing agency and collaboration. Triangle P+ exemplifies this approach, offering personalized learning environments through peer-research methodologies rooted in produsage and collective intelligence. The tool provides immersive learning experiences with multiple access points, bridging traditional education and dynamic, digitally connected environments. It emphasizes reaching learners in their everyday spaces, reflecting the influence of digital platforms on identity and socialization while fostering inclusion, belonging, and ownership. This contribution highlights the importance of transmedia storytelling in creating meaningful social participation and collaboration between families and educators. By addressing the potential of transmedia in non-formal settings, Triangle P+ represents a socially inclusive approach to learning, transcending traditional boundaries and emphasizing collective representation and engagement.

transmedia parental support; family inclusion; peer-research; coproduction

## 1. INTRODUCTION

The digitalization and platformization of society have redefined how people communicate, and access information, leading to a paradigm shift across various domains, including education and parenting responsibilities (Van Dijk et al., 2018). This digital shift offers an opportunity to enhance and democratize parenting education through more accessible, flexible, and participative forms of engagement. This opportunity is particularly relevant in the context of the European Council's Rec(2006)19 on positive parenting, which emphasizes creating supportive policies and research to help families navigate parenting responsibilities in today's world. As family structures become increasingly diverse, it becomes paramount to develop inclusive and adaptable approaches to parenting education that leverage digital tools for wider reach and effectiveness.

Parenting education has traditionally been built around two primary methods: group and individual socioeducational action. Group socioeducational action fosters community support and shared learning, where parents collectively explore and address common challenges in a supportive environment (González, 2018). On the other hand, individual socioeducational action allows for tailored guidance that considers the specific needs and circumstances of each family (Balsells et al., 2023). Both approaches have proven effective in promoting positive parenting by helping parents develop skills and competencies for the well-being and growth of their children (Balsells et al., 2017). Therefore, nowadays, integrating these methods with digital solutions becomes increasingly relevant, especially in promoting participative and collective learning environments that transcend physical limitations (Vaquero et al., 2022).

Within this setting, the parenting triangle (PT) model (Fig. 1) has shown to be a valuable tool for guiding and informing parenting education. Rooted in the ecological model of family and child development (Bronfenbrenner, 2005) and the FACNF (Department of Health, 2001), the PT posits that parenting skills are developed at the intersection of three core elements: the child's needs, the parent's competencies, and the broader environmental context (Milani, Serbati, Ius, 2020). Yet, the tool remains largely dependent on analog resources and in-person interactions, creating a need for a transmedia adaptation that can extend its reach and applicability.

This study aims to address this gap by coproducing a digital platform for family participation on parenting education. The result seeks to promote social

inclusion through parenting education processes, creating a dynamic and participatory platform that allows families to engage actively with parenting resources. As a transmedia tool, the resulting product leverages the principles of media convergence, participative culture, and collective intelligence (Fig. 2) to foster meaningful engagement across diverse media formats and platforms. Transmedia tools create more immersive and participatory learning experiences by allowing content to be presented across multiple media formats, promoting a holistic and interactive approach to education (Scolari et al., 2019). The goal is to enhance accessibility and engagement by enabling families to connect with the material in ways that are relevant to their everyday lives, thereby bridging the gap between structured parenting education and the dynamic digital environments that daily permeate contemporary family life.

Fig. 1. Parenting triangle model (Balsells et al., 2015).

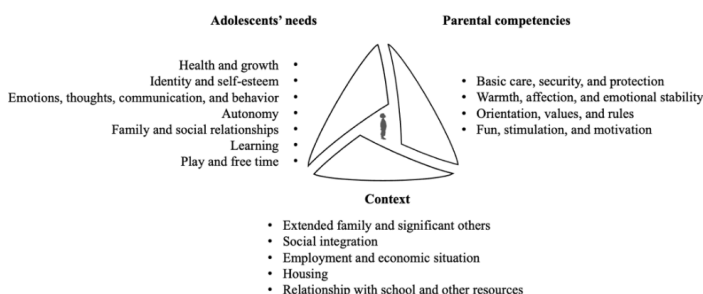

Fig. 2. Transmedia principle (Freire, 2020).

## 2. METHODS

### 2.1. Design

This study utilized a participatory research design rooted in the peer-research methodology. Drawing on Dixon et al.'s (2019) levels of participatory research, this study applies the third level, in which participants assume an active researcher role, contributing equally to knowledge creation alongside academic researchers. The design emphasizes knowledge and resource coproduction benefiting from peer engagement and participant agency, fostering a collaborative atmosphere that supports shared understanding and ownership of outcomes.

### 2.2 Participants

The study included 3 distinct participant groups:

- Parents: 5 mothers participated, all actively involved in parenting education programs. Their ages ranged from 29 to 46 years.
- Children: 23 children, aged between 6 and 12 years, participated. These children were recruited from local community support programs, with a distribution of 13 5–9 years children and 10–12 years 10 children.
- Adolescents: 12 teenagers, aged between 14 and 18 years, participated. Most had received care from social services because of issues with family support.

Each group engaged independently in their sessions throughout the coproduction process. This separation ensured that each group could explore and express its unique perspectives without any influence or interference.

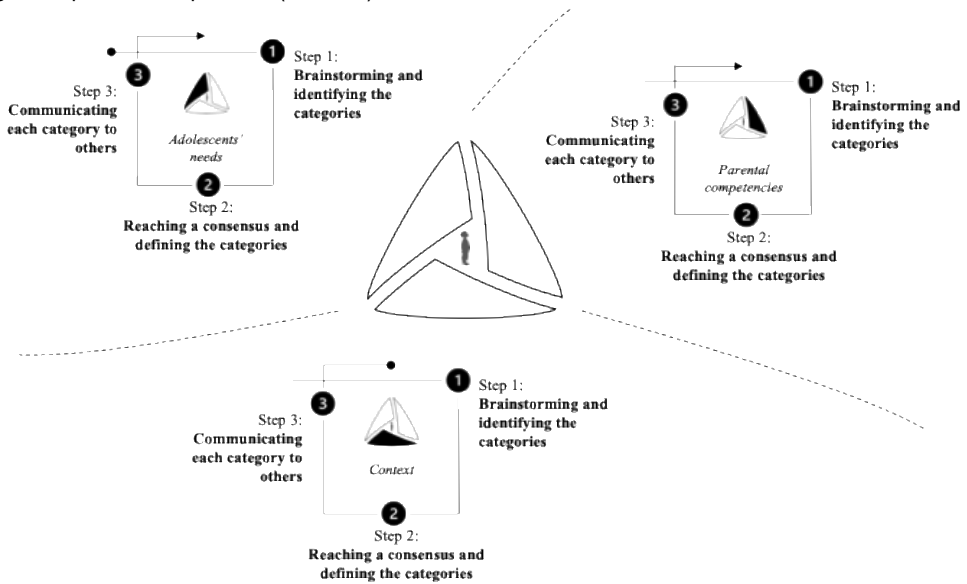

### 2.3 Procedure

The research was structured into 4 main phases (Urrea-Monclus et al., 2023):

1. *Preparation*: Professional researchers organized the groups, dynamics, and materials. A preliminary session introducing the research process was conducted, and ethical consent was obtained from all participants and their legal guardians.
2. *Audience*: Participants engaged in structured sessions focusing on each dimension of the PT to coproduce the final product. Each session included collaborative activities where participants shared experiences and insights. The coproduction process involved 3 steps, which were repeated for each of the PT dimensions (Fig. 3). The initial step involved identifying the core themes relevant to the dimension. Participants

generated diverse perspectives and organized them into specific categories. On a second step, participants collaborated to reach a consensus on defining each category. This step ensured that the elements incorporated were representative of the collective input. Finally, the last step participants created outputs to communicate the categories and definitions using formats chosen for clarity and accessibility.

Fig. 3. Coproduction process (Authors).

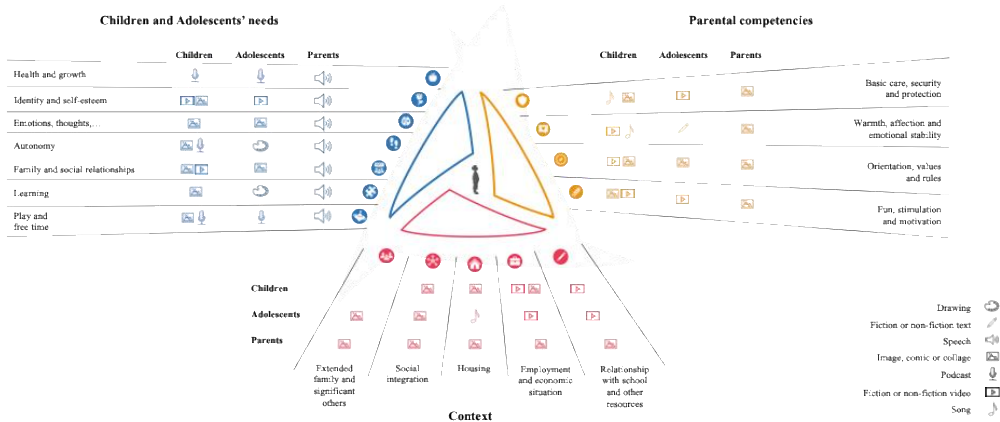

3. *Validation*: Following the coproduction sessions, internal and external validation were held. Participants and additional stakeholders examined and provided feedback on the materials generated. This aimed to ensure that the developed resources were both accurate and reflective of participants' perspectives.
4. *Transfer*: The resulting tool was made available as an open-access platform to ensure it reached a broader audience. This phase also included participants' involvement in professional seminars and conferences to advocate for the tool's impact and applications.

### 3. RESULTS

The interconnected approaches to the coproduced tool, named Triangle P+ (Fig. 4), function synergistically to support the goals of the study. Through this multi-faceted approach, it also addresses social justice, enabling parents to learn and navigate parenting responsibilities.

Fig. 4. Triangle P+ (Authors).

#### 3.1 Transmedia Educational Object

The Triangle P+ was conceptualized as a transmedia educational object, encompassing a diverse array of media resources interconnected through a transmedia logic. By offering content in various formats the Triangle P+ encourages parents, children, and educators to participate in an immersive learning experience that enriches their understanding of family dynamics and parenting roles. Furthermore, these media resources were coproduced with families, encouraging active participation in a produser role that blends production with user engagement, fostering collective knowledge creation. This transmedia approach combines structured content with flexible, user-driven exploration, allowing families to engage meaningfully with the material while fostering a deeper understanding of parenting dynamics.

#### 3.2 Open Educational Resource

The Triangle P+ tool was also designed as an open educational resource, offering freely accessible educational materials that a broad community can consult, use, and adapt. This broadens its reach and reinforces principles of inclusivity and adaptability. The Triangle P+ leverages the accessibility and flexibility of digital tools, empowering parents, educators, and communities to

tailor it to the specific context and challenges. By enabling such customization, the open educational resource framework plays a role in advancing social justice, ensuring equitable access to resources that support positive parenting and educational inclusivity. In this way, the Triangle P+ becomes a tool for spreading knowledge but also an instrument for fostering social inclusion through parenting education.

### **3.3 Digital Platform**

To support interactive and participatory engagement, the Triangle P+ tool was built on a digital platform that facilitates interaction and knowledge sharing among users. The platform emphasizes the role of digital infrastructures in shaping user interactions and data sharing. The platform enables users—parents, children, educators, and professionals—to collaborate, and access resources within a cohesive digital ecosystem. The resources created by each group were tailored primarily for their own profile, such as children for children, to address the unique perspective of each group. However, the final platform allows for cross-role use, as resources produced by one group can be valuable for others, providing insights that can foster empathy and understanding among parents and children, enriching the overall learning experience. Through this digital interface, users can engage with the Triangle P+ resources interactively, enhancing the tool’s impact by fostering a community-oriented learning environment that supports family well-being and parental competencies.

## **4. CONCLUSIONS**

The Triangle P+ represents a social innovation in parenting education, developed through a participatory research that integrates the voices of children, adolescents, and families as essential contributors. This coproduction process underscores the citizen science approach, in which participants act as “experts by experience” (Jacobson, 2021), bringing valuable insights that enhance the research relevance and applicability.

The implications of this project extend beyond conventional e-parenting approaches, advancing towards a model of transmedia parenting education that aligns with the demands of a postdigital society (Cramer & Jandrić, 2021). Family engagement is fostered through the producer role, promoting active participation and knowledge cocreation within a systematic framework. The tool’s multimodal design encourages users to engage with the material in ways that align with their preferences, making the tool more accessible and personally relevant. By mirroring the media formats familiar to participants, the

tool increases user participation and commitment, creating collaborative learning environments where families and professionals alike contribute to a shared learning experience.

Transmedia is a way in today's digital world to bridge the gap between traditional learning and the dynamic environments where individuals live, interact, and grow. The Triangle P+ is designed to harness the potentialities of transmedia by weaving narratives that resonate with learners in diverse and informal settings (Raybourn, 2012). It recognizes the importance of reaching learners in their everyday spaces, acknowledging the influence of digital platforms on identity formation and socialization (Taddeo & Tirocchi, 2021). Moreover, its creation involves collective intelligence, allowing for a more inclusive and diverse representation in content and knowledge development promoting a sense of belonging and ownership for all involved. This approach offers a dynamic and socially inclusive method of learning.

The Triangle P+ sets a transformative example for the field, bridging traditional parental education with the interactive, multimodal, and inclusive potential of the transmedia framework. By extending its reach and fostering social inclusion, it underscores a future for parental education that transcends digital boundaries and adapts responsively to promote social inclusion through non-formal education.

### **Acknowledgements**

The study was funded by the Spanish Ministry of Science and Innovation, State Research Agency, and European Regional Development Fund (PID2022-137305NB-C21). We would like to thank all participants; and the Council of Lleida and the University of Lleida for providing the facilities and materials for conducting the study.

# THE DIVERSITY CHALLENGE FOR HIGHER EDUCATION. BARRIERS AND OPPORTUNITIES IN UPDATING EDUCATIONAL SETTINGS TO DEAL WITH INTERNATIONAL STUDENTS AND GUARANTEE EQUAL AND INCLUSIVE MULTICULTURAL ENVIRONMENTS

Isabella Pescarmona<sup>a</sup>

Roberta Ricucci<sup>a</sup>

Anna Miglietta<sup>a</sup>

<sup>a</sup>University of Turin, Italy

## INTRODUCTION

This position paper aims to open an interdisciplinary discussion on the barriers and opportunities that international students pose at university level, in order to promote greater awareness and focus on how to enhance processes of teaching and managing cultural diversity from an equal opportunity perspective. It intends to launch a critical discussion starting from the findings of both empirical research and theoretical and methodological analyses on intercultural professionalism of teachers, personnel policies, participatory education and field research methods, social justice in education in Higher Education institutions and combating institutional discrimination.

Specifically, this paper would like to discuss the role of three group of actors living in the Higher educational institutions, such as faculty level, Staff level, and peer level by pointing out tensions and challenges (Beech, 2018) these students pose at tertiary education level.

## 1. DEALING WITH INTERNATIONAL STUDENTS IN HIGHER EDUCATION

Educational systems and pedagogical models today are challenged by confronting an increasingly heterogeneous and multicultural student population. To promote the right to education for all and equal opportunities for access and learning, and so ensure that all learners acquire the knowledge and skills needed to promote sustainable development and global citizenship (see

Goal 4, *Agenda 2030*. United Nation, 2015; Banks, 2017), it is more necessary than ever to learn how to make the most of the human capital that students carry and to address the various forms of inequality that still exist. Diversity among students (in terms of culture, age, gender, ethnicity, nationality, religion and social status) is an increasingly important issue and requires complex and intersectional readings of reality, able to take into account intra- and intergenerational differences in order to approach and live with others in an open, inclusive and fair way (Lipura and Collins 2020; Besley, 2012; Grant, 1999). It entails respecting and valuing linguistic and cultural diversity, fostering critical reflection on cultural diversity, encouraging the learner's voice, and supporting the inclusion of disadvantaged and marginalised learners (Council of Europe, 2022).

This change of perspective also concerns Higher Education contexts, which see a growing presence of international students (Erasmus students, students with a migratory background and 'still' a foreigner passport, students arriving under specific conditions, i.e. students refugee like, students at risk like Afghani, Ukrainians etc.). Higher Education contexts, indeed, are challenged both to question certain stereotypical and traditional notions of working methods and relationships with the Other, and to train and update the professional competencies of teaching staff in an intercultural, democratic and non-discriminatory way, as well as those of administrative staff who must interact with this diversity (Beech, 2018; Smith and Conover-Williams, 2017; Unesco, 2022).

It is a matter of updating and improving reflections and practices on educational policies at the system level, involving both those who educate and those who manage the organizational and administrative aspects. Thus, the education and training of tertiary personnel becomes a key to interpreting social and cultural changes and to developing innovative perspectives and practices that can be reflected and impacted also in school and socio-educational contexts on the ground, acting on the intergenerational reproduction of inequalities and promoting the agency of different actors as vectors for greater social justice.

## **2. MIGRANT STUDENTS ON THE STAGE. OPPORTUNITIES AND CHALLENGES FOR HIGHER EDUCATION**

Diversity among students (in terms of culture, age, gender, ethnicity, nationality, social status and so on) is an important issue that Higher Education have to face in an equal and inclusive way in our complex and multicultural societies.

Diversity linked to a migratory experience is quite new at University level in relatively recent migration countries, like Italy. Indeed, apart from Erasmus students and international students enrolled under special agreements between Universities, there are more and more first-generation migrant students, or their children, who challenge the system on several levels (Guadalupe-Diaz, Rincón and Rutter, 2017; Griga and Hadjar, 2014; Launcelot and Brown, 2004).

This growing phenomenon requires attention and work on three levels in a synergetic manner. At faculty level, there is the need (not always well-recognized) to overcome prejudices dealing with their inclusion in the migration framework (which is – after the 2015 crisis more negative) and to learn how to teach in multicultural classrooms (and not-always with European legacy). At Staff level, it is necessary to develop new educational competences and practices in order to address different needs, valorize diversity as a resource for learning, and fight against the various forms of inequality and discrimination, by including principles of plurilingual and intercultural education (Palaiologou, 2023). This concerns a rethinking of some implicit and tacit knowledge, underlying certain established ideas of learning and teaching habits, as well as of the processes of teaching and managing cultural diversity in class, but also at the political and organizational level. At peer level, there is the need to update knowledge and intercultural skills already learned in the multicultural environment of compulsory tracks, and enhance them through teaching methodologies that pay attention to relationships and knowledge exchange in the academic classroom (such as, peer-to-peer; cooperative learning; work-project) precisely in order to promote intercultural competences and build a plural learning context.

In such a perspective, some research and educational initiatives carried out at the University of Turin (Italy) were aimed at exploring the various sub-groups of youth academic paths; discussing similarities/difference between international students and second generations students; and identifying key turning points in their academic paths. These topics were investigated through qualitative research methodologies (such as, interviews, case studies) and highlighted that, on one side, the issue of cultural diversity among students at the University are still a topic under the umbrella of ‘International students’, with a lack awareness of their socio-cultural characteristics. On the other side, this growing learning paths leads students to come to terms with the inheriting parents’ dreams, but also raises sometimes intergenerational conflicts on social class identity issues and labour market opportunities.

In conclusion, the future challenges will be: overcoming the risks of delaying integration paths, due to the lack of equal opportunities; going beyond occasional projects, by fostering the empowerment, recognition, involvement of all the actors involved; and improving the capacity building process for all the involved adults (Ricucci and Pinna Pintor, 2022).

# TRANSFORMING INITIAL TEACHER EDUCATION FOR PLURILINGUAL COMPETENCE: INSIGHTS FROM AN ERASMUS+ PROJECT IN A HETEROGENEOUS SCHOOL

Luca Angelone<sup>a</sup>

<sup>a</sup>Università di Torino

The implementation of a project aimed at promoting intercultural pedagogy and plurilingual approaches in an upper secondary school in Italy provided valuable data that also prompted reflection on initial teacher training. In particular, training in inclusive and workshop-based teaching proved to be crucial for the project's implementation and thus emerge as central elements in this context. This article discusses the data collected through participant observation and semi-structured interviews.

plurilingualism; intercultural pedagogy; observant participation; teacher education

## INTRODUCTION

This article examines a pilot project implemented during the 2022–2023 school year in an upper secondary school in Italy. The project aimed to promote teaching approaches grounded in intercultural pedagogy and to develop plurilingual competences. Drawing on the work of Garcia and Li Wei (2014), the project sought to create an educational environment where the various languages present in the school coexist and interact naturally.

Focusing on a single school context is advantageous as it allows for a more nuanced understanding of how policy directives are translated into everyday practice. Although Italian school legislation supports approaches that foster intercultural and plurilingual education, many institutions struggle to implement them effectively. By closely examining a specific context, this study aims to shed light on the day-to-day dynamics that drive educational innovation.

The project, initiated by the school leadership team and a group of teachers, was designed to transform the educational environment by encouraging innovation in organisational cultures, practices, and policies (Booth & Ainscow, 2011). Its central goal was to test the feasibility of a plurilingual approach grounded in linguistic justice and democracy (Van Parijs, 2011), recognising the equal value of all languages and the importance of linguistic diversity in educational settings. Key strategies included teacher training programmes, opportunities for student mobility abroad, and the dissemination of teaching practices aligned with the project's overarching aims.

The initiative addressed two pressing needs: the persistent risk of academic underachievement among students with a migrant background and the opportunity presented by Erasmus+ funding to promote school internationalisation. Researchers from the University of Turin played an active role in the project, contributing to its design, implementation, and evaluation. The author, who was directly involved, provided operational support and gathered data through semi-structured interviews and participant observation, offering a detailed perspective on how educational innovation emerges in practice.

Building on the description of the school context and the actions undertaken, this article focuses on analysing key data from the project. It highlights critical interpretative insights and their implications for policy recommendations, particularly in shaping pre-service teacher training to better support intercultural pedagogy and plurilingual approaches.

## **1. LINGUISTIC DIVERSITY IN THE INSTITUTE**

The issue of multilingualism holds particular importance within the Institute. With foreign students comprising 27% of total enrolments—significantly above the national average (Ministero dell'Istruzione, 2023)—the school's linguistic diversity is both notable and complex. Overall, students come from 26 different national backgrounds, with Romanian, Peruvian, Filipino, Egyptian, and Moroccan groups most prominently represented. In Italian educational linguistics, scholars such as Bagna and Casini (2012) and Vedovelli (2017) describe this degree of linguistic variation as 'neoplurilingualism,' a concept highlighting the coexistence and interaction of multiple linguistic systems.

However, to gain a deeper understanding of this complexity, it is helpful to broaden our perspective by introducing the notion of a "student with a migratory background," as suggested by international research guidelines. According to

these guidelines, such students include those who are foreign-born or have one or both parents originating from abroad (OECD 2018, pp. 46–49).

By closely examining the birthplaces of parents in three classes, it became clear that in each of these classes, the proportion of students with both parents born abroad exceeded the overall percentage of non-Italian citizens enrolled at the Institute. For example, in the first class, 27.2% of students met this criterion, rising to 47.6% in the second, and reaching 52.4% in the third.

The third class provided an opportunity to explore plurilingualism in greater depth. Within this group, we identified students demonstrating at least partial competence in six different languages. North African varieties of Arabic were particularly prominent—three students spoke Maghrebi Arabic and two spoke Egyptian Arabic—alongside other widely used languages such as Andean Spanish (two students) and Romanian (two students). Additionally, minority yet significant languages, including Albanian (one student), Chinese (one student), and Croatian (one student), were also present.

The picture of linguistic competences—both in Italian and in students’ heritage languages—is highly fragmented. Three newly arrived students in Italy are acquiring Italian and can be considered emerging bilinguals. Nine other students with migratory backgrounds show varying levels of Italian proficiency, influenced by their age of arrival. Among them, the six students born in Italy have full command of Italian. With regard to their parents’ languages, all students report complete oral comprehension, though oral production varies: some use it daily, while others, despite fluent skills, reserve it for what they consider special circumstances. Written proficiency, especially in non-Latin alphabets, presents an additional layer of complexity. Generally, written forms are less frequently used than spoken forms. Another aspect warranting further research is the role of dialects, which may add yet another dimension of linguistic diversity.

These findings confirm a strong presence of languages other than Italian, particularly among students with migratory backgrounds. At the same time, the school’s linguistic landscape is both varied and complex, comprising multiple language variants and varying levels of proficiency in both Italian and heritage languages.

In light of these observations, it becomes clear why the school urgently seeks to develop organisational cultures, practices, and policies that foster an intercultural and plurilingual approach. This urgency is not solely linked to the heightened risk of academic underachievement among a segment of the

student body, but also stems from recognising the potential educational opportunities that linguistic diversity can offer.

## **2. INTERVENTION DESIGN AND IMPLEMENTATION**

The pilot project aimed to introduce initiatives promoting intercultural education within the school, with a primary focus on enhancing linguistic diversity. Central to this objective was the practice of intercomprehension among related languages, broadly defined as a form of communication in which participants express themselves in their own language while understanding that of the other (Bonvino & Garbarini, 2022). This approach sought to foster mutual understanding and highlight the value of linguistic diversity as a resource for inclusive education.

By implementing this approach, the project aimed to provide a practical model for applying fundamental intercultural competences, including the recognition and interpretation of cultures, with an emphasis on finding shared perspectives (Reggio & Santerini, 2014). The project consisted of three key initiatives carried out during the 2022–2023 school year: a teacher training course, a short-term student mobility activity, and a dissemination day.

The first initiative involved an intensive three-day training course for the school's teachers, designed to promote the practice of intercomprehension among related languages. The course highlighted the educational potential of linguistic diversity, focusing on how it can be appreciated and integrated into teaching practices. Two multilingual trainers led the sessions: a native Romanian speaker and a native Spanish (Castilian) speaker, ensuring a diverse linguistic environment.

The second initiative comprised a short-term mobility programme for students. Twelve girls, accompanied by two teachers, travelled to a secondary school in the urban centre of southern Spain. Both schools shared a commitment to strengthening plurilingual competences among teachers and students.

Prior to departure, the students attended preparatory classes on intercomprehension and the observation of linguistic diversity in multilingual contexts. These sessions, led by the institute's teachers, provided a foundation for their experience abroad. Students were selected based on motivational letters demonstrating their interest in intercultural experiences, rather than academic performance or Spanish language proficiency.

Collaborative activities, designed in partnership with the host institution, encouraged mixed groups of students from both schools to engage in practical

and contextualised tasks. These activities aimed to foster communication and provide opportunities to practise intercomprehension, reinforcing the project's focus on linguistic diversity and mutual understanding.

The third initiative was a dissemination day dedicated to plurilingual practices within the school. This event featured interactive activities designed to raise awareness of plurilingualism. Students and teachers participated in hands-on sessions that incorporated playful elements, such as serious games and gamification, to enhance engagement and deepen their understanding of linguistic diversity.

### **3. FINDINGS AND DISCUSSION: THE ROLE OF INITIAL TEACHER TRAINING**

The following section examines selected data to provide insights for revising initial teacher training pathways. Specifically, it focuses on teacher profiles and teaching methodologies that contributed to the successful implementation of the pilot project's themes. The findings highlight that support teachers and workshop-based teaching methods created favourable conditions for advancing intercultural pedagogy and plurilingual approaches. These observations suggest that expanding these themes requires targeted efforts to promote relevant training in initial teacher education.

#### **3.1. Support Teachers' Engagement**

A specific group of teachers demonstrated heightened sensitivity to the themes introduced by the pilot project. The school employs a substantial number of teachers specialised in educational activities for students with disabilities (support teachers), accounting for 52 out of 142 teachers (approximately 36.7% of the total). Most of these teachers have completed specialised pre-service training programmes to prepare for their roles. Regarding participation in the training course connected to the pilot project, support teachers represented the largest group of attendees. Out of a total of 36 participants, 29 were support teachers (approximately 81%).

Further evidence of support teachers' greater willingness to engage emerged in the context of the mobility programme. When teachers were invited to act as accompanying staff, three out of four applicants (75%) were support teachers. Although the numbers in this instance were limited, the trend is consistent: support teachers repeatedly proved to be the group most inclined to participate in the pilot project's initiatives.

Support teachers exhibit characteristics often associated with inclusive

teachers (European Agency for Special Needs and Inclusive Education, 2022). However, the origin of their heightened sensitivity to the pilot project's themes warrants further investigation. While personal factors or specific contextual conditions may have played a role, the data suggest a more systemic influence. The most compelling hypothesis is that initial training pathways significantly shape teachers' behaviour and attitudes, particularly in relation to intercultural pedagogy and plurilingual approaches.

To explore this hypothesis, interviews were conducted with teachers who had participated in the pilot project's training activities. These interviews, especially those with support teachers, revealed a heightened awareness of the value of linguistic diversity, which was often linked to a broader appreciation of diversity in general. Many respondents highlighted the strong alignment between the pilot project's content and their initial training experiences. This alignment underscores the potential of well-designed training pathways to influence teachers' perspectives and practices in meaningful ways.

The findings indicate that the implementation of intercultural pedagogy and plurilingual approaches requires a more prominent focus on inclusive teaching in initial teacher training. Extending this emphasis beyond support teachers to the broader teaching workforce will ensure a more comprehensive integration of these practices into educational settings.

### **3.2. Workshop-Based Teaching**

The issues introduced by the pilot project generally struggled to gain traction and were rarely integrated into other day-to-day teaching activities. However, one particular activity stands out as an exception to this trend.

In recent years, some classes at the institute have participated in a workshop-style experience conducted during school hours. The aim of these workshops is to create a tangible product through cooperative and inclusive working methods. A key feature of this approach is its interdisciplinary dimension: rather than focusing on achieving the specific educational goals of individual academic subjects, the workshops start with the needs of the student group to design a tailor-made educational proposal. Notably, the management of these workshops is entrusted to support teachers, working in collaboration with educators and training agencies.

Within two of these workshop pathways, the experience led to the creation of tangible products that actively embraced and celebrated the linguistic diversity within the class. The decisive factor facilitating the integration of elements from

the pilot project appears to have been the extracurricular dimension of these workshops.

The capacity of these workshops in integrating elements of the pilot project underscores the advantages of operating outside conventional, subject-based structures. This flexibility allowed for more creative and inclusive approaches, facilitating the adoption of intercultural and plurilingual practices.

This case offers valuable insights for the initial training of teachers. If the themes addressed by the pilot project naturally found space only within laboratory-based teaching contexts, it is reasonable to hypothesise that these settings are the most conducive for such themes to take root. To encourage the spread of intercultural pedagogy and plurilingual approaches, it is essential to promote alternative teaching methods that move beyond traditional frontal lessons focused on disciplinary content. This underscores the need to strengthen pre-service training in laboratory-based teaching, equipping future teachers with the skills and confidence to incorporate this approach into their professional contexts.

# INTERNATIONAL MOBILITY, RESOURCES AND INCLUSION OF INCOMING STUDENTS: PRELIMINARY DATA FROM THE VAMOS PROJECT WITH SPANISH STUDENTS

Aurelia De Lorenzo<sup>a</sup>

Elga Zedda<sup>a</sup>

Antonio Lucas-Alba<sup>b</sup>

Emanuela Rabaglietti<sup>a</sup>

<sup>a</sup>SE-CREA Research Group, Department of Psychology, University of Turin, Italy;

<sup>b</sup>ERA Research Group, Department of Psychology and Sociology, University of Zaragoza, Spain

As emerging adults, university students are in a transitional phase in terms of identity, career and relationships, which can be especially challenging during the pandemic. Mental health issues such as anxiety, depression and reduced life satisfaction have increased among young adults, exacerbated by lockdowns, school closures and the inability to study abroad. International mobility, for example through Erasmus programs, is crucial for personal development and fosters skills such as critical thinking and problem solving, which are essential for European citizenship. The VAMOS project was set up to investigate the well-being of Erasmus students at the Universities of Turin and Zaragoza. This study focuses on 40 Spanish students, 15 of whom chose Italy for their Erasmus experience, and analyzes variables such as course of study, language skills, previous mobility experience and motivation. Both their strengths and weaknesses are examined, comparing those who chose Italy with those who did not. The project aims to better understand the needs of these students and develop tailored programs to support their development, enhance the Erasmus experience and promote European citizenship, especially in the post-pandemic period.

Emerging adulthood; Mental health; International mobility; Erasmus programs; European citizenship

## **1. INTRODUCTION. UNIVERSITY STUDENTS AND EMERGING ADULTS IN PAN-DEMIC PERIOD**

Emerging adulthood, typically between the ages of 19 and 35, is a critical developmental stage characterized by the exploration of one's identity in areas such as work, education, relationships, and lifestyle (Arnett, 2007). While this stage offers opportunities for growth, it is also associated with considerable stress and anxiety due to instability and uncertainty in studies, career and personal relationships. While individuals gain autonomy, the responsibilities associated with this transition can lead to psychological pressure (Arnett et al., 2014).

University students belonging to this age group are particularly affected by these challenges. Universities serve as a developmental environment in which students can explore their identity and career path (Arnett, 2016). However, this exploration can either promote resilience and well-being or lead to problems such as anxiety and isolation (Nelson & Padilla-Walker, 2021). Emerging adults are especially vulnerable to mental health issues such as anxiety and depression, which are often exacerbated by academic pressure and economic uncertainty (Arnett et al., 2014).

Research shows that university students are at increased risk to their mental health, with many of them experiencing lower levels of wellbeing compared to other age groups even before the COVID-19 pandemic (Toussaint et al., 2016; Wood et al., 2018). The WHO WMH-ICS project (Auerbach et al., 2018) has shown that diagnosable mental disorders are common among students, including depression, anxiety and substance use, which often begin before or during the study period. Common risk factors include academic stress, social isolation and financial hardship. Barriers to treatment include limited resources, mental health stigma, and lack of awareness of available services (Odrizola-González et al., 2020; Saulle et al., 2022).

The COVID-19 pandemic exacerbated these issues as lockdowns and remote learning increased social isolation and stress levels (Balanzá-Martínez et al., 2020; Halliburton et al., 2021). Addressing the mental health needs of higher education students remains a global priority.

## **2. INTERNATIONAL MOBILITY, ERASMUS AND EUROPEAN CITIZENSHIP**

The COVID-19 pandemic has had a significant impact on international student mobility, preventing young adults from taking advantage of the formative opportunity to study abroad. International mobility plays an important role in the

socio-emotional and relational growth of students and helps them to develop an awareness of their role in national and international communities (Martínez-Usarralde et al., 2017). Studies (e.g. Beine et al., 2014) show that economic, social and political factors, including scholarship opportunities and educational costs, influence the decision to study abroad. However, challenges such as high education costs, visa and residence permit issues and cultural barriers can affect students' ability to participate in international mobility programs (López-Duarte et al., 2020). Amendola et al. (2021) found that international mobility significantly improves students' intercultural competence, professional development and global perspective. Through exposure to other cultures and educational environments, students also improve their soft skills, such as communication, problem solving and teamwork. This personal and professional development makes students more competitive in the global job market, so international mobility programs are essential for enriching their professional profile (Handayani & Wienanda, 2021). In addition, mobility fosters critical thinking, adaptability, self-regulation and creativity, which are crucial for coping with the challenges of adulthood (Van Mol, 2018). International exchange experiences are crucial for young people in the transition to adulthood as they provide significant opportunities for identity reshaping and personal growth. These experiences also foster curiosity and a desire for entrepreneurship, key elements of European citizenship. However, the pandemic has disrupted international mobility and forced universities to adapt their programs, with many moving to online formats and restricting travel. Despite these challenges, the pandemic has also paved the way for virtual mobility programs that could complement traditional exchange programs in the future (Yıldırım et al., 2021; Li et al., 2022).

### **3. THE CURRENT STUDY**

The UNITA consortium<sup>1</sup>, founded in 2020 and made up of 12 European universities, aims to promote student mobility as an instrument of international and intercultural education in the field of European higher education. Funded by the UNITA consortium, the VAMOS<sup>2</sup> project, a collaboration between the Departments of Psychology at the Universities of Turin and Zaragoza, aims to monitor the well-being of students at the two universities who have opted for international mobility in the post-pandemic period.

---

<sup>1</sup> <https://www.unito.it/internazionalita/unita-universitas-montium>

<sup>2</sup> VAMOS: uniVersity internAtional Mobility to develop social-emOtional and creativity Skills

This study analyzes preliminary data within the VAMOS project and focuses on describing the sample of Spanish students who have opted for international mobility, with special attention to those who aspire to study abroad in Italy. Specifically, the study aims to (1) describe who the Spanish outgoing students are and what their characteristics are; (2) test for differences between the students who chose Italy or other host countries; (3) test for differences based on gender; and (4) test for differences between the Spanish outgoing students and the normative reference samples for the variables under consideration.

## **4. METHODOLOGY**

### **4.1. Participants**

A total of 40 students from the University of Zaragoza, Spain, took part in the study. The average age of the sample was 22 years (age range = 21–32 years). Most of the total sample was female (77%). The university students who participated in the study at the time of data collection were enrolled in different study programs: Natural Sciences 38% (Medicine, Environmental Sciences, Sports Sciences), Humanities 57% (Psychology, Education, Law), Arts 5%. The participating students were enrolled in the 2nd (3%), 3rd (55%) and 4th (42%) year of their respective degree programs.

### **4.2. Procedure**

Students completed an online questionnaire to collect sociodemographic data and the variables presented in the Measures section. Participants were informed about the aims of the study, the procedures for data storage, the voluntary nature of participation and their right to withdraw at any time. All procedures performed in studies with human participants complied with the principles of the 1964 Declaration of Helsinki and its subsequent amendments or equivalent ethical standards and were approved by the Bioethics Committee of the University of Turin on July 21, 2023 (Prot. No. 0432954)

### **4.3. Measures**

All students who participated in the study answered an online questionnaire, which was completed in Spanish. The questionnaire included the validated scales to measure the study variables and a section with socio-demographic information such as gender, age, course of study at the time of data collection. The data collection took place in spring 2023. The scales used have been tested and validated in previous studies with samples of university students; the scales used are listed below:

- The Social Problem-Solving Inventory – Short Form (SPSI-SF) developed by Hawkins et al. (2009) with five sub-dimensions: Positive Problem Orientation (PPO); Negative Problem Orientation (NPO); Rational Problem Solving (RPS); Impulsive Style (ICS); Avoidance Style (AS).
- The Life Skills Scale (LSSAA) developed by Kase et al. (2016) with four subscales: Decision Making, coping with emotion, effective communication, Interpersonal Relationships.
- The Perceived Stress Scale (PSS) developed by Cohen et al. (1983).
- The Hospital Anxiety and Depression Scale (HADS), validated in Spanish by Herrero et al. (2003).

## 5. RESULTS

With regard to the first objective, Table 1 shows the results of previous experiences with international mobility, the choice of host country, the duration of mobility, language skills and the reasons for the decision to go abroad. The second table shows the mean values and standard deviations of the variables included in the study.

Table 1. Information about international mobility experiences and motivation

<i>Variables</i>	<i>%</i>
First international mobility experience	99%
International mobility experiences during secondary school	48%
Host Country	
Italy	37.5%
Other countries (France, Germany, Portugal, Czech Republic)	62.5%
Duration of Erasmus	
<6 months	23%
<12 months	72%
>12 months	5%
English language proficiency level	
B1	28%
B2	35%
C1	35%
C2	2%

Erasmus country language proficiency level

A1	42%
A2	20%
B1	15%
B2	15%
C1	5%
C2	3%

Reasons why international mobility was chosen

Networking internationally	65%
Immersion in a new cultural context	75%
Experiences of independence	70%
Personal growth	93%
Job opportunities	23%
CV enrichment	43%
Learning a new language	83%
Furthering a degree	58%

Table 2. Descriptive analyses of the variables considered

<i>Variables</i>	<i>Mean ± SD</i>
Positive_PS	16.47 ± 3.63
Negative_PS	12.30 ± 4.10
Rational_PS	16.25 ± 3.88
Impulsive_PS	8.40 ± 3.15
Avoidance_PS	8.30 ± 3.70
LS_Decision Making	12.22 ± 1.95
LS_coping with emotion	10.82 ± 2.80
LS_effective communication	11.32 ± 2.45
LS_Interpersonal Relationships	13.37 ± 1.19
Perceived Stress	20.95 ± 4.08
Anxiety	5.95 ± 3.58
Depression	3.01 ± 2.81

Note: PS=Problem Solving; LS= Life Skills

For the last objective, the values obtained by the Spanish outgoing students were compared with the normative reference values for each variable considered. The participants in this study scored higher on the life skills “Decision-making” ( $t(39)=1.99, p<.05$ ) and “Interpersonal relationships” ( $t(39)=4.75, p<.001$ ) as well as on stress level ( $t(39)=7.20, p<.001$ ). Conversely, the participants reported lower levels of anxiety ( $t(39)=-2.20, p<.05$ ) and depression ( $t(39)=-2.02, p<.05$ ).

## **6. DISCUSSIONS**

The study examines the well-being, resources and challenges of Spanish university students participating in international mobility as part of the VAMOS project, contributing to the understanding of the complexity of development in emerging adulthood. Participants showed above-average competencies in life skills, confirming the benefits of programs for personal and professional development (Amendola & Restaino, 2021; Van Mol, 2018). In terms of gender differences, young women showed a stronger tendency towards negative problem orientation, avoidant coping styles and anxiety, while young men showed better emotional coping skills, which is consistent with previous research (Nelson & Padilla-Walker, 2021). Participants reported lower than normal levels of anxiety and depression, but significantly more stress, reflecting an interaction between academic pressure, international experiences, and protective factors such as interpersonal skills and decision-making ability. The long-lasting effects of the pandemic, such as social isolation and lockdown, exacerbated the young adults’ mental health problems (Saulle et al., 2022). Limitations of the study include the small sample size and the exclusive focus on Spanish outgoing students, which limits the generalizability of the results. In addition, the cross-sectional nature of the study does not allow any definitive conclusions to be drawn. Longitudinal studies and qualitative methods could improve the understanding of the students’ experiences and their coping strategies.

The practical implications arising from these findings highlight the importance of specific support programs for international students, especially in the post-pandemic period. Universities should address gender-specific vulnerabilities, improve stress management resources and promote the development of life skills. Although virtual mobility has proven to be a viable alternative during the pandemic (Yıldırım et al., 2021), it cannot replace the social-emotional benefits of face-to-face exchanges, which argues for a complementary integration of both formats.

# ADDRESSING LINGUISTIC (IN)EQUALITY IN HIGHER EDUCATION: A CASE STUDY OF SOCIAL JUSTICE AND MULTILINGUALISM AT THE UNIVERSITY OF LUXEMBOURG

Argyro-Maria Skourmalla<sup>a</sup>

<sup>a</sup>University of Luxembourg

Social justice has a twofold role in the context of higher education. Firstly, it serves as a fundamental objective in democratic societies, embodying values such as inclusive education, equal participation, and fair accessibility in resources and in opportunities for the development of individuals. Secondly, within the context of education, social justice refers to the ongoing process of raising awareness regarding power relations and targeting existing inequalities. Language, a crucial component of social justice, remains underexplored in higher education. In the present paper, I focus on the case of the multilingual University of Luxembourg and I provide data about the use and role of languages in this higher education setting. Applying the appraisal framework, and specifically the system of attitude, I analyse lecturing staff and undergraduate students' experiences on the use of languages at the University of Luxembourg. Findings show that there is the need to raise awareness towards language inequality in higher education institutions and find ways to address this further.

social justice; higher education; linguistic diversity; language inequality

## 1. INTRODUCTION

Higher education has a dual role on a national and international level. While higher education institutions become more and more diverse, it is important for higher education to reconsider the challenges that go with it on the national and international level (Smith, 2020).

Social justice has been one of the core values and aims of higher education institutions (Furlong & Cartmel, 2009). Wilson-Strydom (2015) writes that "social justice is currently a 'mantra' in higher education" (p. 143). For Skilbeck (2000) promoting principles of social justice and democracy are one of the core

elements of higher education's role.

There is no universal definition of social justice. In fact, social justice is often associated with topics such as respect, equal access, participation, and representation (Picower, 2012). One of the crucial components of social justice is language (Wolfram, Charity Hudley & Valdés, 2023). The strong connection between the two is explained by Piller (2016) who supports that linguistic diversity facilitates social participation (Piller, 2016). Avineri et al. (2019) notice that language is found in most of the recent discussions around social justice.

Previous research on social justice in higher education focused on areas such as inclusion, equity, access, and participation in higher education from the perspective of specific populations (Brennan & Naidoo, 2007). Even though these topics are closely connected to language (Wolfram, Charity Hudley & Valdés, 2023), “language has received scant attention” (Piller & Takahashi, 2011, p. 375) in relevant research. Piller (2016) explains that there is a lack of systematic research on issues that have to do with social justice and languages.

To address this gap, I focus on the bachelor level of studies at the University of Luxembourg, to explore potential mismatches between the institution's multilingualism policy and the realities in language use, as experienced by members of the educational community. Specifically, with the present paper I aim to reply to the following question:

How do lecturing staff and bachelor students experience the role of the different languages in teaching and in learning at the University of Luxembourg?

## 2. METHODOLOGY

The University of Luxembourg is the only public University of the Grand Duchy of Luxembourg. In May 2020, the university adopted the multilingualism policy<sup>3</sup> according to which English, French and German are the official teaching languages. In addition to the three official languages, the university recognizes the status of Luxembourgish, as the national language. According to the multilingualism policy (2020), languages have a specific function at the university “deriving from its position as academic, legal or national language”.

The present case study delves into lecturing staff and undergraduate students'

---

<sup>3</sup> University of Luxembourg. 2020. Multilingualism Policy. <https://www.uni.lu/wp-content/uploads/sites/9/2023/07/Multilingualism-Policy-English.pdf>

experiences and explores the use and the role of languages at the University of Luxembourg. Given that the aim of the research is to get a deeper understanding from individuals' experience, I considered a qualitative approach more appropriate (Given, 2008; Nassaji, 2020).

I collected data for the research through semi-structured interviews with thirteen lecturing staff from the three Faculties of the university. I chose to conduct semi-structured interviews because it is a research method that contributes to richer data in getting lecturing staff's perspective (Taherdoost, 2021).

For undergraduate students, I designed and launched an online survey that was followed by two focus group discussions. I considered this method for data collection suitable because as mentioned in literature, it is efficient, convenient, and a quick way to collect data from a big audience maintaining anonymity and ensuring confidentiality (Patten, 2014; Cohen et al., 2017). To get a deeper understanding of the sixty eight completed survey responses, I conducted two focus group discussions with students who were willing to further contribute. I chose focus group discussions because it is a research tool that allowed me to bring together a small group of students and to exchange on a specific topic in a more relaxed environment (e.g. Packer-Muti, 2010).

In all research tools used, I asked participants about their role at the university, their experience with teaching/learning in this context and their perspective on linguistic diversity at the university.

Data was analysed using the appraisal framework, and specifically the system of attitude. I consider the appraisal framework suitable for the analysis of the data collected because it is a structured method to analyse how language reflects power dynamics and social inequalities, which were of interest to the research question.

In the appraisal framework, attitude focuses on feelings and is concerned with how they are expressed in discourse (Martin & White, 2005). Attitude is further divided to affect, judgement, and appreciation. According to Martin and White (2005), affect focuses on expressions of feelings that can be either positive or negative. Judgement is concerned with behaviour and approaches it in the framework of social expectations and systems of values. Lastly, appreciation refers to evaluations of abstract concepts such as products, phenomena, and processes.

Appraisal, and specifically the system of attitude is chosen for data analysis because it examines in depth "meanings in context" (Martin & White 2005, p.

94) and highlights the role of individuals, both of which are important to the research. With this approach to data analysis I focus on participants' expressions of affect, judgement, and appreciation to unveil power relations and underlying ideologies.

### **3. FINDINGS**

In this section I include excerpts from the multilingualism policy of the university as well as data collected from the semi-structured interviews with lecturing staff and from the online survey and focus group discussions with undergraduate students.

Starting from the multilingualism policy, the document mentions that “learning and using multiple languages is an added value to student and employee experience” and states that “multilingualism must promote inclusion”. In this excerpt from the official document, multilingualism is positively evaluated with appreciation as beneficial to all members of the university. In the next line, the advantage of using multiple languages at the university becomes a strong judgement that includes an ethical perspective and refers to an active use of multilingualism for inclusion.

However, data from participants present a contradictory picture. One of the students says that at the university “the range of languages is limited and only benefits people who are comfortable with English”. This student expresses a negative low range evaluation for the choice of languages at the university. To that, a teacher adds that he does “NOT observe linguistic diversity at the university” and that he “observe(s) a singularity which is directed towards English”. This participant uses a low range negative appreciation to describe his observations to the use of English at the university. Participant emphasizes the lack of linguistic diversity that he notices at the university by placing emphasis on the negation “not” and by using “singularity” to describe the use of English.

According to participants, English seems to be the language that is mostly used at the university. English is referred to as “the sort of lingua franca” that is “becoming a new dominant (language)”. The phrases “lingua franca” and “dominant language” are an indication of appreciation that reveals the value that participants attribute to English in the context of the university. Based on participants' sayings, English is seen as the commonly used language that prevails other languages.

To the exclusive use of English, one of the participants mentioned that it “can be a huge help” but also talked about the need to consider “what is excluded by

that”. Participant’s sayings include a strong positive appreciation about English being “a huge help”. At the same time, this participant negatively evaluates the dominance of English as an excluding factor.

Participants referred to French as “a secondary language” which is mostly used “in administration” at the university. These phrases are examples of appreciation that show that participants evaluate French as a not very important language at the university. For the same language, a student expressed their dissatisfaction saying that “French is underestimated” at the university. Participant’s expression of affect also shows a negative appreciation to the French language which, according to him, does not get the importance that deserves.

In general, participants appear concerned about French. An example is what a participant says that “French mostly is losing over English”. This phrase shows negative appreciation for the impact of English on French. Moreover, the use of present continuous for the verb adds to the dynamism of the phrase and shows a tendency for something temporary.

German is another of the official languages of the university. One of the participating lecturing staff mentions that “German is coming back much more” since in earlier years, after the Second World War, it was “not a very popular language”. This participant expresses his strong appreciation to the German language. According to him, German is in return at the country, and as an extension to that, at the university. This participant evaluates the changing status of German which was not liked due to its link to the Second World War.

However, a student writes in the questionnaire that there is “too much focus on German for a university which claims to be ‘multilingual’”. This student expresses a strong negative evaluation for the use of German. In addition to that, the phrase “claim to be” together with the use of single quotation marks for “multilingual”, indicate irony from the part of the participant to the extensive use of German at the university.

On the other hand, for Luxembourgish, a Law student mentions that she has “not encountered Luxembourgish once in any way, shape or form”. This participant uses strong negative appreciation for the use of Luxembourgish which is emphasized with the use of “any way, shape or form”. For a lecturing staff participant, Luxembourgish is seen as “a small language and a small literature” that raises questions of “language power” and therefore “have to find our corner”. This participant talks about language power and repeats the adjective “small” when referring to Luxembourgish language and literature,

making a stronger point. The metaphor “finding our corner” shows that Luxembourgish is not seen at the university, and this is why she finds it obligatory for those working with Luxembourgish to find their place at the university. The use of the first-person plural pronoun for this judgement is an indication of subjectivity and shows that she is part of the group.

#### **4. CONCLUSIONS**

Findings indicate that the status and role of languages varies at the University of Luxembourg. This imbalance, as reflected through participants’ experiences, goes back to Piller’s (2016) point about language power and hierarchy amongst the different languages.

Talking about hierarchy and language power, one of the very common topics that emerged in data is the dominance of English. As also appears in literature, English is seen as a threat to national languages in science (Duarte & van der Ploeg, 2019) and to linguistic diversity (Pérez-Llantada, 2018). Even though English appears to open possibilities in this multilingual context, it is important to consider the global but also regional and national mission of the university (Darquennes, du Plessis, & Soler, 2020) given that the more international universities seek to be, the more effective they need to be to engage with the different languages (Soler, Björkman & Kuteeva, 2017). This is why raising awareness towards linguistic diversity is crucial (Coleman, 2006).

Especially for the University of Luxembourg which envisions to be “a University for Luxembourg and the world”<sup>4</sup>, plurilingual approaches to teaching, learning, and communicating research need to be encouraged (Darling, 2021). In this context and aiming to address the (in)justices that come with the different status of languages, “critical planning (...) and purposeful education to make possible greater understanding and acceptance of our complex linguistic realities” is meaningful (Liu, 2018, p. 22).

# FACULTY DEVELOPMENT, INCLUSION AND ATTENTION FOR DIVERSITY: PARTICIPANTS' REFLECTIONS AT THE IRIDI START COURSE AT THE UNIVERSITY OF TURIN

Emanuela Maria Teresa Torre<sup>a</sup>

Federica Emanuel<sup>a</sup>

<sup>a</sup>University of Turin

Universities are increasingly responsible for promoting equitable access and learning opportunities, accommodating diverse backgrounds, and meeting students' needs. Teaching methods and assessments should be inclusive, sensitive to differences in culture, gender, age, and other factors, in order to ensure the success of all students. It is essential to review and monitor assessment processes to reduce biases and prevent discrimination based on stereotypes. To support this, Faculty Development initiatives can enhance student-centered and inclusive teaching practices. Such training fosters intercultural competence and inclusion awareness, positively impacting teachers' attitudes and sensitivity to students' needs. This inclusive approach not only helps vulnerable students express their needs but also improves overall transparency and accessibility in the classroom. This paper examines the IRIDI program at the University of Turin, specifically the START course for researchers, which includes a module on inclusivity. Reflections from participants were analysed through the text analysis software NVivo 11 in order to identify faculty attitudes and challenges, thus guiding future strategies to support inclusive teaching practices.

Higher Education; Faculty Development; Inclusion; portfolio

## 1. HIGHER EDUCATION, INCLUSION AND FACULTY DEVELOPMENT

Due to the diverse educational needs and the heterogeneity of the student population, universities bear the responsibility to ensure equitable access and learning opportunities for all. Inclusive education is increasingly recognized as both a legal and ethical imperative, grounded in the principles of diversity,

equity, and social justice. However, despite its theoretical importance, a significant gap persists between the ideals of inclusive education and their practical implementation.

Universities are urged to promote equal access and learning opportunities for all students. This requires teaching and assessment practices to be inclusive and sensitive to differences such as culture, gender, age, and more, thereby supporting the success of every student. Furthermore, it is necessary to examine summative evaluation processes, particularly during exams, to avoid biases related to stereotypes or prejudices that could distort assessment and decision-making processes, potentially leading to discriminatory practices (e.g., Bellacicco & Parisi, 2021).

To address these challenges, it is essential to equip the university faculty with the skills and knowledge needed to deliver student-centered instructions that meet diverse needs. This can be achieved through targeted Faculty Development programs. Research highlights the significance of such training, with evidence showing that courses on inclusion and intercultural competence positively influence teachers' attitudes, therefore ensuring student-centered teaching that is responsive to their needs (Moriña, Perera & Carballo, 2020; Moriña & Orozco, 2020). Studies report that courses have a positive impact in terms of knowledge and sensitivity to students (Davies et al., 2013; Lombardi et al., 2011) as well as on students in general (Cunningham, 2013; Murray et al., 2014), as it promotes transparency and completeness of information provided in the classroom, attention to students, and the use of tools and methods that are functional for learning and teaching. It should also be noted that the inclusive attitude of teachers fosters the willingness of the most vulnerable students to make their needs explicit, making it possible for the teacher to implement the appropriate accommodations (Sapir & Banai, 2024).

The attitudes, skills, and commitment of university faculty play a pivotal role in shaping an inclusive learning environment. Faculty members not only facilitate academic success but also contribute to cultivating a sense of belonging among students. When faculties display inclusivity, students – especially those from vulnerable groups – are more likely to feel comfortable expressing their needs, allowing educators to provide appropriate accommodations (Sapir & Banai, 2024). Conversely, faculty attitudes rooted in stereotypes or non-inclusive perspectives act as barriers to student success (Solis-Grant et al., 2023).

## 2. THE UNITO IRIDI START COURSE

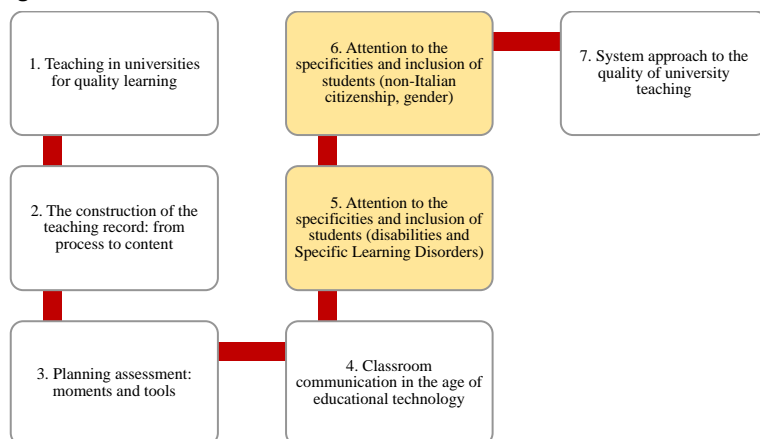

Since 2017 the University of Turin has introduced Faculty Development programs -- the IRIDI courses -- for teaching staff. Among the training options, the IRIDI START course is one designed for researchers, particularly new hires, and consists of seven training modules (Figure 1).

The objectives of the START course are:

- To develop awareness of the teaching choices being made or to be made and of the underlying intentions.
- To adequately plan the activities of the teaching(s).
- To focus on student learning and the factors that facilitate it.
- To make flexible use of digital in teaching (e.g. hybrid, collaborative approaches...).
- To investigate assessment strategies as they significantly influence learning more than teaching (transparency, objectivity, tools, etc.).
- To improve teaching strategies by also introducing innovative elements (ICT, inclusion, soft skills enhancement) and verifying their effectiveness.
- To link the quality of teaching with that of the Institution (from teaching to the course of study, to the University).

Two modules focus on the topic “Attention to the specificities and inclusion of students” from the perspectives of gender, disability and Specific Learning Disorders, and non-Italian citizenship. Specifically, this module provides guidance on rules and regulations and practical recommendations and strategies for effectively handling these cases.

Fig 1. The IRIDI START course

Participants are encouraged to document their reflections in a teaching e-portfolio, a useful tool to ensure meaningful learning (Torre & Emanuel, 2023). In this study, participants' reflections on these forms were explored, with a particular focus on the inclusion of foreign students.

### **3. RESULTS: PARTICIPANTS' REFLECTION ABOUT INCLUSION**

This paper considers the reflections of participants from the first eight editions of the course (2020 to early 2024), which trained 447 faculty members. The trainees decide for themselves on which modules to present their reflections on. The documents (N = 230) were analysed through the text analysis software NVivo 11<sup>1</sup> (Jackson et al., 2019), in order to identify attitudes, difficulties and areas for further exploration, useful to respond to the needs of the teaching staff and student community and to direct future actions to support inclusive teaching.

Participants' reflections on the three topics covered in the module were subjected to lexical analysis. Most participants included reflections related to students with disabilities and specific learning disorders, followed by inclusion of foreign students and gender. Figure 2 shows the words frequency that emerged in the textual analysis of these documents.

As observed, many terms are associated with aspects of teaching and instructional design (e.g., lessons, courses, etc.), while, comparatively, less attention is devoted to assessment.

A closer analysis reveals a focus on inclusion and the need to move beyond the concept of diversity. However, the notion of competence arises specifically in the context of including international students. It appears that when faced with challenges in linguistic and cultural communication, there is a recognition of the need to deepen understanding of these issues and to develop specific competencies to address them effectively.

Texts reflecting on the inclusion of foreign students were analysed using thematic analysis, with a focus on three key aspects: faculty attitudes toward international students, the teaching and assessment challenges encountered in classroom interactions with these students, and the strategies employed by the faculty to promote their inclusion.

---

<sup>1</sup> The analysis was conducted on Italian texts, a translation of the terms and lexical occurrences is provided here.

Fig. 2. Word frequency

Disability and SLD (148)		Gender (35)		Foreign students (49)	
<i>Word</i>	<i>Count</i>	<i>Word</i>	<i>Count</i>	<i>Word</i>	<i>Count</i>
student*	1768	student*	59	student*	378
lesson(s)	469	gender	53	italy/italian*	135
course(s)	453	lesson(s)	32	foreigner	94
teacher(s)	380	teacher(s)	31	course(s)	86
SLD	342	course(s)	24	teacher(s)	83
disability	268	inclusion/inclusive	22	language/linguistic*	82
didactics	226	language	22	culture/cultural	69
difficulties	163	attention	19	diversity	55
exam	158	respect	19	citizenship	47
studying	128	discrimination(s)	16	study	44
<i>learning</i>	<i>122</i>	<i>didactics</i>	<i>11</i>	<b>competence(s)</b>	<b>41</b>
<i>assessment</i>	<i>68</i>	difficulties	10	<i>didactics</i>	27
				<i>assessment</i>	13
				<i>learning</i>	12

The findings reveal several dimensions of faculty attitudes toward international students, emphasizing the value of diversity, shared challenges, and the socio-cultural complexities inherent in the educational experience. Participants reveal a reflective and multidimensional approach to inclusion, characterized by empathy, respect for diversity, and a commitment to understanding the complexities of students' experiences. A recurring theme is the importance of valuing differences without imposing judgments. One participant reflected:

When one encounters a 'difference', it is important to emphasize and value it, not by assigning a hierarchy to the different qualities. The concept, in my opinion, should not be 'we are all the same' but 'we are different in this, and it is a value that this is so; now let us understand each other better'.

Such an inclusive attitude fosters mutual understanding and respect, encouraging both educators and students to view diversity as a strength rather than a challenge. This perspective is crucial for the creation of a supportive learning environment that appreciates each student's unique experiences and contributions.

Some participants highlighted shared experiences with foreign students, particularly the challenges of teaching and learning in a non-native language. This shared struggle fosters empathy and reduces hierarchical distinctions between teachers and students. One participant noted:

The fact that I teach on a course delivered in English puts me and the foreign students on an equal footing as far as language is concerned. For most students (native English-speaking students are rare), English is their second language, as it is for me too.

Language, often seen as a barrier, thus becomes a shared endeavour, helping to bridge gaps in understanding and create a more collaborative learning environment.

Broader reflections within the data addressed the socio-cultural factors affecting foreign students, particularly those from immigrant backgrounds. Recognizing each student's unique characteristics enables the faculty to provide support that extends beyond academic concerns. By paying attention to these dynamics, educators can better understand their students' behaviours, motivations, and challenges, tailoring their approach to foster both academic success and personal growth.

Regarding difficulties and challenges in teaching to foreign students these aspects emerged:

- **Cultural and Knowledge Disparities:** students from different cultural backgrounds often lack shared foundational knowledge or common cultural references.
- **Linguistic and Expressive Barriers:** directly impact the students' ability to communicate effectively, affecting their performance during assessments and leading to potential misunderstandings or misjudgements.
- **Differences in Student-Teacher Interaction:** cultural norms regarding interactions with educators vary widely (e.g. students may address teachers informally or frequently interrupt lessons...).
- **Administrative and Organizational Challenges:** critical issues often arise from institutional and administrative barriers (e.g. university offices that do not offer services in English, documents available only in Italian, inadequate support systems for students...).
- **Lack of Cultural Awareness:** faculty and staff may have limited knowledge of other cultures, which can lead to misunderstandings or even unintentional disrespect.

These challenges highlight the importance of addressing both linguistic and cultural differences, improving administrative support, and fostering cultural competence to create an inclusive learning environment.

Faculty members highlight strategies used to promote inclusion, in particular:

- Inclusive instructional design: incorporate cultural awareness into curricula and teaching activities to ensure relevance and inclusivity; plan and structure lessons to accommodate the diverse needs of foreign students while maintaining the coherence of the course.
- Culturally Accessible Lesson Preparation: use clear and accessible language when preparing lessons; avoiding assumptions about familiarity with analytical or interpretative frameworks specific to a particular culture.
- Individualized Attention and Availability: create a supportive environment by being attentive to students' individual needs and offering availability to address their concerns.
- Facilitating Peer Integration: encourage collaborative activities that engage students in academic content while fostering interpersonal dynamics to break down barriers between international and domestic students. This promotes a more welcoming and inclusive classroom environment.
- Valuing Intercultural Exchange: highlight the importance of intercultural exchange as both a valuable approach and a key competence for academic studies, professional work, and research.
- Providing additional Support: offer extra opportunities for interaction and clarification by organizing additional meetings.
- Peer Mentoring and Collaboration: students can support one another, creating a cooperative learning environment that benefits all.

These strategies aim to create an inclusive and supportive educational experience that values diversity, promotes mutual understanding, and fosters academic success. Addressing the challenges of teaching international students through thoughtful and empathetic practices ensures a learning environment where all students can thrive.

## **CONCLUSIONS**

To promote inclusivity in Higher Education, it is essential to integrate dedicated training on inclusion into Faculty Development programs. These training sessions should emphasize the importance of understanding and addressing the unique needs and characteristics of students, fostering a learning environment that supports their individual experiences and challenges.

Careful planning of teaching activities is equally critical. Educators should design their courses with a clear focus on student learning, considering the factors that enhance their engagement and success. This requires not only the adoption of effective teaching strategies but also the incorporation of inclusive practices into these methods. By doing so, faculty can ensure that all students, regardless of their backgrounds or abilities, have equitable opportunities to thrive.

Moreover, it is important to continually evaluate and refine these strategies to ensure their effectiveness. Incorporating inclusion elements into teaching should be accompanied by mechanisms to assess their impact, allowing for adjustments and improvements based on feedback and outcomes. Another key aspect is the need for clear and accessible guidelines to support inclusion. Providing the faculty with precise instructions and organizational procedures ensures a consistent approach across the university, helping to create an environment where inclusivity is both a shared value and a practical reality. Through these combined efforts, universities can foster a culture of inclusion that benefits students and educators alike.

# THE EDUCATIONAL POVERTY OF MINORS WITH A MIGRATORY BACKGROUND: EXPERIENCES, ANALYSIS, CHALLENGES

Giovanna Filosa<sup>a</sup>

Patrizia Rinaldi<sup>b</sup>

<sup>a</sup>INAPP – Istituto Nazionale per l'Analisi delle Politiche Pubbliche, Rome (Italy)

<sup>b</sup>Institute for Migration Research, University of Granada (Spain).

## INTRODUCTION

While scholarly attention has shifted from focusing on migrants' responsibilities to including those of all stakeholders, the extent to which the general population will accept migration-driven diversification depends on successful migrant integration.

At the third *Scuola Democratica* conference, “Education and/or Social Justice”, with my colleague Giovanna Filosa, an awareness arose to explore the role of education in migration processes. As part of a wide-ranging study, our panel offers a comparative study already underway between Italy and Spain, expanded to include experiences from other European and non-European countries. All studies are based on educational asymmetries and the analysis of gaps between domestic and foreign schoolchildren.

The panel, “The educational poverty of minors with a migratory background: experiences, analysis, challenges” received many proposals that he was split into two sessions.

The panel presentation arose from the desire to open our horizon or, if you like, build a Trojan Horse. We enter the matter by comparing ourselves with other academics doing similar research.

Our focus is on the case studies proposed by Scholars, Academics, researchers, social workers, teachers, and managers, which have territorial roots and are multi-disciplinary.

Different research fields, such as law, sociology, anthropology, geography, statistics, demography, and pedagogy, have been boarded for the most complete scenario.

First, the theoretical debate around migrant integration through education has been ongoing in Western nations for nearly a century, and the relevant literature suggests that integration is the only way to coexist. However, both theoretical and empirical studies tell us that there is no exact definition of 'educational integration' and no agreement on how to define it. Instead, there is empirical evidence of the lack of educational integration.

Although starting from different postulates, the comparative study between Italy and Spain yielded the same results.

To seek homogeneity in the papers, we established the following research questions:

- Does the current education system succeed in integrating migrant children?
- Does it bridge the differences between nationals and immigrants?
- Where are these gaps to be found within the school systems?

The research questions are based on these hypotheses:

- Data show differences between nationals and foreigners.
- Differences remain for second generations.

Some variables of the school systems examined emerged:

- Poor learning.
- Socio-cultural drawbacks.
- Risk of poverty.
- Educational deprivation.
- Vulnerability.
- Disability.
- Unaccompanied Migrant Minors.
- Use of leisure time.

Around these variables, the presentations had in common the realisation that migration is part of the evolution of humanity. All deal with first and second generations of immigrants, inequality, and the gap between newcomers and natives.

## **PANEL 1 – PARTICIPANTS**

Professor Maddalena Colombo from the Catholic University of Milan starts with her study on SEN students, those from immigrant, poor, and deprived

backgrounds. Her paper focuses on the pandemic period and how public schools cared for the most vulnerable students in the “emergency” and “post-emergency” frameworks. What was the role of teachers and principals?

The second presentation discussed the educational integration of Unaccompanied Migrant Minors, brilliantly introduced by three researchers: Chiara Ferrari, Alessandra Caragiuli from the Catholic University of the Sacred Heart, and Alessandra Barzaghi from the ISMU Foundation.

Francesca Gabrielli (University of Roma Tre) discussed her research on the Third Sector, how leisure time is used, and the Sector’s role in combating the educational poverty of minors with migratory backgrounds.

Denis De Almeida Barros, a Portuguese national researcher at the University of Urbino, touched on the painful notes of Disability Studies in Education and proposed a model for studying the BES category in Italian schools.

The last paper of the first session is by Francesca Biondi del Monte from the Scuola Superiore di Pisa on the right to education of unaccompanied migrant minors and their transition to adulthood in the Italian legal system.

## **PANEL 2 – PARTICIPANTS**

In the afternoon, the discussion continued with four interventions. Annalisa Di Nuzzo, from the Suor Orsola Benincasa University of Naples, presented an articulated speech entitled “Migrant Minors, Second Generations, Resistance to Inclusiveness and Transculturalism. A Case Investigation into the Anthropology of Migration”. The intervention aimed to problematise the definition of “second generations”, starting from an anthropological, transcultural and cross-cultural perspective. Through the methodology of action research and case studies, phenomena such as barriers and resistance to inclusion were analysed. Currently, the ability to cooperate with people of different cultures is one of the most important skills for creating an inclusive society which can involve the “new Italians”.

The successive presentation, by Ilaria Usalla (Málaga University), focused on an intervention of teaching Italian as a second language classroom. The didactic strategy was based on the utilisation of literary texts to bridge the gaps between foreign and native students within plurilingual and pluricultural classrooms, pointing to the motivation to learn as a crucial factor of education. The follow-up survey discussed aspects such as educational experience and reading habits acquired.

Oggiano & Mesaroli's paper (Civicozero Onlus) concerns the educational challenge in interventions for Unaccompanied Foreign Minors (UFM), significantly affected by trauma and/or learning disabilities. Inclusive, innovative and effective teaching for foreign students with Specific Learning Disabilities (DSA) and Special Educational Needs (BES) can include social mediation techniques, cooperative learning, peer education, colourful image lexicon, communicating maps, gamification, playful teaching (word wall, word search, crosswords, spot the differences) and so on. In the future, it will be essential to provide teacher training on the teaching methodology used in this research and to strengthen collaboration with interdisciplinary experts: linguistics, pedagogy, neuroscience and developmental psychology.

The last paper is by Jacob Garrett (Ca' Foscari University, Venice) and describes a study on Parent Councils (*Decreti delegati*) in Italian schools. With archival documents (e.g. PTOF *–Piano triennale dell'offerta formativa*) and semi-structured interviews, the author explores the training offer for migrant students and their families in some Italian schools, pointing to inequality in the participation of migrant parents and inclusive or exclusive democratic practices.

## CONCLUSIONS

At the end of the afternoon session, a broad debate was stimulated among all the participants in the panel, which highlighted some points for reflection:

- It is crucial to continue to reflect on the new transnational identities that these young migrants carry on: many people land in Italy as a gateway to Europe to train here but settle wherever the working conditions are particularly advantageous.
- The interconnection between policies for the scholastic inclusion of young migrants and those to combat the falling birth rate and illegality and for the qualification of the future resident workforce does not escape.
- Policies for educational inclusion must be rethought together with those for the reception and integration of migrants, for the acquisition of citizenship and the support of families with a migratory background.

Ultimately, the educational and training poverty of young migrants is one of the main challenges that the school systems of advanced countries must face to be truly fair and inclusive. If inclusion is a lifelong life-wide process, it begins right at school. In education and training systems, the intellectual capital of migrant

origin risks being dispersed, if not adequately supported, in the broader framework of policies aimed at qualifying educational paths for all. The obstacles to learning that need to be removed are linguistic, social, and cultural. In educational and training inclusion paths, schools and families must be guided and accompanied by informal proximity networks and experiences – often more structured – linked to the third sector, associations, and voluntary work to ensure that the entire territory is transformed into an educating community.

# DISABILITY MODELS IN EDUCATION: WHAT FITS THE B.E.S. CATEGORY?

Denis De Almeida Barros<sup>a</sup>

<sup>a</sup>University of Urbino Carlo Bo

This study examines Special Education Needs (SEN) through the lens of Disability Studies, focusing on students with migratory backgrounds in Italy. It focuses on Third-Tier SEN, encompassing socioeconomic, linguistic, and cultural disadvantage (referred as BES), and explores its implications within the educational system. Drawing on the British Social Model of Disability and a constructivist methodology, the research demonstrates how deficit-based perspectives can hinder inclusion efforts and perpetuate exclusion. Data were collected through participant observation in third-sector organizations and unstructured interviews over 11 months. Two case studies reveal the nuanced barriers faced by students, from stigmatization to unequal treatment, demonstrating how social factors can shape educational difficulties. The findings underscore the transformative potential of studying BES students for an understanding of processes of disablement students with migratory backgrounds are subjected to. Findings also point to the creeping presence of exclusive practices that go against the tide of general interest towards building inclusive educational settings.

BES; disability studies; migrant learners

## INTRODUCTION

The concept of Bisogni Educativi Speciali (or BES., eng: SEN) represents a broad and inclusive category encompassing various types of educational and social difficulties. In Italy, the definition of BES was introduced by the Ministerial Directive of 2012 (MIUR 2012), which reorganized general SEN into three categories: disabilities certified under Framework Law 104/1992; Specific Learning Disorders (DSA) as defined by Law 170/2010 and other developmental disorders; and finally, educational needs arising from social disadvantage, cultural barriers, and difficulties linked to a lack of familiarity with Italian

language and culture. This last category is further described in Ministerial Circular no. 8 of 2013 as the Area of Socioeconomic, Linguistic, and Cultural Disadvantage (MIUR, 2013). Particular attention is given to students with migratory backgrounds or newcomers to Italy. Socioeconomic, linguistic, and cultural disadvantage (hereinafter, simply BES) encompasses a variety of irreducible situations, with the responsibility falling on teaching staff to observe and identify these difficulties in students. For this reason, it can be described as a “general and soft label,” requiring no medical certification and determined by the teaching council.

Although research has examined the presence of students with migratory backgrounds in Italian schools and addressed disability and learning disorders within the framework of inclusion, the situation of students with BES linked to socioeconomic, linguistic, and cultural disadvantage remains underexplored, especially relative to learners with migratory backgrounds. This study seeks to analyze Third-Tier SEN, focusing specifically on students with migratory backgrounds. Disability Studies applied to education provide the theoretical framework, and through a qualitative methodology and two case studies, this research aims to understand how a deficit-based approach constitutes a barrier to education.

In the Italian context, the inclusion of students with BES intersects with the broader challenge of an educational system grappling with cultural and linguistic diversity. When such diversity is approached from a deficit-based perspective, the result can be disablement.

## **1. THEORETICAL FRAMEWORK**

### **1.1 Disability Studies**

Disability Studies offer a perspective on the social construction of disability. Although it is impossible to encapsulate all approaches to disability proposed by this field, it is worth emphasizing that many scholars and activists with disability highlight how historical, economic, and cultural contexts shape the experiences of people with disabilities (Slee, Corcoran, & Best, 2019).

In relation to the present study, one key question arises: why use Disability Studies to examine BES, which does not explicitly denote disability? This approach is justified for two reasons. Empirically, students experiencing socioeconomic, linguistic, and cultural disadvantage, and those with specific learning disorders, often share educational tools and spaces. These include personalized learning plans and curricula detailed in Personalized Learning

Plans (PDPs) that feature compensatory and dispensatory measures; such measures frequently overlap; and interventions like pull-out sessions—work conducted outside the classroom in small groups—are common (Anastasiou, Kauffman, & Di Nuovo, 2015).

Secondly, Disability Studies applied to education consider the learning community as a whole, without initially distinguishing between able-bodied and disabled students, viewing ability as a characteristic distributed only after schooling (Gabel, 2005). Disability Studies underscore the importance of including different identity markers in their intersection with the distribution of ability (Erevelles, 2005). This perspective is essential for understanding the complexity of BES, particularly for students with migratory backgrounds, who often face multiple forms of disadvantage.

This approach enables the examination of how social barriers, rather than individual characteristics, contribute to the creation of disabilities in education. As such, Disability Studies challenge traditional medicalized perspectives, proposing an analysis that intersects ability, class, racialization, migratory status, and gender among those involved in schooling (Annamma et al., 2013; Connor et al., 2015).

## **1.2 British Social Model**

Part of the analytical framework for this study is the British Social Model of Disability, developed by scholars such as Michael Oliver (1990; 1996). This model distinguishes between disability and impairment. The former is defined as a social condition imposed by economic, political, and cultural barriers, while the latter refers to a physical or mental characteristic of the individual. As highlighted by UPIAS (1976): “Disability is something imposed on top of our impairments, by the way we are unnecessarily isolated and excluded from full participation in society” (p. 4).

Central to this model is the metaphor of “on top”, which suggests the ontological precedence of impairment over disability. While this implies that individuals with impairments are not inherently disabled, it also establishes that impairment is a necessary (albeit insufficient) condition for disability. It is within the space between impairment and disability that economic, social, and cultural factors come into play, shaping individuals’ abilities. Thus, disabilities result from a process of disablement occurring at a supra-individual level.

A fundamental characteristic of the British Social Model is its transformative potential: it shifts attention from individual deficits to collective responsibilities.

Applying this model to BES entails examining how educational contexts might further the disablement of learners inadvertently, despite their explicit inclusive goals.

## **2. METHODOLOGY**

This contribution, part of a broader research project conducted in the metropolitan area of Turin, adopts a qualitative approach. In line with the social model of disability, the constructivist method allows for exploring the social construction of phenomena (Hacking, 1999), including categories of student populations. Utilizing grounded theory for data analysis (Tarozzi, 2008), which facilitates questioning and expanding the British model of disability outlined earlier, the data collected underwent constant comparison, resulting in revisions to the initial theory.

Data collection involved 11 months of participant observation in third-sector organizations registered with RUNTS. These organizations engaged in after-school programs, educational support, and socialization activities. These aggregation spaces are also crucial educational contexts where a plurality of socio-educational research questions intersect (Besozzi & Colombo, 2014). Participant observation was supplemented with unstructured conversations with students, educators and volunteers. The focus was limited to middle school students, given the significance of the transition from Primary to Secondary schooling orders and the division into differentiated educational pathways at its conclusion (Romito, 2014; 2016).

The organizations selected for the study were chosen based on their alignment with research objectives. Located in areas with significant migratory presence among 11-to-14-year-olds (MLPS, 2022), many observed students faced challenges related to using Italian (both as a communicative and instructional language), economic deprivation, and behavioral difficulties. Attention was directed at relational dynamics and barriers encountered by students.

## **3. CASE STUDIES**

### **3.1 Case 1**

A 12-year-old participant from a family with limited economic and cultural resources irregularly attended activities at Association 2. During a conversation about the participant, an educator emphasized how the family's "cultural poverty" was decisive in shaping academic performance and engagement within the association. The presumed lack of cultural resources was also cited

as influencing the participation of the participant's sibling. In this case, the scarcity of economic and cultural means was unilaterally assumed and extended to the family, justifying the siblings' disinterest in the association's proposed activities.

### **3.2 Case 2**

A 12-year-old boy of Moroccan origin attended activities at Association 4. The association's space was divided by a large wall that separated the homework area into two parts, one less visible to educators. The participant often sat in this space, speaking Arabic with friends and siblings—a behavior for which he was frequently reprimanded due to his impetuosity. After completing his homework, I asked the participant to draw a map of his class, indicating foreign students and support teachers. He depicted the support teachers near individual students' desks, since they provided personalized assistance. A week later, a friend of the participant completed the same activity and revealed that the participant himself received support from a teacher, a fact previously concealed. The participant displayed evident signs of shame when his friend redrew the map and did not respond to inquiries about the support teacher. This case highlights the practice of separation of perceived "difficult" students from others. Furthermore, it points to the relational impacts on individuals labelled as BES.

## **4. DISCUSSION**

The analysis of the case studies reveals how socioeconomic, linguistic, and cultural disadvantage can reinterpret the British Social Model of Disability. While maintaining a constructivist approach to disability, Shelley Tremain (2001; 2015) questioned the apparent naturalness of impairment as posited in the British model. Adapting Butler's critique of the sex/gender distinction (Butler, 1999), Tremain suggests that impairment, like disability, is shaped by cultural readings of the biological body, such that historical, social, and economic factors lead to certain bodies being perceived as inherently impaired and others as normative.

Tremain's position aligns with critiques of deficit-thinking—the tendency to view learners' differences as intrinsic shortcomings disconnected from context (Souto-Manning & Rabadi-Raol, 2018). This approach naturalizes socioeconomic, linguistic, and cultural disadvantage, interpreting it as a fixed category. Consequently, such interpretations risk disabling students through processes exemplified in the "SENization" of students with migratory

backgrounds (Migliarini, 2018). The result is a deficit model where exclusion is predicated on attributes assigned a degree of incapacity.

Within this reprisal of the British model, impairment plays a significantly different role. It represents no more a biological, pre-discursive reality upon which disability is predicated, rather, impairment is conflated within cultural diversity, presumptively read as individual deficit. Hence, the possibility of a disabling treatment in BES students with migratory backgrounds.

## 5. CONCLUSION

In summary, the theoretical analysis and case studies demonstrate the utility of Disability Studies in examining BES linked to socioeconomic, linguistic, and cultural disadvantage. By adapting the constructivist approach of the British Social Model to students with migratory backgrounds, a framework emerges in which even impairment results from deficit-oriented perspectives on this student population.

Limitation to the study must be addressed. First, despite being selected among a several instances, the cases presented have no universal validity. Secondly, the model proposed is not an all-encompassing one, rather it points to one possible occurrence in researching inclusion at the intersection of ability and migrational status. Hence, the conclusion shall be interpreted as a call for broader investigation in the BES categories, to identify elements that might slither into the practices of inclusive education.

# LEISURE TIME USE AND THE THIRD SECTOR'S ROLE IN COMBATING EDUCATIONAL POVERTY OF MINORS WITH A MIGRATORY BACKGROUND

Francesca Gabrielli<sup>a</sup>

<sup>a</sup>Niccolò Cusano Telematic University of Roma

This contribution addresses the issue of educational poverty among minors with a migratory background, with a particular focus on the use of leisure time and the role of the Third Sector in promoting inclusive educational practices. Through a quantitative approach, as a part of a broader research, a self-administered semi-structured questionnaire has been given to a statistically representative sample of 1761 students enrolled in the third year of lower secondary school in the academic year 2021/2022 in the municipality of Rome. The results reveal a statistically significant association between migratory background and engagement in certain educational or social activities during leisure time, mainly due to the characteristics of the territory of residence. Therefore, the importance of promoting the empowering function of the territory and a pedagogical responsibility extended to the entire community is emphasized, recalling the importance of the Frabbonian concept of “integrated educational system”. In this context, the central role of the Third Sector emerges, whose active participation underscores the importance of a collaborative and synergistic approach to address this challenge, highlighting how combating educational poverty requires the joint and coordinated commitment of all stakeholders involved.

educational poverty; minors with migratory background; third sector.

## INTRODUCTION

Due to the insights provided by various studies and a legislative trajectory that was, in part, influenced by the advocacy initiatives of the Third Sector (Save the Children, 2014, 2016, 2018), the issue of educational poverty has gained prominence in recent scientific and political discussions. It is now integrated

into public policy agendas (L. 208/2015), calling for a comprehensive, multi-level analysis to underscore its unique complexity.

In particular, the research problem from which the investigation originates is the phenomenon of educational poverty of minors from migratory backgrounds who are particularly exposed to educational poverty, due to challenges related to family and economic situation, bureaucratic obstacles, unequal access to higher education, and risk of early school dropout (MIM, 2024).

From this, the ultimate goal of the study is to explore this specific field of inquiry in order to enhance the understanding of educational poverty, contribute to the ongoing scientific discourse, and support the development of strategies for its prevention and mitigation.

The first paragraph briefly presents the theoretical framework, the second one describes the research design, illustrating its essential features and giving an account of the methodological framework, and the third paragraph presents the main research findings, followed by brief concluding remarks.

## **1. EDUCATIONAL POVERTY: A COMPLEX AND MULTIDIMENSIONAL PHENOMENON**

The analysis of poverty, in all its forms, is often a daunting challenge, both because of the complexity in defining such a complex concept and the difficulties in measuring it.

The notion of poverty in the educational context emerged in the social sciences discourse in the late 1990s to draw attention to the multidimensionality of the poverty phenomenon, not entirely reducible to purely economic aspects (Alkire & Foster, 2007; Anand & Sen, 1997; Bourguignon & Chakravarty, 2003; Sen, 1999). Scholars agree on the limitations of defining poverty as mere lack of income and describe it as a multidimensional concept, involving a wide range of aspects, such as education, health, employment, food security, active participation in social and political life, etc.

In particular, the construct of educational poverty has its roots in the *Capability Approach*, developed in the 1980s by Nobel laureate in economics Amartya K. Sen (Sen, 1999) and further explored by philosopher Martha C. Nussbaum (2011), with the aim of proposing a new theoretical paradigm for human development as an alternative to the predominant economic and political models.

Over the past two decades, there has been extensive discourse in the literature

regarding the significance of measuring and analyzing educational poverty (Allmendinger & Leibfried, 2003; Lohmann & Ferger, 2014). It has been emphasized that the impact of educational deprivation is subtle, creating a gap during a vulnerable period that proves challenging to overcome later in life (Battilocchi, 2020). An initial disadvantage can result in a crystallization of the same across different generations and transform cultural factors into hereditary elements, in a vicious circle of poverty.

In this context, accurate measures of educational poverty are crucial for designing effective policy interventions, and local data play a vital role in tailoring actions to specific communities. A review of the scientific literature reveals that the dimensions and measures of educational poverty are not fully developed. In fact, despite numerous studies on the subject (Agasisti et al., 2021; Botezat, 2016), there is still a lack of shared theorization of this notion to date (Battilocchi, 2020).

Educational poverty is understood as a polysemic concept with broad semantic boundaries, multidimensional, and depicted by a poly-perspective characterization (Sannipoli, 2019). It can be described as a shifting reality, emerging whenever circumstances are identified that restrict an individual's development, limit the expansion of their horizon of possibilities, and narrow the range of experiences accessible to them (Sottocorno, 2019). Educational poverty refers to the deprivation of formal, non-formal and informal educational opportunities, due to multiple factors of disadvantage, preventing the full flowering of human potential, with an impact on the whole community, present and future (Di Genova, 2023; Finetti, 2023; Gabrielli, 2024; Patera, 2022; Sottocorno, 2022).

## **2. METHODOLOGY**

The research employs a quantitative approach. Indeed, the extensive nature of the research object and the descriptive and explanatory nature of the investigation's objective have suggested the use of this perspective, albeit with an awareness of the unique visual angle (Corbetta, 1999, p. 74) through which reality has been observed, thus acknowledging the limitations of the acquired knowledge.

Specifically, the survey technique has been chosen, involving the administration of a self-completed semi-structured questionnaire with group data collection to a statistically representative sample of 1761 students enrolled in the third year of lower secondary school in the academic year 2021/2022 in the municipality

of Rome.

With reference to the unit of analysis, in this survey it has been decided to accept the proposal of a recent document of the Italian Ministry of Education (MI, 2022): the paper aims to overcome the legal classification of 'student with non-Italian citizenship' and to replace it with the broader one of 'student from a migrant background'; the latter would include all those students who do not fall under the statistical category of 'non-Italian citizenship' but are, whether or not formally recognized as citizens, individuals whose backgrounds and perspectives contribute to the multicultural and plurilingual fabric of Italian schools (MI, 2022, p. 10). Therefore, on the basis of this recommendation, it has been decided to adopt the category of 'student with a migrant background', which includes all pupils born in Italy or abroad from at least one immigrant parent, regardless of the legal recognition of citizenship.

The survey has been conducted through a probability sampling design. Since the research specifically focuses on students from migratory backgrounds, a stratified probability sampling design has been chosen, allowing to increase the efficiency of the sample in the presence of areas of greater homogeneity (Cohen et al., 2007). The effective sample consists of 27 schools: for each adhering school, all grade III classes of all secondary school plexuses have been involved within the project, for a total of 106 classes in 35 plexuses. At the end of the procedure, a statistically representative sample of 1761 pupils enrolled in the third year of secondary school in the academic year 2021/2022 in the territory of the municipality of Rome has been obtained.

### **3. LEISURE TIME USE**

As far as the main results are concerned, one of the aspects investigated is that of leisure time, particularly focusing on the people with whom time is spent and the participation in sport and cultural activities.

With regards to people with whom time is spent, comparing the sub-sample of 1189 students with no migratory background and the sub-sample of 516 students with a migratory background (figure 1), it appears that the former is characterized by a higher percentage of students spending their free time with friends (86.1% vs. 73.7%) and relatives (63.7% vs. 59.6%), while the latter reports a higher percentage of students spending their free time alone (21.3% vs. 13.5%) or with other types of people (1.0% vs. 0.4%). In particular, it is possible to say that there is an association between the items 'nobody' and 'friends' and migration background: this association, although moderate ( $V= 0.1$

and  $V = 0.2$ , respectively), is significant for the whole sample at the 0.001 level, given the Chi-square ( $\chi^2 = 15.8$  and  $\chi^2 = 39.1$ , respectively) and p-value ( $p < 0.001$ ). Therefore, students with migrant backgrounds spend their leisure time alone with a significantly higher percentage frequency than their peers.

Figure 1. People with whom one spends leisure time

With reference to sports, analysis of the data for students with and without migrant backgrounds shows that the former play fewer sports than the latter (figure 2): in fact, an association emerges between the variables ‘frequency with which a sport is played’ and ‘migrant background,’ which, although weak ( $V = 0.2$ ), is significant for the entire sample at the 0.001 level, given the Chi-square ( $\chi^2 = 51.5$ ) and p-value ( $p < 0.001$ ).

Figure 2. Frequency with which a sport is practiced

Investigating the reason for not playing a sport (figure 3), we find that the sub-sample of students without migration background reports higher frequencies in the modes related to endogenous factors, such as 'I don't like sports' or 'I don't know which one to choose', while that of students with migration background is characterized by higher percentages in the modes related to exogenous factors, such as 'my family does not allow me to play a sport', 'my family cannot afford it' or 'in my neighbourhood there are no sports activities'. In fact, it is possible to say that there is an association between the reason for not playing a sport and migration background, which, although weak ( $V= 0.2$ ), is significant for the whole sample at the 0.01 level, given the Chi-square ( $\chi^2 = 19.6$ ) and p-value ( $p = 0.007$ ).

Figure 3. Reason for not playing a sport

Delving into the territorial aspect, the presence of certain educational and social presences within the area of residence of the survey participants – such as parks, places to meet friends, sports centers, etc. – was investigated. Comparing the two subsamples (figure 4), it emerges that students with migrant backgrounds report lower percentages in all proposed items, with statistically significant associations. For example, it is noteworthy that the percentage of students with a migrant background living in territories where sports centers are present (64.9%) is 10.6 percentage points lower than that of students without a migrant background (75.5%) and is characterized by a statistically significant association for the entire sample at the 0.001 level, given the Chi-square ( $\chi^2 = 23.7$ ) and p-value ( $p < 0.001$ ). This finding, therefore, confirms the weight of spatial context in participation in sports-type activities.

Figure 4. Presence of educational and social places in the territories

## CONCLUSIONS

The data presented reveal the centrality of territories as spaces charged with potential and ambivalence (Zoletto, 2022), influencing accessibility to various educational opportunities and contributing significantly to individual identity formation. In fact, educational experiences, mediated and supported by the territory, are the starting point for developing pathways that can either promote inclusion or cause marginalization, significantly influencing individual destinies. In order to combat educational poverty, on the one hand there emerges the need to promote the expansion of coverage and access to educational principals and to create highly inclusive opportunities in contexts characterized by a complex sociocultural reality (Zinant, 2022). On the other, the importance of promoting pedagogical responsibility shared by the whole community emerges, recalling the importance of the Frabbonian concept of an integrated educational system (Frabboni, 1989): a political project of “building a shared culture of education” (Maia, 2018, p. 168), nurtured by the various educational actors in a given territory, in a democratic and inclusive perspective.

In this context, the central role of the Third Sector emerges, whose active participation underscores the importance of a collaborative and synergistic approach to addressing this challenge, highlighting how combating educational poverty requires the joint and coordinated efforts of all stakeholders in the field.

# MIGRANT MINORS BETWEEN DISCRIMINATION AND EDUCATIONAL OPPORTUNITIES. A RESEARCH PERSPECTIVE ON ITALIAN CONTEMPORANEITY

Giulia Gozzelino<sup>a</sup>

Federica Matera<sup>a</sup>

<sup>a</sup>University of Turin

Starting from two qualitative academic research carried out by the authors (Gozzelino, Matera, 2020; Matera, 2021, 2022a, 2022b, 2024) the contribution provides a critical pedagogical reading of the link between the educational poverty of migrant minors in Italy and their self-determination, proposing reflections and actions of operators in the development of opportunities and experiences to encourage collaboration between school and territory, active citizenship, the empowerment of minors and intercultural encounters in their social context.

Migrant minors: education; intercultural dialogue; participative researches

## INTRODUCTION

The UN Convention on the Rights of the Child (1989) considers the child a citizen to be promoted and liberated (Milani, 2019), taking up the fundamental principle of non-discrimination, but disadvantages and violations emerge from the Italian framework. Migrant minors are one of the least protected categories in Italian society (Save the Children, 2019, 2022). Scientific research shows how institutional and social racism, media disinformation and structural violence emanate from the institutional invisibility of these minors and at the same time reinforce it, compromising their ability to self-determine, as well as their ability to establish and maintain relationships significant with the local population and to participate in the construction of a more complex narrative on migration, which is often lacking or flattened on the side of deviance (Galtung, Vincent, 1992; Penalva, La Parra, 2008; Matera, 2021, 2022a; Milani, Matera, 2022;

Matera, Serrano García, 2022, Matera 2024).

In Italy, new laws on immigration make the essential relationship between school and territory for integration even more complex, delegating the responsibility for the reception and training of foreign minors to charities, volunteers and individual initiatives and denying the essential dialogue for educational planning. By exacerbating the educational disparities of foreign minors, they take away the possibility to aspiring to change, developing skills and building a conscious training question around the constraint of the migratory mandate and the logic of predestination (Matera, 2024).

Starting from two qualitative academic researches carried out by the authors (Gozzelino, Matera, 2020; Matera, 2021, 2022a, 2022b, Matera 2024) the contribution provides a critical pedagogical reading of the link between the educational poverty of migrant minors in Italy and their self-determination, proposing reflections and actions of operators in the development of opportunities and experiences to encourage collaboration between school and territory, active citizenship, the empowerment of minors and intercultural encounters in their social context.

## **2. A RESEARCH ON EDUCATIONAL POVERTY AND SELF-DETERMINATION**

The first research conducted aims to investigate how educational poverty affects the self-determination of foreign children and what educational actions are promoted to free foreign children from conditioning and invisibility.

Migrant and foreigner status has an important impact on educational poverty (Save the Children, 2014, 2019, 2022), which is exacerbated by the conditions of political, media, social and institutional invisibility of foreign-born children, which impacts the exercise of active citizenship (Milani, 2019; Milani & Matera, 2022; Matera & Serrano García, 2022). For that reason, a qualitative research was carried out through a questionnaire addressed to operators active in educational services for foreign minors in the Piedmont Region. Sixteen educators were involved: 13 educators working with Foreign Minors (81.3%); 9 educators working with Italian Minors of foreign origin (56.3%) and 4 educators with Unaccompanied Foreign Minors (25%), thus allowing us to have a global picture of the management of minors from migratory backgrounds, and not only those who face a journey themselves or who find themselves upon arrival without reference figures.

In particular, the questionnaire allows us to understand what educators' conception of 'educational poverty' is. From the methodological point of view,

we carried out interpretive-constructivist research (Trincherò, 2002; Cadei, 2005) to capture the representations that respondents have of the phenomenon under study, to understand the meanings they attribute to it. The instrument used is an open-ended questionnaire, so it is not binding from the point of view of the answers required of the subject and useful for gaining a wide range of information. and the analysis of the empirical base was conducted through the construction of a posteriori categories, focusing on emergent themes, from the perspective of Constructivist Grounded Theory (Charmaz, 2001, 2008, 2014). Emerging data were subjected to interpretive reading, making them interact with the theory, and the results make no claim to standardization nor generalization. The first question was: “Thinking about the foreign or foreign-born children you work/have worked with and the issue of self-determination, what traits of educational poverty emerge?”. From the educators’ responses, the following traits of educational poverty in children from migrant backgrounds emerge:

- link between educational poverty and social origin: difference between urban contexts and rural contexts;
- lack of knowledge of the Italian language, which compromises relationships with peers and the exercise of active citizenship;
- institutional discrimination;
- logic of predestination: that we see in lack of interest in school due to willingness to work, in access to circuits of deviance, in migratory mandate;
- lack of resources to support children’s life projects: thus, a strong connection emerges between educational poverty and the responsibility of agencies and institutions.

In the words of the interviewees, the connection between educational poverty and the feeling, in the children, of being relegated to a “future already written” within family plans and cultural logics emerges strongly: “It almost seems as if some children already feel destined for a certain future because of their origin” (Q.16).

The lack of reference points – external to family ties, “with whom to confront, confide in, wonder about one’s future in complete freedom” (Q.8) – turns out, therefore, to be an important risk factor for the increase in educational poverty. A call, this, for education to *make free* the child of foreign origin from the inequality in which his or her path is often realized.

The second question was: “What educational responses do you activate/have

you activated to promote the participation and freedom of foreign minors?”. The words of the educators show that education is invited to educate for freedom, that is, to encourage the development of critical thinking for the authentic self-realization of the subject, encouraging the knowledge and expression of one’s nature and the construction of a personal vision of the *self* and the *world* within other contexts of experimentation and constraints that are perceived as generators of meaning: “The educational proposal was to break the mold, to bring one’s potential into play beyond the imposed limits, by experimenting with one’s abilities in sometimes unexpected areas” (Q.16). “We work to make children understand that they are the protagonists of their lives, that they can make it and that their future does not necessarily have to be the one written by the family or the system” (Q.15).

The achievement of a free will is the ultimate objective that education must aim for. The acquisition of the freedom to decide regarding one’s own personhood, which cannot ignore the provision of significant opportunities to be able to be.

The educators demonstrate attention to the promotion of commitment and responsibility, with an eye oriented towards the community and freedom for social participation: “It is a daily and constant path in which we try to make the person responsible” (Q.15), “to express the potential and desires and find areas of interest in which the children can engage” (Q.16). Strategies aimed at “involvement” (Q.10), at “respect for others” (Q.14), at “dialogue” (Q.11) are activated: the restitution of the word is a starting point and social rebirth, the fulcrum of educational work to free our future.

### **3. UNACCOMPANIED MIGRANT MINORS: INVISIBILITY AND EDUCATION**

Faced with a context of growing deprivation and invisibility of educators and unaccompanied migrant minors, the second research presented aims to understand how educators foster the culture of migrant childhood in society and how they promote the construction of more complex narratives on child migration for inclusive and intercultural societies.

Educators are considered: experts in educational practice with foreign minors; holders of experiential knowledge, of working theories; competent and thoughtful professionals (Schön, 1993) “innovation leaders” (Milani, 2017); “men of art”, therefore capable of activating significant transformations in the social context.

Involving education professionals in participatory research paths, where critical co-reflection on the epistemology of professional practice is promoted (Schon,

1993), allows the creation of complex knowledge, promotes the organization of knowledge, the articulation and the intertwining of different knowledge.

The knowledge emerging from participatory research aims to overturn consolidated imaginaries on burning issues such as immigration through a multi-perspective and situated knowledge that arises in the environments of educational practice and which is grafted onto collective and reflective processes of interpretation, management and resolution of problems venues with a global scope.

In the framework of an emancipatory pedagogy (Freire, 2002), participatory research aims to bring the minor back to the center of attention and pedagogical action through the voice of *invisible educators*, placing themselves in dialogue with their practical knowledge.

The participatory research process that involved educators active in the structures and services for unaccompanied migrant minors in the City of Turin involved two levels interconnected in a circular and systemic process:

- Fact-finding survey: involved a sample of 26 privileged witnesses of the reception system, who operate in the system at different levels and covering different functions (educators of different types of structures, cultural mediators, managers of institutions, services and associations, of CPIA and of professional training), by means of 34 dialogical-reflective interviews. The interview was configured as a space for learning and building new knowledge emerging from the interaction.
- Research-Training (Reason & Bradbury, 2008): involved the participation in six focus groups of seven coordinators (also educators) from six different services. The focus group was configured as a learning and planning context and as a micropedagogical environment (Demetrio, 1992), i.e. as a cultural environment from which new knowledge and skills emerge.

Challenging dominant narratives means bringing innovative stories and actions to light, contributing to the formation of a complex thought on the migratory phenomenon, designing intercultural meeting spaces with citizens, to stimulate social participation and empowerment, reevaluating one's role as protagonists of the migration process. critical refoundation of policies and interventions on migration and reception.

There are various strategies activated to encourage widespread learning and intercultural encounters in the city.

For example, the production of collective works by minors and their presentation in contexts open to citizens turns out to be a valid tool for raising public awareness and building a divergent, more complex and powerful narrative on child migration.

Planning coordinated and widespread reception requires the active involvement of the actors of the formal and informal reception network, including citizens, in order to collegially build experiences and relationships.

In this sense, it is essential to prepare training courses so that minors from migrant backgrounds can change their position in the job market and move, for example, from the kitchen to the bar counter, from the role of vigilant, where there is an absence of communication, to the role of salesman, where communication skills even become a resource.

From this perspective, it is also important to create stable, aware and constructive links with companies and private corporations, in a network and shared planning logic, so that new potential employment situations can be opened up for minors. Companies can actively contribute to overturning collective imaginaries that are often deficient or leaning towards deviance.

# FROM INTEGRATION TO INCLUSION. THE EDUCATIONAL CHALLENGE IN MSNA INTERVENTIONS BETWEEN TRAUMA, LEARNING DISABILITIES AND INCLUSIVE TEACHING

Francesca Oggiano  
CivicoZeroOnlus

## INTRODUCTION

This article investigates the learning difficulties of Unaccompanied Minors Migrant particularly Arabic speakers, who are included in the Italian education and school system. UMM are a moderately young phenomenon in Italy and Europe. Originated in the 1990s, it has become over the past three decades a constant phenomenon with high numbers already in 2016 when 25,846 Msna arrived in Italy (Ambrosini Maurizio, 2020). According to the Ministry of Social Policy (July 2024) there are 20,213 unaccompanied migrant's minors in Italy. This is a predominantly male population (89.7%), between the ages of 16 and 17, although in recent years there it has been a decrease of the age of arrival 13- to 14-year-olds and in some cases even 10- to 11-year-olds have arrived (Benaly Mariem, 2024). Almost 75% of unaccompanied minors are over 16 years of age, 50% of these are 17 years old and 25% are 16 years old. Children between 7 and 14 years old represent 10% of the total, minors aged 15 years represent 14% and UMM up to 6 years of age represent just over 1% of the minors considered overall<sup>1</sup>. During 2024, there was also an increase in psychiatric cases, or cases with psychological difficulties among incoming UMM and, often, minors with physical and/or cognitive- sensorial disabilities. 'Children who arrived before then 2024, were prepared and had a clear family goal and mission statement to achieve, whereas now groups of minors arrive, even from the same family (siblings and cousins); difficult kids are also sent to Europe so that someone can take care of them" (Benaly Mariem, 2024). Nationalities are variable, however at 30 June 2024 the most represented communities in Italy are: Egypt (3,924),

---

<sup>1</sup> Ministero del Lavoro e delle politiche sociali, rapporto di approfondimento semestrale, dati al 30 giugno 2024.

Tunisia (2,145) and Gambia (2,274). The urge to leave is often influenced by serious economic crises in the countries of origin, social conflicts and lack of future prospects. From a pedagogical-educational point of view, the three most representative nationalities share a low and/or absent basic scholastic education in their countries of origin. Among the Arabic-speaking minors (Egyptians and Tunisians) there is a large proportion of boys from the regions of: El Minieh, Beni Souef, Assiout and Fayoum in Egypt; Kairouan, Jendouba, Kasserine and Siliana, in Tunisia, completely illiterate (Diana, 2020). This has negative consequences concerning the education/training path to be set up in the host country, not only because of the gap in second language (L2). Illiteracy, in fact, is combined with cognitive, relational and emotional difficulties, often determined by pre – peri – post migration traumas that make the school learning process even more complicated, fragmented and slow. The Msna are lone, vulnerable teenagers who in most cases have spent months, if not years, in Libya or crossed the Balkans by foot through Turkey to reach Europe. The trauma symptoms have a broad spectrum, from impairment in school functioning including increased absence from school, decreased intellectual functioning, reading ability and academic performance, and lower rates of graduation (Delaney-Black et al., 2002; Milam, Furr-Holden, & Leaf, 2010). In 2010, Italy adopted (L. 170/2010) all the inclusive methodological/didactic tools necessary to ensure the right to study and accessibility to professional training for pupils/students with special educational needs (Sld – Adhd) and disabilities (L. 104/1992). To date, however, the inclusion and educational success of the migrant population is still an obstacle course frequently rejecting (school refusals) due to the language and cultural gap and riddled with failures and drop-outs, once included, due to the lack of ‘formal’ (SSN) or informal (teaching staff) acknowledgement of learning difficulties (L. 107/2010) that effectively deny access to personalized, fully inclusive and accessible teaching.

## **1. THE EDUCATIONAL CHALLENGE WITH UMM ARABIC-SPEAKING.**

There are 161,803 Arabic-speaking students in Italy and they represent 18, 69% of the total, most of them are Moroccan (109,401), followed by Egyptians (31,298) and Tunisians (21,104); the other nationalities are under 5,000, including Syria (1,814) and Libya (749) (MIUR 2022/2023). Among the countries of origin of Msna, Egypt is the first Arab-speaking country with 4,667 minors detected as of 31 December 2023 (Ministry of Social Policy 2024). The Egyptian community is the largest in the country (155,892) and is also a community with large households, from 3 to 7 people. The Tunisian community ranks 14th in

terms of presences (98,243) on Italian territory and is notable by a high incidence of young people (37.2% of the community is under 30). These data take on a high relevance in relation to the arrival of unaccompanied minors from the two North African countries, who in Italy can count on a huge network of contacts among their nationals, which, in some cases, can facilitate their entrance into the black or illegal labour market. UMM, especially Arabic-speaking Tunisians and Egyptians, can in many aspects be considered true economic migrants:

developed countries turn away fathers looking for work, labelled as economic migrants, but they cannot turn away children who arrive alone and ask protection. Families of origin are thus induced to invest exactly in their children, and more particularly in their adolescent males, to seek an in northern markets” (Ambrosini, 2020, 216).

Most of the UMM, once they arrive in Italy, have a family assignment to look for a job, which will allow them, firstly, to return the travel debt, and secondly, to assure a respectable life for their family. This is an unavoidable starting point for all school teachers engaged in planning an educational-pedagogical pathway that should be individualised as much as possible and adapted to the needs of children, who in most cases dropped out of school at 9-10 years old, to help their families in economic difficulties, or because they were kicked out of a school system unprepared to deal with students with learning difficulties, sensorial disabilities or special educational needs. Unlike their Italian and second-generation peers, for whom it is possible to map out their past school career and detect any traumas or learning disorders through interviews with their family, UMM arrive in Italy with any personal information, useful for setting individualized study curricula. The observation of the teaching staff in the classroom, both in the performance of teaching tasks and in peer relationships, becomes a significant tool to develop hypotheses about some possible learning difficulties.

The only available informations at the time of their arrival are related to the Egyptian and Tunisian education systems, where, despite the efforts made by the two North African countries to assure access to public education system, still remain significant challenges such as: school drop-outs and illiteracy (Diana, 2020), with still high rates especially in the rural areas of the two countries. “In Egypt, a 2017 census shows that 18.4 million citizens aged 10 and above are illiterate. In Tunisia, residents of rural areas are the most affected by this phenomenon”. In Egypt in particular,

the public school attended by 90% of the students is in deep crisis. The mnemonic and authoritarian teaching method, the low salary of teachers and the overcrowding of classrooms seem to be at the heart of the malfunctioning of the education system (Mazzei, 2018, 49).

The background of negative and often traumatizing experiences suffered in the school system of the country of origin leads Arab-speaking UMM, especially Egyptians, to a negative opinion not only of the education system, which is considered useless considering the high unemployment rate of graduates in Egypt (Mazzei, 2018), but also towards the teaching staff, who in their past experience have been identified as authoritarian, repressive and rejecting, rather than a caregiver.

## **2. TRAUMAS, LEARNING DISABILITIES AND INCLUSIVE TEACHING**

The main routes of arrival of the Msna into Italian territory are landings by sea (Mediterranean route) and arrival on Italian territory near border crossings (Balkan route) (Ministero del Lavoro e delle Politiche Sociali, 2024). The beginning of second language learning and registration in mandatory schools (14-16 years old) usually takes place once the minors are assigned to the first welcoming system, generally located in the region where the arrival took place. This, brings to light the first problem related to the schooling of minors, which follows an irregular path due to the removal of minors from welcome centers because of: fostering, family tracing or voluntary leaving of minors, who wishing to reach Italian regions where the network of Egyptian and Tunisian communities is more present (Lombardia, Friuli-Venezia Giulia, Emilia Romagna e Lazio). That means the exit of minors, not only from the welcome system, but also from the educational – professional system. The UMM are a new target group for the Italian school system. They are usually admitted to the Cpia (Centers for Adult Education) to start a literacy course in L2 or to short professional training courses (maximum 6 months). In the last few years, however, we have seen the arrival of young people of compulsory school age, who cannot be enrolled in the Cpia (16 years of age). These students once enrolled in the secondary school (high school or college) hardly manage to complete their studies. There are many obstacles to their education: frequent interruptions in their studies due to continuous relocation or voluntary displacement from the first and second welcoming centres; illiteracy in their mother tongue (L1); language gap in L2; traumas pre – peri e post journeys, that actually demand to the teaching staff the activation of resources (teachers or special needs tutors) individualized and inclusive teaching methodologies, even

in the absence of national health system certification for learning difficulties or disorders.

If UMM experience a psychological distress or a physical condition that requires a diagnosis or health certification, the path is very complex. First of all, the legislation does not clarify who should/could undertake it. Secondly, access to services without a residence permit and without knowledge of the language is almost impossible. If the child succeeds in the neuro-psychiatric examination, there are no suitable tools, from a linguistic and cultural point of view, for a health assessment: the lack of mediators and of a deep knowledge of the approach to mental distress in other cultures weighs heavily in the sector; instead, an eco-systemic and global vision would be necessary (Traverso & Marullo, 2020, 128).

Trauma, in fact, has obvious repercussions on the cognitive and behavioural processes of minors and often compromises their educational and training success. Concentration problems, intolerance to sit still at the desk, inhibition of working memory, oppositional reactions with peers and teachers are some of the ‘symptoms’ that can be detected by the teaching staff in the classroom.

Children who have experienced trauma experience neurobiological effects hindering their abilities to learn (Delima & Vimpani, 2011; Fox et al., 2015). Trauma damages the hippocampus which can impede memory and learning (Brendtro, 2015). The more trauma and stress a child experience, the less likely he or she can cognitively process information and learn. Hyperactivity Disorder (ADHD) and learning and behaviour issues are identified in schools by teachers who then refer the child for testing. ADHD has become a common diagnosis and one of the most frequently accessed interventions is medication (Cornel-Swanson, Irwin, Johnson, Bowman, & Frankengerger, 2005). Like children who have experienced trauma, children with ADHD have trouble regulating emotions, sitting still, concentrating, organizing, and have problems with their peers (Murrell, Steinberg, Connally, Hulse, & Hogan, 2015). Children who have experienced trauma typically are unable to regulate their emotions. Even if they appear relatively calm, their brain chemistry and bodies have adapted to respond more quickly and strongly to potential danger, which could be a harmless stimulus. In the typical school setting, there is a lot of stimulation including other children, teachers, different environments, and more” (Berg, 2017, 11).

Classroom observation by teachers is therefore an indispensable resource for promptly activating all the resources needed to create a learning environment that is as welcoming and inclusive as possible, facilitating the learning of unaccompanied foreign minors with customised teaching plans, using, where necessary, intercultural mediation to make study content fully accessible while

fostering positive relationships between peers (student-student) and between pupils and teaching staff. Despite the difficulties of being able to access the activation of special teachers and support tutors due to the lack of NHS certification, the teaching staff can activate classroom experimentation using teaching methodologies, already developed by special pedagogy and inclusive language education for Italian-speaking: special educational Needs students (social mediation techniques; massive use of images in texts; simplified texts with longer introductory phases; closed-answer and never open-answer tests; controlled compositions; frequent pauses and shorter lessons to facilitate lack of concentration and weak or absent working memory) to check their efficiency and adapt their contents, using intercultural pedagogy and multilingualism, to this particular category of learners with a migrant background.

## **2. CONCLUSIONS**

The situation presented in this article shows the limits of inclusion within the Italian education and school system, which is today called to face an important and unavoidable challenge: taking charge of the education of unaccompanied foreign minors with a migratory background. More than twenty years have passed since Italy adopted the 'Guidelines for the Reception and Integration of Foreign Pupils' updated in 2022 (L.189/2022), however, the education of UMM and minors with a migratory background continues to be the exclusive affair of the Cpia and too often linked only to second language courses, even for minors of compulsory school age (14-15). Standardized educational paths predominate to the disadvantage of individualized interventions. This is very often due to the lack of adequate teaching tools and supports within the school system. The need is therefore to start mapping out the learning difficulties of the UMM reconstructing their school and family history and testing the didactic tools already made available by special pedagogy and inclusive and accessible language education in order to verify their effectiveness and test new tools that enable the full success of the educational process.

# TEACHING LANGUAGE THROUGH LITERARY TEXTS: A POSSIBLE DIDACTIC STRATEGY FOR THE ITALIAN AS A SECOND LANGUAGE CLASSROOM

Ilaria Usalla  
Universidad de Málaga

This paper describes the potential affordances offered by the use of literary texts, ludolinguistic activities, and creative writing activities, for teaching Italian as a second language to young learners, paying particular attention to the potential for social and linguistic inclusion, as well as employing an approach that accounts for the rational and emotional dimension of the learner. The objective of this research is the observation of a teaching experiment in which linguistic purposes and literary means encounter in order to create a particular focus on the creative uses of language and storytelling. The data analyzed here was collected within an 'Italian as L2' course aimed at foreign students attending a lower secondary school in the Cagliari area, specifically directed to a group of A2 level learners aged 12 to 16 years old from Bangladesh and Pakistan. The corpus of data consists of a teaching unit specific for A2 level learners, supplemented by preliminary activities for creative writing and for vocabulary development, as well as a post-intervention questionnaire.

second language teaching; Italian; inclusion; linguistic education; literary text

## INTRODUCTION

The Italian school population presents itself as a multicultural and multilingual community of students: the percentage of students without Italian citizenship, according to ministerial data, has increased compared to previous years, reaching a value of 11,2% in the 2022/2023 school year.<sup>1</sup>

As a direct consequence of the incremented linguistic and cultural

---

<sup>1</sup> For more details see the full report conducted by the Ministero dell'educazione e del merito - Ufficio di Statistica (2024).

heterogeneity within educational institutes, a rising number of students experience the Italian class as an ‘Italian as a second language’ (Italian L2) lesson, as opposed to native speakers; in addition, the lack of proficiency in Italian language affects all school subjects and the learning experience as a whole. For those students coming from a migratory background and experiencing difficulties associated with the language gap, linguistic inclusion is hence fundamental to achieving quality learning.

The school system plays a significant role in gradually overcoming this obstacle and supporting the student while developing strong linguistic skills, which constitute the fundamental means to social inclusion and educational success.

In this perspective, the objective that animates this work is to explore the array of possibilities for teaching the Italian language addressing the educational demands of school-aged learners studying Italian as a second language.

Specifically, this study analyses an approach that equally emphasizes linguistic and literary aspects, aiming to set the act of storytelling and a creative usage of Italian as a focal point, while developing grammatical structures suitable for A2-level lower secondary students.

## **1. THEORETICAL PREMISES**

The Italian society and school population is historically characterized by a multifaceted variety of cultures, languages and dialects sharing the same geographical space. In such a rich and complex context, language education must meet the educational needs of all individuals, in accordance with the principles expressed by GISCEL (*Language Education Study and Action Group*) in the *Ten Theses for Democratic Language Education* (1975). These principles highlight the weak points of traditional language education and advocate for a shift to a more democratic approach to language teaching.

In light of these considerations, it is essential to reevaluate the traditional approach to teaching the subject of Italian in schools. In the Italian education system, ‘Italian’ is typically divided into language studies and literature, despite the fact that the relationship between language and literary texts is complex and inseparable (Lavinio, 2021). Literary texts not only offer an insight on culture, history, and collective values, but also embody language, idiomatic expressions, registers, and even nonverbal communication (Colombo, 2005; Caon, Spaliviero, 2015). They provide valuable information to students learning Italian as a second language, and offer potential for intercultural education, especially in multicultural contexts (Pinello, 2014; Spaliviero, 2021).

Encouraging students to engage with literary texts across various genres can foster a love for reading, which is a fundamental goal of education. This process requires guidance and support from teachers. In the context of second language acquisition, the wealth of information in literary texts provides many educational opportunities. Creativity, used as a tool to explore language across different levels (morphology, syntax, phonology, text) and contexts, has been shown to be effective in promoting language learning (see among others Altieri Biagi, 2005; GISCEL Sicilia, 2005; Guerriero, 2021) and is explicitly advocated in the *Indicazioni Nazionali* (MIUR, 2012).

It must be emphasized that engaging with language and literary texts creatively does not lead to linguistic anarchy. Only those who understand the rules can fully participate. Thus, a playful approach that places the learner at the center while stimulating curiosity and motivation can complement metalinguistic reflection and be integrated into the various activities aimed at language acquisition.<sup>2</sup>

## **2. THE DIDACTIC PROPOSAL**

### **2.1. Participants**

In the 2020-2021 school year, CPIA<sup>3</sup> '1 Karalis' and the University of Cagliari collaborated to offer an Italian L2 course for lower secondary school students in the Cagliari area.<sup>4</sup> Due to the multilevel nature of the class, students were grouped by Italian proficiency levels according to the Common European Framework of Reference for Languages (CEFR; Council of Europe, 2020). The intervention targeted A2-level Italian learners and involved six students, aged 12 to 16, all first-generation immigrants from Bangladesh and Pakistan.

### **2.2. Data collection**

The language course lasted from February to June; however, the experimentation took place between the months of May and June for a total of 14 hours.

The educational intervention formed a corpus of data consisting of two

---

<sup>2</sup> For ideas and linguistic games adaptable to different educational contexts and age groups, see Fornara and Giudici (2015).

<sup>3</sup> CPIAs are *Provincial centers for adult education and training*. They are public schools that offer educational services for people aged 16 and over. For further details see Deiana (2022).

<sup>4</sup> The language course is part of a broader project titled 'ItalStudio' coordinated by Professor Antonietta Marra and Professor Giulia I. Grosso (University of Cagliari) and conducted in collaboration with CPIA '1 Karalis'. The project was devoted to the enhancement of cognitive-academic language proficiency of students with migratory background, through the use of adequate teaching materials.

preliminary activities for creative writing and vocabulary development, a Teaching Unit (TU), and a satisfaction questionnaire.

Data collection was conducted in the classroom through written responses and direct observation, as recording students' oral production was deemed inadvisable. The presence of a recording device was likely to elevate the affective filter,<sup>5</sup> hinder learner-teacher interactions, and ultimately disrupt language acquisition processes. Additionally, usage of masks and adherence to social distancing measures, implemented to mitigate COVID-19 transmission, would have posed significant practical challenges for recording.

### **2.3. Preliminary activities**

The first phase of the experimentation includes two preliminary activities inspired by Gianni Rodari's *La grammatica della fantasia* (1973)<sup>6</sup> and is designed to enhance collaborative skills and encourage the use of past tenses in storytelling.

The first activity consists of a creative writing exercise based on images: students are divided into groups, and each group collaboratively develops a story inspired by two images projected on the screen.

The second activity, the 'fantastic binomial', involves the pairing of two seemingly unrelated words provided by the teacher, which students use as the basis to create written stories. This task is performed in pairs, encouraging collaborative storytelling. During both activities, students receive teacher guidance and follow prompting questions to support their creative process. At the end of each activity, students share their stories with the class.

### **2.4. The Teaching Unit: *C'era una svolta***

The title of the TU '*C'era una svolta*' alludes to the underlying theme that accompanies students in their educational path: it combines storytelling with unexpected turns of events and unique characters that prompt reflection on 'diversity'. The structure of the Unit is inspired by Gestalt psychological theories (Freddi, 1970; Titone, 1976) and consists of six phases: motivation, globality, analysis, synthesis, reflection, and verification.

The selected activities are programmed according to the linguistic competences of the students, hence aligned with the A2 level of the CEFR. The

---

<sup>5</sup> The concept of affective filter refers to Krashen's five input hypotheses (1982).

<sup>6</sup> Gianni Rodari (1920-1980) was an Italian writer and educator, known for his innovative contributions to children's literature and educational theory. His work has significantly influenced educational practices through his ideas on creativity and storytelling.

primary focus is the construction of the *passato prossimo* tense, the understanding of its distinction from the *imperfetto* in relation to the communicative functions of narrating events in the past as opposed to describing habitual actions in the past, and vocabulary expansion through forming antonyms with prefixes. An inductive method is employed, as it is believed to be particularly effective in fostering student engagement and active participation.

In the initial motivation phase, learners watch the short film *Float* as an icebreaker to stimulate engagement. This phase includes elicitation activities involving guided analysis of both linguistic and visual elements. The absence of spoken dialogue (except for one English sentence) increases the accessibility of the film to all students and requires them to interpret plot progression, character relationships, and implicit cultural and social themes solely through visuals, regardless of their Italian proficiency level.

Subsequently, students proceed to the comprehension phase, responding in writing to open-ended questions that reveal their strengths and areas for improvement. The themes of the video are then explored collectively through a brainstorming activity, aided by a spidergram to deepen understanding and encourage collaborative discussion.

In the globality phase, the short story *La chitarra magica* serves as an input text, guiding learners through the unit to the final assessment. Selected from Stefano Benni's *Il bar sotto il mare*, the text has been adapted to align with the students' proficiency levels. Linguistic adjustments included changing *passato remoto* to *passato prossimo* and simplifying vocabulary, using tools for readability like GulpEase and READ-IT.<sup>7</sup>

Benni's work, known for its fantastical elements and unique characters, complements the unit goals by fostering discussions on themes of "diversity" and otherness. Following activities that facilitate the general comprehension of the text, students move to the analysis phase, identifying linguistic patterns through varied tasks. A transcoding exercise engages students by asking them to draw *Lucifumandro*, a character described as an unconventional godmother adorned in sequins. This activity leads to discussions on gender identity, discrimination and bullying.

The metalinguistic reflection segment focuses on a detailed examination of

---

<sup>7</sup> Modifications to the text have been done in respect of the literary work and its author. The didactic adaptation of the text is to be intended as a transitional phase that makes the encounter between the learners and the literary text possible and enjoyable.

linguistic structures in the text. Subsequent exercises include gap fills, cloze tests, creative manipulation of proverbs, prefix-based word formations, and crossword puzzles. The interactive quiz *Kahoot!* is used for informal, playful assessment throughout the unit.

In the final verification phase, students complete two assignments: in the first, they are asked to write an ending for the input text, aided by “Propp-Rodari cards”; in the second, they compose a short story about a cherished childhood memory.<sup>8</sup>

### **3. QUESTIONNAIRE**

The questionnaire, which was administered at the end of the TU and filled anonymously, provide valuable insights into students’ reading habits, highlighting key trends. Students generally express an enjoyment of reading but report limited access to books at home, apart from school texts; five students have 25 books or fewer, while one has none. Two students specifically noted that they left many of their books in their home countries. Overall, students indicate that reading played a more central role in their lives before relocating to Italy, with various factors contributing to a decline in this habit.

The findings also reveal positive feedback on the course, particularly regarding the creative activities. Some students suggested incorporating additional literary genres, such as mystery and detective fiction, to enrich their engagement with the course material.

### **4. CONCLUSIONS**

Data collection and classroom observation indicate that all students met the linguistic objectives for the unit. Even “off-program” moments provided valuable opportunities for open dialogue on complex topics, utilizing the L2 to express meaningful thoughts, share experiences, and facilitate connection. This setting allowed for the natural integration of creative, language-focused activities, including reading and imaginative storytelling, which effectively stimulated motivation and engagement. Imagination and storytelling emerged as powerful, democratic tools, enabling all participants to engage actively in class activities.

These findings underscore that, while stories are not the only element necessary

---

<sup>8</sup> The two distinct prompts are designed to ensure that each student can produce a text demonstrating achievement of the linguistic objectives set for the teaching unit.

for student engagement, they serve as a valuable motivator, enriching the range of teaching activities available. Imagination should be valued alongside attention and memory in education, enabling a full spectrum of linguistic expression.

Reflecting on students' reading habits enables teachers to tailor interventions to meet specific needs, selecting literary texts that suit the linguistic level, age, and interests of learners to capture their attention and curiosity. Overall, the educational intervention yielded positive results. However, the lasting impact on students' appreciation for reading will depend on sustained continuity in teaching and instructional intent.

# THE CURRENT VALUE OF *LETTERA A UNA PROFESSORESSA* FOR THE SOCIOLOGY OF EDUCATION: A BOOK FOR PARENTS

Gian Luca Battilocchi  
Università Cattolica del Sacro Cuore

A well-established approach to *Lettera a una professoressa* considers it a pedagogical manifesto primarily addressed to Italian school teachers. This contribution intends to propose a revisitation of the work of the School of Barbiana along two directions. On the one hand, it would highlight the contemporary relevance of the text as a contribution to the sociology of education, particularly regarding the understanding of educational inequalities, by means, among other things, of a valuable statistical survey on the phenomenon of early school leaving; on the other hand, it would underscore the role of family environments and reinterprets the book as an appeal for responsibility and organization, primarily directed at parents.

Don Milani; sociology of education; educational inequalities

## INTRODUCTION

The aim of this contribution is to show the persistent relevance of *Lettera a una professoressa* by the School of Barbiana for the sociology of education. In addition to some key and yet well-known issues, I especially aim to highlight how the book describes still-current mechanisms underpinning the reproduction of educational inequality. Furthermore, I argue that it can be read assuming parents as the declared recipients of the letter, despite its overt address to teachers in the title.

### 1. MASS SCHOOLING AND (RE)PRODUCTION OF INEQUALITIES

*Lettera a una professoressa* places itself in the cultural and political debate on school in Italy in the 1950s and 1960s, characterized by a plurality of dilemmas: between selection and socialisation, and between equality and selection (Besozzi, 2017, pp. 192-195). It also sheds light on the emergence and

persistence of social inequalities in education during those years, even amidst the advent of mass schooling, as well as the substantial risk of reproducing such inequalities.

The introduction of the unified lower secondary school by Law 1859 of 1962 meant the affirmation of a principle of formal equality of opportunity of access; however, it brought out the social inequalities that compromised a full participation in the education system and the achievement of positive learning outcomes for all.

Grounding its arguments in a foundational reference to the constitution, *Lettera a una professoressa*, as well as the pedagogical experience of Barbiana, distances itself from a liberal and meritocratic perspective and fully adheres to a substantial idea of equality, which is expressed in the achievement of tendentially equal outcomes, and in the didactically declined commitment to the scholastic success of all pupils. Consistently, the prior of Barbiana reported the persistent selectivity of the renewed middle school and of the entire segment of compulsory schooling, strictly linked to the social origin of the students. Doing so, Don Milani took an equally clear position with respect to the new alternative that comes to the fore, that between selection and equality. In this regard, with his usual immediacy, Don Milani and the schoolboys of Barbiana pointed out that the eight years of free and compulsory schooling provided by the Constitution had to correspond to eight different classes and the attainment of the middle school leaving certificate; otherwise, it would be just 'fractions of equality'.

## **2. 'SCHOOL HAS ONLY ONE PROBLEM'. SELECTION AND SCHOOL DROPOUT**

As is well known, the book includes a statistically well-founded sociological study of the issue of school dropout, which, for the boys of Barbiana, represents the essential problem of the school, the outcome that reveals a misrepresentation of the nature and the constitutive mission of the school as an institution.

School dropout remains a relevant problem in Italy nowadays. However, in the decades following Barbiana's experience, it has substantially changed its face, shifting the effects of selectivity beyond compulsory schooling to the upper secondary school level. Despite this, the vision of the phenomenon that can be observed in the pages of the *Lettera* is, in the writer's opinion, characterised by relevant elements of modernity.

With reference to the sequence of conceptions of school dropout proposed by

Colombo (2010, pp. 34-42), the analysis of the School of Barbiana echoes a 'structural' vision and the theories of deprivation and social reproduction, insofar as it identifies mechanisms and institutional responsibilities for the expulsion of socially and culturally disadvantaged sectors of the school population. However, in reconstructing the pathways of school truancy involving the schoolboys of Barbiana, the focus seems to shift towards a more up-to-date 'contextualised' approach. Consider, for instance, Gianni's story, which is portrayed through a focus on character and biographical elements, the context of origin with its constraints but also its frustrated potential, and the procedural aspects in which school practices interact with these factors, triggering and developing trajectories of disaffection from school and early attraction towards work (Scuola di Barbiana, 1967, pp. 20-21).

Moreover, in the pages of the book, we can trace a broad vision, attentive to a variety of critical manifestations, not only limited to early exit from the school system, in line with a conception "that considers school drop-out a complex and variegated phenomenon that includes everything that is "lost" – temporarily or permanently – during the assessment of the outcomes of the learning process" (Besozzi 2017, p. 203).

Consider, for example, the emphasis placed on the mechanism triggered by failures: even when they do not result in immediate dropout, the accumulated delay relative to regular courses and the ageing process in school expose repeaters to what is referred to as a 'tragedy of the older ones', the risk of further failures and of leaving school too early, entering the workforce before completing the primary cycle.

The fact is that, inexorably, failure hits the older children. Those who have a job within arm's reach. Instead those children who are within the correct age-frame pass. They had no reason to fail them in the past years. They have no reason to do so now either (Scuola di Barbiana, 1967, pp. 20-21).

### **3. HATING EQUALITY. MECHANISMS OF SEGREGATION**

On some pages in *Lettera a una professoressa* one can also find descriptions of specific mechanisms that continue to be relevant in the production of school inequality. This is the case, for example, with the dynamics related to school choices, connected to the so-called school effect (Cavaletto, Luciano, Olagnero, Ricucci, 2015, pp. 28-32), which refers to the phenomena of selective orientation of some parents towards more qualified and prestigious, or otherwise preferred schools and sections, and the avoidance of socially

undesirable institutions.

If these dynamics manifest themselves today in the context of school autonomy and growing competition between institutes, Don Milani clearly indicates how the egalitarian and democratic goal of the institution of the single middle school could be circumvented with a collusive dynamic between families and school principals.

A headmaster in Florence told a lady: 'Don't worry, send him to me. Mine is the least unified average in Italy'. Playing the sovereign people is easy. All you have to do is gather the 'good' guys in a section. It is not important to know them personally. You look at report card, age, place of residence (country, city), place of origin (north, south), father's profession, recommendations. So two, three, four different middle schools will live in the same school. A is the 'Old Middle'. The one that runs well. The most esteemed professors let it go. A certain kind of parents go out of their way to put their child there. B is already a little less, and so on (Scuola di Barbiana, 1967, pp. 20-21).

#### **4. 'TO WHOM DOES IT BENEFIT THAT SCHOOL IS LITTLE'. SCHOOL TIME AS A VECTOR OF (DIS)EQUALITY**

A similar focus on the drivers of inequality is placed on school time. For Don Milani, the time dimension is a key factor in reproducing inequalities and maintaining the classist nature of the school.

More specifically, Don Milani highlights the issue of the learning loss during the summer break and its differing impact on students from different social backgrounds, leading to a widening gap between them.

Summer holidays, in particular, seem to coincide with precise interests. The sons of the rich go abroad and learn more than they do in winter. The poor ones, on the first of October, have forgotten the little they knew in June. If they have re-sit sessions in September, they cannot afford to pay for repetition classes. Normally they do not sit for them. If they are peasants, they give a hand in the heavy summer chores not to burden the farm with further expenses. (Scuola di Barbiana, 1967, p. 60).

The book of the School of Barbiana seems to anticipate the essential terms of the 'faucet theory', later developed by the scholars of summer learning loss (Entwisle, Alexander and Olson 2001). According to this theory, during the summer the flow of educational and training opportunities is essentially turned off for all children. However, children from higher social strata can benefit from the resources provided by their family environment, thereby reducing the effects

of the interruption in educational activities.

## **5. A BOOK FOR PARENTS. AN INVITATION TO GET ORGANISED**

Despite its focus on the school system and despite the fact that it appears to be addressed to teachers from the very title, the book begins with a clarification that it was not written for teachers, but for parents, and aims to serve as an invitation to organize themselves.

Thus, it seems legitimate to read the text in a way that emphasises not only the role of educational institutions but also that of family contexts in the production and reproduction of school inequalities.

A passage in the *Lettera* allows us to better understand the invitation addressed to parents (especially those from peasants and mountain communities): confronted with the class composition practices that allowed for a substantial circumvention of the egalitarian instance of the 1962 reform, Don Milani draws a sharp distinction between the attitudes of parents from different backgrounds (Scuola di Barbiana, p. 33). While parents from families with greater economic and cultural resources understandably become involved in their children's success at school, the parents from poorer families remain passive in the face of what they perceive as a previously totally unimaginable opportunity. The passivity and silence of these parents are rooted in a relationship of reverent subordination to teachers, to whom they attribute unquestionable authority, capable of having a decisive influence on the image and evaluation of their children's gifts and potential. In light of this asymmetry of power between teachers and (some of the) parents, Don Milani's appeal calls for a collective activation of parents, in the form of a 'union of dads', with the aim of claiming a constitutionally guaranteed right: the school open to all.

The issue of involvement in their children's education is introduced here by emphasising the resource gap between parents of different social classes in terms of information on how the school institution works, investment in their children's education, and building an equal relationship with schools and teachers. The form of parental activation that the book advocates, however, is not limited to a conscious and equipped promotion of their children's school experience but extends to collective mobilisation. In doing so, it seems to envision a commitment for the parents from more disadvantaged social classes that does not merely reproduce that of better-equipped families, but is primarily focused on a level of advocacy and political negotiation.

## 6. SOCIAL ORIGIN, FAMILY ENVIRONMENT AND PARENTING STYLES

*Lettera a una professoressa* offers valuable insights into how the home environment and family educational practices contribute to shaping different outcomes in the educational and socialization processes. The book outlines different kinds of home and family contexts, as well as differing levels of parental investment in the “cultivation” of their children’s talents and potential. Maybe Pierino’s story can provide us with a clue. Let’s try to show affection even toward his family. The doctor and his wife are smart people. They read, they travel, they entertain friends, they play with their child, they have time to dedicate to him, they know how to do all this well. The house is full of books and of culture. At five years of age, I [Gianni] could use the shovel expertly. Pierino the pencil. (Scuola di Barbiana, 1967, p. 63)

In my view, a lot of echoes and references can be traced between the description of Pierino and Gianni, of the “houses of the poor” and the “houses of the rich”, and the findings of Annette Lareau’s work (2011), especially where she characterizes parenting styles and psychological profiles of children according to social class: middle-class parents are distinguished by a style defined as “concerted cultivation”, by structured care of their children’s experience in order to bring out their talents and potential, while working-class and poor parents are characterised by an approach called “accomplishment of the natural growth”, aimed at responding to children’s essential needs without, however, pursuing systematic stimulation of growth processes. These logics of action differ especially in two aspects: the enjoyment of educational opportunities beyond the school offer and the mastery of language and its competent use in interaction with adults. Lareau seems to echo the School of Barbiana particularly when she outlines the salient outcomes of these child-rearing logics, contrasting the “sense of entitlement” of middle-class children with the “sense of constraint” of children from working-class and poor families: the former would develop ease in their relationships with adults, a sense of legitimacy in their aspirations. In contrast, the burden faced by the latter would be expressed in relationship difficulties with adult authority and in a sense of inadequacy and passivity within institutional contexts, facets of what, in *Lettera a una professoressa*, is indicated as Gianni’s dominant psychological trait: the shyness of the children from mountain and peasants backgrounds.

## 7. CONCLUSIONS

I have attempted to outline the legacy of Don Milani’s work for the sociological

analysis of educational processes and systems. As we have seen, the *Lettera* must be placed within the framework of the debate on mass schooling in Italy in the 1960s, but the text proves capable of highlighting mechanisms that remain active in the development of school inequalities, showing the specific responsibilities of the main agencies of socialisation.

Some proposals in the book are based on representations that merit further articulation and updating. The current Italian scenario appears distant from both the one described and criticized, as well as the one hoped for by the schoolboys of Barbiana. With regard to family-school relationships, Triani (2011, p. 230) pointed out for example that, while in the *Lettera* parents are urged to mobilize collectively, “today the problem even seems to have been reversed and schools complain of families that are too “invasive”, that look only to the particular interest of their own child and take on a defence of it without exception”.

The analyses of the school and its functioning present a view not far from that which led Bourdieu to unequivocally consider the school as an instrument of social preservation (Bourdieu, p. 203). In the case of the prior of Barbiana, this perception is shaped by his personal experience as a teacher, by the failures and hostility his boys encountered within the school system. However, the lucid and severe analysis is intertwined with civil and pedagogical commitment, leaving no room for a defeatist attitude. On the one hand, Don Milani identified the Gospel and the Constitution as the foundational references for his life as a teacher; on the other hand, his love for his children and his passion for teaching probably represent an inescapable key to his pedagogical experience.

# DON MILANI GENERATIVE CENTER. LOOKING FOR THE PRESENT “BARBIANA SCHOOLS” TO PROMOTE THE IDEA OF ACTUALIZATION

Viola Davini<sup>a</sup>

Eugenio Pandolfini<sup>a</sup>

<sup>a</sup>“scientia Atque usus” Research Center for Generative Communication

“scientia Atque usus” Research Center for Generative Communication (sAu Research Center) has explored the relationship between technology, cultural heritage, and communication since 1991. This research culminated in the creation of the “Atque” Design and Communication System and its application in the Generative Center “Scuole di Barbiana”. This article discusses the theoretical and practical foundations of the “Atque” Design and Communication System, emphasizing its transformative potential in turning cultural heritage and archives into participatory knowledge centers while addressing the risks of compulsive digitalization and unsustainable energy consumption.

Generative Communication; Cultural Heritage; Digital Technology; Memory and Documentation

## INTRODUCTION

This contribution shares a research project from the “scientia Atque usus” (sAu) Research Center for Generative Communication with the scientific community and stakeholders. Since 1991, the sAu Research Center has been redefining the relationship between new technologies, cultural heritage, and communication. This effort led to the creation of the “Atque” Design and Communication System (Atque System) and its implementation in the Generative Center “Scuole di Barbiana” (Generative Center), which is detailed further in this document.

The sAu team emphasizes that cultural heritage and archives are invaluable resources. However, the digitalization of such resources must be meaningful. Reckless digitization risks turning physical archives from inaccessible formats

into equally opaque digital systems while escalating unsustainable energy consumption. To counter this, the sAu Research Center has focused on designing archives and documentation centers that foster knowledge sharing and active community engagement.

The Integrated Atque System was developed to enable the effective sharing of knowledge generated through Generative Communication projects (Toschi, 2011), ensuring that involved communities not only benefit from but also contribute to the enrichment of this collective knowledge.

### **1. 30 YEARS OF RESEARCH: GENERATIVE COMMUNICATION AND DIGITAL TECHNOLOGIES TO ENHANCE CREATIVITY AND COLLABORATION, PROMOTING CRITICAL AND PROACTIVE DOCUMENTATION**

The sAu Research Center carries forward the legacy of research on the potential of new digital technologies to enhance people’s creative, critical, and collaborative activities. This work builds upon projects initiated since 1991, including the Research and Application Center for Informatics in Text Analysis (C.R.A.I.A.T.), active at the University of Florence from 1991 to 2022; the Communication Strategies Laboratory, established in 2001; and the Center for Generative Communication, launched in 2016 within the Department of Political and Social Sciences at the University of Florence.

In this context, the sAu Research Center conceived, designed, and developed the Atque System as a cohesive set of tools for conducting research, analysis, planning, development, supervision, communication, and training—all strongly oriented toward documentation and knowledge sharing.

### **2. DESIGNING AND DEVELOPING NEW TECHNOLOGIES WITH A HUMAN TOUCH**

The Atque System is distinctive in its foundation on a critical value for the future of communication: the human touch. Designing and developing new technologies with a human touch means valuing critical thinking and human creativity within a vision of increasingly collaborative projects (Norman, 2013). It involves leveraging shared data documented not only for archiving but also for sharing, discussing, and connecting with other elements of knowledge. The primary goal is to generate new knowledge through new initiatives.

Unfortunately, the current architecture of digital automation systems has driven communication (institutional, organizational, informational, etc.) toward an exacerbated fragmentation of human labor, intelligence, and memory (Toschi, 2019).

Through these technologies and their proposed uses, elites and powerful groups impose perspectives, behaviors, and opinions through repetitive daily practices, fostering their internalization. As a result, individuals' capacity to connect various elements into a systematic vision is severely limited.

Based on these premises, we encounter a society unable to manage the diversity and complexity that characterize this historical moment. It lacks the ability to analyze its own contexts, recognize its cultural, economic, and social heritage, and use its memory to plan for the future.

### **3. THE ATQUE SYSTEM**

The Atque System enables collaboration between different researchers and specialists while fostering dialogue among them and stakeholders. It offers a suite of digital tools for use across the entire lifecycle of activities, including research and project implementation, project monitoring and training.

These tools emphasize a shared commitment to creativity and human thought, allowing organizations to:

- Systematize collective memory: Collect knowledge from diverse sources, including researchers, stakeholders, and organizational records.
- Build cohesive project communities around shared innovation goals.
- Enhance internal communication
- Promote creativity and cooperation.

### **4. OFFICINE, LIBRARY, MATRIX, AND ACADEMY: DESIGNING DIGITAL SOLUTIONS TO ACTIVATE KNOWLEDGE AND MEMORY GENERATION PROCESSES**

The Atque System is designed to communicate project outcomes through a precise content publication strategy. This strategy seeks to shape a body of knowledge useful both to the project's internal community and to external parties interested in the same topics. It generates a communication approach that transforms the knowledge of people involved in each project into a shared resource, promoting innovation and disseminating the concept of knowledge as a common good (Hess & Ostrom, 2006). This knowledge emerges from specific application contexts, embodying the results of collaboration and cooperation across sociocultural and economic fields traditionally separated and hierarchized (Bateson, 1972).

The Atque System consists of four primary tools: sAu Officine, sAu Library, sAu

Matrix and sAu Academy.

sAu Officine serves as the operational hub of the sAu community, bringing together organizations, stakeholders, institutions, companies, and citizens to collaborate on projects through the *Generative Communication* approach. This evolving workspace supports ideation, design, development, and monitoring of projects, fostering innovation and transcending traditional networks. It ensures broad participation by engaging diverse stakeholders, enabling asynchronous and customizable interactions with sections such as project timelines, directories, and working documents.

For knowledge management, sAu Officine integrates two complementary tools: sAu Matrix and sAu Library.

sAu Matrix specializes in archiving and organizing relationships and contacts. It allows for continuous updates to individual and group profiles, tracking activities, and recording potential connections. Profiles are shaped by active dialogue, creating tailored communication strategies and strengthening community ties.

sAu Library acts as a relational database that organizes resources produced by projects. It enhances transparency, documents shared activities, and systematizes data to convert project memory into actionable knowledge. It embodies the idea of knowledge as a common good (Hess & Ostrom, 2006), bridging the gap between theoretical understanding and practical application (Bateson, 1972). sAu Library ensures that knowledge generated through collaboration becomes a sustainable and adaptable resource.

In an era dominated by digitization and automation, sAu Library emphasizes human-centered knowledge curation. By integrating past insights with innovation, it drives the creation of new ideas while reinforcing the importance of selecting and contextualizing information (Toschi, 2015).

To support practical application of this knowledge, sAu Academy provides tailored training programs for the project community. In close synergy with the other tools, Academy fosters a dynamic interplay between knowledge (Library) and its operational dimensions (Officine and Matrix). The training equips participants with project management skills and *Generative Communication* techniques, enabling them to address system-level complexities and contribute effectively to collaborative efforts.

Participants gain expertise in applying Atque System tools while mastering transdisciplinary approaches. sAu Academy emphasizes communicative behaviors that bridge disciplines, encouraging creative and systemic thinking

(Pandolfini & Sbardella, 2020). Training sessions, led by experts across various fields, prepare participants to navigate contemporary challenges, ensuring that digital technology remains a tool for human ingenuity.

## **5. DON MILANI'S LESSON: A NEW RELATIONSHIP BETWEEN SCIENTIA AND USUS**

The sAu Research Center had spent at least two years planning the application of the Atque System to a project aimed at documenting Don Milani's legacy.

As a teacher, Don Lorenzo Milani (1923 – 1967) emphasized the importance of language, communication, and empowering those with weaker communication skills to fully exercise their citizenship. As a writer, he prioritized documentation, as evidenced by the wealth of material that underpins his works, including *Esperienze pastorali* (Milani, 1958), *Lettera a una professoressa* (Scuola di Barbiana, 1967), and *L'obbedienza non è più una virtù* (Milani, 1965).

Don Milani demonstrated a unique and forward-thinking approach toward interpreting and practicing the relationship between knowledge traditionally associated with science (*scientia*) and the skills tied to practical application (*usus*). He redefined the interaction between knowing and doing, bridging high culture and popular culture, and highlighting the presence of *usus* in *scientia* and vice versa.

Before establishing itself as a documentation center, the Generative Center ([www.centrogenerativo.it](http://www.centrogenerativo.it)) was conceived as a community-building project aimed at schools, institutions, voluntary and religious organizations, unions, and other entities. It seeks to gather and document resources, projects, and experiences that update and expand Don Milani's philosophy and work. This stems from the sAu Research Center's conviction that documentation must not be limited to the mere accumulation and organization of information. Instead, it must be accompanied by a concrete plan for utilizing the documented resources. This plan must precede the documentation itself, ensuring that the resources remain alive and valuable.

The Generative Center aims to provide an environment — accessible both nationally and internationally — that enhances diverse experiences and realities. It leverages the Atque System and the Generative Communication technique to document and update Don Milani's thoughts and actions. By doing so, it promotes the continued relevance of his teachings in addressing contemporary challenges.

By integrating community building into its foundation, the Generative Center seeks to document not only the historical experience of Barbiana but also the

ongoing initiatives inspired by its values. The Center acts as a living entity where resources are documented with the explicit intention of inspiring and supporting further creative and impactful endeavors.

The primary objective of the Center is to promote the creation of a highly structured community dedicated to reflecting on social, cultural, and religious issues through a project-oriented approach, inspired by the teachings and legacy of Don Milani. This community aims to activate virtuous cycles and establish connections among documentation, communication, and actualization activities. It is recognized that none of these three elements can exist independently but must operate in relation to the others, particularly in connection with the realization of specific projects — whether educational, social, or cultural — that have clearly defined objectives.

The Generative Center and the tools that enable the use of its resources have been designed with a focus on how potential stakeholders can utilize them. For this reason, the first action taken by the Generative Center on the day of its launch was the announcement of an open call to schools across Italy to participate in its development and test the tools as they were being created. Following the involvement of schools, the decision was made to engage organizations and associations (both secular and religious), research centers, and experts. These were the first participants invited to join the community envisioned and created by the Generative Center: this community – managed through the Atque system – consists of individuals who act daily based on shared values and a social project centered on the dignity of the human being, even as they align themselves with the legacy of the Don Milani.

## **6. MEMORY AS A POLITICAL PROJECT: “REMEMBERING” IS MORE THAN “MEMORIZING”**

As with all projects of the sAu Research Center, the development of the Generative Center was guided by precise research questions: What and for whom is an archive or documentation center today? What is the difference between “memory” and “memorizing”?

The answers that the research group has formulated stem from long-term inquiries, briefly summarized in earlier sections. The Generative Center is not—and could not be—a static repository of the original documentation from the Barbiana experience. Instead, it aims to create relationships between that historical memory and the many contemporary realities that continually revitalize its legacy across diverse spaces, forms, contexts, and sectors.

The distinction lies in the purpose and approach. Memory is always a tool for planning and is shaped by the questions we seek to answer. Today, due in part to misconceptions about the capabilities of digital tools, we tend to record, store, and accumulate information — data, photos, videos — without immediately determining how they might be used. While memorizing is a mechanical activity, using memory is a generative activity. The key difference, therefore, lies in the presence or absence of a human touch.

From these considerations arises the urgency to move beyond the logic of first collecting, organizing, and documenting material and only later questioning its purpose or audience. Instead, the project of utilization must precede the collection and organization of documentation:

An archive that can be continually interrogated and enriched by all who believe in the project is an essential condition for acting in the present. An archive that interprets memory not as a dusty and cumbersome repository but as an active process in the present, continuously questioning who we are and, more importantly, who we want to be tomorrow: for ourselves, but especially for our daughters, sons, grandchildren, and future generations. (...) To work effectively with the memory of the past means working in the present: asking how past experiences can help us improve or innovate while also recognizing how our current actions need to be remembered for the future, especially if they are new, unprecedented, or divergent from established memory. Today, memory is a right we must fight for, as it comes from history and points toward history. (Toschi, 2012, p. 58).

Updating cultural heritage means reconsidering its values, ideas, and historical significance in light of contemporary society and its evolving needs. Documentation alone, no matter how technologically advanced or user-friendly, is insufficient. For a resource or experience to be genuinely relevant, additional steps are necessary:

**Understanding Context:** it is essential to acquire a clear understanding of the context in which a resource or experience was created — what values drove it, what intellectual foundations it drew upon, and what impacts and consequences it produced.

**Learning to Communicate:** beyond documenting an experience, it is necessary to communicate it in a way that fosters the generation of new ideas, thoughts, experiences, and solutions. This type of communication turns cultural heritage into a constant resource, inspiring new reflections on current realities and serving as a stimulus for innovation and community building.

## CONCLUSION

In conclusion, the application of the Atque System for documentation presented in this contribution is an example of generative processes that leverage the potential of digital technology in direct opposition to the contemporary trend toward compulsive memorization, which is permeating every aspect of our personal and professional lives.

The Generative Center embodies the essence of Barbiana's legacy, not as a static monument to the past, but as a dynamic force driving the search for contemporary "Barbiana Schools." These are spaces where the principles of equity, creativity, and human-centered education are actualized to meet the needs of today's society. By leveraging the tools of the Atque System and embracing Don Milani's vision, the Center champions the idea of actualization — turning memory into action and values into practice. In doing so, it invites educators, communities, and organizations to collectively envision and construct a future where the transformative power of education continues to resonate, inspire, and evolve.

# 'THE WORD' SETS YOU FREE: DON MILANI'S REVOLUTIONARY ANTI-IDEALISTIC AND MAIEUTIC APPROACH

Vanessa Lamattina  
University of Salerno

Lorenzo Milani considered the individual an historical product who does not possess innate qualities and whose conscience is merely the reflection of a surrounding fraction of civil society. This perspective, which we could define as 'anti-idealist', sites Milani closer to the thought of scholars Gramsci and Bourdieu, who were convinced that the social world is endowed with an immanent, objective and persistent structure and a system of forces to which all things, including human actions, are subject. In education, denying this system of contingent forces means not admitting that teaching methods are likely to have differing effects on pupils from differing socio-economic strata. Espousing the conventional rhetoric of merit, schools may effectively fuel the process of social inequity reproduction. In an attempt to block this process and address the class differences inherent in the Italian school system, Milani decided to 'take sides' by dedicating his educational activism to the poor. He adopted a maieutic pedagogical method in the hope of seeing critical subjectivities flourish among the less privileged classes, promoting awareness and encouraging them to struggle to emerge from their condition of subordination.

Don Milani; anti-idealism; Popular School

## 1. LORENZO MILANI'S ANTI-IDEALISM

From its establishment until the end of the 1950s, the Italian school system maintained a dual aim of reproducing existing social stratification and preserving the hegemony of dominant social groups (Baldacci, 2019, 166-167). This entailed providing access to high school for the ruling classes, and vocational training for the subordinate classes. Underpinning this type of scholastic structuring is an *idealistic and elitist pedagogy* according to which an individual is not a socio-historical product but a being endowed from birth with all the characteristics that will configure their fate (Charnitzky, 1996). Schooling

merely makes manifest the qualities already present in each, separating ‘talented’ students from students who do not conform to required standards or whose talents are not immediately visible (Gramsci, 1977, Vol. i, Q. 1, 123, 114). Political, historical and social changes in Italy since the end of the 1950s have contributed to bringing the school system in line with a progressive democratisation of constitutional inspiration (Baldacci 2019, 170). However, these changes have failed to rebalance the classism in Italian schools, and the elitist pedagogical approach applied in the reforms remains unchanged. It is no coincidence that, by focusing on enhancing graduate employability, competitiveness and ‘know-how’ (Lundvall & Johnson, 1994), the new educative and training strategies adopted in Europe since the 1990s have made Italian schools similar to businesses, rewarding students able to use their skills to game the economic market and condemning those who do not ‘naturally’ adapt (Gallino, 2015; Mayo, 2015). Espousing the rhetoric of merit, a school may thus further reward the most energetic and regular and penalise the most listless or nonconforming, effectively fueling the process of social inequity reproduction.

In countering this entrepreneurial approach, Don Lorenzo Milani’s pedagogy is considered a critical and revolutionary alternative to traditional Italian education. For Milani, the individual is an historical product who does not possess innate qualities and whose conscience is merely the reflection of a surrounding fraction of civil society (Scuola di Barbiana, 1967). This perspective, which we could define as ‘anti-idealist’, sites Milani closer to the thought of scholars Gramsci and Bourdieu, who were convinced that the social world is endowed with an immanent, objective and persistent structure and a system of forces to which all things, including human actions, are subject (Bourdieu & Passeron, 1970; Gramsci, 1977, Vol. i, Q. 4, 50, 486). In education, denying this system of contingent forces means not admitting that teaching methods are likely to have differing effects on pupils from differing socio-economic strata (Bourdieu & Passeron, 1970; Gramsci, 1977, Vol. i, Q. 4, 55, 502; Scuola di Barbiana, 1967). In an attempt to rectify this denial and to address the class differences inherent in the Italian school system, Milani decided first of all to ‘take sides’ by dedicating his educational activism to the poor (Braccini & Taddei, 1999; Milani, 1957). His critique of traditional schooling opposed obstacles posed to the poor in accessing culture, and also the ongoing cyclical retransmission of social classism in and about which underclasses lacked means of determination and expression. In practice, Milani adopted a maieutic method which was not aimed at gentrifying the poor — the transformation and/or negation of their essence in a process of slow

homologation — but at the acknowledgement of authentic diversity: the tools provided by the teacher should be useful for deciphering the social world, imagining alternative realities and freely expressing one's subjectivity in language (Milani, 2004, 28-29, 77). That is, his school did not provide poor students with notions to be acquired uncritically; rather, it hoped to see critical subjectivities flourish, gaining awareness and an ability to struggle to emerge from their condition of subordination (Milani, 1956, 2005, 2007). Giving 'the word' to the poor, and thereby allowing them to express, critique and shape culture, became Milani's main mission (Milani, 1956, 17-18).

## 2. A SCHOOL FOR THE POOR

Don Milani turned his attention to popular schools, dedicating himself to the lower classes, the poor and the illiterate (Braccini & Taddei, 1999, 38). He reserved a deep respect for peasant culture. As Bussagli (2005, 3) recalls in the beautiful preface to the text *La Parola fa eguali*, Milani never thought that a farmer's son was more ignorant than a pharmacist's or a doctor's son. The farmer's son is the bearer of a culture that differs from that of the pharmacist's son but is not inferior. For Milani, this oppressed culture, rich in very important values, must be enhanced by providing those who possess it with the means to express it in the best possible way (Milani, 1957, 210). In 1956, before being 'exiled' from San Donato to Barbiana due to continuous conflicts with the Florentine curia, Milani wrote a letter to Ettore Bernabei, director of Florence's *Giornale del Mattino*, which read:

Dear Director, do you really think that one of my mountain boys has a lesser amount of knowledge than his city peers? (...) Granted, in books there is a concentration of observations that with our eyes cannot be so powerfully expressed. (...) I am sure, therefore, that the difference between my son and yours is not in the quality or quantity of the treasure enclosed within the mind and heart, but in something that is on the threshold between the inside and the outside, indeed it is the threshold itself: the Word. Your children's treasures expand freely from that wide open window. The treasures of mine have matured within and become sterile. (Milani, 1956, 17-18, authors' translation)

The objective of Milani's educational activism was to eliminate class differences; initially, he chose to address this by ensuring more schooling opportunities for the poor. He developed a school for the poor with three rules: do not fail; full-time school; find a purpose (Scuola di Barbiana, 1967, 80).

Seeking to provide his students with the tools to understand the ideological

structures in which we are all entangled, Milani also promoted three actions: 1) the value of the strike; 2) the rejection of traditional textbooks; and 3) the rejection of recreation. To the former: at the Conference to Educational Directors organised in Florence in 1962 by the Councillor for Public Education, Fioretta Mazzei, Don Milani had the opportunity to express his ideas on the state school institution. After underlining, à la Bourdieu, the tendency of state schools to reward those from bourgeois families to the detriment of those from peasant and worker families, he asserted that children should all be taught the ethics of striking and allowed to strike if they saw fit (Milani, 2005, 85-86). This idea triggered a heated debate with one of the educational directors present, who accused Don Milani of praising the revolution. “Studying is not a subversion!”, thundered Milani (ib.), always a proud defender of the right to culture. Once, in 1961, some children did go on strike to protest their teacher’s continuous delays. The strike consisted of staying at school until the teacher would guarantee the punctuality of the timetable and, otherwise, of returning to Don Milani where, in the absence of an available teacher, the older children would teach the younger ones. One day, finding the school closed, the teacher went to Don Milani to take the children back but received his refusal. He later recounted: “I replied that I am not sending them back, because they are on strike, and that if this situation does not appear on the register, that is, if their absences appear to be otherwise justified, I would denounce her for ideological forgery” (Milani, 2005, 60). “The word ‘strike’ is sacred to the poor, their only weapon against the lords!” (Milani, 2004, 67), he declared, and for this reason it must be taught to the children.

One of the peculiarities of Milani’s educational action stems from its incessant attempt to bring out a critical spirit in children. Underscoring the importance of studying the ideological structures of society in order to form and spread critical rationality, in his programme of revision of teaching methods Milani called for the rejection of traditional textbooks in favour of other textual tools, such as newspapers, that were ‘living things, not dead things’ (Braccini & Taddei, 1999, 103). In Milani’s Barbiana school, students read the news of the day, commenting on it and looking for the names and political orientation of the financiers of the newspapers in question. In 1961 Milani created, together with Professor Capitini, the School Newspaper, a simple and short newspaper for the workers and peasants of Umbria which dealt, in each issue, with a single topic of current affairs that was of interest to the world of work. The broadsheet contained a column about the fight against illiteracy, in which the origin and meaning of words that were deemed fundamental to the cause, but that were

yet incomprehensible to the peasants, were explained: 'colonialist', 'civilisation', 'independent', 'violence', 'functionaries', 'cultural creation', and so on.

Another fundamental aspect of Milani's educational action is his clear alignment against the 'logic' of recreation (Milani, 2007, 33). Convinced intellectual work, rather than recreation, should be the counterpoint to manual labour, as prior of Barbiana Milani had completely abolished it in his school. From Milani's point of view, entertainment is a weapon used by the ruling class to attract and distract the subordinate ones, which is why it is absolutely necessary to flee from it and devote one's free time to cultural development. In his *Recreation*, Milani recounts an emblematic episode (authors' translation):

It happened that going to the village to make a phone call I found one of them [his students] in the bar struggling with the telephone book [... and I said to him,] "workers like you are just as the lords want them. Don't you see that they organise the Giro d'Italia [national bicycle race] and the cinema for the purpose of fooling you and keeping you away from school and the union? Your friends don't read the Gazzetta and take care to keep up with their union and send their children to university, yet they laugh behind your back!" And so on for an hour, until he was destroyed (ivi, 18-19).

Milani formulated a scheme of recreational activities distinguished into four categories: a) recreation with its own malice in addition to that of sterility; b) recreation that is bad only because it is sterile; c) recreation that is good only for physical health; and d) recreation that is good because it is instructive. Among the first, Don Milani places the cinema, TV and the bar, all of which extend bourgeois control by providing the illusion of being able to choose and, therefore, of being free. This point has been explicated by Milani on several occasions, but we believe it was best explored during a lesson to girls from the middle school of Borgo S. Lorenzo in 1965. On that occasion, to a girl who was convinced of her ability to choose her fate, Milani replied that

in Paris or New York, eight or ten years ago, a rich man master, or a small group of rich men who owned a whole chain of record companies, decided to make the girls bop from the North Pole to the South Pole, including in the halls of Borgo or Vicchio. (...) None of you have chosen any of the dance tunes you dance to: you have taken them as they have been given to you. If any of you had chosen to dance the minuet, there is no scope to do that; yet your great-great-grandmother danced the minuet. (Milani, 2004, 28-29, Authors' translation)

Among recreations that are bad because they are sterile, Milani included 'passive' sports, such as taking boys to the stadium and the races, following sporting events on television, reading the sports newspaper *Gazzetta*, etc. (Milani, 2007, 55). Among recreations useful for physical health, he included sports in which children can actively participate (ivi, 61). Yet all these forms of recreation deviate from the main objective that Milani (2005, 77) had set, that is, to wage a class struggle.

Listen, boy, your social class, the oppressed, the unhappy all over the world, from Algeria to the Congo, from Barbiana to Monte Giovi, in the workshop, in the fields — the oppressed of the whole world, the proletarians of the whole world, suffer from this imparted suffering that you experience. Dedicate your whole life to helping your class emerge from this situation (ivi, 77, Authors' translation)

With this counsel, we come to perhaps the highest point of the entire Milanese educational action: for Don Milani there is no freedom without equality and there is no individual without collectivity. To the 'ignoble' goal of studying for oneself, selfishly, to make money, Milani parries another: "Study for a whole class, which is ninety percent of people. Expand your heart to the rest of the world" (ib.). Indeed, Milani's pedagogy has the concrete objective of creating and spreading a new humanism through educational action that is first and foremost political. It aims for transformation of both the general understanding of the world and of one's position within that world, and for a new, solid apprehension of the planning horizon at which fresh perspectives and *modus vivendi* are imagined.

# THE CRONOBOK OF DON MILANI'S LIFE: AN INTERSECTION OF PHILOLOGY AND CRITICISM IN REVITALIZING HIS LEGACY

Marco Sbardella<sup>a</sup>

<sup>a</sup>"scientia Atque usus" Research Center for Generative Communication

The article introduces the resources created and developed by the "scientia Atque usus" Research Center for Generative Communication for the Generative Center "Scuole di Barbiana", with a particular focus on the Cronobook dedicated to the life of don Lorenzo Milani. The Cronobook represents an innovative experiment that combines a philological biography of don Milani with a critical interpretation of his life and works. Through a Generative Writing approach, the project aims to foster a continuous dialogue between past and present, involving schools, researchers, and students in the reinterpretation and renewal of Milani's thought. The goal is to revitalize don Milani's message to address contemporary issues like school dropout and educational poverty, keeping his legacy alive in modern challenges.

Don Lorenzo Milani; Generative Center "Scuole di Barbiana"; Generative Communication; Generative Writing

## 1. WHAT IS THE CRONOBOK OF DON MILANI'S LIFE?

Writing a biography certainly consists of a philological activity of gathering and organizing the events of a person's life, but, as Toschi (2016) argues, "philology cannot exist without criticism and vice versa." This intertwining of philology and criticism is particularly evident in the case of don Lorenzo Milani. His life has been subject to contrasting interpretations between supporters and detractors, making it necessary for the biographical work to not only chronologically collect data and dates but also to include a critical and contextual interpretation of his thought and actions, along with the context in which these took shape.

The controversies surrounding don Milani, his message, and his behavior were intense even during his life. His assignment to the remote rectory of Barbiana,

after the death of the rector of San Donato di Calenzano, was intended by the Florentine ecclesiastical hierarchy as a way to isolate and silence this uncomfortable young priest. These controversies did not end with his untimely death in 1967, at the age of only 44, and they have continued even during the centenary celebrations of his birth (May 27, 2023 – May 27, 2024). The dialectic between philology and criticism, in fact, clearly emerges in the debate sparked by Scotto di Luzio's (2023) pamphlet on Milani's pedagogical legacy and in the response that Cesari (2024) gave to this publication.

In this context, the need for a continuous and unceasing dialogue between philology and criticism represents the focal point of the Generative Center "Scuole di Barbiana" ([www.centrogenerativo.it](http://www.centrogenerativo.it)), which aims to renew and revitalize the thought and values of the prior of Barbiana through innovative research and documentation tools. Among these, one of the main ones is the Cronobook of don Lorenzo Milani's life, a digital and interactive resource that researchers of the "scientia Atque usus" Research Center for Generative Communication (henceforth: Research Center sAu) have designed and developed specifically for the Generative Center.

The purpose of the Generative Center is to foster the creation of a community engaged in reflecting on social, cultural, and religious issues inspired by don Milani's teachings and testimony, with the aim of overcoming current challenges related to communication, inclusion, and hospitality issues for which don Milani's thought and practices still offer essential insights today.

The Cronobook embodies the creative tension between philological rigor and critical interpretation, offering an operational model to actualize Milani's legacy and transform it into an educational tool that supports projects which, by looking to the past for lessons, are oriented towards addressing the most pressing current challenges for our schools and society. Always, in the spirit of Milani, with the aspiration of making our school ever more just, inclusive, and democratic: a true workshop of communication and citizenship (Toschi 2023).

## **2. WHAT DOES REVITALIZING DON MILANI'S LEGACY MEAN?**

To understand the approach of the Cronobook, it is necessary to consider the meaning of the term "revitalize" within the context of the Generative Center's project. Revitalizing the thought, testimony, and values of don Milani first requires a philological understanding of his writings and access to firsthand testimonies, such as the personal letters collected in the second volume of his complete works (Milani, 2017) and the testimonies of those who personally

experienced the Barbiana School. This is the *conditio sine qua non*, which must be accompanied by interpretative criticism, needed to distinguish those aspects of Milani's life and thought that would be incorrect and unhelpful to decontextualize (for historical, cultural, social, or personal reasons) from those that are still useful today in guiding behavior in different contexts, both inside and outside school. Finally, the third step is *actualization*, placing Milani's experience and testimony within the contemporary context, making it alive and meaningful, and continuously enriching it with new content and experiences.

The Cronobook arises from this generative tension between philology and criticism, presenting itself as a tool that, on the one hand, documents the coherence between Don Milani's life and message through a philologically accurate and scientifically rigorous biography, and on the other hand offers a platform for collective writing, allowing researchers, teachers, and students to enrich and expand the project with new events, resources, and interpretations.

### **3. STRUCTURE AND OBJECTIVES OF THE CRONOBOK**

The Cronobook, accessible from the website of the Generative Center "Scuole di Barbiana," is a research and consultation tool based on critical and philological analysis of biographical literature, as well as direct testimonies from those who had the privilege of interacting with don Lorenzo Milani daily, as well as what he personally recounted to friends and relatives in his private letters. This tool has two main objectives. The first is to provide a scientifically based biographical model, created through mediation between authoritative sources.

The Cronobook, in fact, builds a biography that emphasizes the coherence between Milani's life and message. The chronology of his existence is integrated with autobiographical narratives drawn from his correspondence and other primary sources. The second objective is to experiment with a Generative Writing method. From this perspective, the Cronobook is designed as a shared writing space where experts and researchers, as well as active classes involved in updating his message, can contribute by adding resources, events, and references, each with their own signature. This approach allows for different perspectives to be integrated into a common structure.

### **4. ACCESSIBILITY AND INTERACTIVE STRUCTURE**

The Cronobook offers an interactive structure designed to meet the needs of diverse users, from academic researchers to teachers and their students. Like

all content and resources created for the Generative Center, the Cronobook is organized around three main macro-themes:

**School:** Explores the role of the school as an instrument of social justice, focusing on the Barbiana experience and Milani's critique of the school as a means of perpetuating social injustices and economic inequalities.

**Citizenship:** Analyzes Milani's contribution to the formation of conscious citizens, highlighting the link between education and democracy and the extraordinary importance he placed on the Constitution.

**Faith:** Examines the religious dimension of Milani's thought, viewed as a driver of social action and commitment and as a compass guiding his decisions, and the conflicts he faced with the ecclesiastical hierarchy.

Users can navigate the Cronobook through three possible modes:

- **Search by Event:** This allows users to identify specific events through keywords.
- **Search by Date:** Users can view events organized by year, month, or specific day.
- **Thematic Search:** This option enables users to explore events associated with the three macro-themes mentioned above (school, citizenship, faith).

## **5. A GENERATIVE WRITING EXPERIMENTATION**

A distinctive feature of the Cronobook is its approach to collective writing, expressed through “Generative Writing.”

By Generative Writing, we mean a writing paradigm that not only embraces the potential offered by new technologies but aims to radically transform the way we conceive and practice collaborative writing. Here, writing is not simply understood as a mechanical process of text composition but as a project activity rooted in critical thinking and shared reflection, leading to the creation of communities and the continuous generation of new ideas. This concept goes beyond mere collaboration or document sharing, proposing a model where writing is conceived as a continuous process of ideation, discussion, and integration. Generative Writing, ultimately, aims to add value to those creative processes of research and design that bring together the world of *scientia* (experts) and *usus* (a broader and more diverse audience). This approach aims to overcome the traditional barriers of specialized communication – which has become standardized, as in academic discourse – by exploring themes of design, collaboration, and the appreciation of differences, with the goal of promoting a form of writing that does not simply produce content but generates knowledge, builds community, and stimulates innovation.

The Cronobook, therefore, presents itself as an open space to host diverse but integrated contributions, thanks to a shared structure. This approach allows for continuous enrichment, enabling researchers (as well as students working in groups with the support of their teachers) to add new events or enrich existing ones with resources and references. An additional important aspect is interdisciplinary dialogue: the Cronobook promotes collaboration between scholars from different fields, fostering a more comprehensive and multifaceted understanding of don Milani’s figure.

## **6. LETTERS TO A TEACHER: THE NEW PROJECT FOR SCHOOLS**

For the 2024/2025 school year, with support from the Fondazione CR Firenze, we launched the project “Letters to a Teacher: Students Write to don Lorenzo Milani”. This initiative is aimed at teachers and students in secondary schools in the Metropolitan City of Florence, who can participate in a training program and a series of Generative Writing workshops organized by researchers of the Research Center sAu. Through this program, the classes involved will, by the end of the school year, write letters – modeled after Milani’s famous public letters – dedicated to current issues in schools and society today, such as:

## Education for multiculturalism and social inclusion

- Combating educational poverty and school dropout
- Health education and prevention
- Food education
- Knowledge and preservation of territory and heritage
- Education in sustainable thinking and behavior

### Citizenship education – not only digital citizenship

In addition to writing new letters, for which the participating classes will be able to rely on the Cronobook and the other resources presented in this article, schools that have worked on these topics in recent years will have the opportunity to document these projects on the Generative Center’s website, becoming one of the ‘Voices from Today’s Barbiana’.

## 7. CONCLUSIONS: REVITALIZING DON MILANI'S LEGACY

The Cronobook represents an innovative response to the need to revitalize the legacy of don Lorenzo Milani, combining philological rigor and critical interpretation into a living and participatory tool. Through meticulous documentation, critical analysis, and generative writing, the Cronobook not only preserves the past but also projects it into the present and future, making it a relevant tool for all those who, in schools and beyond, are committed to initiatives that address contemporary challenges.

In an era when schools are called upon to respond to new forms of inequality and promote active citizenship, the Cronobook offers an educational model that does not limit itself to the transmission of knowledge but engages in the shared and inclusive construction of formative resources. As Milani stated,

The right goal is to dedicate oneself to others. And in this century, how does one love if not through politics or school? We are sovereign. It is no longer a time for alms but for choices.<sup>1</sup>

The Cronobook of don Milani's life embodies this vision, presenting itself as a tool for education that not only helps to understand and interpret the past but, above all, inspires an idea of the future based on active participation, social justice, and a concept of culture that transcends current divisions between the world of *scientia* and that of *usus*.

### **Acknowledgements**

The development of the Cronobook of don Milani's life was made possible thanks to co-financing from the Fondazione CR Firenze (<https://fondazionecrfirenze.it/>), and the IT implementation was carried out in collaboration with Centrica (<https://www.centrica.it/>).

---

<sup>1</sup> Il fine giusto è dedicarsi al prossimo. E in questo secolo come vuole amare se non con la politica o con la scuola? Siamo sovrani. Non è più tempo delle elemosine, ma delle scelte. (Scuola di Barbiana, 1967, 94)

# THE TOPICALITY OF THE SCHOOL OF BARBIANA ON THE CENTENARY OF THE BIRTH OF DON LORENZO MILANI

Marco Sbardella<sup>a</sup>

<sup>a</sup>“scientia Atque usus” Research Center for Generative Communication

This article explores the enduring relevance of don Lorenzo Milani’s educational and pedagogical philosophy on the centenary of his birth. Through an interdisciplinary panel discussion, the legacy of the Barbiana School is examined in the context of contemporary educational practices and its potential to address persistent social inequalities. The panel, organized by the “scientia Atque usus” Research Center for Generative Communication and the Generative Center “Scuole di Barbiana,” featured diverse perspectives from academia, school leadership, and the third sector. The discussion underscores the importance of reimagining education as a tool for social justice and active citizenship. By combining theoretical insights and practical applications, this article highlights how don Milani’s ideas can continue to inspire a more democratic and inclusive educational system.

Lorenzo Milani; Social Justice in Education; Democratic School Practices; Barbiana School Legacy

## INTRODUCTION

The panel was organized to explore, from various perspectives and disciplinary approaches, the pedagogical and educational legacy of Don Lorenzo Milani just a few days before the conclusion of the year-long celebrations for the centenary of his birth (May 27, 2023 – May 27, 2024). Furthermore, the panel was conceived to examine how the innovative ideas of the Barbiana School continue to inspire contemporary educational practices.

Promoted by the “scientia Atque usus” Research Center for Generative Communication ETS ([www.sau-centroricerche.org](http://www.sau-centroricerche.org)) in Florence as part of the activities of the Generative Center “Scuole di Barbiana”

([www.centrogenerativo.it](http://www.centrogenerativo.it)), the panel involved speakers who delved into various aspects of Lorenzo Milani's educational approach and its modern applications. The participants included two academic researchers (Vanessa Lamattina and Gian Luca Battilocchi), a school principal (Ornella Castellano), and two researchers active in the third sector (Viola Davini and Marco Sbardella).

### **1. VANESSA LAMATTINA – 'THE WORD' SETS YOU FREE: DON MILANI'S REVOLUTIONARY ANTI-IDEALISTIC AND MAIEUTIC APPROACH**

Vanessa Lamattina (University of Salerno, Italy) opened the panel by reflecting on Don Milani's educational approach, characterized by profound anti-elitism and a strongly maieutic method. She illustrated how Milani, operating in 1950s and 1960s Italy, challenged a dualistic educational system that restricted high school access to the ruling classes, relegating working-class individuals to vocational training. According to Lamattina, Milani rejected the idea that students should "compete" to demonstrate innate talents and viewed school as a tool for dismantling inequalities, contrary to the practices of the educational system of his time, which perpetuated them.

Lamattina highlighted how Milani considered the traditional school responsible for "treating unequals equally" and penalizing those who lacked the cultural capital to understand the language of school. These concepts share clear connections with the theories of Pierre Bourdieu and Antonio Gramsci. Lamattina further emphasized the importance of language as a tool for emancipation, which Milani intended to offer to everyone without erasing the diversity and richness of popular culture.

### **2. GIAN LUCA BATTILOCCHI – THE CURRENT VALUE OF LETTERA A UNA PROFESSORESSA FOR THE SOCIOLOGY OF EDUCATION: A BOOK FOR PARENTS**

Gian Luca Battilocchi (Catholic University of the Sacred Heart, Italy) analyzed the value of *Lettera a una professoressa* from the perspective of sociology of education, explaining how this text criticizes the Italian school system for its role in perpetuating social inequalities. Battilocchi discussed the contrast between formal equality and substantive equality, emphasizing how Milani and his students advocated for the democratization of access to education.

Battilocchi's contribution also explored the concept of the "school effect," where families from higher social classes influence their children's school choices, directing them toward more prestigious institutions and avoiding socially undesirable contexts. According to Battilocchi, Milani's observations

anticipate the theories of social reproduction and the “summer learning loss” phenomenon, where educational disparities between students of different social origins are exacerbated during summer breaks.

### **3. ORNELLA CASTELLANO – THE LOWER SECONDARY SCHOOL, YESTERDAY AND TODAY ... THE BARBIANA SCHOOL AND ITS IDEAS. IT’S YOUR TURN, GENERATION Z**

Ornella Castellano, a school principal, presented the experience of the Falcone Comprehensive Institute in Copertino, which is part of the Veliero Parlante network. She illustrated how her school has concretized and modernized Don Milani’s approach. The institution she leads adopts innovative methods such as Circle Time and creative storytelling, fostering discussions on social issues starting from texts like the Italian Constitution and *Lettera a una professoressa*. Great importance is given to communication and media: students were encouraged to produce podcasts and radio broadcasts to explore the right to education, social inequalities, and the value of inclusion.

### **4. VIOLA DAVINI – “DON MILANI GENERATIVE CENTER”: LOOKING FOR THE PRESENT “BARBIANA SCHOOLS” TO PROMOTE THE IDEA OF ACTUALIZATION**

Viola Davini (sAu Research Center) presented the Generative Center “Scuole di Barbiana,” a project promoted to foster reflection and the modernization of Don Milani’s principles and values. The Generative Center is based on the “Atque” Design and Communication System, an integrated set of tools designed to facilitate cooperation among stakeholders to continuously expand communities of interest around a project. It is also intended to communicate project outcomes through a precise content publishing strategy to engage communities beyond the project.

The goal is to build a “Milanian Galaxy,” an educational community that shares and practices the principles of the Barbiana School daily.

Davini illustrated how the Center supports various organizations by providing research tools and support for developing new educational projects and communicating Don Milani’s values. She described the sAu Academy, an online training space that offers educational paths for schools and integrates the content of the “Atque” environment.

## **5. MARCO SBARDELLA – THE CRONOBOOK OF DON MILANI’S LIFE: AN INTER-SECTION OF PHILOLOGY AND CRITICISM IN REVITALIZING HIS LEGACY**

In the final panel presentation, Marco Sbardella (sAu Research Center) introduced the *Cronobook* of Don Milani’s life, an innovative tool that systematically and scientifically documents Milani’s life and works, organizing events and texts based on philological and critical criteria. The *Cronobook*, divided into three thematic areas (School, Citizenship, and Faith), allows users to navigate significant events in Don Milani’s life and analyze his writings in relation to the historical context and contemporary testimonies.

- Sbardella also presented other resources created by the sAu Research Center and made available to schools and associations:
- The Cloud of Notable Things: The result of an in-depth content analysis of Milani’s works, this tool enables users to explore central themes like inclusion and social justice.
- Voices from Today’s Barbiana: A section featuring contemporary school projects that apply Don Milani’s ideas through initiatives such as debates and podcasting.

## **CONCLUSIONS**

The panel discussions highlighted how Don Milani’s ideas remain relevant, not only as a pedagogical model but also as a toolkit for making schools more democratic and capable of fostering active citizenship among younger generations. The participants emphasized the importance of keeping Milani’s message alive, not solely through academic studies or by revisiting his name and the historical experience of Barbiana but, more importantly, through educational practices that promote an inclusive and democratic school system.

# FEMALE BULLYING AT SCHOOL. THE MULTIDIMENSIONALITY OF VIOLENCE AMONG ADOLESCENT GIRLS

Antonia De Vita<sup>a</sup>

Giuseppe Burgio<sup>b</sup>

Francesco Vittori<sup>a</sup>

<sup>a</sup>University of Verona; <sup>b</sup>Kore University of Enna

## INTRODUCTION

Analysing bullying through a gender perspective has become increasingly necessary, driven by the recognition of both the potential and the limitations of literature that interprets phenomena – such as male and female bullying – as universal and, therefore, neutral-masculine rather than masculine-neutral. Over the past fifty years, female and feminist thought has developed a scientific discourse that deepens our understanding of reality in its complexity. This discourse highlights sexual and partial subjects (Diotima, 1987), emphasising a perspective rooted in sexual difference and gender as critical interpretative lenses. It also foregrounds knowledge situated and embodied within specific subjects and contexts (Haraway, 1988). This evolution has culminated in the compelling intersectional perspective, which enables us to address diversity, recognising that everyone simultaneously embodies multiple, intersecting diversities (Yuval-Davis, 2006). Therefore, it is essential to open both female and male bullying to autonomous interpretations (De Vita & Burgio, 2023; Burgio, 2018; De Vita & Vittori, 2022). The studies conducted in Italy highlight a theoretical and empirical gap capable of defining female bullying dimensions. The national research “Female bullying at school. An intersectional mixed-method investigation” (coordinated by De Vita & Burgio) tried to fill this gap. The survey involving several Italian Universities (Verona, Enna “Kore”, Milan-Bicocca, Genoa, Perugia and Foggia), through a mixed-method approach, sought to deepen the understanding of female bullying from a gender and intersectional perspective by highlighting its shades (De Vita & Burgio, 2023) and measuring its incidence of the phenomenon in Italy in terms of frequency (Batini et al., 2023), implementing data collection involving the school population of the early upper secondary school. This panel was therefore aimed

at including proposals that explored the several thematic cores around female bullying from an interdisciplinary point of view.

## **1. INSIGHTS FROM THE PANEL DISCUSSION**

The panel highlighted how female bullying, though less visible than male dynamics, is equally pervasive and rooted in verbal, relational, and social exclusion. Peer relationships and social pressures shape roles and behaviours, often driven by cultural and gender norms that reinforce “femininity” and power hierarchies. Research using participatory approaches and Student’s Voice methodologies emphasised the value of involving students and adults as “experts” in addressing peer bullying.

## **2. SUMMARY OF THE MAIN SHARED CONTENTS**

This paragraph summarises the main contents presented and discussed during the panel. We emphasise that some of the contributions received were not presented and discussed due to the absence of the panellists.

### **2.1 The size and forms of the phenomenon**

Among the works presented, Scierra and Batini trace the data of the national research framing the phenomenon and confirming some research hypotheses, namely that bullying between girls manifests itself mainly between school desks and online, within the peer group of the same gender and school year and is often verbal and relational. Quantitative data show that bullying affects boys and girls equally, without greater female victimisation. However, there is a greater involvement of girls in episodes of verbal abuse and exclusion from the peer group. These specificities were confirmed by Genova and Quadrelli, who, through an action-research project carried out in the Marche Region (Central Italy), employed creative methodologies and thus stimulated students’ imagination through drawing. The drawings show a representation of bullying with a male prevalence in the role of the perpetrator, but also a complex phenomenology of female bullying, in which girls exercise psychological as well as physical violence towards both girls and boys.

### **2.2 Anticipation of the age of female bullying**

Peroni showed how even school-age girls are subject to female bullying, pushed to conform to models of adult “femininity”. The absence of reference adults and the self-sufficiency of the young participants suggest a potential for resilience and self-empowerment in the face of intra-gender-based violence.

### 2.3 Itineraries for teachers and families

Caso and Altamura underlined how teachers and parents are essential in recognising and combating bullying, with the risk that ineffectiveness in the role makes them inadequate.

A guideline of interventions for adults has been proposed to improve support and prevention.

### 2.4 Social stigma and mutual recognition

Landuzzi and Dusi, examining the dynamics of social stigma, highlighted how female bullying reflects stereotypes that crystallise and impose themselves with the force of stigma. Experiences of abuse can profoundly influence the victims' self-perception, underscoring the need for an educational perspective of mutual recognition and respect.

### 2.5 Counteractions co-designing

De Vita and Vittori, on the other hand, presented the last step of the national research that involved some schools in Verona in the co-design of actions to prevent and combat female bullying by employing participatory and self-awareness methodologies such as the Theatre of the Oppressed and the 16 Attitudes, intending to create a compelling and replicable pedagogical model capable of promoting and increasing the emotional awareness of female students and teachers through a peer-to-peer approach.

### 2.6 Coping strategies for girls

Disalvo, based on the focus groups carried out in Foggia (Southern Italy), explored girls' coping strategies to contain peer bullying. The results of her research indicate that, although bullying negatively affects the social-emotional growth of adolescents, female students can draw on and build resilient devices from themselves. However, they need more outstanding educational support from adults to cope with the phenomenon.

### 2.7 Invisible spaces and cyberbullying

Emmanuele analysed how female bullying manifests itself in the so-called "invisible" spaces, offline, such as the corridors of a school or the locker room of a gym, and online, such as Instant Messaging and social media platforms. The "strategic" use of these spaces by those who perpetrate prevarication, together with the complex and articulated set of hetero-normative dictates of conformity to the gender culturally assigned to the subjects, makes the bullying

phenomenon less visible, more challenging to identify for adults and, ultimately, difficult to predict and control.

## **2.8 Responses to bullying in Irish schools**

Rutherford's contribution has brought an international point of view to the discussion, which has so far centred on the Italian case. Focusing on the Irish case study, the researcher explored "girl-to-girl" bullying, showing how the use of a post-human approach highlights how the incidence of everyday contexts and tools can influence bullying dynamics. Therefore, Rutherford proposes adopting an "intra-action" perspective that focuses on the material dimensions of the phenomenon and the effectiveness of actions located in context to prevent and combat girl-to-girl bullying.

## **CONCLUSION**

Female bullying often manifests itself in less visible ways than male bullying, as demonstrated by the analysis of invisible spaces "onlife". This feature requires greater awareness and training of reference adults to identify the phenomenon and intervene effectively. The contributions highlighted how teachers and parents can be both part of the solution and the problem. Training programs and participatory educational strategies can fill skills gaps. Female bullying reflects and crystallises gender stereotypes that impose standards of femininity and relational power. The studies suggested the need for interventions that challenge these norms, fostering an environment of growth that promotes diversity, counteracts stigma, and encourages inclusion and well-being of students. Girls can develop forms of resilience through self-empowerment processes and educational support among peers. Involving students and teachers in the co-design of counteractions, as shown using participatory methodologies (Student's Voice), can lead to greater awareness and more effective interventions.

The panel showed that addressing female bullying requires an integrated approach, including education, adult training, and participatory strategies, as well as a gendered and intersectional review of the bullying narrative from a gender perspective.

# LIGHTS AND SHADOWS OF ADOLESCENCE BETWEEN SOCIAL STIGMA AND THE NEED FOR RECOGNITION: A PHENOMENOLOGY OF FEMALE BULLYING

Maria Gabriella Landuzzi<sup>a</sup>

Paola Dusi<sup>a</sup>

<sup>a</sup>University of Verona

This essay is based on the analysis of data collected as part of the research “Female Bullying at School: An Intersectional Mixed-Method Investigation” conducted in the city of Verona. Five comprehensive institutions were involved, and ten focus groups were conducted with female students aged 16. The data analysis, carried out using the CCM method, revealed small glimmers of hope within a phenomenon that causes significant distress among younger generations, such as bullying. Furthermore, the students also proposed potential intervention strategies aimed at supporting the victims of bullying from an empowerment perspective.

female bullying; social stigma; recognition theory

## INTRODUCTION

Bullying arises and develops within social relationships among peers (Novara and Regoliosi, 2007), and in Italy, it affects up to 25 percent of student (Menesini and Salmivalli, 2017).

Nevertheless, it became an object of research in a systematic mode only in the early 1970s (Olweus, 1978). We know that it is a complex, multifaceted, and evolving social phenomenon (De Vita and Burgio, 2023), characterized by a power asymmetry, a specific intentionality and a prolonged reiteration over time (Olweus, 1994). Two main roles are “staged”: the victim and the bully, enacted in front of a third party, the audience composed of peers. Their interactions create a complex relational dynamic that particularly affects the pre/adolescent period, during which the need for approval and friendship from peers emerges

forcefully. Characteristic of this life phase are the definition of one's position in the social hierarchy and the management of one's own reputation (Emler and Reicher, 2000). The mutual recognition among group members is crucial in determining belonging, and one of the fundamental objectives of the bully/ies is the victim's marginalization (Olweus, 1994).

The target of bullying – in the majority of cases – are “those who differ from their peers” (Sharp and Smith, 1995, 145). Among peers, any deviation from the “norm” constitutes a potential risk factor, which increases as the perceived degree of “diversity” grows, leading to possible stigma and rendering adolescents potentially vulnerable (Attawell, 2012) to aggression. This paper is based on the evidence from the national research “Female Bullying at School. An intersectional mixed-method investigation” coordinated by Antonia De Vita and Roberto Burgio and involving multidisciplinary research units belonging to six Italian universities: Verona, Enna “Kore”, Perugia, Genova, Foggia, Milano-Bicocca. The research, through qualitative and quantitative methodologies, has allowed a deeper understanding of female bullying from a gender and intersectional perspective by collecting data in cities in northern, central and southern Italy and involving school population (De Vita and Burgio, 2023).

The object of this essay is to understand how, in aggressive relationships between girls, the social stigma (Goffman, 1963) deriving from diversity is intertwined with the need for recognition (Honneth, 2002b) since, in this delicate transitional phase that is adolescence, the possibility of appreciating the new self that is advancing and of identifying oneself in it, depends to a large extent on the gaze of peers.

## **1. FEMALE BULLYING**

Female versus male bullying is still an under-studied topic because it is a particularly complex phenomenon, consisting of multiple elements (De Vita, 2018; 2021; De Vita and Vittori, 2021; 2022) although some elements are common.

Firstly, bullying takes place in a public context i.e. school (Menesini, 2000); that it often unfolds in groups (Emler and Reicher, 2000, 12-13) and that it arises and develops within social relationships among peers (Novara and Regoliosi, 2007). Indeed it is a phenomenon that has a close correlation with age (Rivers and Smith, 1994) because it is during childhood and adolescence that the definition of one's identity and social role represent fundamental developmental tasks that require confrontation especially with the peer group, thus becomes the

container par excellence of models to which to refer in order to define one's position in the social hierarchy and negotiate one's reputation (Emler and Reicher, 2000). It is also to gain recognition and approval from the group that the adolescent uses the body – e.g. clothing, posture, jewellery, tattoos – both as a means of expression and as a criterion for defining the “us” and the “other” (De Vita and Burgio, 2023). Specifically, female bullying has an “educational” function by teaching through violence and exclusion, the norms of “correct” femininity and group membership (De Vita and Burgio, 2023). In addition, while boys are more likely to use direct aggression, both physical and verbal (Viljoen et al., 2005, 523-524), girls use relational bullying significantly more frequently (Robson and Witenberg, 2013) by enacting behaviors such as gossiping about the victim when she is not present, making her confidences public, turning their backs on her when she approaches, using insults or nicknames to humiliate her in public, “stealing” her friends or boyfriends (Catanzaro, 2011). Indeed, this correlates with the need for approval, belonging and friendship from peers emerges forcefully (Emler and Reicher, 2000) and which characterizes adolescent girls who are searching for their identity at this stage of life. Teenagers, are so caught in a paradoxical situation in which they have to be the same as others to be accepted/but also unique to express themselves. Given this, the target of bullying is “those who differ from their peers” (Sharp and Smith, 1995, 145), and the kind of diversity that catches the attention of bullies mainly concerns the aesthetics of the body, for example, the weight (Neumark-Sztainer et al., 2002) that become the stigma domains of stereotypes and discrimination (Goffman, 1963). Stigma is not just a physical sign, but rather an attribute related to social disapproval that leads to a ‘spoiled social identity’ (Goffman, 1963). It's associated with the enforcement of social norms (Phelan et al., 2008) and it has negative consequences for the victims' well-being (Stutterheim et al., 2009) who may experience depression, anxiety and isolation.

## **2. METODOLOGY**

For this essay the researchers analysed 10 group interviews, corresponding to a sample of approximately 60 female high school students in Verona, carried out within the framework of the national research mentioned above. The tool of Web-Based Focus Groups was adopted for group interviews (Daniels et al., 2019), carried out through online meeting platforms (Zoom and Google Meet) and recorded. The duration of each Focus Group was approximately 2 hours. The participation of female students was voluntary, subject to the presentation

of the research and consent by parents.

The focus groups were verbatim transcribed and the coding process was conducted following the procedures indicated by the seven steps provided by Retrospective Constant Comparative Method (CCM) (Olson et al., 2016).

### 3. FINDINGS

Analysis of the group interviews revealed several themes characterising female bullying among which the researchers for this study highlighted: stigma and denial of recognition.

#### 3.1 Female bullying: three types of stigma

The girls interviewed state that they are bullied because of their weight, skin colour and the stigma attached to their ethnicity. Following Goffman's (1963) typology, stigmatization among female peers is thus related to: a) *the body* namely regarding standards of beauty, weight, and phenotype; b) *individual character* perceived as weak namely regarding weakness, fragility, shyness, being a "bad girl"; c) *ethnic belonging* namely regarding nationality, religion, being strangers or foreigners. It frequently occurs that these three stigmas are being attached to the same girl at the same time, and this reinforces the girls' poor body image to the point of creating conditions of fragility and isolation that are fertile ground for both 'social' aggression by peers and 'individual' self-aggressive behavior such as anorexia, bulimia, depression or even suicide.

I was bullied for a long time, for four or five years. (...) if I touched something they told me not to touch it because I had Ebola, since I was from Africa. (...) My classmates, when there was group work, always excluded me, they never touched my things, they didn't take my paper, they threw it on the ground. One of the moments that hurt me the most was when my companions took the broom and threw it at me, saying: 'Clean up, you are dirty'. (P. 2-15)<sup>1</sup>

Through stigmatization, the girls' words evoke the negative forms of recognition identified by Honneth (2002a; 2002b).

Even when I was in primary school I was teased (...) Then in fourth and fifth grade my classmates also started to tease me, so everyone teased me, just

---

<sup>1</sup>The identifying terms of the young female interviewees included in this work have been replaced by acronyms known only to the researchers. The identification code refers to the school to which the interviewee belongs (e.g. P.) and the number to the word turn assigned in the interview transcript.

because I was a bit curvy, I was a bit overweight. They were always teasing me about that. Even in middle school (...) they used to tease me and make comments like ‘look at that whale’, things like that. (M. 1-10)

### **3.2 The denial of recognition: the “elemental” forms of contempt (*Mißachtung*) among female peers**

The three negative forms corresponding to the three positive models of recognition-love-friendship, esteem-social solidarity, and rights are what Honneth calls the three elementary forms of contempt (*Mißachtung*) of the human being and his dignity, which involve the experience of humiliation (Honneth2002a; 2002b). These are: the denial of love and friendship (physical and psychological abuse), the denial of social esteem and solidarity, and the denial of the rights of the other. The narratives collected from the girls highlight how bullying moves along the negative line of misrecognition to its extreme form, contempt.

To describe bullying, I would say it is a form of humiliation in which a subject is targeted by one or more individuals who make the victim feel uncomfortable through humiliation, and, perhaps, even leading to the subject’s death if the situation escalates. (M. 2-40)

## **4. DISCUSSION AND CONCLUSION**

In the present work, the collected data are interpreted through the constructs of social stigma and recognition. The analysis (through the CCM) revealed that there are not only shadows (manipulation, competition, destructiveness) in the bullying phenomenon, but also lights(complicity, support, friendship).

### **4.1 Shadows of Adolescence Between Social Stigma and the Need for Recognition**

The main shadows emerging from the girls’ words tell of significant exposure to psychological violence, in which a key role is played by the ‘weight of words’, used by the ‘bullies’ to stigmatize, humiliate, marginalize.

Exposure to these forms of attacks generates in the target-victims the emergence or growth of negative emotions towards themselves: from guilt to wounds to self-esteem to self-loathing. The outcome of these prolonged attacks and negative perceptions of self can lead to the onset of physical and psychological forms of self-aggression and generate great suffering in them at a time of existence when everything is upside down, and everything in their existence has to be redefined (Dusi, 2024a; 2024b).

The narratives of the girls interviewed highlight how the partners are well aware of this identity, psychological and emotional fragility, and choose 'weapons' intentionally designed to destroy the victim's self-esteem and self-confidence.

#### **4.2 Lights of Adolescence Between Social Stigma and the Need for Recognition**

In adolescence, the desire to be socially accepted is especially vivid, as is very painful the rejection (Crone 2012, Pietropolli Charmet, 2018), but the stories of these girls highlight not only the suffering, but also how facing the shadows sometimes leads to the discovery of one's own value, the importance of authenticity and solidarity in peer relationships. As one young girl states: "The three key words are: 'never give up'" (P. 2- 10). The students also indicated possible ways of intervention to support the 'victims' of bullying from an empowerment perspective. To tackle bullying and the stigmatisation that results from it, it is important to promote female solidarity: 'There should be a common solidarity among women' (E.1 -77). According to their experience, this is an effective tool to counteract bullying and stigma. The interviewees report a sense of isolation and loneliness, in which adults appear to be absent. According to these girls, it is important to foster experiences that help young people discover their own worth, nurture self-esteem, and promote friendly relationships among peers.

# GIRL-TO-GIRL BULLYING IN IRISH SCHOOLS: A CALL TO INTRA-ACTION & RESPONSE-ABILITY

Vanessa Rutherford  
University College Cork

Girl-to-Girl bullying drama is high stakes and ‘unsolved’ in an Irish school context. This paper interrogates concepts of intra-action and response-ability, to consider the human materialities at play in girl-to-girl bullying. The paper will draw on examples from qualitative research with preservice and qualified teachers in Ireland, exploring the shaping of posthuman gender and ‘school bullying’ together with human agentic, matter such as place/space, objects and time, as co-constitutive processes. It will explore the key discursive-material agential intra-actions through which ‘girl’ materialize in school- space-being-mattering’s and re-mattering’s with a specific focus on skincare, skirts, sexting and swots. The paper will conclude with recommendations on how a focus on new materialism offers the potential to transform the focus and response to gender bullying in our schools. How does response-ability challenge bullying or actions that lack com-passion, feeling, caring?

intra-action, response-ability, girl-to-girl bullying

## INTRODUCTION

The last decade has witnessed an intensification of bullying discourses, which are often framed around a binary logic of protection (‘victims’ of bullying) and vilification (pathologizing ‘the bully’). It is time to challenge the traditional, essentialist psychological understandings of bullying. We must move away from deficit model of making better anti-bullying policies and support young people who are actively negotiating & challenging gendered & sexualized inequalities in school spaces/places. The Irish Health Behaviour in School-aged Children (HBSC) Study 2018 has found that 29.2% of school children in Ireland report having been bullied (29.8% of boys and 30.2% of girls). This figure has increased since 2010 (24.3%). The percentage of girls who have been bullied is higher among girls in the 12–14-year-old category (31.9%, 31.5% of 10–11-year-

olds and 27.2% of 15–17-year-olds).

And while attitudes to school are broadly stable among boys, girls become somewhat less positive about school in general, apparently because of the impact of greater emotional difficulties (Smyth, May 2024). Preliminary analysis suggests this is at least partly related to increased emotional difficulties among girls (Smyth, May 2024).

The emotional impact of being labelled bully/victim is too often passed over in the classroom setting and as a result anxiety, anger and defensiveness surface.

In Ireland, the Joint Committee on Education, Further and Higher Education, Research, Innovation and Science published its report on School Bullying and the Impact on Mental Health in 2021. The Department of Education's Action Plan on Bullying and related Anti-Bullying Procedures for Primary and Post Primary and identified it as need to be urgently audited and updated in line with current policies on child protection, wellbeing, and Relationships and Sexuality Education, and benchmarked against UNESCO's recently published recommendations on tackling bullying and cyberbullying in schools.

In the report, the Committee makes a total of 28 recommendations. Several key platforms contributed to the report on school bullying, identifying it as a major concern. SpunOut is Ireland's youth information and support platform. The SpunOut submission refers to the findings of a survey of 430 young people, (91% of whom were aged between 14 and 21), conducted in February 2021. Of the respondents who reported being bullied, 54% said it related to weight or appearance.

Jigsaw, the national centre for youth mental health, submission refers to the 2019 My World Survey 2, which was developed by Jigsaw and the University College Dublin, School of Psychology and was completed by 19,000 young people. My World Survey 2 found that 39% of adolescents in secondary school in Ireland have experienced bullying.

Rape Crisis Network Ireland (RCNI) submission refers to research they carried out on adolescents' experiences of sexual harassment. This found that adolescents reported high levels of sexual harassment within their school communities. 63% of respondents disclosed that they were subjected to unwelcome sexual comments, jokes, or gestures to or about them in the last year. 23% felt that sexual harassment within school is common, often overlooked or not adequately disciplined by school authorities. 47% stated that they would not know how to report sexual harassment within their school. 36% reported receiving no formal education pertaining to sexual harassment while at

school

The Irish Society for the Prevention of Cruelty to Children (ISPCC) submission refers to a study of 6- to 11-year-olds, 14.3% of children were identified as bullies, 18.2% were identified as victims, and 19% were identified as both bullies and victims.

In this paper, I interrogate the concept of bullying as ultimately more than an individual and intentional acting out of aggression from bully to victim. It is more than a binary bully/victim (typologies of bullies/victims). Bullying reflects the situational & socio-cultural dimensions of power along the lines of gender, class, race and sexuality. It is characterized as a messy landscape which makes navigating it incredibly difficult and challenging for adolescent girls.

### **'BULLYING' IN AN IRISH CONTEXT**

Contemporarily, the Irish Second-level Students' Union (ISSU) identifies types of bullying to include physical bullying, which involves, but is not limited to, hitting, pinching, spitting, vandalizing someone's property or belongings; verbal bullying, which can range from constant passing of comments to unrelenting verbal abuse; exclusionary bullying, which involves deliberately leaving someone out or excluding them specifically; sexual harassment; gesture bullying, which involves threatening or intimidating signs and gestures from one individual or group to another, and prejudicial bullying and racism.

O 'Moore (2014) defines cyberbullying as

...aggressive, willful behavior that is directed by an individual or group against another individual or group with the help of technological devices, primarily mobile/smartphones and the internet.

CyberSafeKids Ireland in their eight annual 'Trends and Usage Report' for 2022-2023 conclude that cyberbullying continues to be a persistent issue that children report as a concern as they navigate the online world. Almost 3 out of 4 children owned a smartphone at age 12 (74%), before they made the transition into secondary school, when ownership rose to 97% for both 12 and 13 years old. Over a quarter (26%) of younger children 8-12 report experiencing something upsetting online, with just under a third saying that they kept it to themselves. 25% of children aged 8-12 told us they had experienced one or more common cyberbullying behaviors. 12-16-year-olds, 40% of whom reported experiencing cyberbullying. Bullying peaked in primary schools at ages 11 and 12, with 28% citing one or more experiences. The numbers were much

higher for the older children but peaked at the age of 15 with 45% of children in this age group citing at least one experience of cyberbullying (CyberSafeKids – Ireland, 2023).

Some examples of bullying include exclusion from chat groups; receiving hurtful messages, threats to share ‘stuff about me’; ‘nasty comments posted about me’; ‘my photo/video posted without permission’ and ‘fake profiles used to target/scare me’ (CyberSafeKids – Ireland, 2023).

There can be no doubt that bullying, in its many guises, represents ‘a pervasive part of young people’s education in Ireland’ which impacts on students’ learning and their wellbeing (An Everyday Lesson: #ENDviolence in Schools).

At the core of the issue, are the realities of young people at school, experiencing exclusion, silence, violence and harassment that manifests in ‘ill-being’, including academic attrition, depression, self-harm, substance mis use and, in some cases, suicide. Recent international research confirms the associations between emotional wellbeing on the one hand and perceived schoolwork pressure, parent-adolescent communication, and bullying victimization (ill-being) was stronger for girls than for boys (de Looze *et. al.*, 2020).

The Irish Primary Principal’s Network (IPPN) caution

...that bullying can cause significant mental health issues including stress, anxiety, depression, psychotic episodes, and suicide as well as physical health issues including an increased risk of heart disease and other illness (Irish Parliamentary Hearings, House of the Oireachtas, 23 Aug 2021).

Barnados children’s charity warns that

...the physical psychosomatic health problems linked to bullying, including headaches, poor appetite, poor sleep, abdominal pain, dizziness, fatigue, musculoskeletal pain, sore throats, and cough and colds (Irish Parliamentary Hearings, House of the Oireachtas, 23 Aug 2021).

In April 2023, Education Minister, Norma Foley TD launched Cineáltas, an action plan on bullying, an implementation plan 2023-2027. The document is grounded in the Department’s Wellbeing Policy Statement and Framework for Practice and UNESCO’s whole education approach to preventing and addressing bullying and cyberbullying.

Cineáltas has drawn on the Wellbeing Policy Statement and Framework for Practice 2019, United Nations Educational, Scientific, and Cultural Organizations (UNESCO’s) Whole Education Approach, as well as national and

international research and best practice to develop a robust strategy that places the student at the centre of the school community and at the centre of national education strategy and policy development.

Chair of the Steering Committee, Dr Noel Purdy Director, Centre for Research in Educational Underachievement, Stranmillis University College, Belfast warns:

We have a collective responsibility as a society to prevent and address bullying behaviour in all its forms. I am also reminded of the challenge set at national level in United Nations International Children's Emergency Fund's (UNICEF) *Innocenti Report Card 7* which states that: The true measure of a nation's standing is how well it attends to its children – their health and safety, their material security, their education and socialization, and their sense of being loved, valued, and included in the families and societies into which they are born (UNICEF, 2007, p. 1).

Yet, despite the growth in policies at a macro level, bullying remains a *taboo* topic. Silences and institutional failures to tackle gendered and sexualized violence in schools endure. Unfortunately, developmental psycho-educational discourses of bullying are accepted both formally and informally. There is urgently a need to engage with how anti-bullying policies operate at the level of school practice and discourse.

### **RETHINKING GIRL TO GIRL BULLYING: LOOKING TOWARD A POST HUMAN LENS**

Posthumanism decentres the 'human' as a separate, bounded, individualistic category to situate the human in relation – with other humans and nonhumans. Cary Wolfe (2016) notes that 'posthuman theory creates new, imaginative ways of understanding relations between lives'. Posthuman approaches offer some new insights which 'extend traditional conceptions about what matters' (Taylor and Fairchild, 2020). This paper argues that post human theory provides new insights into how we see 'girl to girl bullying', intra-actions and material contexts.

Concepts of *intra-action* (Barad, 2007) and *response-ability* (Haraway, 2008, 2016) offer possibility in this discussion of 'girl to girl bullying'. The concept 'intra-action' refers to that which is simultaneously materially & discursively produced. The 'self' comes into being in relation with and through the entanglement of oneself with others, whether human, non-human or environmental. And the concept of 'response-ability' refers not to the paternalistic version or *being* responsible for another which intimates a *power-over*, rather it's a relational process, our ability to respond, to act & how we

might *learn* to be more responsive to others. The hyphen indicates the relationship between the material & the discursive, not privilege one over the other. These key concepts allow us to think about ‘becoming’ in a material-discursive rewriting of subjectivity.

The discourse ‘bullying’ operates to individualize complex gendered power relations and dynamics embedded in children’s school-based cultures. Materialities are always discursively produced and the discursive is always materially produced. This leads us to think about how discourses (*Mean/IT girl*, *SWOT*) function and how they materialize? How do they work? Drawing on the work of *Karan Barad*, and other ‘new materialists’ or ‘material feminists’ – it’s clear that girls ‘intra-action’ with other bodies, human and non-human, produce subjectivities and performative enactments in school-based cultures.

The shaping of posthuman gender reflects a fashioning ‘...that brings the material back in without rejecting the legitimate insights of the linguistic turn’ (Hekman, *The Material of Knowledge*, 7). It is a set of linkages and connections with other bodies and other things. Agency is an enactment, rather than something than someone possesses. Therefore, agential realism ascribes agency to matter as well.

Agential realism creates dynamic and shifting entanglements. It

...provides an understanding of the role of human and non-human, material and discursive, and natural and cultural factors in scientific and other socio-material practices (Barad, 2007, p. 23).

Agential realism provides for the intersection of real and socially constructed, co-constitutive processes that include human, agentic, matter (place/space, objects and time) hold relevance. The term diffraction, referring to patterns of difference, ocean waves passing through an opening & spread differently offers possibilities within discourse around bullying. Fundamentally, school bullying is shaped by entanglements of discourses, places, materialities, embodied practices that are all inter-connected within the school landscape. Culture, class, race/ethnicity and other axes of identity & power and (gender-) normative behaviors regarding friendship, conflict, and bullying all inscribe the everyday and process heterosexual identity construction.

## **WHAT ARE THE KEY DISCURSIVE-MATERIAL AGENTIAL INTRA-ACTIONS THROUGH WHICH 'GIRL' MATERIALIZES IN SCHOOL- SPACE-BEING-MATTERING'S AND RE-MATTERING'S?**

Primary data collection was drawn from research where the key aim, was to examine the impact of the University College Cork, Professional Masters of Education programme and master's level qualification on the development of pre-service post-primary teachers. Together with data that emerged from a 'body image' research module on an undergraduate programme qualification on the development of pre-service post-primary teachers. Overall, the research sought to understand the experiences and perceptions of both the graduates of the programme and the school principals of the schools in which students undertake their professional placement component and engage with their primary research projects. Ethics are guided by the School of Education Research Ethics (SERE), UCC. Themes that intersect with bullying appear sprinkled throughout many of the transcripts. Like Braun, I draw on this rich yet 'accidental data' (2011, p. 276). The analyses point to five main themes that specifically frame this paper – these themes resonate with me and hold 'an affective force' (McLure, 2013). The themes are are 'mean girl'/'kind girl' discourse; swot; skincare; skirts; social media and sexting.

### **Swots – 'mean girl'/'kind girl' Discourse**

Two conflicting discourses of girlhood emerge: good girls are kind, should be friends as per the traditional school ethos. The 'mean girl' discourse (Ringrose, 2006) is strikingly at odds with the 'nice girl' narratives. Rather girls are naturally bitchy and mean. This discourse offers a complex and confusing set of ideals for girls to negotiate.

Pre-Service Teachers (PSTs) touch on concepts on 'bitchiness' & 'meanness' as expected counterpoints to female 'niceness'.

My all-girl School Placement (SP) environment was naturally 'bitchy' and very different to my 'all-boys' school placement experience (Eliza, 2024).

Girls are sneaky... they know all about you and then use the information against you when they need to (Maud, 2024).

Mean girl or secondary school attitude (Eliza, 2024).

Meanness is intricately entangled in performing normative subject position of girl. The mean -nice binary within femininity is certainly evident and powerful

but it leads us to question the social and cultural expectations of *niceness* at all costs?

### **SWOT**

A 'swot' refers to a person who studies very hard and is not interested in other things (Collins Dictionary). To label a classmate or colleague a SWOT serves to subjectify into SWOT position. This is a form of policing.

Data shows the negotiation of power hierarchies among girls that tend not to be categorized as bullying and are passed over in the classroom and playground. However, they illustrate how competition emerges amongst girls. For example, a PST tells me

Labels are seen quite frequently in school. What I have noticed, in an all-girls school is that students will not call the students a name to their face, but they will say it to their friends subtly in the class and laugh about it. Often the cliquy groups frown upon people answering questions in class or studying as it is seen as 'uncool'.

This would happen a lot in my fourth year class, the cliquy group in the class would always make comments about the quieter girls answering or trying in the class, for example, 'oh here she goes again', but they would not really say it to the other student, instead they would say it amongst themselves, but just loud enough so the other student would hear and know that it is about them (Lily, 2024).

The PST continues, it

...seems to be a trend in general that studying, doing your homework and trying to do well at school is laughed at. I have seen it myself in my own...classes, that students who are in the 'popular group' actually lie about how much study they do so as not to be labelled a 'SWOT', but then they do well in their tests, and they too keep this a secret, or play it down to their friends, when it is something that they should be proud of (Lily, 2024).

... the students who are in the 'popular group' and who are also smart and ambitious at school try to downplay it, which is quite sad... (Lily, 2024).

The vignettes show girls as socially sanctioned to express meanness. It's subtle and ambiguous. These typical modes of intersubjectivity, of negotiated power hierarchies among girls are rarely 'called out' as bullying. There is little questioning of these practices unless they transgress beyond the classroom.

## Skincare

Skincare is central to the intra-active process through which the bullying phenomena around gender and sexuality materialize. Social media influencers play a huge role in the promotion of specific skincare trends and skincare routines. Snap Chat, Tik Tok, Instagram, WhatsApp are listed as the most used social media amongst sixty-one Irish students (all-girls school), aged 12-16 years old' (Lily, 2024). Cybersafe confirms that girls used image-focused apps more than boys. These include Instagram (13%) and BeReal (9%)' (Cybersafekids, 2023). These represent forms of image management for girls who are especially pertinent to the demands of post-feminist culture, in which women's self-esteem and confidence are closely linked with physical attractiveness (Yvonne Tasker and Diane Negra, 2007). Against this backdrop, skincare cannot be dismissed in importance as material, dynamic force agents in contemporary feminist research.

PST Lily notes

I have noticed the popularity of tan, nails and make-up in school since I started in September. From about second year up, quite a lot of students come into school every day with a full face of makeup: foundation, eye-shadow, lipstick, fake eyelashes (Lily, 2024).

Another PST comments:

The girls wear tan at all costs... [they often] arrive in blotchy tan instead of tights (Eliza, 2024).

And,

There is huge competition between them [the girls who are] ... setting the trends...There are certain students who I have never seen without a full face of make-up and tan in school...it seems there has been a standard created in the school and students now feel pressure to conform to this standard. Certain students always conform to these standards, they always have a full face of makeup on, tan, eyelash extensions, nails and hair is always perfectly done (Lily, 2024).

It seems that it is normative for girls to position themselves and others in sexual hierarchies. What is significant is how sexual competition and shaming emerges among girls. This invariably creates conditions where bullying flourishes.

## Skirts

The skirt has agentic force, intra – acting with the body in spacetime matters. In Ireland the ‘skirt’ was historically closely linked to class, race and culturally specific notions of feminine sexual respectability. In 1926 readers of *Irish Monthly* were warned that ‘modern girls’ needed ‘refinement’, given their unashamed ‘vulgarity’,

The modern girl (...) smokes like a chimney (...) She talks loudly (...) she speaks without the slightest reserve (...) she flings herself into the chair and throws one knee over the other, which, owing to the brevity of the skirt, is neither aesthetic nor edifying. She goes into a public restaurant and finishes up with ‘something’ to wash down her ‘smoke’ (...) She gloats over sensational, emotional, erotic novels, of which...after reading them, you had better go and wash yourself seven times in the Jordan (...) She is either incapable or unwilling to help her mother in the management of the house (...) The question of female costume has reached its nadir in women’s bathing and athletic dress, which is simply revolting, a gross outrage of decent society. It is paganism, pure and simple, naked and unashamed, reminding us of Eve and her figleaves! (Rutherford, 2018).

A history of control over girls and women’s bodies is represented in an apparatus of being *ladylike*. Clothing and uniform specifically were powerfully enforced in schools via rules that positioned girls in specific ways along gender, class and sexualised expectations of respectability (Rutherford, 2015).

School skirts are a material reality that intersect with historical dualisms. Contemporarily, the skirt presents students with an identity dilemma: ‘some students don’t bother changing their skirt... some roll them up, others won’t’ (Maud, 2024). Whilst, ‘some girls have a fear of exposing their skin, for fear of negative bodily comment rejection’ (Maud, 2024).

Another PSTs notes that

They [the girls] are hyper-aware of their image... competition between them around whose skirt is the shortest...who is setting the trend...who are the cool girls’...The length of a student’s skirt in a way can indicate what ‘class’ they fall into, in the social ranks of the school

Skirts and skirt length are an issue in school. Students are constantly rolling up their skirts and making them extremely short and because there is a slit in the skirt, it gives the illusion of being even shorter

Even though teachers are constantly policing the issue of skirts being very short, students continue to roll them up... (Lily, 2024).

There can be no doubt that skirts represent the ultimate material object that can be stylized and embedded with meanings for girls in schools. Skirts implicate significant agential force upon the wearer. Its location transforms a girl's body. Skirts cannot be dismissed in importance as material, dynamic force agents in feminist research on girl-to-girl bullying.

### **Social Media & Sexting**

Digitally circulated media, including sexting or the exchanging of nude, semi-nude, or sexually suggestive images and texts of and between peers via mobile phones or on social network sites, is a normalized practice in peer cultures. It offers a space that can lead to bullying for some individuals. School Principal, James notes that because of social media 'the problems now that we are dealing with are off -the-scale compared to what they were... (SP, James, September 2023).

Cybersafe kids illustrate that girls posted videos of themselves online more than boys and this became even more pronounced for 12-16 year olds, with 1 in 2 girls reporting that they had posted. When online girls were more likely than boys to indicate negative feelings, including "jealous of others", "afraid", "anxious", "inadequate", "like I'm missing out" (Beresford et al., 2023).

'Harmful content can sometimes be distributed in large messaging groups and once seen by group members, it can't be unseen' (Beresford et al., 2023). Snap Chat, for example, represents a potential weapon to spread rumors quickly and does not involve face-to-face confrontation. It provides a space for ambiguous acts such as tagging, posting unflattering photos, and posting photos at an event from which somebody had been excluded. The features of such as defriending, blocking, emoticons, tagging, sharing and strike rates are all designed to be ambiguous.

Online spaces represent sites of control, surveillance and social policing by and among young people. Disrupting control and power via an emphasis on digital sexual ethics & rights to one's body are necessary to reduce risk and harm (Setty, 2019). As one School Principal notes:

I just think our younger generations have had such wonderful exposures that we haven't had but equally then they will see far greater knocks because of the speed of the What's App, the speed of the social media...they are not prepared sometimes for the knock that can come and, while you can't prepare them for every incident, maybe some [resilience] awareness raising [is what is needed] (SP, Edith, November 2023).

## **A CALL TO INTRA-ACTION**

This paper makes a case for a focus on new materialism as it offers the potential to transform the focus and response to gender bullying in our schools. As teacher educators, we need to expand our research in profound ways that revalues matter as well as discourse. We need to explore how these concepts change the analysis of bullying, a critical educational model. Bullying phenomena constitutes more than discourse rather incorporates powerful agentic forces that include skincare or skirt, social media, classrooms, school corridors, school bathrooms, school playgrounds – words, silences, texts, snaps, sounds, smells and feelings, they ALL matter. These concepts are intricately overlapping and co constitutive. Bullying within this frame can be seen as emerging as we materialize it – discursive and material agents intra-act in *space-time- matterings*.

If we shift the focus and show how the individual, the human agent is only one part of the bullying drama. We move away from the ‘conscious, willful human master’ towards a broader landscape that combines *intra-acting* material and ‘discursive actants’. We are materializations entangled in other materializations; we happen in our mattering. So, the agentic force of skirts, skincare, tan, make-up, lashes, all need to be taken into consideration in understanding instances of sexual shaming and positioning of girls. If we attend to the intra-actions of non-human agents, materialities and discourses we can create awareness around ethics necessary to expose and deal with bullying phenomenon and bullying events in schools.

## **A CALL TO ‘RESPONSE-ABILITY’**

This is not a call to the paternalistic version of *being* responsible for another, intimates a *power-over*, rather it’s a relational process, our ability to respond, to act and how we might learn, to care, to be more responsive to others. As Haraway puts it, it is in getting to know detailed relationships that the ability to respond emerges (Haraway, 2016).

Response-ability as a concept is seen as being potentiated by sensibilities and practices such as attentiveness, politeness and curiosity, rendering each other capable, openness to encounter, and iteration or *on-going-ness* (Bozalek, 2023). This concept allows us the potential to address the intersectional complexities at play in girl-to-girl bullying. This type of bullying cannot be in a specific individual, nor a specific event, place or time. It is not straightforward or easily apprehended. We must attend to the intra-actions of non-human agents,

materialities and discourses to produce what becomes known as caring and ethical responses to bullying phenomenon and episodes.

A ‘whole education’ approach is needed (UNESCO, 2023). It is incumbent upon policymakers, initial teacher education (ITE) providers and schools to develop their understandings of how issues of gender and sexual violence continue to underpin school cultures. So, how could compassion, feeling, caring pedagogies and ethical practices challenge and deconstruct bullying and regulative discourses and recognize the material forces that intra-act with the discourse?

Seeing caring pedagogies as intra-active (Barad, 2007) or intra- woven ensures in Haraway’s term ‘multispecies flourishing’ (2026) and ultimately transformative classroom experiences. By mapping relationality rather than a binary, we can expose the complex entanglements at play in G2G bullying. We begin to understand force relations differently and move from a deficit model to support young people, and preservice teachers to challenge gender and sexual inequalities.

# A GENDER PERSPECTIVE ON BULLYING. FINDINGS FROM A NATIONAL SURVEY

Irene D. M. Scierri<sup>a</sup>

Federico Batini<sup>b</sup>

<sup>a</sup>University of Florence; <sup>b</sup>University of Perugia

Bullying represents a global issue and a fundamental violation of human rights. UNESCO estimates that one in three students is a victim of bullying. The prevalence of this phenomenon highlights the importance of continuing to study its modes of expression and strategies for counteraction. While male bullying has been extensively researched, female bullying has received less attention, possibly because it is less visible and, in some respects, more complex than male bullying, involving intricate, cross-sectional, and multidimensional interactions. To gain a better understanding of the gender dynamics underlying bullying and to deepen the knowledge of female bullying, a national project was conducted, involving multidisciplinary research units from six Italian universities and adopting a mixed-method research design. The purpose of this contribution is to present the results of the quantitative study regarding the assessment of the extent and characteristics of bullying across the national territory, with an exploration of potential gender differences in the interpretation of the phenomenon.

female bullying; gender perspective; secondary school; bully survey

## INTRODUCTION

Bullying, traditionally defined as unwanted aggressive behaviour, repeated over time and characterised by a real or perceived power imbalance between perpetrators and victims (Olweus, 1996), is both a global issue and a violation of human rights (Greene, 2006).

According to UNESCO (2019), one in three students worldwide experiences bullying. In Italy, estimates suggest that the prevalence of bullying ranges from 5% to 25%, depending on the measurement tools, population, cut-off criteria, and timeframes considered, while cyberbullying affects between 5% and 19% of the adolescent population (Menesini et al., 2017). The ISTAT survey (2015)

indicates that 50% of adolescents aged 11 to 17 report experiencing offensive or violent behaviour from their peers, with 19.8% being recurrent victims (at least once a month). The third monitoring report on bullying and cyberbullying in Italian schools (Elisa Platform, for the academic year 2022/23<sup>1</sup>) highlights an increasing trend in systematic face-to-face bullying, with 25.3% of students reporting victimisation (21% occasionally, 4.3% systematically) and 7.9% experiencing cyberbullying (6.6% occasionally, 1.3% systematically).

These figures emphasise the importance of ongoing research into the modes of expression and strategies for preventing and addressing bullying. While male bullying has been extensively examined, female bullying remains less visible and, in some aspects, more complex, involving relational, cross-sectional, and multidimensional interactions (De Vita, 2021; De Vita & Burgio, 2023; Owens et al., 2000; Varjas et al., 2008).

The literature suggests that female bullying is primarily relational (Espelage et al., 2004), predominantly intra-gender (Duncan, 1999; Mavin et al., 2014), and has significant psychological consequences, including depression, anxiety, and an increased risk of self-harm and suicidality (Baier et al., 2019; Hay & Meldrum, 2010; Kim et al., 2019).

To better understand the gender dynamics underlying bullying and to deepen the knowledge of female bullying, a national project was conducted. This paper presents the quantitative findings, focusing on the prevalence and characteristics of bullying in Italy and offering insights into gender-specific differences in the interpretation of this phenomenon.

## 1. NATIONAL RESEARCH PROJECT

The national survey was conducted between 2020 and 2022, involving multidisciplinary research units from six Italian universities<sup>2</sup>. The research had three main objectives: to achieve a more in-depth understanding of female bullying; to investigate the incidence of female bullying compared to male bullying in terms of frequency and intensity in Italy; and to develop intervention and prevention strategies in the participating schools, alongside launching an awareness campaign (Batini et al., 2023).

---

<sup>1</sup> <https://www.piattaformaelisa.it/risultati-monitoraggio-a-s-2022-2023>

<sup>2</sup> University of Verona (A. De Vita, F. Vittori, P. Dusi, M.G. Landuzzi, L. Ghirrotto), University of Enna "Kore" (G. Burgio, S.R. Emmanuele, S. Peroni, A. Di Lisi), University of Perugia (F. Batini, I.D.M. Scierri), University of Genoa (A. Traverso, M.G. Gibellini), University of Foggia (A.G. Lopez, R. Caso, A. Altamura, A. Disalvo), University of Milano-Bicocca (S. Magaraggia, M.G. Gambardella, B. Fiore, A. Dordoni).

The quantitative data collection aimed to achieve the following objectives: to identify the prevalence of bullying at the national level and its characteristics; to explore gender differences related to the phenomenon; to compare the various forms and specificities of bullying across different urban contexts, identifying significant differences between the cities studied; to contribute, together with the qualitative part, to understanding the perceptions and experiences of students regarding this phenomenon.

A mixed-methods research design was employed to achieve these objectives. The target population consisted of students attending the first two years of upper secondary school in the cities of Arezzo, Foggia, Palermo, Perugia, and Verona, selected as sample cities. The sampling strategy was non-probabilistic, and the sample included girls and boys who, after the schools' preliminary agreement to participate in the project, volunteered to complete the questionnaire.

For the quantitative part of the research, the *Bullying Survey* questionnaire (Swearer, 2001) was used, involving 2,481 students with a mean age of 14.8 years ( $SD = 0.73$ ). Of the participants, 64.3% were *female*, 35.0% were *male*, and 0.7% identified as *other*. Of these students, 44.0% were in their first year of secondary school, while 56.0% were in their second year.

## **2. RESULTS**

### **2.1. Prevalence of School Bullying**

The first question in each of the initial three sections of the questionnaire asked participants whether they had been victims, bystanders, or perpetrators of bullying. In response to the question, *Have you been a victim of bullying in the last 12 months?*, 7.4% of participants answered Yes.

To examine gender differences in bullying, a gender-based analysis was conducted: 8.6% of girls identified as victims of bullying, compared to 4.4% of boys ( $\chi^2(1) = 15.075$ ,  $p < 0.001$ ,  $V = 0.078$ ).

Regarding the role of bystanders, 26.6% of the sample reported witnessing another student being bullied, with no significant gender differences.

In the section focused on perpetrators of bullying, 2.8% of participants admitted to having bullied others, again with no statistically significant differences between genders. However, a slightly higher percentage of boys identified as perpetrators compared to girls (3.2% vs. 2.6%).

At the end of the questionnaire, seven additional items were included to

describe different types of bullying behaviours. Respondents were asked to indicate how often they had experienced these acts over the past 12 months. These questions provided more detailed insights beyond the general query, *Have you been a victim of bullying in the last 12 months?*, and allowed for more specific responses.

A combined analysis of the responses enabled the calculation of the prevalence of systematic bullying (defined as bullying experienced frequently over a year), which was found to be 8.4% (6.1% for boys and 9.6% for girls) ( $\chi^2(1) = 9.172$ ,  $p = 0.002$ ,  $V = 0.061$ ). Although these percentages are not substantially higher than those of participants who explicitly identified as victims, they remain notably greater.

In addition to assessing systematic bullying, the items also allowed for the calculation of occasional bullying, defined as infrequent but still present occurrences, which affected 45.3% of respondents (44.6% of boys and 45.7% of girls) ( $\chi^2(1) = 0.270$ ,  $p = 0.603$ ,  $V = 0.010$ ).

Regarding the frequency of bullying incidents, victims most commonly reported experiencing them *Once or more times a month*. Girls reported a higher frequency of victimisation compared to boys, both as victims (35.0% of girls vs. 10.5% of boys reported being bullied once or more times a week) and as bystanders (19.0% of girls vs. 9.1% of boys reported witnessing bullying incidents multiple times a day).

## **2.2. Characteristics of Bullying and Gender Differences**

Regarding the locations where bullying incidents occur, it is noteworthy that the most frequently mentioned physical space for such episodes is the classroom (67.4%). However, virtual spaces (cyberbullying) surpass physical spaces, with 76.6% of respondents reporting online bullying. No significant gender differences were found in relation to the locations of bullying.

Concerning the perpetrators, bullying is predominantly carried out by peers from the same school year (Fig. 1).

A gender-based analysis reveals that bullying is primarily an intra-gender phenomenon: boys tend to bully male peers, while girls are mostly victimised by other girls. However, a substantial proportion of girls also report being targeted by boys (Fig. 2).

Verbal and relational bullying are the most common forms, whereas physical bullying is the least frequent (Fig. 3).

Verbal and relational forms are more prevalent among girls (Fig. 4). The only

form reported more frequently by boys is pranking (40.7% vs. 7.2% among girls).

Fig. 1. Perpetrators of Bullying (Aggregate Responses from Victims, Bystanders, and Perpetrators;

Percentage Data; n = 911)

Fig. 2. Comparison Between Genders in Identifying Perpetrators of Bullying (Percentage Data; Female, n = 137; Male, n = 38; \*p <.05, \*\*p <.01, \*\*\*p <.001)

Fig. 3. Forms of Bullying Experienced as Victims (Percentage Data; n = 180)

Fig. 4. Comparison Between Genders in Verbal and Relational Form of Bullying Experienced as Victims (Percentage Data; Female, n = 137; Male, n = 38; \*\*p < .01, \*\*\*p < .001)

In terms of the reasons attributed to bullying, as reported by victims, bystanders, and perpetrators, the three most frequently cited reasons are: *Being clumsy*, *The way of dressing*, and *The way of speaking*. Certain reasons are reported more frequently by girls, specifically: *They think I am fat* (48.2% vs. 23.7% for boys), *Because of the clothes I wear* (51.1% vs. 28.9%), and *Because I am different* (48.9% vs. 23.7%).

Another critical aspect to highlight is the impact of bullying. Overall, the most frequently reported consequence is *Feeling sad*, with female victims and bystanders perceiving the negative consequences more intensely than their male counterparts. For instance, 75.1% of female victims reported *Feeling sad*, compared to 31.6% of male victims.

With regard to the school's response, only 26.5% of victims reported that teachers and school staff were aware of the bullying incidents, and 25.4% believed that the school staff handled the situation inadequately.

Finally, regarding attitudes towards bullying, the majority of respondents condemn bullying. However, this attitude is more pronounced among girls. Specifically, girls show a greater capacity for empathy towards bullying victims compared to boys (e.g., *I feel sorry for the victims of bullying*, 96.4% vs 92.8%; *Bullies harm others*, 92.1% vs 89.2%). Girls are also more likely to recognise bullying as a problem (88.8% vs 82.8%) and tend to disapprove of bullies more than boys (93.7% vs 90.9%). On the other hand, boys demonstrate a greater understanding of the motivations behind bullying behaviour compared to girls (31.6% vs 24.7%).

### 3. DISCUSSIONS

The data collected allow for the achievement of the study's objectives and contribute to expanding knowledge on the prevalence and characteristics of bullying phenomena in the national context. First, the analysis reveals an incidence of 8.4% for systematic bullying (6.1% among boys and 9.6% among girls) and 45.3% for occasional bullying (44.6% among boys and 45.7% among girls). The characteristics of bullying acts confirm findings established in the literature, particularly with regard to bullying:

- It primarily occurs in classrooms and online;
- It takes place within peer groups;
- It is predominantly an intra-gender phenomenon;
- It manifests mainly verbally and in relational dynamics;
- It remains a phenomenon that is still "invisible" to the adults involved.

Regarding gender differences in bullying, the research has revealed several notable disparities, including:

- Girls more frequently identify as victims of bullying;
- Girls report a higher frequency of bullying acts, both as victims and as bystanders;
- Girls report experiencing verbal and relational bullying to a greater extent than boys;
- “Pranking” is the only form of bullying more commonly reported among boys;
- Reasons linked to aesthetic aspects are more prevalent among girls (e.g., being overweight or clothing);
- Girls, both as victims and as bystanders, perceive the negative consequences of bullying more strongly than boys;
- Girls show greater empathy and concern for victims of bullying and are more disapproving of bullies. Boys, on the other hand, tend to understand and tolerate bullies to a greater extent than girls.

When interpreting the results, the self-report nature of the questionnaire must be considered, highlighting the perceptual nature of the bullying acts examined here. In this regard, particularly among boys, there may be a lower tendency to recognise themselves as victims, rather than a lower incidence of the phenomenon. Conversely, girls may have a greater ability to “see” and recognise bullying in its various forms, while boys may tend to minimise the acts as simple “pranks” and recognise bullying primarily as physical dominance.

## **CONCLUSIONS**

Despite certain limitations, primarily stemming from the non-probabilistic nature of the sample, the study offers significant contributions to bullying research, with a particular focus on the gendered aspects of the phenomenon. It reaffirms the relevance of bullying and underscores the distinct perspectives of girls, highlighting the importance of adopting a gender-sensitive approach in both studying and addressing the issue. In light of these insights into the dynamics of bullying, including a gendered perspective, the development of co-constructed, shared prevention and intervention strategies is recommended. These strategies should incorporate the viewpoints of all stakeholders and foster a safer, more inclusive school environment for everyone.

# BRIDGING GENDER GAPS IN STEM EMPLOYMENT: INSIGHTS FROM LA SAPIENZA UNIVERSITY GRADUATES

Giulio Lucentini<sup>a</sup>

Astrid Favela<sup>b</sup>

Valeria Bruno<sup>b</sup>

<sup>a</sup>Università degli Studi di Macerata; <sup>b</sup>Sapienza Università di Roma

The research project at Sapienza University of Rome, conducted by the UNI.CO research group, investigates the transition of STEM graduates into the workforce, integrating administrative university career data and compulsory communications from the Ministry of Labor. This innovative approach, diverging from traditional interview-based research, provides a diachronic view of the entire target population's employment contracts. Focusing on STEM disciplines' crucial role in contemporary society's technological and socio-economic advancements, the study aims to evaluate the alignment and impact of STEM education on job market demands. The target population includes approximately 70,000 graduates from 2008 to 2019, analyzed for contract types, professional qualifications, and employment duration. The research also explores the effect of employment during university studies on academic experience and subsequent job trajectories. Additionally, it incorporates an analysis of gender disparities, aiming to uncover potential differences in the career outcomes of male and female graduates, addressing the gender gap as a crucial factor in employability and labor market integration. Expected results aim to offer insights into improving STEM graduates' employability, addressing the mismatch between academic achievements and labor market valorization, thus contributing to educational and employment policy formulation

STEM; Workforce transition; Employment; Gender gap

## INTRODUCTION

This work, carried out by the research group of the *Laboratorio sulla Transizione al Lavoro*, is part of the research stream of the Uni.Co. group at Sapienza University of Rome. For over a decade, this group has developed a research model on labor market transition processes based on the integration of

university administrative data on academic careers and data from the *Comunicazioni Obbligatorie* (mandatory notifications) of the Ministry of Labor.

The Uni.Co. model relies on the integration of selected information from databases on student careers and mandatory notifications. This integration involves a complex process of data cleaning and anonymization, resulting in the construction of two matrices for analysis: the “contracts” matrix, which catalogs and analyzes the various types of employment contracts, considering aspects such as duration, type (subordinate, quasi-subordinate, etc.), and employment sector; and the “graduates” matrix, which collects demographic data, academic paths, and employment outcomes. These matrices provide a comprehensive and detailed view of employment dynamics and contractual characteristics, highlighting trends over time and differences in labor market transition pathways among different groups of graduates.

However, some limitations of the adopted approach are worth noting. The main limitation is that the employment data only cover subordinate and quasi-subordinate work. Consequently, data on self-employment, freelance work, scholarships, research grants, and employment abroad (if contracts are not signed in Italy) are excluded from our analysis.

In this specific study, we aim to focus on the analysis of gender differences, particularly within STEM disciplines. The choice to emphasize STEM fields stems from the persistent gender disparities observed in these areas, both in terms of academic enrollment and subsequent employment opportunities. By leveraging the Uni.Co. model, we will examine how these disparities manifest in the transition to the labor market, taking into account key variables such as contract type, employment sector, and time to job placement.

Our analysis will pay special attention to identifying patterns that highlight the challenges faced by women in STEM, including potential barriers to accessing stable and high-quality employment. Additionally, we will explore whether certain academic and demographic factors can help mitigate these disparities or, conversely, exacerbate them. This gender-focused lens allows us to contribute to the broader debate on how to promote more equitable access to and outcomes within the labor market for graduates in traditionally male-dominated fields.

## **1. UNI.CO POPULATION AND TARGET POPULATION**

Our research focuses on graduates from STEM (Science, Technology, Engineering, and Mathematics) degree programs at Sapienza University. The

identification of STEM degree programs was based on the classifications provided by Sapienza’s INFOSTUD system.

Graduates in STEM disciplines amount to 60,625 individuals, of which 31,960 completed bachelor’s degrees, 22,407 completed master’s degrees, and 6,285 completed single-cycle degrees. The gender distribution, presented in Table 2, reveals a shift in representation: women, who constitute 61% of the entire graduate population, account for only 45% of STEM graduates, while men increase their representation from 39% to 55%.

Sapienza University maintains the grouping of degree programs into faculties, and STEM degree programs are offered in 7 out of the university’s 11 faculties (Table 3). These programs are predominantly concentrated in four faculties, which account for 96.8% of all STEM graduates.

For the purpose of analyzing labor market transition pathways, we have decided to exclude bachelor’s degree graduates. This is because their transition to the labor market is significantly influenced by whether they continue their studies, a factor that is not fully traceable at present. There is a risk of classifying as unemployed those individuals who continue their education at institutions outside Sapienza.

The target population of this study, therefore, consists of all Sapienza University graduates who have obtained a Master’s or single-cycle degree in STEM disciplines under the 509 and 270 academic regulations. This population comprises 28,665 graduates.

Figure 1 – Gender Distribution of STEM Graduates

## **2. EMPLOYMENT INDEX AND COHERENCE INDEX**

To evaluate the labor market transition of master's degree graduates, we used two indicators. The first, the employment index, calculates the percentage of working days net of overlaps within the observed period. This indicator allows for the comparison of individuals observed over very different timeframes by standardizing the measurement. The second indicator, the coherence index, calculates the number of working days aligned with the field of study of the master's degree, relative to the observed period.

The data analysis highlights a more favorable transition for STEM graduates. The average employment index for STEM graduates is nine points higher than that of graduates from other fields, while the coherence index is a significant 24 points higher. The median employment index for STEM graduates exceeds that of non-STEM graduates by 12 points, while the median coherence index for non-STEM graduates is 0 compared to 53 for STEM graduates.

A different trend is observed when examining the modal values. For the employment index, the mode among non-STEM graduates is 100, compared to 98 for STEM graduates. However, when it comes to the coherence index, the mode for non-STEM graduates is 0, while for STEM graduates, it reaches 100.

In the STEM field, male graduates with grades between 90 and 99 show the highest employment index (46.7%) in the top range of master's graduates working 67–100% of the time. Female graduates with grades between 80 and 89 follow closely with 45.4%.

Outside of STEM programs, the highest employment percentages in the top range are observed among male graduates with grades between 90 and 99 and 100, at 46.7% and 44.0%, respectively. Female graduates with grades of 100 reach 36.5% in the top employment range.

In STEM programs, male graduates with a high school diploma grade of 100/100 exhibit the highest percentage in the high coherence range, at 19.4%, while female graduates with the same grade show 14.4%.

In non-STEM fields, the high coherence range is also led by male graduates with a diploma grade of 100, at 7.8%, whereas female graduates with the same grade achieve 5.6% in the high coherence range.

Overall, in STEM programs, both the employment and coherence indices tend to increase with higher grades in both diploma and degree, especially among male graduates.

Table 1 – Sapienza Master’s Graduates 2008-2018: Comparison by Categories Between Coherence Index and Degree Grade

Degree Grade	Employment Index 67-100%		Coherence Index 67-100%	
	Female	Male	Female	Male
Up to 95	29,2%	40,1%	6,7%	11,5%
96-104	30,5%	41,8%	9,1%	14,1%
105-109	30,2%	43,0%	10,2%	16,0%
110	28,6%	39,7%	10,3%	16,2

### Employment Index

Among graduates with a degree grade of 110, the percentage in the high employment range (34–66%) is 37% for both STEM and non-STEM programs. This stable result does not reflect an increase with higher grades.

Graduates with grades from 105 to 109 and 96 to 104 in STEM programs show a higher percentage in the high employment range, at 44% and 45%, respectively. This highlights that a high grade is generally associated with better labor market integration in STEM fields.

### Coherence Index

Graduates with grades from 96 to 104 in STEM programs achieve 17% in the high coherence range, the highest among the categories, indicating that an excellent grade can be associated with greater alignment between studies and employment.

Despite high grades, graduates with a grade of 110 in STEM programs reach only 15% in the high coherence range. This result is slightly lower than those with slightly lower grades (96–104 and 105–109), suggesting that achieving the highest grade does not necessarily guarantee the best match between education and employment.

We can observe that, despite higher grades, there is no consistent increase in either the employment or coherence indices for the highest grades, particularly for a grade of 110.

The maintenance of similar or lower percentages of coherence and employment for the highest grades may reflect market dynamics or sector-specific characteristics that do not exclusively value academic excellence but instead require additional skills or experiences.

Table 2 – Sapienza Master’s Graduates 2008-2018: Comparison by Categories Between Employment Index and Diploma Grade

Diploma Grade	Employment Index 67-100%		Coherence Index 67-100%	
	Female	Male	Female	Male
Only 60/100	20,8%	27,1%	3,7%	6,9%
61-69	22,1%	31,6%	4,7%	9,7%
70-79	25,9%	39,1%	7,4%	13,8%
80-89	26,2%	41,8%	9,2%	16,3%
90-99	31,3%	44,5%	11,3%	17,4%
Only 100/100	32,3%	42,3%	11,9%	18,0%

In the STEM field, male graduates with diploma grades between 90 and 99 show the highest employment index (46.7%) in the top range of master’s graduates working 67–100% of the time. Female graduates with grades between 80 and 89 follow with 45.4%. This indicates that men with higher diploma grades tend to achieve better employment outcomes in STEM fields, while women with slightly lower grades also demonstrate strong results in the same context.

Outside STEM programs, the highest employment percentages in the top range are observed among male graduates with grades between 90 and 99 and 100, at 46.7% and 44.0%, respectively. Female graduates with a grade of 100 reach 36.5% in the high employment range, showing a lower rate compared to their male counterparts.

When it comes to coherence between education and employment, male graduates in STEM programs with a diploma grade of 100/100 exhibit the highest percentage in the high coherence range, at 19.4%, while female graduates with the same grade reach 14.4%. This indicates a gender disparity in how well academic backgrounds align with job roles, even at the highest diploma grades. In non-STEM fields, the high coherence range also sees male graduates with a diploma grade of 100 in the lead, at 7.8%, compared to female graduates with the same grade, who achieve 5.6%. This suggests that coherence between studies and employment is generally lower outside STEM fields, but the gender gap persists in both areas.

### 3. CONCLUSION

The analysis presented highlights persistent gender differences in both employment and coherence indices among Sapienza University master's graduates, particularly in STEM fields. Male graduates consistently show higher percentages in both employment and coherence indices across various grade categories, while female graduates demonstrate lower outcomes despite comparable academic performance. These disparities point to systemic issues that go beyond individual achievements, suggesting the influence of structural barriers and market dynamics that differentially affect men and women in the transition from education to employment.

In STEM fields, male graduates with high grades, especially in diploma scores, achieve better alignment between their studies and employment, as well as higher employment rates in the top range. Conversely, female graduates, even with similarly high grades, often face more challenges in achieving the same levels of employment and coherence. These findings reflect broader societal patterns that underscore the need for targeted interventions to bridge gender gaps, particularly in fields traditionally dominated by men.

It is important to emphasize that this study is part of a broader effort to shed light on gender disparities among university graduates in Italy. While the current project focuses on Sapienza University, it represents only a starting point. In the near future, this initiative will expand to include additional regions, enabling a more comprehensive understanding of the gender dynamics affecting graduates across the country.

By incorporating data from diverse geographic and institutional contexts, future studies will provide a richer and more nuanced picture of the factors contributing to gender differences in education-to-employment transitions. This expansion will also help identify best practices and inform policies aimed at promoting equity and inclusion in the labor market, ultimately fostering a more just and balanced society.

Through this ongoing research, we aim to contribute to the academic and public discourse on gender disparities, highlighting the importance of addressing these challenges not only as a matter of fairness but also as a crucial step toward fully leveraging the potential of all graduates in Italy.

# A CODING WORKSHOP AGAINST GENDER BIAS

Scicchitano Emanuela  
Del Vecchio Anna  
Istituto Comprensivo Laives, Italy

In the STEM disciplines, as in many other areas of society, a strong gender inequality persists, because of the cultural survival of gender bias, that lead girls to believe they are not “suited” to study scientific subjects. To defeat this inequality, which could result in future wage disparities, it is essential to eradicate stereotypes from the early years of education. This is the goal that the comprehensive institute of Laives has set with its Coding workshop. It was organized in vertical continuity between primary and secondary education, using the “job shadowing” model. A secondary school teacher, an expert in educational robotics, worked alongside a primary school teacher and a group of students from a 5th grade class, in order to prepare the pupils for Lego League. The teachers provided all students with the same opportunities and methodological strategies, encouraging them to work together to build an effective team and bring out their natural leadership and problem-solving skills. During the workshop, the boys expressed greater skills in building competition robots, while the girls focused on writing the programming code, collaborating to find an effective solution. Through mentoring from female teachers experienced in STEAM subjects, they found motivation and overcame gender stereotypes.

coding workshop gender bias, gender equality, gender gap, educational robotic activities, empowerment, leadership, STEAM, job shadowing.

## INTRODUCTION

In order to describe the project, which the school I lead has supported, I will start by pointing out the vision that sustains us every day and inspired our school’s logo: “A Glance into the Future”. This motto means that school must always have the courage to keep its gaze on the future and summarizes the six ideas that guide our school planning:

- gender equality: the removal of obstacles to self-actualization, as stipulated in Article 3 of the Constitution, requires overcoming psychological and social barriers that limit women's free expression, which is often conditioned by fear of negative judgment;
- team working: only a coordinated team effort can initiate the necessary change, valuing the group as a democratic space for discussion, sharing, mutual support and growth through analysis, synthesis and constructive dialogue;
- the leadership of ideas: schools must cultivate winning ideas, because they are able to positively and creatively impact the future. I prefer to speak of winning ideas and not of winning people, because we cannot accept the replication of unethical models of success in the future, which imply the affirmation of the few at the expense of the many. We advise the pupils to feed their minds and imagine new solutions to today's problems;
- The enhancement of making: no idea is successful if it cannot imagine itself concrete and realisable. Schools must overcome the idealist paradigm whereby ideas are superior to making and must recover a craft dimension of study and learning processes.
- The centrality of the STEAM disciplines: science, technology, engineering, art and mathematics delineate the fields of knowledge of the future, where computational thinking, artificial intelligence and robotics will be the means of change that we can already see powerfully creeping into our present. If we want this change to be inclusive, women must be given the opportunity to choose it, to experience it and to shape it according to their point of view. Otherwise, STEAM disciplines will continue to be the field in which mechanisms of exclusion and domination continue to be perpetrated;
- The school as a revolutionary place: the school revolution is based on two principles: rebel, overcoming rigid mental patterns and building an inclusive narrative, and study, to base change on solid knowledge and skills.

School as a place of revolution also implies the need to transform it from the ground up. Change cannot be promoted without accepting that it involves the school itself, challenging us and asking us to evolve. The school revolution is not only within it, but concerns its essence and the way it is experienced. A collective step forward is needed to make change possible.

## **1. ANALYSIS OF THE CONTEXT: THE NATIONAL RECOVERY AND RESILIENCE PLAN**

The Istituto Comprensivo Laives took the opportunity offered by the National Recovery and Resilience Plan, particularly with the Next Generation Classroom measure, to renovate spaces and teaching. This intervention responded to needs that emerged from the self-assessment report, which indicated: a decline in students' math skills, a gender gap in math achievement, and limited digital skills of teachers and pupils. The goal was not just to purchase goods, but to initiate change toward an innovative, inclusive, and creative school built on the six key ideas initially introduced.

## **2. THE LAIVES TEAM PROJECT**

### **2.1. Teacher Training**

According to Edgar Morin, a well-made head is one that is able to connect different knowledge together, to intercept problems in order to solve them, to accept the challenges of the present and to think strategically; paraphrasing Morin, I maintain that a well-made project is one that has the following characteristics:

- it knows how to connect and make people with different experiences work together, overcoming sedimented professional barriers;
- it knows how to intercept real needs and identify solutions to meet them;
- is brave in saying yes and putting itself to the test;
- acts in the short term, but projects itself in the long term.

The Istituto Comprensivo Laives created a project to form “well-made heads,” as described by Morin, using Recovery Plan funds to implement the six key ideas. The goal was to unite the various elements, like pieces of a puzzle, since, as Martha Rosler says, “there are no fragments without a whole.” The whole is represented by the school, with students and teachers linked by training, which occurs through the teaching/learning process. We have invested in teacher training, starting with refresher courses on the use of technology in the classroom, particularly educational robotics. By joining the STAAR network, which offers field training workshops, teachers experiment with computational thinking, robotics and team building and then apply these skills in the classroom with students. This approach reflects the key ideas outlined in the introduction:

- gender equality: the teaching team was composed of men and women fairly equally;

- team working: the lecturers worked together in mini-groups of 5-6 people;
- leadership of ideas: the group work based on peer learning included moments of comparing ideas in search of the most effective ones for solving the problems posed or carrying out the tasks assigned;
- the enhancement of making: workshop participants had to work with Lego robots within playgrounds to be built together;
- the centrality of STEAM disciplines: the workshop made the participants, who came from very different teaching backgrounds and different school orders, aware that there is no future of the school without them;
- the school as a revolutionary place: change in the school starts with ourselves and the question: what can we educators, together now in this classroom, do to go beyond our usual practices and overcome the logic of 'it has always been done this way'?

## **2.2. Pupil's Involvement**

The LaiveSteam project developed during the school year within the value framework, which the head teacher described, with the following goals:

- to put into practice with class groups what has been learnt in the field of educational robotics in the refresher courses run by the Rete STAAR;
- contribute to the drafting of a vertical digital curriculum;
- push the cooperation between teachers of different school grades through job shadowing;
- working in authentic learning contexts;
- strengthen an inclusive perspective;
- make this activity the pivot of a broader stakeholder engagement project.

In order to achieve these goals, the project was set up by selecting two groups of pupils from the last class of primary school (1st group: 7 boys; 5 girls; 2nd group: 7 boys; 6 girls). This selection was made by requesting the families to join in, in order to encourage the full involvement of our stakeholders and without requiring anything other than motivational support for our activity. Within the two groups there are two students with special needs and one student with a migrant background. The inclusiveness provided by the project allowed all participants to demonstrate their potential in the various activities.

The project was divided into two time fractions:

- From September to November 2023: it was focused on the main notions of computational thinking, Coding and Educational Robotics highlighting their educational value within a teaching process in a non-homogeneous group;
- From December 2023 to May 2024: it was dedicated to ‘making’, as we moved on to the more craft-based aspect of the project.

The goal was to participate in the First Lego League – Explore competition, held in mid-May at the Bruno Kessler Foundation in Povo (TN). This event was an authentic learning environment, in which we worked for a year to form a 6-member team ready to compete in the field of educational robotics with other national teams.

The First Lego League Explore is a competition category for girls and boys ages 6 to 10, focusing on STEAM themes to stimulate self-esteem and critical thinking. Participants apply math, science and technology knowledge to create innovative and inclusive solutions. Specifically, we used the Lego Spike kit to design and build an original playground inspired by the values of gender equality, inclusion and creativity.

The design arose from a real situation: there is a 10-year-old girl in the class with severe sensory difficulties. Her classmates, who have learned to communicate with her in Italian Sign Language (LIS), asked themselves a question: how to make a concert inclusive, so that even those who cannot hear the music can appreciate it?

From this reflection came a project that imagines a concert: singers play and move on a stage, while light sensors follow the rhythm of the music. Thus, the children worked synaesthetically, transforming music into light to make it accessible to all.

In the second part of the activity the students wrote a computer code to connect the robot with the PC. During the various tests, they discussed and looked for the most effective solutions, inspired by the idea of leadership model.

The third phase involved the design and the creation of a paper ‘poster’ in which they show the path they have followed to arrive at the resolution of the challenge, proposed by competition.

Eventually we come to the last phase: the competition, that took place on 11th May and we took part as LaiveSteam with a mixed team of 6 pupils, who challenged 10 other teams and won first prize in the Core Values category, which inspired us: inclusion and gender equality.

### 2.3. The Role of Girls

As we said, gender equality is one of the key ideas of our lab and we have implemented it through several strategies:

- the model of two female teachers engaged in science, who demonstrate with their example that STEAM are “girl stuff” and can therefore become in the future a possible choice of study or work. Teachers become so the first and most visible tool of female empowerment, especially in that age group in which learning occurs mainly by observation;
- The motivational approach: we must, from the beginning of the school career, motivate girls and future women to break through the so-called “glass roof” that at some point in their lives prevents them from performing prestigious jobs, traditionally considered “boy stuff”, although they have also been more successful students than males during their schooling. It is a phenomenon globally defined “leaky pipeline”: so after university, the presence of women in the post-university world and work begins to drastically reduce, due to the difficulty of managing at the same time family and social life;
- The importance of team building and the lab approach based on doing using technology: in the design work in mini groups, the girls had to learn not only to make their voice heard but to hear it themselves. In every activity the vision of girls was decisive to write the code. All have completed the tasks, sometimes before the deadline, and they succeeded in explaining their choices, during the first phase of design and last of computer writing. The initial critical issues, mainly due to the belief that Lego and robots are purely for males, have been mitigated by the tenacity and precision that the girls have put to complete the tasks;
- The deconstruction of gender bias: the laboratory ended with satisfactory results and all proved to have learned the fundamental parts of the programming. It was interesting to note the ease with which the girls entered into interaction with the group of boys making improvements and simplifications necessary for the development of the project. The boys, initially by gender bias conditioned, have reconsidered on the skills of the girls and constantly supported their ideas and their participation in the race of robotics, encouraging them to express their opinion in every context. To scratch the “Crystal Rood” above all, in the scientific field we must deconstruct the gender stereotypes that Elena Gianini Belotti already reported in her famous

essay, *On the side of girls: the influence of social conditioning in the formation of the role of women in the early years of life*. If the school system aims to be effective, it must “give back to each individual who is born the possibility of developing in the way that is most congenial to him or her, regardless of the sex they belong to”. In order to succeed, the school must help to affect those psychological structures that make women feel inadequate and “not talented”, even before testing themselves, especially when they have to interact in groups with boys. At the beginning of our journey, the girls were already defeated and resigned to the idea of not being able to participate in the race: at 10 years for them the “crystal roof” was already a limit to their chances. We worked with them to break through it and to channel their energies towards achieving a goal, which they thought they could not achieve. We used their tenacity and precision to convince them that Lego and robots don’t have gender preferences. We as human beings, invented these superstructures to simplify our approach to reality, but our intelligence and motivation can be so broad that it embraces complexity. This has been understood by whole group, that so changed its mind and its attitude.

### **3. CONCLUSIONS**

If we now return to reflect on what the photographer Martha Rosler suggested, that there are no fragments if there is not a whole, we can observe that the whole is in a school the pedagogical framework in which we insert our projects. The coding lab, which we explained, was born from a basic assumption: to abolish within the class gender differences, to educate the students as individuals with specific talents and make them able to share them with others. This perspective is the only one that allows us to make the revolution at school and to transform the school in a revolutionary place.

# ENSURING GENDER EQUITY IN PROMOTING COMPUTATIONAL THINKING IN PRIMARY SCHOOL. A SYSTEMATIC REVIEW

Francesco Claudio Ugolini<sup>a</sup>

Panagiotis Kakavas<sup>b</sup>

<sup>a</sup>Università degli Studi Guglielmo Marconi; <sup>b</sup>43th Primary School of Patras

This paper is part of a wider review about the effective pedagogical strategies aiming at developing Computational Thinking (CT) in primary school (K-5). Within this research, we focus here on those studies who specifically focus, directly or indirectly, on gender equity. Its relevance is based on the awareness that Computer Science is stereotyped as a male-oriented field right from the earliest school grades. In our review, we selected journal articles and proceedings papers, in 10 well-known databases, from 2006 to 2022, with specific inclusion criteria: Among the 31 studies that met those criteria, 12 papers dealt with gender equity to some extent: 7 of them mentioned “gender”, “girls”, “equity” either in the title or in the keywords, the other adopted the gender difference among the criteria of analysis. As a general result, all the papers, although proposing different pedagogical approaches, don’t detect a significant difference of CT development between girls and boys. Nonetheless, we can find some interesting information related, for instance, to group composition or to the scaffolding type. These results can give further directions to research and educational practices on how to properly structure educational activities aiming to develop CT in primary school able to promote gender equity.

Computational Thinking; Primary School; Gender Equity; systematic review

## INTRODUCTION

This paper refers to a wider research regarding the most effective strategies to develop Computational Thinking (CT) in K-5 children, within which it focuses specifically on gender equity. Its relevance is based on the awareness that Computer Science is stereotyped as a male-oriented field right from the earliest school grades (Cheryan, Master & Meltzoff, 2015; Master, Meltzoff & Cheryan,

2021). This is an issue for several reasons, related to different points of view; we will present them from the most functionalist-oriented to the most emancipatory-oriented. First, in countries whose economy depends on highly skilled workers in computing fields, the underrepresentation of females in computing has resulted in shortages of qualified workers (National Research Council, 2010; Mouza et al., 2020). Second, a lower computational literacy may result in lower job opportunities, as computing is becoming essential across many fields (Barker & Aspray, 2006; Mouza et al., 2020). Women may therefore miss out on high-status lucrative jobs (Cheryan, Master & Meltzoff, 2015). Third, an underrepresentation of women in teams dealing with innovation in computing products may also imply that those products are less responsive to the needs of female consumers (Cukier, Shortt, & Devine, 2002; Mouza et al., 2020). Lastly, from the most macroscopic sociological viewpoint, computer scientists design tools that shape modern society, and therefore such designs should be appropriate for the broadest population (Margolis & Fisher, 2002; Cheryan, Master & Meltzoff, 2015).

For these reasons, institutional policies aim at broadening participation of women in STEM (National Academies of Sciences, Engineering, and Medicine, 2007; European Commission, 2020), and research on the effectiveness of CT development programs and/or activities in Primary School often deals with gender equity as well. In this paper we discuss the results of 12 papers emerging from a wider Systematic Review about the effective instructional strategies for the development of CT in primary school (K-5) (Ugolini & Kakavas, *forthcoming*). In the next paragraph we will present the inclusion criteria both of the main Review, and of the sub-review which is the specific focus of this paper. We will then present and discuss the results.

## 1. METHODOLOGY

In our main Review, we selected journal articles and proceedings papers from 10 well-known databases<sup>1</sup>, from 2006 to 2022, with the following inclusion criteria:

- explicit reference to CT in title and/or abstract and/or keywords;
- English language;

---

<sup>1</sup> Association for Computing Machinery (ACM) *SpringerLink*, Education Resources Information Center (*ERIC*), *Bio-Medical Library*, *IEEE Xplore Digital Library*, *Wiley*, *Taylor & Francis Online*, *Ingenta Connect*, Learning & Technology Library (*LearnTechLib*) and *Science Direct*.

- the typical form of a scientific full paper;
- focus on CT in K-5 school;
- a sound methodology, with at least a pre- and post- assessment and at least one assessment tool of CT, valid and reliable to some extent, which considers CT as a thought process (i.e. not only as an acquisition of Computer Science knowledge).

Thirty-one studies met those criteria.

For the purposes of this work, from among those papers, we selected those that dealt to some extent with gender equity. We found that 7 of them include “gender” references (“girls”, “gender studies”, “gender difference”, “equity”...) in title, abstract and/or keywords, while 5 other studies adopted the gender difference as a criterium of analysis. We therefore analyse here 12 papers.

We can identify three sub-groups of studies:

- 4 studies specifically focus on possible differences between boys and girls in terms of effectiveness of the proposed instructional strategies, presenting a reference to gender both in their Research Questions (RQs) and in the theoretical premises;
- 4 studies propose diversification of the instructional strategies for girls; more precisely, two of them focus on group or pair composition and the two others on the scaffolding type;
- 4 studies slightly address this issue when presenting the results of the research.

In the next paragraph we will present the results and the discussion according to these three sub-groups.

## **2. PAPERS WITH A SPECIFIC FOCUS ON GENDER DIFFERENCES**

### **2.1. Results**

The first paper (Del Olmo-Muñoz, Cózar-Gutierrez, & González-Calero, 2020) deals with 2<sup>nd</sup> grade children, and evaluates the effectiveness of unplugged activities in terms of CT (by Bebras<sup>2</sup>), but also on motivation. This is not surprising: studies addressing the lower grades of Primary School, or even Kindergarten, address first access to CS activities, and, as such, they also focus

---

<sup>2</sup> Although the CT assessment tools are not a specific focus of this paper, we must point out that there is still no full agreement on how to assess CT (and therefore on its operational definition); for this reason, when speaking about effectiveness on CT, we feel it is needful to explain//specify the assessment tool being used. See (Román-Gonzalez, Moreno-León, & Robles, 2019). for further details about this issue and about the main CT assessment tools.

on dimensions other than CT, and the instructional strategies addressing these grades almost always focus either on educational robotics or on unplugged activities. One of the RQs explicitly states: “Are there significant differences in the effectiveness of the approaches in terms of CT skills or motivational outcomes related to the gender of the students?”. The study shows no significant difference in terms of motivation between boys and girls when they start approaching CT with unplugged activities.

The three other studies of this subgroup address 5th grade pupils (or, in one case, both 4th and 5th grade).

Ma et al. (2021) evaluate the effectiveness, in term of CT (by CT Test) and Self-Efficacy (by CTLs), of an advanced Problem Solving model (the IGGIA Model). It includes one specific RQ related to gender equity: “Can the problem-solving instructional approach for primary education promote girls’ CT performance as well as boys’ CT performance?”. According to this study, the girls belonging to the experimental group show a significant improvement both in terms of CT and self-efficacy in respect to those belonging to the control group.

Mouza et al. (2020) evaluate the effectiveness of a one semester long out-of-school program, addressing one single-group of 4<sup>th</sup> and 5<sup>th</sup> grade students, with a mixed-methods approach: referring to the well-known Brennan and Resnick (2012) operational definition, only CT Concepts are assessed in a quantitative way, while CT Practices and CT Perspectives are examined qualitatively. One of the RQs states: “How does repeated participation in an after-school computing program influence student learning of CT concepts related to programming? Are there any gender differences among student outcomes?”. While CT Concepts were significantly higher in boys than in girls both in pre- and post- test, the learning gain is not. Moreover, 50% of the students who returned for further participation in the programme were girls.

Lastly, Noh & Lee (2019) also evaluate the effectiveness of an advanced problem solving model (the Creative Problem Solving Model), applied to Educational Robotics, which aims to develop both CT (by Bebras) and Creativity (by the Torrance Creativity Test). One of the RQs is “Does a course in programming a robot improve CT and creativity when prior skills and gender are taken into account?”. No difference between girls and boys in terms of CT was found, while girls improve creativity significantly more than boys; the authors suggest that this is due to the collaborative activities within the model (e.g. brainstorming).

## **2.2. Discussion**

Among the 4 studies, only one deals with a “first access” to programming (2<sup>nd</sup> grade) showing that an unplugged approach, though puzzle-based, can help in limiting the gender differences, especially about motivation, which is crucial for this specific age-group.

The three other studies show that well designed programs, typically including collaborative activities, imply a significant learning gain both in boys and in girls without significant gender differences. This is not to be taken for granted, because, in referring to our Review as a whole, we have to point out that the approaches concerned here were among the most advanced: a constructionist-based long-term out-of-school approach, the Creative Problem Solving Model and the IGGIA Problem Solving Model. Therefore this systematic study confirms that an accurate instructional design is recommended in order to meet the gender equity goal in educational activities aiming at developing CT in primary school.

## **3. PAPERS WHICH FOCUSED ON DIVERSIFICATION BASED ON GENDER DIFFERENCES**

### **3.1. Results**

The four papers focusing on diversification of the instructional strategies we found in this review can be further grouped into two sub-categories.

Two studies (Taylor & Baeck, 2019; Wei et al., 2021) focus on the composition of groups or pairs in activities aiming at developing CT.

Addressing 4<sup>th</sup> and 5<sup>th</sup> grade children, Taylor and Baeck (2019) evaluate the effect on both CT (by CT Test) and motivation, of group composition (by gender and by role) within an educational robotics activity. They found that composition by gender (all female, all male, mixed) has no effect on CT and motivation, while assigned roles, whether they are fixed or rotate, have.

On the contrary, Wei et al. (2021) found some differences related to pair composition, evaluating the effectiveness of a Scratch-based constructionist program, on both CT (by DrScratch) and self-efficacy: girls in girl-girl pairs do not improve their CT, while those in a boy-girl pair do; the results related to the self-efficacy in programming are even less encouraging, as girls improve neither when paired with a boy nor with a girl.

Two other studies focus on the scaffolding type.

Angeli & Valanides (2020) address Kindergarten children (5-6 y.o.) in an

educational robotics program (using Bee-Bot robots). They explicitly compare the effectiveness on CT (by CT Assessment Rubric) of two scaffolding types on the same Problem Solving Scenario (see RQ3: “Do the two scaffolding techniques differentially affect boys’ and girls’ computational thinking?”). The study found that boys benefited more from an individualistic, kinesthetic spatially oriented, manipulative-based activity with cards, while girls benefited more from a collaborative writing activity.

Jin et al. (2021), on the other hand, address a sample of all girls belonging to a 3<sup>rd</sup> grade, comparing an extensive scaffolding with a limited one, in a Scratch-based Program, regarding their effect on CT (by CT Test and CTLS). The study found that an extensive scaffolding improves both CT Skills and Self Efficacy.

### **3.2. Discussion**

Gender doesn’t seem to have a great effect on group composition, at least in educational robotics activities addressing 4<sup>th</sup> and 5<sup>th</sup> grade pupils. We must anyway point out that this results from a single study, related to groups composed by 3 or 4 students in a 14-week-long programme; further research is therefore needed, to strengthen this result in term of generalisability.

Even more so, because, in terms of pairs, a different outcome was found: in terms of CT improvement, a constructionist-based on-screen activity was more effective for 4<sup>th</sup> grade girls when paired with boys than with another girl. Much attention must be paid to this result, as pair-programming is a strategy often adopted in coding activities (Campe & Denner, 2020). As an extensive scaffolding appears to be effective on girls in terms both of CT development and CT self-efficacy, we may suggest to adopt it when dealing with girl-girl pairs or groups with a high proportion of girls.

Regarding grid-based educational robotics activities in Kindergarten, it has to be noted that the use of cards, which is often adopted, appears to be more effective in boys than in girls, who on the contrary prefer to be individually supported by the teacher.

## **4. OTHER PAPERS**

In our review, we found 4 other papers who slightly address the gender equity issue when presenting the results of the research.

Jiang & Wong (2021) show no significant difference between 4<sup>th</sup>-5<sup>th</sup> grade boys and girls after a 5-week long programme combining plugged-in and unplugged activities; Jiang & Li (2021), show no significant difference between 5<sup>th</sup> grade boys and girls after a 5-week long scratch-based programme, except for

algorithmic thinking (corresponding dimension of the CTLS), which was more developed by boys. On the other hand, Yilmaz Ince & Koc (2020) show a benefit for girls in problem solving (corresponding dimension of the CTLS) after a 2-week long programme, though it must be said that this study addresses only 3 5<sup>th</sup> grade pupils (the remaining of the sample belongs to 6<sup>th</sup> grade).

In the last paper (Tran, 2019), gender equity is overall mentioned as a context element for a 10-week long unplugged programme, addressing an early exposure to coding, for 3<sup>rd</sup> grade pupils.

These studies don't provide particularly significant results; they nonetheless support the idea that coding medium-to-long programmes addressing upper grades pupils do not substantially amplify the gender gap in CT development.

## CONCLUSION

Our review shows that there is not huge evidence assuming that activities aiming at developing CT are more effective in boys rather than in girls. On the contrary, well designed programs, typically including collaborative activities, imply a significant learning gain both in boys and in girls without significant gender differences.

We nonetheless can identify some interesting indications:

- at K level, girls benefited more from the collaborative writing activity scaffolding;
- Early exposure can help narrowing the gap about motivation;
- There are some differences in self-efficacy: girls in pairs do not improve self-efficacy; some research show an improvement in boys of the algorithmic dimension and an improvement in girls in problem solving dimension; extensive scaffolding helps in improving self-efficacy.

# GENDER, INTERCULTURE, EDUCATIONAL PERSPECTIVES. ANALYSIS AND CONTRAST OF GENDER AND ETHNIC-BASED VIOLENCE DYNAMICS

Carla Roverselli<sup>a</sup>

Stefania Lorenzini<sup>b</sup>

<sup>a</sup>University of Rome "Tor Vergata"

<sup>b</sup>University of Bologna

## 1. KEY FACTORS

This panel intends to place itself at the intersection of the following macro-themes: "gender inequality and sexist education" and "intercultural education and non-racism". The issues considered are manifold and briefly outlined here.

### 1.1. Gender-based violence

The issue of gender-based violence is trans-historical and trans-cultural: it affects everyone and, unfortunately, is still topical. We define gender-based violence as

all those forms of violence from psychological and physical to sexual violence, from the persecutory acts of so-called stalking to rape, up to femicide, which affect a vast number of people discriminated based on sex<sup>1</sup>.

Violence plays a significant and widespread role in the universe of women, masquerading in many ways and always taking on new forms, including self-harm and self-destruction (Durst, 2012, 53). All these forms of violence know no boundaries of religion, age, or social group.

### 1.2. Gender inequality

The inequality between men and women, the lack of recognition of women's identity, and the fact that women are 'second' to the male role and, therefore, subject (in the sense of subjugated) (De Beauvoir, 1961) are specific causes of violence. To achieve true equality between men and women, to overcome

---

<sup>1</sup> <https://www.interno.gov.it/it/temi/sicurezza/violenza-genero#:~:text=Con%20l'espressione%20violenza>

female subordination, however, there is still a need today for ‘unequal equality’ (Benadusi et al., 2009), i.e. to compensate for the persistence of women being ‘second’ to men. The overcoming of subordination would bring them out of anonymity, not because women are nameless but because they are not named other than through an interposed person, that is, dissolved in the “universal neutral declined into the masculine” formula that is still struggling to disappear. Gender inequality is more frequently present in contexts where social justice is absent, the relationship of subalternity has been internalised, and the stimulus to develop theories of social transformation is lacking. Still, it can certainly present itself, more or less explicitly, even in democratic contexts that aspire in principle to equity, even between genders.

### **1.3. Gender and colour discrimination and the intersectional perspective**

Similarly, inequality and discrimination based on ethnicity and, in particular, towards dark skin colour still present themselves as a significant critical issue of social coexistence. The most frequent areas of inequality and forms of discrimination, as studies in the field show (Tria, 2015), concern ethnicity, gender, sexual orientation, age (young and old), disability, and religious beliefs (anti-Semitism, Islamophobia). We identify at least two different levels of discrimination. Multiple discrimination: this refers to the simultaneous membership of several disadvantaged social groups, which makes people potentially victims of events detrimental to their dignity, placing them at a disadvantage.

These forms of discrimination increase cumulatively due to the co-presence of different risk factors in the same individual (Makkonen, 2002). The different factors act concurrently but separately. Intersectional discrimination: Discrimination is based on several factors that interact so that they can no longer be distinguished and separated. The concept of intersectionality constitutes an interpretative paradigm introduced in 1989 by Kimberlé Crenshaw, an American jurist and activist, who highlighted how, in society, the different manifestations of oppression and exclusion (racism, sexism, ableism, homophobia, transphobia, xenophobia) do not act independently but are interconnected and create a system of oppression/exclusion that reflects the intersection of multiple inequalities and discriminations (Crenshaw, 1989).

Thus, dark-skinned women may experience discrimination in ways that are both similar to and different from those experienced by light-skinned women (as women) and in ways that are both similar to and different from dark-skinned men (as dark-skinned men). They often experience the combined and mutually

reinforcing effects of discrimination based on the intersection of gender and skin colour, i.e. as black women (Crenshaw, 1989). In this latter respect, their situation (at the crossroads of several social categories: gender and colour) is qualitatively different (Crenshaw, 1991) from that experienced by light-skinned women as well as from that experienced by black men or privileged black people (Crenshaw, 1989; Bello and Mancini, 2016; Bello, 2020). This specific condition can only be understood by considering the interplay between several identity factors. It indicates how categories co-construct each other by creating no longer separable situations into individual categories operating separately (Bello, 2020).

The focus here is on specific aspects of discrimination that may be directed at the female gender, particularly dark skin colour or the synergy effect of their combination.

Gender and skin colour share a strong visibility. Their immediate prominence in a person's distinguishing features can make the risk of discrimination particularly pronounced. Due to the cognitive mechanisms of inference and generalisation that preside over the formation of categories and the activation of stereotypes and prejudices in individual mental processes (Lorenzini, 2018), the perception of these peculiarities leads to categorising an individual as female/woman (not male/man) or in the case of dark skin as foreigner/foreigner (not native), according to real automatisms.

## **2. EDUCATIONAL PROPOSALS FROM AN INTERCULTURAL, ANTI-RACIST AND ANTI-SEXIST PERSPECTIVE**

The Istanbul Convention (2011) on Preventing and Combating Violence against Women and Domestic Violence stipulates that the contracting countries (and Italy ratified this Convention in 2013) shall take all necessary actions to include in school curricula at all levels of education, teaching materials on topics such as gender equality, non-stereotypical gender roles, mutual respect, non-violent conflict resolution in interpersonal relationships, gender-based violence against women and the right to personal integrity, appropriate to the cognitive level of pupils (Istanbul Convention 2011, a.14, c.1).

The next comma, 2, invites the Parties to take the necessary actions to promote the principles enunciated in comma one also 'in non-formal education facilities, as well as in sports, cultural and leisure centres and the mass media'.

This Panel, considering this and our country's commitment, intends to focus on the contexts of extracurricular, non-formal and informal education, and

therefore on family life, religious contexts and territorial educational services, on a target audience of adults and young adults, and through the presentation of the results of research carried out in Italy and abroad, it aims at 1) highlighting the different forms of the manifestation of violence with respect to gender and sexual orientation in the specific contexts of extracurricular, informal and non-formal education 2) to analyse if and how heterogeneous actors in the field of extracurricular, informal and non-formal education, can be personally affected, as women/men/other, by forms of symbolic and non-symbolic violence in relation to particular types of users; 3) to bring out if and how heterogeneous actors in the field of extracurricular, informal and non-formal education, can in the performance of their role, break or (re)produce dynamics of symbolic and non-symbolic violence with respect to gender and sexual orientation.

For these thematic areas, the intersectional perspective will provide the theoretical and methodological tools to consider the inseparability of racism, capitalism and patriarchy. In this way, each research will be able to reveal itself as a contribution to a social transformation that changes the way everyday life is lived, putting an end to white supremacy to the growing social and economic apartheid that separates black and white, rich and poor, men and women; putting an end to sexism and class exploitation. Such was also the revolution in values that bell hooks (2020, 55-66) wanted to bring about by using the intersectional perspective as a tool for analysis.

Studies on women writers or life situations that have carried out anti-racist and feminist struggles, elaborating an alternative pedagogy, will also restore knowledge's transformative value.

# SCOUTS AND GUIDES' EXPERIENCE OF COEDUCATION TO PREVENT VIOLENCE AND BUILD POSITIVE GENDER

Paola Dal Toso  
University of Verona

The aim of this article is to deal with the issue of coeducation in the scouting experience, proposed by Agesci (Catholic Scouts and Guides Association of Italy), founded in 1974 through the merger of the male and female associations. Co-education is not a simple coexistence of the two sexes under the banner of promiscuity. In Agesci, the intuition behind the choice of coeducation stems from the conviction that it is possible for boys and girls to grow together, to live together an educational project beyond any pre-established roles. The educational aim is to help them mature in their relationship with themselves and others through the Scout method. In this way, Agesci proposes to combat gender-based violence with an educational proposal that offers the opportunity to experience mutual recognition of the richness of diversity and to build positive relationships between men and women. Agesci has opted for diarchy, which means that at all levels of the association, the sharing of tasks and educational responsibilities is entrusted to men and women together, with equal dignity and responsibility. For the boys and girls, this is a tangible testimony of how men and women can work together.

Co-education; Scouts; Guides

## INTRODUCTION

In the fight against the dynamics of gender and ethnic-based violence, a preventive action can be carried out at an educational level. In this sense, this contribution intends to present the reflection and experience of co-education lived by the Association of Italian Catholic Guides and Scouts (Agesci), a reality born 50 years ago from the merging of the male association of scouts (Asci) and the association of guides (Agi).

## **1. THE ASSOCIATIVE PATH TOWARDS CO-EDUCATION**

Various scouting experiences began in Italy as early as 1910. In 1916 the Italian Catholic Scouting Association was founded which, as a result of the dispositions of Fascism, was forced to terminate in 1928 only to be reborn in 1944, while, addressed to girls, the educational proposal of Guiding began on 28 December 1943 with the establishment of the Italian Guide Association. In the Holy See's letter of approval (8 December 1944) Monsignor Montini had stressed the Pope's wish that "a clear separation be maintained between the Association of Italian Guides and the other similar one of the Young Explorers" (Morello & Pieri, 1991, 98).

In the Italian socio-cultural context, women's awareness of their rights and the need for their recognition matured between the 1950s and 1960s: the feminist movement and the post-conciliar atmosphere contributed to this. Also young women and the leaders within Agi became aware of the equal dignity of men and women, of the equality of rights and consequently of the need to educate them to overcome pre-constituted roles corresponding to the psychological and biological nature of male and female. The latter were educated to traditional 'values', such as submission, silence, and self-giving.

Gradually the need to merge Agi and Asci matured, though there were conflicting positions and opposition in both associations. It was feared that Agi ran the risk of being suffocated numerically by the Asci and risked losing its specific originality, while in Asci there were those who warned that the method could be watered down. In Agi, the decision to form a single association also involved painful personal choices to the point of leaving the association. Overcoming difficulties and resistance, in 1969 Agi approved Asci's proposal to set up a mixed commission to deepen the theme of co-education, and the following year the creation of Asci-Agi leaders communities. In particular, Agi experienced a very lively ideological debate in its central structures: associative tensions and criticism in some ways reflected the contradictions and divergences present in society, which led to moments of true disbandment, chaotic and lacerating discussions.

It should be borne in mind that, on the other hand, on a local level, during the 1960s many leaders and leaders, rovers and scolte – boys and girls between the ages of 16 and 20 – were in fact working together. It can be said that in a certain sense the unification of Asci and Agi was actually experienced before the

decisions that officially led to the establishment of Agesci (Italian Catholic Guides and Scouts Association) on 4 May 1974. The unification was approved by Agi thanks to 98.8% of the votes in favour and 76.5% by Asci. As a matter of fact, the merging process of the two associations was essentially managed at the leadership level, while it was promoted by the drive of a large part of the grassroots, i.e. the groups and units that, having been ahead of their time, applauded the fusion.

The unification was not an easy, simple choice and there was no shortage of difficulties with the episcopate; furthermore, during the path that led to the decision to establish Agesci there was no lack of contrasting positions and opposition, which led to painful decisions. In fact, disagreeing with the choice of coeducation, the Italian Association of Catholic Guides and Scouts of Europe, known as Scouts of Europe – ESF, was founded in 1976. This reality was divided into groups separated by sex and led by leaders of the corresponding sex.

If at the time of the merger between Agi and Asci there was a fear that the former would be ‘swallowed up’ by the latter, if only from a numerical point of view since the numerical ratio was 1 to 3, after 50 years of Agesci’s life, it can be noted that in the year 2023-’24, the 191,881 members are distributed in the various age groups almost equally between males and females and among educators the former are 16,080, the latter 15,427 (Scouts, 175).

## **2. EDUCATIONAL INTENTIONALITY**

Fifty years ago, at the time of the birth of the Agesci, the choice of coeducation was not understood as putting boys and girls together, a simple mixing of scouts and guides. The insight behind the choice of coeducation (Galli, 1994) arose from the conviction that it was possible to bring boys and girls together, to educate together by living a common proposal, beyond any pre-established roles. The aim was to help, through the scout method, children and young people to become autonomous and aware of their sexual identity in their relationship with themselves and with others (Lucchelli & Patriarca, 1994).

The associative choice of co-education made by Agesci is expressed in the Associative Pact, the document that summarises the ideas and experiences matured in Asci and Agi, accepted and developed in Agesci:

The Agesci leaders share the responsibility for education and bear witness to the enrichment that comes from reciprocal diversity. While respecting the concrete situations of local and personal realities and the different rhythms of growth and maturation, they offer girls and boys common educational

experiences, beyond any imposed or artificially constituted roles. Growing together helps them discover and welcome their identity as women and men and recognise in it a call to full self-realisation in love. Co-education opens up and founds education to welcoming the other (Agesci, 2002, 32).

Agesci proposes an educational pathway in which boys and girls live meaningful educational experiences together, under the guidance of educators who are attentive to their integral development, who accompany them and make the difference between the sexes a resource that allows them to get to know themselves and each other, fostering collaboration and respect.

Of course, from an educational point of view, scout leaders do not always take care to identify what are the attentions, the conditions to make the coeducational situation really meaningful. At times, coeducation is confused with being together between people of both sexes, under the banner of promiscuity, a simple coexistence, so much so that in some scout groups it is limited to proposing common activities to boys and girls. This ends up by proposing an undifferentiated, amorphous, depersonalised model, in which everyone does the same things indiscriminately, everyone is asked to achieve the same performance, almost as if to miniaturise, erase and abolish differences, which are mostly considered a cultural fact and the cause of inequalities. In this way, there is a danger of standardising the educational proposal.

Agesci has grasped the educational value of coeducation, which consists in boys and girls being together (Centro Documentazione Agesci, 2010), with the concern to create the conditions so that each person can find space and a way to express their personal characteristics, making sure that they can express what they are in their specific originality.

At the educational level, this implies that the realisation of the human person - whether man or woman- is effectively guaranteed, and that the peculiarities, talents and potentialities of each person are valorised while respecting their individual peculiarities, differences and needs. It is a question of promoting in children a process of identification with their own sex and, at the same time, of serene integration with the other sex, for a harmonious and balanced development of the male and female personality (Lorenzini, 1993).

To achieve this, simply being together is not enough, but an educational intervention capable of nurturing knowledge, acceptance, and appreciation of oneself and of the other as a person different from oneself is necessary. It is a matter of helping the person to realise himself or herself in a global, integral way,

according to that specificity, uniqueness, diversity of being a man or a woman. The educational path should help the person discover and realise the meaning of their own sexual humanity. That is why it is necessary to address issues such as personal identity, self-esteem, autonomy and the ability to be free and responsible, to consciously exercise one's relational and communication skills, to identify and respect a hierarchy of values. Recognition and awareness of each other's originality leads to grasping the value of the other, while consolidating a positive self-image. Experiencing mutual recognition of the richness in diversity, discovering complementarity, makes one happy.

In today's socio-cultural panorama, the task of accompanying children and young people to experience man/woman relationships not in a superficial manner, but in mutual understanding, in deepening knowledge and esteem, within a project of progressive enrichment, is a delicate and complex one. In the experience of participating in the group, each person can learn to live the relationship with the other, to welcome him/her by respecting him/her, and it is precisely this relationship with diversity, which can contribute to discovering one's own identity as a woman or man, accepting it, recognising in it the invitation to full self-realisation. At the educational level, this implies supporting the growth of autonomous persons, responsible for their own sexual identity, capable of meeting others authentically, listening to them, respecting them, welcoming them, developing the capacity to establish positive relationships.

The opportunities of a group life are particularly precious for educating to reciprocity, insofar as they make people experience diversity as a resource and allow them to welcome their own identity, to know it, accept it, value it, meeting each other in their mutual differences.

The scout proposal contributes to the affective and social maturation of the person by offering a training path aimed at educating to relationships, to respect between males and females, to mutual esteem, recognising themselves as bearers of specificity, of their own sexual humanity to be promoted. For the developmental phase during which the question of one's own sexual identity arises with greater urgency, particularly for the 11-15 age group, the scouts/guides, the Agesci educational method provides for separate training and socialisation moments: the squadrons – small groups – are single-sex, also offering a certain autonomy of activities. Separate activities between the two genders are also planned, precisely to enable the boy and girl to live out their identity, to foster a more complete development of their sexual identity, to be more welcoming towards the other.

Ultimately, what emerges is the importance of accompaniment by an educator who is mature from a relational point of view, attentive, and capable of offering content, meaningful experiences and stimuli for the progressive elaboration of one's own identity. Accompanying the younger generations in the adventure of becoming men and women means helping them to discover a framework of existential values that will allow them, in addition to strengthening their identity, to build a life project open to relationships and capable of looking to the future.

In short, for Agesci, while respecting the different growth and maturation times of the different local realities, co-educating means proposing common growth experiences, so that boys and girls can be open to meeting, welcoming and getting to know each other, beyond pre-established roles: through confrontation they can better understand their own peculiarities and learn to appreciate the characteristics of the other. In this perspective, the diversity of being male or female, of masculinity and femininity are valued, avoiding the risk of mortifying, flattening differences, or even violently suppressing them, because the specific diversity of being male and female, inscribed in sexual difference, is a wealth. In this way, Agesci also intends to combat the increasingly socially felt problem of gender-based violence.

It is evident how coeducation is not a merely instrumental aspect of the scout proposal, but a qualifying feature of the idea of man and woman to which the educational path tends. At the end of their journey of growth together, scouts and guides come to mature and make their own the value of the complementarity between male and female, in a dynamic of mutual enrichment, in all dimensions of life.

### **3. SOME CONSIDERATIONS**

It should be borne in mind that since 1974 Agesci has chosen diarchy, i.e. to entrust all tasks and responsibilities in the leadership of the association at all levels, to male and female leaders jointly, with equal dignity and responsibility. Therefore, there is the co-presence of a man and a woman, not only in the educational communities, but also at every level of associative responsibility.

For young people, living in a relationship with responsible adult figures with equal capacity and decision-making power, equal commitment to a common project is a tangible testimony of how much a man and a woman can collaborate, correct each other, grow together and have an absolutely equal role. This aspect of the Scout experience also contributes to building positive relations between males and females and preventing violent actions.

It should be noted, however, that in fact there is not always a leader and a leader in mixed units, but for various reasons the former finds him or herself taking on and leading the unit alone, with the consequent educational implications.

So far no analysis has been carried out to evaluate from a historical-pedagogical point of view how, following the unification of Agi and Asci, some methodological differences ended up being lost, at least in part, in the course of the last fifty years, while they constituted a wealth characterising the educational proposal of Guidism. More generally, there was a lack of educational reflection on the effective implementation of the coeducational proposal. In the course of the fifty years of the history of Agesci, the subject has returned to associative attention in the mid-eighties, but has not found continuity in reflection.

It could be an important contribution to reflect at an associative level on the possible contribution in educational terms in preventing violent actions and building positive relations between males and females, also taking into account the fact that in many groups children and young people from other cultures and religions are welcomed.

# INTERSECTIONAL AND GENDER PERSPECTIVES: A RESEARCH ON TRAFFICKED REFUGEE WOMEN

Gaetana Tiziana Iannone  
University of Rome Tor Vergata

This research explores the care of trafficked Nigerian women within the SAI (reception system integration) project of the Municipality of Latina. The focus is on educational pathways oriented to the recovery of psycho-physical well-being, global autonomy, and balance after the migration trauma and violence suffered, and emancipation from the stigma of multiple vulnerability. The research is based on experiences gathered during five years of work and uses Constructivist Grounded Theory (Charmaz, 2014). The intersectional perspective and gender difference pedagogy are used to investigate the variables that hinder the promotion of resilient behaviour. The aim is to co-construct a grounded theory that stimulates the creation of a resilient and educative community, oriented towards pedagogical hope (Freire, 2014).

Gender perspective; intercultural pedagogy; intersectionality; emancipation; liberation.

## INTRODUCTION

This research investigates the phenomenon of trafficking of Nigerian asylum-seeking and refugee women received in the SAI with particular regard to the processes and practices acted out within reception contexts. Italy represents a country of destination and transit for trafficked migrants recruited and transported for the purpose of exploitation (Easo 2019, Unhcr 2021; 2022). This type of migration features women to a greater extent, thus delineating, a sexual exploitation that is characterized by gender. The human trafficking is a phenomenon that affects both women and men. However it cannot be said to be gender-neutral, (Cotesta,1999) since, vulnerability is conditioned by gender itself, becoming even more pronounced and potentially traumatic.

The gender perspective is an essential element for a complete and comprehensive understanding of the phenomenon of human trafficking, as it allows, social and economic policies to be monitored and evaluated with women's needs in mind and, enabling the design and implementation of ameliorative systemic actions. The feminization of migration pathways projects us into the perspective of gender and difference (Roverselli, 2015) and suggests that we should delve into the phenomenon by considering the traumatic bearing that configures this target audience as “the damned of the earth” (Bianchi, 2022).

## **1. FOCUS NIGERIA**

### **1.1. Root causes of sexual exploitation of Nigerian migrant women**

Sexual exploitation of Nigerian migrants can be declined through several closely related aspects, of which the first three are borrowed from relevant literature (Easo report, 2015; Unodc, 2006; Carchedi, 2012) and the personal field experience of the writer, the last two are related to the first emergencies of the research in question. We refer to exactly:

- First aspect: the migratory propensity of these young women and their deep-rooted desire to emancipate themselves from conditions of extreme hardship, such as illiteracy, absence of parental figures of reference, domestic violence poverty, breadth of family units, absence of educational/schooling and employment opportunities.
- The second aspect introduces the first actors in the criminal network of trafficking, namely, the so-called sponsors (maman traffickers) those who lend themselves to find money and false documents to make the journey abroad (Ezeh M.D., 2017).
- The third aspect is related to Nigerian ritualism, namely, the juju oath that seals a pact, a contract between the maman/sponsor and the trafficked woman. The practice of juju ritual is a syncretic form that to this day endures in parallel with the Christian and Muslim religions, intersecting and traversing across these monotheisms.
- The fourth refers to the recruitment of Nigerian girls through the device of debt bondage, which traces its roots to debt bondage: which forces victims to submit to severe forms of exploitation in order to pay off a very high monetary debt in exchange for freedom” (Coi Nigeria Report, 2020). The debt incurred takes on an economic, moral and psychological character at the same time, placing these women in an existential

condition that we could well decipher, in the words of Ernesto De Martino, that is, in “a magical existential drama” (2008).

- The fifth aspect can be traced back to the ways in which the victims were enslaved, which are in no way linked to a single component – discernible in the univocity of the juju ritual – rather it is characterized by a contamination of factors that have diverse origins: for example, the deep internal fractures of a corrupt state, the violence of Libyan guerrillas, prostitution on Italian streets.

## **1.2. Context of the research**

SAI is a national initiative aimed at the reception, protection and inclusion of asylum seekers and holders of international protection. It offers integrated reception interventions: in addition to providing board and lodging, activities include legal assistance, social accompaniment, literacy, training, vocational retraining, housing and socio-economic integration. (Manuale SAI, 2018). In the SAI of Latina, to date, there are 111 beneficiaries, of which 23 are adult women. There are 10 declared victims of trafficking: 3 asylum seekers and 7 refugees. L2 teacher. The multidisciplinary team (pedagogists, educators, social worker, psychologist, cultural mediators, Italian L2 teacher), as a result of the now stable presence of women victims of trafficking, was invited by the Ministry of the Interior to continuous and specific training to meet the socio-educational needs of the beneficiaries. It was necessary to acquire transversal/intercultural skills aimed at fostering an understanding of the specific vulnerability experiences of trafficking victims, facilitating the mastery of tools useful for designing educational interventions.

### **1.2. Slide of trafficking into asylum**

In the 2015-2019 period, the phenomenon of human trafficking has become intertwined with the flows of asylum seekers and international protection, asylum seeking has become the main channel of access for victims in our country. The phenomenon has mainly affected women and unaccompanied foreign minors of Nigerian nationality, who, according to the International Organization for Migration are among the most trafficked individuals (IOM 2020). The Geneva Convention represented the starting and reference point for the connection between trafficking and asylum, a reference that, however, was connoted only in form and not in substance, in fact, if one delves into the historical-legal course of this normative device, one can highlight how the definition of the refugee condition addressed in the abstract a target

representable in the adult male, political dissident, fleeing from an oppressive regime after World War II. One can well note the lack of reference to gender, sexual orientation.

## **2. THEORETICAL FRAMEWORK**

### **2.1. Gender, intercultural, intersectional perspective**

The general framework of this research is systemically and complexly placed in the groove of cross-cultural, gender and intersectional pedagogy. Women's migration is not thought of as a generalized indistinct; rather, it is taken up with its full range of specificity, vulnerability and revolutionary charge. Migration has already been considered as a total social fact (Sayad, 2001); women's migration is a total social fact to be analyzed also from a gendered perspective: the damned of the earth are doubly fragile migrants, they have bumpy routes much more than those of male migrants and are, in fact, the new Sisyphuses. (Vaccarelli, 2019). As argued by Fiorucci, the underlying idea that gives rise to this thesis embraces the idea that pedagogy can only be intercultural per se, and that:

Interculture if it does not want to become rhetoric is an essentially political task, intertwined as it is with cultural conflicts, socioeconomic differences, diversity management, migrant rights, democratic development and the promotion of equal rights among all citizens (Fiorucci 2020, 43).

The intersectional perspective, in hooks' engaged and feminist pedagogical interpretation, appears to be a good frame of meaning in which to move and position oneself and from which to draw in theoretical references.

### **2.2. Methodological note**

Constructivist Grounded Theory (Charmaz, 2014) appears to be a good methodology for this context: flexible, antidogmatic, open-ended, recursive, and, above all, constructivist, that is, connoted in a sense that is inclusive and oriented toward enhancing the target's experiences. It is a flexible heuristic strategy that turns an ever-watchful eye to the researcher's theoretical sensibility and the ways in which meanings are constructed. It suggests that we study the context of the reception of trafficked women starting not from an epistemic question, but from a socio-educational problem perceived as relevant by the components of the community involved: operators, mediators, educators, social workers, psychologists and beneficiaries.

### 2.3. The research process

I was involved in the data analysis along with a theoretical sampling that was channelled into over 40 intensive interviews, 2 focus groups and analysis also of interviews with privileged witnesses working in the anti-trafficking network. In the open coding phases I elaborated about 500 labels, through a process of abstraction and comparison, then I arrived at the focused coding with 30 provisional categories in total and, finally, at the 9 categories identified through the process of focused coding propedeutic to the theoretical one. Finally, the 5 core categories emerged, in a process that lasted 3 years.

- Becoming competent in/for SAI. Several properties converge within this category that refer to the training needs of the multi-professional team, their need for intercultural and gender pedagogical training, the need to approach and be aware of acting a committed militant pedagogy. Furthermore, as an explanatory property to this category, the SAI is configured as a true educating community, a microcosm within which dynamics and relationships coexist for a goal of good, improvement and emancipation.
- A language to be and a device to act. This category gives an account of the explanatory properties relating to the training needs of the target group with a specific focus on learning Italian L2 and of the design tools. Literacy is configured as a complex path of emancipation, which is 'much more' than learning a language or obtaining a qualification. Mastery of the Italian language must not be instrumental and colonising but capable of guaranteeing autonomy and reorienting one's education. The learning paths are all tied to the certainty, not only of the immediacy of the moment, but to the acquisition of skills aimed at full and effective inclusion and the reconquest of one's individual autonomy, understood as effective emancipation from their need for temporary assistance (Catarci, 2019).
- It is never how we would like it: co-constructing in a challenging context. The explanatory properties relating to anxieties, unexpectedness, difficulties and emergencies, the frustration of an area that is set up as pretending to be welcoming and the fear of failure on the part of both the pedagogically oriented professions and the target group converge in this category. The economic and social devaluation of those who work in the SAI, the prejudices against the beneficiaries but also against the professionals. The theme of being born out and the materiality,

sometimes very different, from what one has read and studied in manuals and the hyper-procedurality of bureaucratic practices that are sometimes dehumanising.

- Juju ritual and migration trauma. This category recalls ancestral and hyper problematic issues that come to the fore as an impediment to pathways to well-being and health. It recalls the avoidance of clandestine voluntary termination of pregnancy one of the most painful issues but also one of the most challenging from an educational point of view because it goes to the crossroads of culture, traditions, use of one's own body, vision of oneself and vision of the social status linked to motherhood. It is a category in which powerful conceptual knots come together that are difficult to untangle and that are still very much tied to a traditional rituality and syncretic spirituality that we cannot disregard and that the educator must necessarily take into account.
- Nigerian's fighters. In the latter category we find properties such as pedagogical hope (Freire, 2014), resilience and resistance (Lopez, 2018), the ability to redefine trauma (Beneduce, 2010), and one's agency. Thus, the ability to know how to reinvent oneself, to be able to bet on oneself anew. There is a clear reference to emancipatory practices that must not be imposed from above but shared with the beneficiaries: their motivation to want to regain possession of their own existence.

### **3. THE EMERGENT THEORY**

- The emergent theory arises from a comparison and recursive dialogue between the five core categories; as in the best auspices of CGT an attempt was made to elaborate a grounded theory that would put all the categories that emerged into dialogue by valorising their intersectional bearing. Essentially, the theorisation suggests 'what not to do', i.e., not to trivialise beliefs and experiences and, above all, to value a critical vision in educational processes, i.e. not to lower projects from above but to make actors, figures with pedagogical value, capable of forming themselves and being immersed in the work that takes place on a daily basis. This interpretative theory suggests that we aspire to be operational: uniting theories and practices to become a tool for facilitating and improving work and projects in the SAI, enhancing the aspirations of the entire sample involved, imagining and acting as an

educating community: becoming competent, continuously training, meta-thinking, supervising and involving the entire team in all the steps: going round the world while standing still. This means deconstructing our cultural clothes that lead us to act education in a sometimes ethnocentric and uncritical sense and to act in a decolonial way. Not imposing a pedagogical colonisation, imagining what the beneficiaries need without considering their point of view and without giving them a voice. To avoid this colonising drift, it is necessary to redefine processes, practices and concrete proposals together on the basis of what is really useful and what is really shared.

# ALIAS CAREER AND NON-BINARY STUDENTS IN THE ITALIAN EDUCATIONAL INSTITUTION

Richard Bourelly<sup>a</sup>

<sup>a</sup>Sapienza University of Rome

This contribution describes the challenges non-binary students face in Italian secondary schools by analysing the alias career (*carriera alias*) regulations of 344 secondary schools. This school policy ensures that trans\* students can use their chosen name on unofficial school documentation. While some tertiary institutions with the alias career have removed pathologising requirements, such as the requirement for a diagnosis, secondary education remains fragmented. As a result, non-binary individuals, especially those who do not pursue a medicalised transition, are particularly affected. The analysis found significant variation in eligibility criteria. Moreover, only a minority of schools used gender-neutral language within the regulations, with most institutions opting for the generic masculine or binary endings. Additionally, access to gender-neutral spaces, such as bathrooms and locker rooms, is severely lacking and sometimes not offered to the broader school community. To conclude, the study highlights the barriers non-binary students face, including the lack of nationwide standards, gatekeeping practices, and insufficient understanding of their needs.

non-binary; trans; education; *carriera alias*; Italy

## INTRODUCTION

Since the 2018/2019 school year, Italian schools of all levels have started to adopt the alias career (*carriera alias*). This school policy aims to allow trans\*<sup>1</sup> pupils to use their chosen names and pronouns through a confidentiality agreement. A minority of schools also allow trans\* students to use their chosen

---

<sup>1</sup> In this paper, the word 'trans\*' will be used as an umbrella term for people whose gender identity is not congruent with their gender assigned at birth. When only binary or non-binary identities are relevant, the distinction will be specified.

bathroom and locker room, train their teaching and non-teaching staff, and educate students on LGBTQIA+ issues.

The University of Turin first established the alias career as a substitute for the *doppio libretto*. In this similar policy, trans\* students were given a second (physical) student's record book with their chosen name. During the last years, it faced many changes in some universities under the request of trans\* students, such as at the University of Bologna, the University of Palermo and the Sapienza University of Rome, where the mandatory requirement of a diagnosis of gender incongruence/gender dysphoria was abolished. This demand stemmed from the need to eradicate pathologising requirements and to allow access to all trans\* students, including those with non-binary gender identities. Even though there have been significant steps forward in tertiary education, the pathologisation of the alias career persists in most secondary schools, with 75% requiring a diagnosis as of August 2023 (Bourelly, 2024). As a result, many trans\* students face difficulties in accessing support at school. In particular, non-binary pupils may not qualify for the alias career, especially those not wishing for a medicalised gender transition. This demand also excludes all those who live in a city or region without gender clinics and LGBTQIA+ associations and do not have the economic means for a private psychologist specialising in gender incongruence or travel to access public care.

This contribution, part of a larger doctoral research project, describes the accessibility issues of the alias career for non-binary pupils through the regulations of secondary schools that have adopted the policy by August 14, 2024.

## **1. NON-BINARY PEOPLE AND EDUCATION**

The school experience of trans\* pupils is usually defined by bullying, marginalisation and victimisation. Macro and microaggressions also characterise their experience, usually by denying the use of their names and pronouns. As a result, mental health, academic performance and classroom engagement might suffer, leading to absenteeism and dropping out (McBride, 2021).

Non-binary students face further unique challenges (Johnson et al., 2020) related to their gender identity, which usually is not recognised as authentic due to gender binarism. The invalidation of their identities also stems from adultism, as adults within the institute usually position themselves as more knowledgeable than learners and thus do not believe they can comprehend their

gender.

Non-binary students can also encounter difficulties when navigating gender-segregated spaces such as bathrooms, locker rooms, and physical education, as most schools in Italy do not provide gender-neutral facilities. Indeed, the binary nature of gendered spaces in most schools can lead to non-binary students feeling excluded, uncomfortable, or forced to conform to an identity that does not align with their own (Johnson et al., 2020; Paechter et al., 2021).

Additionally, the lack of gender-neutral pronouns and endings in Italian contributes to isolation (Johnson et al., 2020), as students may not find their identities reflected in the language used by their teachers and peers. While options like gender-neutral symbols (\*, @), the ending in 'u' or the *schwa* (singular ə and plural ɜ) have emerged, they are mainly used in queer spaces and often face resistance from the broader community (Manera, 2021).

## 2. METHOD

This contribution draws from the author's extensive exploratory mixed-method research project (Bourelly, 2023; 2024). The project aimed to map schools adopting the alias career, analyse the regulations of 344 upper secondary schools, and gather insights from binary trans\* students, principals, teachers, parents, and activists with first-hand experience with the policy. While direct interviews with non-binary students would have provided critical insights, limitations in accessibility and participation meant that their perspectives were not represented through first-hand accounts. Indeed, further research is needed to explore non-binary students' experience with the alias career comprehensively.

This study qualitatively analysed the regulations of 344 upper secondary schools to explore how the alias career is designed to support non-binary pupils, *de iure*. The analysis focused on identifying themes and examining potential implications for non-binary students seeking support at school. Particular attention was given to various aspects of the alias career regulations, including the language used (binary or gender-neutral), schools' specific requirements for accessing support and gendered spaces.

The analysis reveals potential challenges and barriers non-binary pupils might face before or after requesting the alias career. These findings represent a preliminary step in addressing broader questions of inclusivity, representation, and the perceptions and pre-conceptions schools hold regarding the trans\* population.

### 3. CAN NON-BINARY STUDENTS ACCESS THE ALIAS CAREER?

The school regulations governing the activation and implementation of the alias career can vary significantly across institutions. Due to the lack of an official stance from the Ministry of Education and the discretionary authority granted by School Autonomy (Benadusi et al., 2020), no national regulations or best practices are recommended to schools. As a result, the alias career school regulations are fragmented, with no standardised support for trans\* students across institutions.

Starting with the language used within the regulations, of the 344 institutions analysed, only 15 adopted gender-neutral language using the *schwa* or asterisks. Most schools, however, use both masculine and feminine endings, while some use the generic masculine. Even when gender-neutral language is used in the alias career regulations, it is often not extended to other documents and information available on schools' websites. This disparity suggests that gender-neutral language is primarily intended for information dedicated to trans\* pupils and not the broader school community. The only known exception is Liceo Cavour (Turin), which stopped using gendered language and adopted the asterisk for official communication, such as school circulars (Sandrucci, 2021).

As a result, non-binary people who do not use gendered language for themselves may perceive the use of the alias career regulations as problematic and that the policy is aimed only at binary trans\* students. This sentiment is also reflected in the differing requirements for activating the alias career. While most schools require a diagnosis of gender dysphoria/gender incongruence to access support, some institutions impose even more stringent conditions. For instance, Istituto Via delle Sette Chiese (2022) requires students to undergo gender-affirming hormone therapy before receiving support. Liceo Benedetti-Tommaseo (2023) sets even more extreme conditions, requesting that students initiate legal proceedings to change their name and gender marker. These unnecessary demands add psychological and financial burdens to families and adult students, reinforcing cisnormative and medicalised views of trans\* identities and excluding those unable to meet such standards.

Further gatekeeping exists in some institutions (e.g., Istituto Olivelli-Putelli, 2023), where the school principal may decide on a case-by-case basis whether to grant the alias career. Personal values, such as whether a student appears 'feminine' or 'masculine' enough to be considered trans\*, may influence decision-making. This particularly impacts non-binary individuals and those

with diverse gender expressions (Johnson et al., 2020; Paechter et al., 2021).

Binary gender biases are also evident in gendered spaces, such as bathrooms, changing rooms and physical education classes (Mcbride, 2021). For instance, while some schools allow students to use the bathroom corresponding to their gender identity, many do not provide a gender-neutral option, thus excluding individuals not wishing to use gendered facilities. Some schools, such as Liceo L. Manara (2022), have instituted gender-neutral bathrooms accessible to all students. However, others allow only students with the alias career to use these bathrooms (e.g., Liceo S. di Giacomo, 2022), which can severely compromise their privacy and safety.

The documents examined show that the variation in school regulations concerning the alias career, from the language used to activation requirements, highlights significant barriers to inclusion and support for non-binary students. While some schools attempt to provide gender-neutral spaces and use gender-neutral language, most institutions reinforce binary gender identities and norms. These discrepancies between institutions demonstrate the need for a unified and inclusive approach to support all gender identities within the Italian educational institution. This should begin with comprehensive training on the diverse needs of the trans\* community, leading to policies that consider these differences.

## **CONCLUSIONS**

To conclude, despite some schools' favourable regulations and practices for non-binary pupils, the landscape is highly fragmented, with many students facing gatekeeping. Indeed, there are several limitations to the alias career, as most schools aim the policy at binary trans\* students and not the broader trans\* community.

To ensure that all students, regardless of gender identity, feel included and supported at school, it is essential that the Ministry of Education establishes national non-pathologising regulations and provides best practices to implement in all schools. In the meantime, schools' alias career regulations must be revised to include gender-neutral language. Additionally, gender-neutral language must not be used only in documentation addressed to trans\* students but also to the broader school community. It is also important to emphasise that the policy is aimed at all trans\* pupils and provides gender-neutral spaces for all students. To ensure that non-binary students' needs are addressed, their families (and transgender associations) must be consulted to

explore and understand their needs.

Lastly, training on trans\* identities for both teaching and non-teaching staff and education on gender diversity for students in alignment with the National 2022-2025 LGBT+ strategy (Ufficio Nazionale Antidiscriminazioni Razziali, 2022) is essential. These educational initiatives are vital to address the lack of understanding of trans\* identities and gender binarism within the educational institution (Johnson et al., 2020; Paechter et al., 2021).

# LEARNING ABOUT THE QUEER. DECONDITIONING IMAGINARIES AND EDUCATION

Silvia Nanni  
University of L'Aquila (Italy)

Five years after the research study conducted in Italy and Spain by Vaccarelli, Fiorenza, Di Genova (2021), aimed at studying the attitudes of future teachers and social workers towards educational issues related to sexual orientation – my proposal intends to deepen and explore through a qualitative methodological approach how again the social background, the level and quality of the information possessed correlate with attitudes linked to educational issues related to sexual orientation. The research will be based on focus groups aimed at university students from the degree courses in Educational Sciences, Primary Education and Social Services at the University of L'Aquila. The focus groups will collect qualitative data through comparison and open dialogue between male and female students of the indicated study courses on some specific themes regarding their level of awareness of the LGBTIA+ reality. We will also try to understand whether they are aware of the need for education to assume a queer perspective (Burgio, 2012) that takes the principle of complexity (Borruso, Gallelli, Seveso, 2023) as a shared basis and question ourselves about gender education (Butler, 2014; Nanni, Di Genova, 2023).

LGBTIA+, training, Focus group, pedagogy, queer

## INTRODUCTION

The research presented at the Third International Conference of the Journal “Scuola Democratica” is the result of some reflections generated by the ongoing debate in both the political and the cultural public sphere on gender discrimination, civil rights of LGBTQI+ people and educational and pedagogical principles to be followed in that regard. From many sides, attempts have been made to propose such guidelines with the necessary openness related to the

historical time we live in, in which the freedom of expression of personal identity – including sexuality – has become the new frontier in the affirmation of human rights.

In the world of education, the attack is aimed not only at materials used in teaching, but also at institutional documents that *simply* talk about gender equality and equal opportunity in the prevention of discrimination and unequal treatment. For example, some passages of the so-called “Legge della Buona Scuola” (*Good School Law*) (Law 107/2015) that explicitly call for ensuring the education for gender equality and the prevention of gender-based violence and all forms of discrimination, or the guidelines that the Ministry of Education has issued on this matter (MIUR, 2015a) have come under attack. Under attack, moreover, are certain World Health Organization documents proposing new *standards* for sex education in Europe (with Italy being dormant on this issue in the European scenario) or focusing on educational problems related to homophobic bullying as well.

In recent years, attempts have been made to construct the idea that an alleged gender ideology was circulating (see Accolla, 2015; Grimaldi, 2015), which constitutes a true social danger, aimed at confusing and undermining the ground of both girls’ and boys’ sexual identity. This operation has silenced many voices that, even from below, have experienced embarrassment over this issue. It put school administrators and teachers in a situation of indecision, bewilderment and fear, even where certain pedagogical intentions could have been expressed, and affirmed the paradigm of silence that, according to Pietrantoni, Prati and Saccinto (2011, p. 75), processes the homosexuality as a too delicate and unapproachable taboo subject.

## **1. WHY SHOULD EDUCATIONAL RESEARCH BE INTERESTED IN THESE QUESTIONS?**

Why should pedagogical inquiry – both the more reflective and the experimental one – care about such questions, at the risk of seeming inconvenient? How much do the resulting problems affect those dimensions of education and training that concern educators, teachers and professionals working in social services?

- The pedagogical inquiry should be more concerned with such issues because, in the face of forces that are hostile to change, there is a world in motion. This world is real and manifest in its contradictory nature, and raises every day stringent questions about which substantial actions are needed (let us think about the homophobic bullying in schools and the

discrimination and harassment of LGBTQI+ people);

- Even today, in common sense and social interactions, as gender studies and pedagogy demonstrate (Burgio, 2015; Ulivieri, 2015, Burgio&Lopez, 2023), there is a tendency to naturalize those differences, which are instead the result of a long process of historical, social and cultural construction, implicitly mediated by the education in all its expressions (Nanni, 2023). One can think of “boys” and “girls” games, educational models that are never gender-neutral (Biemmi 2017), conditionings that eventually permeate the body, identity, future perspectives and interpersonal relationships. This is where the – implicit, unaware, “conditioned” – education becomes pedagogy, when it succeeds in reflecting, knowing and deconstructing, with the aim of becoming conscious education again, free from conditioning and respectful of individual inclinations.

The deconstruction of binarism occurs through a process of decolonization of the imagination of professionals with the aim of deconditioning education from gender stereotypes and prejudices – even (or above all) implicit ones.

The researches on this focus were conducted by the pedagogy group at the University of L’Aquila and presented in February at the CIEG (Centro Interdisciplinar de Estudos de Género) International Congress “Social Gender, Feminist and Women’s Studies: knowledge, public policies and social justice” at the University of Lisbon.

From these considerations and five years after the research conducted in Italy and Spain by Vaccarelli, Fiorenza, and Di Genova (2021) – aimed at studying the attitudes of future teachers and social workers towards educational issues related to sexual orientation – the following research framework and design are constructed.

The latter started from the assumption that the processes of education and socialization are to some extent predictive of the future construction of attitudes. It was hypothesized that the type of education received at all levels (formal, informal and non-formal) plays an important role in the social reproduction of the *status quo* or, on the opposite, in the establishment of more open and change-oriented positions.

The research focused on the need to explore the level of knowledge of female and male university students – from the degree courses of Science in Primary Education, Science in Education and Science in Social Service at the University of L’Aquila – and how much their level and quality of information about gender

studies were related to educational issues connected to sexual orientation.

## 2. EDUCATIONAL RESEARCH ON GENDER ISSUES

The research was carried out from February to May 2024; for data collection, it involved three focus groups targeting male and female students of the three Bachelor’s degree courses. This was followed by three structured interviews with one member of each group on a voluntary basis to implement some dimensions that emerged from the thematic analysis carried out with the MAXQDA software.

The focus groups and interviews were audio recorded and transcribed verbatim. The interviews, each lasting about one hour, were conducted via videoconference using a structured outline that addressed the following questions:

- Does the social background influence the attitudes and opinions related to educational issues connected to sexual orientation? If yes, in which way?
- How would you rate your own level of knowledge on LGBTQIA+ themes?
- Do you think that access to information on the topic is easy and affordable for everyone in any setting (school, university)?
- Do you know the meaning of the term intersectionality?
- As a future educator, teacher, social worker what do you believe is the role of gender education and what practices would you put in place? What do you propose?

The process of content analysis of the texts led to the creation of a codebook (DeCuir-Gunby, Marshall, McCulloch, 2011) (Tab. 1)

Tab. 1. The Codebook

Category code	Subcode	Excerpts
Considerations about one’s academic path	The internship as an educational experience Need for more practice in the university Positive experiences with courses, workshops or seminars Perceived need for more specific courses Desire to keep the university open to the territory	The internship as an educational experience “Personally, as you say, the internship is the thing that has helped me the most. I’m now in my third year, I’m almost finished, and the

	Need to train trainers/educators	<p>internship is the experience that has helped me the most, because it allowed me to put in place the not only theoretical teachings that we have learned in this course of study and, at the same time, it allowed me to see how some issues are not dealt with or preferred not to be dealt with to avoid any problems. Yet maybe the problem begins right there, as educators we should experiment more, inform ourselves more and then try to put in place new practices that can involve everyone.”</p> <p>Perceived need for more specific courses</p> <p>“Well, maybe I would include a course in gender pedagogy also in the three-year degree course that at any rate can give you at least the basic training to then go further on specific dynamics in the Master’s degree course. I think it would be good, useful, necessary,</p>
--	----------------------------------	--

		<p>and could arouse personal interest from each of us”</p> <p>Desire to keep the university open to the territory</p> <p>“Debate is also important because then, I mean maybe, those who come to the university have the opportunity to access certain topics, while still those who do not come to the university risk to be left without this knowledge.”</p> <p>Need to train trainers/educators</p> <p>“In my opinion, before introducing it at the educational level, there should be some training of the people involved on these issues. What I mean is that you can’t disregard something like this, otherwise the education obviously fails, so for sure an investment needs to be made primarily on us and then on those who have to receive and learn these teachings, if we really want a change from this point of view and therefore a greater inclusion.”</p>
--	--	---

<p>Proposals for educational practices</p>	<p>Use of game-play and drawing during workshops  Use of illustrated books  Updating textbooks  Educating adult parents about gender  Implementing the curriculum  Addressing issues on a daily basis  Starting with children  Admitting lack of ideas for educating about gender</p>	<p>Implementing the curriculum/Addressing issues on a daily basis  “I think that in the curriculum of any subject, or rather of the subjects that most allow it, like literature, history, art, music, perhaps also mathematics, there have been personalities like Alan Turing, who could be food for thought. It’s good to include them in the curriculum, without bringing them out as exclusive events, but as foundational elements, also talking about personalities or events or works of any kind that relate to the LGBTQ+ world. That could certainly work anyway, because you put it into the curriculum and then it can be passed to the children as something on the agenda, not just as something exceptional. This can be done also with racism, with the Shoah.”    “(…) especially, maybe, not to be</p>
--	---	---

		<p>reduced to just a lecture, on a given day, without a continuation, because in the end that's what it is, but it should be also something a little bit structured and lasting (...)"</p> <p>Admitting lack of ideas for educating about gender  "Honestly, I wouldn't be the one to start this."  "I couldn't really tell what tools are actually used"</p>
--	--	---

For all the constructs (supercodes), subcodes have been developed that, in the economy of this paper, will not all be explored here and will relate to:

- Participants' perceptions and sensitivity;
- Participants' statements and stances;
- Biographical experiences;
- Analysis of the emerging topics that demonstrate a familiarity with LGBTQIA+ issues.

The evidence that questions the pedagogical world at various levels is the need for more training and, at the same time, the inability to formulate a structured response to the need itself. The impact this scenario may have in the educational and social professions of the future is evident and requires scientific answers. It is imperative, as this research briefly illustrates and demonstrates, to demand teachers, educators and social workers who have theoretical awareness and adequate knowledge, free from prejudices and pathologizing views related to the gender issue. Academic training must necessarily consider this, and it is necessary to equip oneself (Batini, 2011) regarding modalities, themes and methodologies, especially by decolonizing views and beliefs.

There is a need to reflect on and deliver education from a queer perspective

(Burgio, 2012) that takes the principle of complexity (Borruso, Gallelli, Seveso, 2023) as a shared basis and that investigates the gender education (Butler, 2014; Nanni, Di Genova, 2023). By bearing in mind that there is no single theory of gender, nor a single way to do gender education, and that the debate about genders, identities and intersectional oppressions is in constant evolution, as it is the process of deconstruction and co-reconstruction, educating for genders thus results in educating for multiplicity as an openness to intersectionality.

# HOMOSEXUAL SONS AND DAUGHTERS: WHY WE SHOULD UNDERSTAND, SUP- PORT AND LOVE THEM

Massimiliano Stramaglia  
University of Macerata

This essay is divided into three parts. The first part consists of a theoretical overview: it is a reflection on the problem of parents' 'non-acceptance' of homosexual sons and daughters through a targeted psycho-pedagogical analysis. The focus is not so much on the different sexual orientations considered by the LGBTQ+ community, but on the specific case history of homosexual orientation perceived by the parent or declared by the child. The second part focuses on the collection of statistically irrelevant and purely experiential data through research-stimulus of two classes of students at the University of Macerata. The research-stimulus, conducted by the administration – on a voluntary basis – of a questionnaire, makes it possible to activate a circuit of projective mediation which, starting from the requisite return of the results and simple classroom debate on the data collected, makes it possible to imagine and to see oneself in the circumstances envisaged and to elaborate representations of oneself, with oneself and with others, should the circumstances turn out to be true. The third and last part reports on some of the countless intellectual stimuli that emerged during a long-distance interview with Dr Fiorenzo Gimelli, Honorary President of AGEDO (Association of Parents, Families and Friends of LGBTQ+ People), on the subject in question.

family; school; education; inclusion; homosexuality

## 1. HOMOSEXUAL SONS AND DAUGHTERS: “NON-ACCEPTANCE” AS AN EDUCATIONAL PROBLEM

Although society is evolving in terms of the accumulation of knowledge, openness towards homosexuality is still not a given. In some countries, homosexuality is still considered a crime (<https://rainbowmap.ilga-europe.org/files/uploads/2024/05/2024-rainbow-map.pdf>). Monotheistic religions deny the possibility of same-sex relationships. In Italy, homosexuals

are discriminated against in terms of both social policies and civil rights. Within this framework, the first problem we should ask ourselves is with regards to the reception of homosexuals by their families, especially their parents. Parents are the point of reference for every child. If they indirectly communicate to the child, through the words and gestures they exchange with each other, judgments of intolerance or fear of homosexuality, the child will learn that homosexual people are unworthy and that one must “be afraid” of them. If we look at the comedies of the 1970s and 1980s, sarcastic jokes aimed at male homosexuals are abundant: in those societies, being attracted to people of the same sex is considered ridiculous, if not downright despicable. In the 1980s, among other things, male homosexuals were perceived as carriers of HIV because it was believed that the virus was more easily transmitted through intimate contact with anal mucosa. On the contrary, extensive research on the subject has shown that, at least up to ten years ago, most male homosexual couples have anal intercourse infrequently or not at all (cf. Stramaglia, 2015a). However, anal intercourse is also present in heterosexual couples. The problem of preventing risky behaviour does not concern homosexual orientation, but the correct dissemination of information. The long wave of intolerance and discrimination only crashed hard against the rock of the LGBTQ+ community (which includes homosexual people) in the late 1990s, a time when young people attracted to people of the same sex began to express class consciousness, claiming their right to love. It is no coincidence that it was not until 1990 that homosexuality was removed from the Diagnostic and Statistical Manual of Mental Disorders. In the 2000s, there is talk on many fronts of the “normality” of homosexual orientation: it is finally understood, awakening consciences from the torpor of the bourgeois, classist and patriarchal education of the previous decades, that homosexuality is not a pathology and not even a perversion.

Parents, however, do not always accept that their child is homosexual, and the child does not feel accepted for this reason. Accepting their child’s homosexuality means to become aware of it, to stop wondering: “Where did I go wrong?”, recognising the dignity of their child’s sexual orientation and wanting what is good for them. The real issue is not whether the child is homosexual, but whether they are at peace. Many parents (most often fathers) pretend that their children can be happy by pretending to be heterosexual: this is an act of arrogance, which hides a deep parental egocentrism and, above all, a feeling of shame and guilt for what the child may represent in the eyes of others (cf. Terriaca and Baiocco, 2019). The truth, on a psychological level, is another. All of us as human beings fear death (cf. Malavasi, 1985). Those who are unable to

produce works of the spirit or are not at peace with the idea of death may come to believe that they become eternal through their children who prolong the lineage. When a son or daughter declares themselves to be homosexual, the most common scenarios are as follows:

- in the case of an only child, parents are concretely confronted with the idea of death and end up blaming the child in order to not admit that, sooner or later, they themselves will die;
- in the case of families with several children, homosexuals are perceived (in some cases) as “black sheep”: as those who have more problems than their brothers and sisters (who will generate, or have generated, grandchildren) or as symbols of their own “failure”, because life that does not generate life is “death”, or decline (radicalisation of emotional blackmail).

Not accepting homosexual children means deluding oneself that one is eternal: if the father and mother are not self-aware parents and have chosen to have children because “that’s what people do,” the result is that homosexual children are marginalised, not recognised, nor loved to the full. On the contrary, they need their parents’ love even more, because their life can only be fulfilling if they feel understood *from the very beginning*. Another “excuse” used by parents for not accepting homosexual children goes something like this: “I accept you, but society does not accept homosexual people”. In reality, on a psychological level, this is nothing more than a projection, i.e. a defence mechanism that consists of attributing personal thoughts to others. The projection, often unconscious, hides the parental inability to take responsibility (cf. Freud, 1961). If the child is homosexual, the correct statement is: “I welcome you: therefore, you will *also* be welcomed by society”. A parent who welcomes, recognises and loves their child convinces them of their worth, and this positively influences their social contacts. In contrast, a child who is not accepted by their parents will think: “If my father and mother do not understand me, how will anyone else understand me?”. In this way, parents become the children’s tormentors. Most probably, these are parents who themselves were not loved as children. But this is not a justification. As the historian Badinter (2012) states, psychological justifications for our actions do not apply when there are common sense reasons. To not accept a homosexual child is to give them death: here is the reversal of the above projection. “You, son/daughter, are telling me that you will not give me any more children, that I will not be eternal; I prefer, therefore, that it is you who will die”. Parents can be supported in the

development of an accepting attitude by means of a few measures.

First of all, avoid exaggerated reactions: these block the communication process, so a more rational and less emotional approach is preferable. Of course, the parent will feel bewildered at first, but the bewilderment should not affect the relationship with the child, otherwise there is a risk of remaining entrenched in one's own positions and communicating nothing meaningful or conciliatory.

Secondly, asking oneself what is really frightening about homosexuality: beyond the child, what *actually* changes in *one's own* life if they discover that they are homosexual? Very often, parental fear stems from the difficulty of facing the opinions of others: "What will they think? What will they say?". Well, everyone, even if we behave impeccably, always has "something to say" about us. Starting from the assumption that we are still subject to judgement relieves us of the fear of others' prejudices. In a scale of values, however, the child should come first, then the others. A child who does not feel accepted by their parents will find it difficult to accept themselves and others, will tend to isolate themselves, and will seek insubstantial social relationships with all the attendant risks. We learn to love our children: we do not judge them. We brought them into the world, something they never asked us to do.

## 2. THE EXPERIENTIAL DATUM: A RESEARCH-STIMULUS EXAMPLE

The research-stimulus presented here was conducted with two classes of students at the University of Macerata on a voluntary basis. A short questionnaire was administered to the students and filled out within ten minutes. The small and statistically unrepresentative number of the sample made the research an *opportunity to reflect* together on the topic in question, without any claim to exhaustiveness. The data were returned and accepted. The instrument chosen to be administered was the following:

Sex:  
.....

Age:  
.....

Degree course:  
.....

Sexual orientation:  
.....

1. Would you like to have a child? (only if you do not have any)

- YES
- NO
- MAYBE
- I DON'T KNOW

2. If you answered YES or MAYBE to the first question, would you rather have a boy or a girl?

- BOY
- GIRL
- I WOULD BE HAPPY EITHER WAY
- I DON'T KNOW

3. If you answered YES or MAYBE in the first question, would you like to have only one child or more than one child?

- ONLY ONE CHILD
- AT LEAST TWO CHILDREN
- AT LEAST THREE CHILDREN
- I DON'T KNOW

4. If one of your children, male or female, told you when they were 15 that they were homosexual, how would you react?

- I WOULD ACCEPT THEIR SEXUAL ORIENTATION
- I WOULD NOT ACCEPT THEIR SEXUAL ORIENTATION
- I WOULD ASK MYSELF WHERE I WENT WRONG
- I DON'T KNOW

What do you think about homosexuality?

-----  
-----  
-----

With regard to gender distribution (male or female), as is the case for humanities courses, the representation of the male sex is radically low. The average age for males is 24; for females, 21. With regard to males, the average betrays the objective fact: one male is 21, another is 27. Here, we prefer to omit mentioning the specific degree courses in which female students are enrolled for obvious reasons of confidentiality.

None of the students are parents. Although this is an insignificant and statistically unrepresentative sample (27 students), there are 4 “minority” sexual orientations (1 “homosexual”, 1 “bisexual”, 1 “pansexual”, 1 “transgender”). In one case, however, the student confused gender identity with sexual orientation (“transgender”). To the question: “Would you like to have a

child?”, 0 students answered NO. To the question: “Would you rather have a boy a girl?”, 0 students answered I DON’T KNOW but 24 students answered: “I would be happy with either way”.

The age of *coming out* was set at 15 years in order not to distract the students’ attention from other factors (such as moral judgments, etc.): indeed, it is commonly believed that, at 15 years of age, a teenager can at least have an *idea* of their sexual orientation without being treated as a child by the adults concerned. When asked: “How would you react to your child coming out?”, there were 4 students who stated that they did not know how they would react.

When asked the open-ended and general question: “What do you think about homosexuality?”, 25 students described it as a “normal” variant of sexual orientation, while 2 heterosexual students “do not know what to think”. Nevertheless, 2 heterosexual students who consider homosexuality a “normal” variant of sexual orientation do not know whether or not they would “accept” a homosexual son or daughter.

Some of the open-ended responses provided are worth mentioning, as they open up the need for an *open and clean debate* on this issue both within the family and within the school and the entire civic community, expressing, however, some contradictions in terms:

Personally, I consider homosexuality to be a normal aspect of human nature. Anyone is free to live their sexual orientation openly, without fear and/or reservation (male, heterosexual, does not know how he would react to a son or daughter coming out)

...loving a person of one’s own or the opposite sex does not harm or disturb anyone. I think that homosexuality is also *an issue to be dealt with in the family* (female, heterosexual).

Homosexuality, in today’s society, is still a taboo. (...) *strategies of awareness and respect* should be applied *from an early school age* (female, heterosexual).

In addition to the limitations already pointed out, the research-stimulus carried out presents further limitations: it is a small sample of male and female students, who may have felt “conditioned” in their choice to fill in the questionnaire by the authoritative role of the lecturer; the lecturer has a very clear orientation in favour of the rights of the LGBTQ+ community and this may have influenced them in their choice of answers. It should also be noted that these are students attending humanities degree courses and, therefore,

“inclined” towards issues related to a culture of inclusion.

### 3. INTERVIEW WITH FIORENZO GIMELLI: THE SOCIO-CULTURAL SIGNIFICANCE

This last paragraph aims to elaborate on some of the cultural stimuli that emerged from an interview with Dr Fiorenzo Gimelli, Honorary President of AGEDO (Association of Parents, Families and Friends of LGBTQ+ People), in line with the theoretical elaboration and the experiential data outlined so far. What parental *awareness* should be emerges from the interview: Gimelli states that a homosexual child, in the mind of a parent, “will have a harder life than others”. The stimulus is important to reflect on the interpretation of this awareness. It is true that being part of a minority makes life more difficult; it is also true that, in life, it is sometimes unavoidable to side with a minority position. The need for parents of a homosexual son/daughter to have a non-judgmental and supportive attitude towards their offspring is reconfirmed, precisely because of the greater harshness (a fact of life) that an “other” sexual orientation such as the one in question entails. According to Gimelli, “We need to move the issue from the level of value (ethics) to the level of identity (person): 1) it is pathological that coming out in Italy still exists; 2) we need sex and affectivity education in schools and in curricular form for everyone”. The stimulus provided allows us to move from the logic of inclusion to that of *normalisation*: it would be a civilisational step if no one were to declare their sexual orientation to anyone anymore; at the same time, today’s schools cannot avoid the task of educating on sexuality and affectivity – not in an ideological form, but as a *preventive* measure against the development of forms of social unease. He also states, “Young people claim their relationships, not just their human dignity, which belongs to everyone”. The problem is not only and not so much sexual orientation, but the *right to be a couple legitimately*, without incurring more or less covert or overt forms of discrimination (Stramaglia, 2015b). Gimelli notes the value of the most recent scientific discoveries: “(...) the variability of the human being is much greater than we once knew; now that knowledge has advanced, we must respect it”. Finally, according to Gimelli: “Very young people have less influence on the formation of laws than adults, they have little affection for politics and therefore, although they are open, they struggle to break down barriers”. The tasks of a democratic school are thus manifested in all their complexity: to promote socio-cultural integration processes through the promotion of a culture of *otherness* and *difference*; to enable all students to feel accepted and understood, providing them with the tools to understand reality in a non-doctrinal and non-politicised, but conscious manner (cf., for example, Burgio, 2022; Fiorucci,

2023); and engage in fruitful dialogue with families, in order to foster processes of shared growth and guarantee all sons and daughters the right to become healthy and happy adults.

# STEREOTYPED SOCIAL REPRESENTATIONS OF GENDER VIOLENCE AND MAFIA

Sabrina Garofalo<sup>a</sup>

<sup>a</sup>University of Calabria

Gender violence is substantial and structural to mafia power, useful to the reproduction of dynamics and hierarchies. The paper will share the results of the research on subjectivities when crossed by gender-based violence and mafia violence, in different contexts. The study also aims to contribute to the debate on actions and policies to contrast the mafia system, highlighting the relationships between the social dynamics of gender-based violence and those linked to the specificity of mafia violence, starting from the deconstruction of the imaginary and myths, to build paths linked to the liberation of bodies and the self-determination of subjectivities. The research was conducted with an intersectional approach, creating a specific matrix of domination to read and analyze the materials, through judicial sources, life stories and semi-structured interviews.

violence, mafia, women, human right

## INTRODUCTION

The contribution is part of a research project whose main objective is to analyze how mafia power legitimizes and supports gender-based violence, in contrast to the large number of stereotypes and prejudices on which the power of the mafia itself is based. On the other hand, the result of this work is that gender-based violence is also substantial and structural to the Mafia's power, functioning as a means of reproducing dynamics and hierarchies. This work is based on two premises: the first is the definition of the Mafia as a negation of democracy, specifically in terms of rights and freedoms; the second is the definition of gender violence as a violation of human rights. It is therefore possible to interpret the phenomenon of gender-based violence within mafias through the lens of political analysis, emphasizing how both gender violence and mafia violence are understood as violations of democracy. Consequently, it becomes

possible to activate measures of prevention and counteraction to violence that simultaneously serve as pathways toward the promotion of democracy.

## **1. VIOLENCE IN MAFIA ORGANIZATIONS**

In particular, the case study focuses on the ‘Ndrangheta, chosen for its specific characteristics as a power organization based on territory and family, with dynamics tied to the control of territories and bodies. The ‘Ndrangheta is characterized by a strong dialectic between elements linked to tradition and highly modern aspects. At the same time, it manages to maintain a strong connection with its territories of origin while organizing illicit and financial trafficking at a transnational level. Unlike other organizations, the ‘Ndrangheta builds its power on concepts such as honor, where mafia power itself—coinciding with male power—is constructed through female behavior. As mentioned in the introduction, it is necessary to change the perspective on the ‘Ndrangheta to deconstruct the founding stereotype of power itself and understand how the intersection of these two levels creates different dynamics and pathways of subjectivity. The stories analyzed and the common categories used can be read as a cross-sectional overview of the ways in which violence—both mafia and gender-based—is enacted, reproduced, and deconstructed. At the foundation of this reflection lies the necessary shift in perspective regarding the ‘Ndrangheta, which allows for the deconstruction of the founding stereotype of mafia power—‘women and children are untouchable’—while revealing the dynamics through which these two levels intersect, creating different subjectivities and pathways. The stories of women analyzed in previous studies on gender and mafia are silently permeated by the underlying thread of gender violence, which intersects with the dynamics of mafia violence. Where violence is understood as a foundational experience of mafia power, it triggers various dynamics that also influence gender relations. It is thus possible to observe the unfolding of a strategy that does not renounce violence. Silent dynamics of violence are employed to reproduce power strategies in everyday life within a ‘conditioned’ context. Alessandra Dino writes:

Violence creates bonds and relationships; it takes root in bodies, acts as an identity factor, a tool for the symbolic display of power, and a means to demarcate the boundaries of belonging and legitimacy. Yet it also pervades everyday life, intersecting the emotional sphere and the most significant issues of mafia identity: secrecy and power, death, fear, pain, guilt, repentance, and shame. (Dino, 2017, 255)

In this sense, violence is also used as a cognitive tool to identify the dynamics underlying recognition and disdain associated with women's subordination in mafia contexts. Consuelo Corradi states:

Violence, with its burden of injustice, opens a window onto the understanding of other social phenomena: family structures, child abuse, the improvement of social policies, women's emancipation, domestic deviance and crime, gender roles, and services for the reception and care of victims. (Corradi, 2016, 103)

By using violence as an interpretative category within the intersectional approach, the body and the link between the body and mafia power become central: a variety of different material conditions weigh on the female body when it becomes the performative site for the production of identity and mafia ideology.

The bodily dimension becomes crucial to the analysis. As previously discussed in the preceding chapter, control over bodies is an expression of power itself. Corradi (2016) further states: 'Violence gives shape to the victim's body,' in a clearly situated space and time, which become loci of control, interpreted in various forms.

Graziella Priulla (2016) adds: 'Social control is therefore founded on female sexuality. By regulating and domesticating it, society is effectively regulated on familial, political, economic, and symbolic levels.'

The bodily space thus becomes, as in the case of the women discussed in the previous chapter, a public space:

The female body is thus configured, unlike the male one, for its fertility potential, as a public place exposed to the scrutiny of the community, burdened with a series of objectifiable potentials, separable from the one who possesses them, and appropriable by the community itself. (Priulla, 2016, 172)

Violence, therefore, is not merely a tool for asserting power in Weberian terms: 'It is at once both a tool and the substance of action and identity (...) the subject (political, collective, or ethnic) who chooses violence is shaped by violence.' (Corradi, 2016, 19)

The mafia organization can thus be identified as a group that reproduces customs and processes of legitimation within an identity framework.

By considering the various explanatory theories of gender-based violence, it is

possible to identify the diverse ways in which violence can be interpreted and read in the everyday lives of the women analyzed. Firstly, this is represented as the socialization of men and women into traditional roles. This socialization occurs in a context where violence remains a silent backdrop, even within family history, identified as:

Violence silenced over the course of family history, which—just like the rigid behavioral codes that men, women, children, and adolescents must adhere to without the possibility of questioning them—strongly binds the process of subjectivation within a specific structure of these worlds. (International Journal of Psychoanalysis and Education – IJPE 2013 vol. V, n° 1)

It is important to draw on psychological analyses to understand how ‘mafia culture is all-encompassing, leaving no mental space unoccupied. It infantilizes and enforces concepts of care and protection that satisfy deep needs for attachment and security, sacrificing subjectivity and personal responsibility.’ Growing up in mafia contexts represents a complex process where socialization into gender roles leads individuals to perceive their situation as ‘natural,’ and therefore right and inevitable. The distinction of roles and the specificity of expectations are distinctive features of mafias, which ‘regenerate themselves in those who will come’ and engage in activities linked to ‘educational trafficking’ and the transfer of knowledge and practices.

The socialization processes of male and female roles, themes widely addressed in literature from various perspectives, can be understood here as acts and methods aimed at developing an idea of masculinity as hegemonic. In mafia contexts, it becomes evident that: Women are precious assets because of their essential capacity to procreate.

From the perspective of theories defined as ‘acquired vulnerability,’ central to this analysis is the self-perception of women as weak and men as strong. Socialization processes contribute to constructing an imaginary in which women are represented as weak subjects in need of protection, and men are portrayed as strong, violent, and justified in their actions. This legitimization aligns with theories of control and social exchange, where male impunity enables violent actions without the threat of sanction. The absence of sanction is also supported by masculinity theories, as highlighted by Connell (2015), which manifest in three forms:

- Social disdain for women, resulting in stereotypical views of them;
- Hegemonic masculinity, which emphasizes power, domination, and a

perceived right to exercise unlimited power both inside and outside the family;

- An environment that supports violence.

In this reconstruction of literature on gender-based violence in relation to mafia power, we must also consider patriarchal-gender theories, which argue that societies are: “Dominated by men and constructed in their image (...) Violence against women serves the unequal and unjust distribution of roles.” (Belmonte, Saccà 2022).

This interpretation, valid for organizations such as the ‘Ndrangheta, aligns with gender-power theories, which describe violence as instrumental to maintaining power through an unequal and hierarchical gender distribution. The objective of this contribution is to make visible how gender-based violence in mafia relationships is structural in its various forms and methods, and how it is necessary to give voice to survivors by reconstructing the stories of women murdered by the mafia, whose biographies speak through their erased bodies.

## **2. FROM LIFE STORIES TO POLITICAL PROPOSALS**

The research conducted in areas traditionally influenced by the ‘Ndrangheta, as well as in secondary infiltration contexts such as northern and central Italy, highlights acts of violence that fall under the definitions of gender-based violence. Such violence manifests in forms attributable to sexual, economic, physical, and psychological violence.

Testimonies of this specific violence are found in all stories, where the domination of women’s bodies, imposed by the logic of honor, translates into daily practices of isolation and control, ultimately limiting their personal freedom. Segregation and violence are intertwined elements driven by the imperative to control bodies, with acts of violence often experienced at a young age as a pedagogical tool for punishment. Family relationships are marked by violence, which also manifests as domestic violence in its various dimensions and forms. One woman recounts: “He beat me because I rebelled, because I said what I thought, and he attacked me to shut me up”.

An other important reflection can be linked to studies on the theme of recognition. To speak of violence in the terms of “denied recognition”, or of “missed recognition” can offer a further starting point for analysis and, above all, for the identification of new perspectives. In addition to defining violence as a violation of human rights, as evidenced by the Istanbul Convention and international treaties, the experience of women in the ‘ndrangheta contexts can

be read as a continuous reproduction of acts of contempt and humiliation, denial of dignity. Honneth writes: “The experience of contempt implies the risk of violence that can lead to the collapse of the identity of the whole person”. What we read in women’s stories is the denial of subjectivity, from isolation to femicide. Continuous offense and ‘contempt’ can be traced in biographies studied in continuous dynamics that also cancel what is identified as ‘spiral of violence’, defining simultaneously alternate forms of construction of tension, of explosion of violence and more or less reduced ‘honeymoons’. An element little treated in the literature is linked to the feelings of humiliation and mortification that lead subjectivities to activate mechanisms whereby the annulment of the self occurs gradually until resignation. The centrality of the bodies and the violence suffered as persons returns with force, as Honneth (1993) says “Forms of ill-treatment which by violence deprive a person of any possibility of freely disposing of his body represent the most elementary form of personal humiliation”.

The analyzed stories reveal different types of violence, from beatings to individual and group sexual violence, culminating in the killing of women for reasons tied to honor. All of this has roots in mafia socialization models and role expectations—particularly within the ‘Ndrangheta—operating within a patriarchal and male-dominated logic of power.

From this reflection, the contribution seeks to identify new tools within the educational sphere to promote prevention and counteraction strategies. This reflection focuses on activities and projects in schools, at the intersection of two themes: the fight against the ‘Ndrangheta and the fight against gender-based violence.

This analysis must consider the mediatization of the women and ‘Ndrangheta’ theme, which has created a thematic trend influencing public debate in Calabria. In addition to television fiction on the subject, the past three years have seen the production of journalistic investigations, narrative texts, and theatrical works. While these initiatives have shed light on the stories of women victims of mafia violence, they have also reinforced stereotypes of women within ‘Ndrangheta families.

Gender education initiatives in schools are based on the assumption that adopting this perspective in education means dismantling the way reality is organized through fixed categories that assign precise roles to individuals based on gender. This requires structured pathways that expose asymmetries and discrimination between men and women, starting with their relationships.

Additionally, it re-centers intimate relationships, which are founded on gender-based behavioral norms. These norms generate power dynamics that often underlie violent behaviors, as they create relationships rooted in possession and control.

Power and control are central to mafia dominance itself, encompassing roles, the exercise of power over bodies, socialization agencies, the production and reproduction of a social system, violence, and fear.

# THE ROLE OF ITALIAN LGBTQ+ CENTRES AGAINST DISCRIMINATION (CAD) IN THE PUBLIC SPHERE. A CASE STUDY

Fabio Mostaccio<sup>a</sup>

<sup>a</sup>University of Messina

In Italy, violence against LGBTQ+ people is constantly increasing, but despite this, policies implemented to address these issues have, so far, been fragmented and weak. After a harsh political clash, 37 projects were funded across the country in 2022 to create CADs and two shelters for victims of violence. This paper focuses on the political role of these activities: we present the first results of a research conducted with a qualitative approach (in-depth interviews, interviews with key informants) in a specific case study, a CAD in Reggio Calabria (Southern Italy), a particularly fragile area of the country from a political and economic point of view. Since the rates of violence alone do not explain the violent experiences suffered by LGBTQ+ people, the objective of this research is to analyze the actions and working methods of this organization to verify its social and political role and identify how these activities contribute to the construction of a public sphere capable of unveiling asymmetric power relations and, finally, highlight appropriate policy indications to reduce gender inequalities.

Gender-based violence; LGBTQ+ communities; Homophobia; Centres Against Discrimination; Shelters.

## 1. VIOLENCE AGAINST LGBTQ+ PEOPLE AS THE INDEX OF DEMOCRACY DEFICIT

Gender-based violence represents a form of victimization of patriarchal origin, which translates into producing and reproducing structural gender inequalities. It is exercised not only against women but also against lesbians, gays, transgenders, and gender non-conforming people. LGBTQ+ people, in addition to being the object of stereotypes and prejudices, increasingly suffer forms of physical violence (Tomsen and Mason, 1997; Mason and Tomsen, 2001; Meyer, 2015; Gahan and Almack, 2020; Lund, Burgess and Johnson, 2021). When discussing violence, we are referring to the marginalization, exclusion, and harm

experienced by LGBTQ+ individuals and those with non-normative or socially unacceptable sexual or gender orientations, behaviors, or expressions. This can range from subtle, implicit violence that occurs daily to more overt and direct forms.

In Italy, this phenomenon is constantly increasing, but despite this, policies implemented to address these issues have, so far, been fragmented and rather weak.

In the absence of official statistical data, the most authoritative source at European level is the annual Rainbow Map of ILGA-Europe, a report that – using seven indicators: equality & non-discrimination, family, hate crimes and hate speech, legal gender recognition, Intersex bodily Integrity, Civil Society Space, Asylum – measures the level of democracy of European states. According to this report, Italy in 2024 is 35th out of 48 countries monitored (Fig. 1), even behind Orbán’s Hungary, known for his radical positions against LGBTQ+ people (Nuñez-Mietz, 2019; Kovàts, 2020).

Fig. 1. The human rights condition of LGBTQ+ people in Europe. Source: ILGA- Europe <https://rainbowmap.ilga-europe.org>

According to this study (ILGA, 2024), the areas in which Italy is particularly behind the European average concern, on the one hand, the lack of legal control relating to the protection of the integrity of the bodies of intersex people, understood as the exclusive recognition of a person’s control over their own body (in particular, the prohibition of medical intervention before the child can express informed consent and the opportunity for victims to obtain justice in the competent courts) (Bauer, Truffer and Crocetti, 2020). On the other hand, the lack of law to protect LGBTQ+ people who are victims of hate speech and crimes perpetrated against them precisely because they are sexual minorities (Fig. 2).

Fig. 2. Hate crime and hate speech against LGBTQ+ people in Europe. Source: ILGA- Europe <https://rainbowmap.ilga-europe.org>

On this point, despite LGBTQ+ associations reporting exponential growth in both verbal and physical violence against members of their communities, the governments that have succeeded one another over the last few years, regardless of the composition of the majorities, have never managed to launch any regulatory apparatus. A legislative vacuum for LGBTQ+ organizations is read as the plastic representation of the democratic deficit – understood as the gap between citizen aspirations and their satisfaction, in terms of response from government bodies (Norris, 2011) – which translates into the denial of their rights.

The European Agency (ILGA, 2024) tells us that in Italy, even today, 53% of homosexual people are afraid to hold hands with their partner in public places, 38% say they have suffered at least one episode of discrimination, 18% say they have suffered attempts at conversion practices, that is, someone who tried to treat them from homosexuality. The same report tells us that the number of LGBTQ+ Italian students who declare they have suffered acts of bullying, mockery, or discrimination at school is increasing, they were 43% in 2019, and today they are 68%. 51% of LGBTQ+ students declare they are afraid and keep their sexual orientation or gender identity hidden in the classroom.

On this point, in the past, the Italian Parliament tried to open a political debate. There have been several attempts to pass legislation, but all have proven unsuccessful. The most recent effort also failed: after a long parliamentary process, in 2021, the bill Zan – the law that should have dealt with preventing and combating forms of violence based on sex, gender, sexual orientation, gender identity, and disability – was definitively rejected by the Italian Parliament. Despite this, through a parliamentary expedient, the left parties, promoters of this law, managed to save part of it and enable the creation of a

program aimed at supporting, assisting, and preventing violence against LGBTQ+ people: “Program for prevention of violence due to sexual orientation and gender identity” achieved by the National Equal Opportunities Department. The idea was to create assistance activities to provide legal, health, psychological, and social mediation assistance to the recipients through CADs and support the shelters already present on the national territory. In 2022, this led to 37 projects being financed across the country to create 35 CADs and 2 shelters for LGBTQ+ people who are victims of violence.

## **2. THE ITALIAN CENTRES AGAINST DISCRIMINATION. A CASE STUDY**

The lack of specific laws to protect people from homophobic and transphobic violence in Italy encourages systemic discrimination and contributes to increasing the inequalities experienced by LGBTQ+ people, who are also denied access to resources and, in general, to citizenship rights. For this reason, Italian LGBTQ+ communities have self-organized to create centers against discrimination and shelters for young victims of violence. The aim is to organize support and assistance for vulnerable people without social protection. These organizations, providing essential services to sexual minorities, carry out political action that enters the public sphere, helping to fight violence and raise public awareness, reaffirming the need for recognition of the rights of LGBTQ+ people.

Through funding provided by the “Program for Prevention of Violence due to sexual orientation and gender identity”, many LGBTQ+ organizations have had the financial resources to set up new CADs. Thus, for the first time, even in smaller or peripheral cities, there was the opportunity to experiment with activities to support members of the LGBTQ+ community.

From that perspective, one of the most stimulating case studies concerns the “Centre Against Discrimination LGBTQIA+ Calabria”, in Reggio Calabria in Southern Italy.

This organization is interesting to study for several reasons: that project was born in an area considered very weak from a socioeconomic point of view and, more specifically, from a political one. This area has weak political participation and is considered afflicted by a widespread poor civic culture. In this direction, studying LGBTQ+ communities in their ability to activate participatory processes can be useful to grasp the stereotypes and prejudices with which Southern Italy is often described. Furthermore, precisely because of the marginalized condition of the area, it can be interesting to verify whether actions

attributable to good practices are prepared and how they are organized.

This research, which began in 2023 and is still ongoing, aims to investigate the political role played by CADs and shelters for LGBTQ+ people. It intends to analyze practices, methodologies, relationships with the local community, and their connection with similar organizations or movements at the national level. A further objective is to identify any good practices that can be useful to propose innovative policies.

For this reason, the approach used is to examine three levels that respond to the specific research topic of our project:

- The “micro-level” examines services’ internal workings and intervention strategies, such as counseling, crisis intervention, case management, community organization, advocacy, and active listening.
- The “meso-level” looks at the relationships between movements.
- The “macro-level” considers how this work can be viewed as “best practices”.
- We have been using a qualitative methodology, specifically:
- In-depth interviews with “key informants” people who are aware of the current situation in the management of these services (we have interviewed all the staff members so far, and we are going to interview local administrators, politicians, social workers, and other experts involved in this project able to give us information about the CAD activities social and political impact.
- Ethnography research approach within the CAD.

This CAD provides many services: the LGBTQ+ advice desk for Orientation to Local Services, Psychological Support, Legal Helpdesk Job Orientation, Health Helpdesk Support for LGBQIA+ Migrants, Training for Administrative personnel and Volunteers. However, it is becoming an important reference point for public health: between the 14th of March 2022 and the 31st of December 2023, they had more than 200 requests for help (in 2024 so far, the requests are around 20), especially for legal support for gender reassignment, and medical support for sexually transmitted infections (STIs) or HIV tests.

The staff members define themselves and their projects as part of a national movement. A node of the regional and national network: this CAD was born within Arcigay (the most popular Italian LGBTQ+ organization), but mostly, they recognize an important political role in their work:

When the CAD project was written, they never considered only Reggio Calabria. The lack of services for LGBTQ+ people concerned not only our city but the whole Calabria region. This is the reason why it was called “CAD Calabria”. We wanted to be a reference point for all Calabrian people. For this reason, we also created a service point in Cosenza, another important city in our region. The most important thing is networking because it is the only way to overcome the marginalization of LGBTQ+ people. (Silvia, Legal consultant)

From the beginning of the project, the CAD has tried to propose itself as a local actor, carrying out activities aimed at citizens within it. Therefore, it has attempted to find allies outside and promote good practices. They transformed “bad practices” into “best practices”. Even in the public health aspect, which should be routine, such as the respect of privacy for everyone needs an HIV test:

Until last year, in violation of all legal provisions, in our Local Health Department, to get a free HIV test, you needed a doctor’s prescription, or you had to go to a private practice for a fee. That’s incredible! We reported the matter, and we opened a negotiation with the new manager – who is much more sensitive – and quickly established a new agreement that respects the principle of anonymity without charge, and which also provides us the chance of having a doctor who cyclically comes to our office for testing. (Francesca, member of the staff)

Beyond the health role, the CAD has arranged events around the city aimed at LGBTQ+ youth. They involve citizens promoting a culture of respect towards LGBTQ+ people. It is the purpose of Space-Q:

We created Space-Q with a specific idea: to put everything that each young Calabrian needs in it. It is a traveling Queer community space. Every month we establish events across the city, at clubs and bars that host us, and we organize training sessions on queer history, the rights of LGBTQ+ people, sexual education, and sometimes watching films to then discuss together. We often invite prominent figures (mostly Calabrian people) to tell us their story and their experience because often the youngest think they are alone, the only queer in the city, who must necessarily escape from here. We want to offer them another point of view, another chance (Alice, member of the staff)

Regarding the difficulties encountered in their activity, the cad staff underlines some critical issues related to the context in which they operate. One of the most important problems concerns a few reports of homophobia cases. For the staff of CAD, there is a double interpretation: on the one hand, it could be

understood that LGBTQ+ people fear, don't trust the police, and don't feel protected by the law. On the other hand, it is a sad signal: many people who live in violent contexts are not aware of being the object of abuse.

### **3. FIRST FINDINGS**

According to the people interviewed, the results we have got so far are considered satisfactory despite the difficulties underlined. As far as we are concerned, for the initial questions we asked ourselves, the first results that emerged from the research reveal data of great interest: the CAD's ability to act as an institutional actor to produce good practices, a local actor able to understand the needs of LGBTQ+ citizens.

At the same time, however, they are recognized by LGBTQ+ people, but they struggle to be recognized by the whole city or region.

This still raises strong questions concerning the issue of civic culture, which deserves to be further explored.

On a more general note, it should be underlined that without specific laws that support systemic change, these projects may not have the necessary longevity. To achieve long-term results, these CADs must be able to work in a network with all the other institutional actors, as demonstrated by their experience with the local health service. If these centres fail to establish a strong network among themselves and with the political institutions, it could disrupt the development of best practices required to improve policies.

# DISCRIMINATION AS A FORM OF GENDER-BASED VIOLENCE: CONSEQUENCES OF SEXIST STEREOTYPES ON THE TRANSGENDER COMMUNITY

Michel Sterbini

University of Bologna

Gender-based violence operates as a systemic mechanism for maintaining hierarchical social structures. The hetero-cis-sexist ideology at its core significantly impacts the everyday lives of transgender and gender non-conforming (TGNC) individuals, producing specific forms of discrimination, such as transmisogyny, pathologisation, and health disparities. In this context, the voices of TGNC people and activists are marginalized, and their knowledge is often downplayed. This paper examines some instances of oppression experienced by the trans and non-binary community as forms of gender-based violence. The analysis draws from literature, data collected through ten semi-structured interviews with non-binary activists in Italy, and my personal experience as an activist in a trans\* association that provides trainings in high schools. The aim of this paper is to highlight harmful prejudices faced by TGNC people, emphasizing how the educational system can contribute to dismantling these stereotypes by learning from queer experiences and allying with activists.

transgender community, gender discrimination, heterosexism, cisnormativity.

## INTRODUCTION

The Council of Europe defines gender-based violence as “any type of harm that is perpetrated against a person or group of people because of their factual or perceived sex, gender, sexual orientation and/or gender identity” (Pandea, 2020). Gender-based violence (GBV) is a multi-dimensional phenomenon, it is eminently instrumental and deeply embedded in specific economic, political, and historical contexts. GBV serves a ‘corrective’ function, to maintain power relations and hierarchical social orders, as it is intertwined with other axes of

oppression, such as race, disability, class and neurodiversity. GBV can be conceptualized as a pyramid, with oppressive ideologies – for example, patriarchy, heterosexism, colonization, cisnormativity and ableism – at its basis. These systems nourish institutional and systemic discrimination, gendered expectations, stereotypes, unjust or inadequate laws, and disparities in access to resources and life opportunities.

Heteronormativity plays a crucial role in the construction and reproduction of the gender binarism as a social institution (Lorber, 1994). It can be defined as the normative assumption that human beings can be categorized into “two mutually exclusive categories” (Rubin, 1975) sexually attracted to each other. Heteronormativity is institutionalized and naturalized, concealing “the fact that social differences always belong to an economic, political, ideological order” (Wittig, 1980). As a society, we raise children through this lens, teaching them a presumed nature that hides the arbitrariness.

At the core of gender binarism stands cisnormativity, the assumption that the standard human experience is that of cisgender subjects. For gender non-conforming individuals, this results in a systematic oppression that is reproduced in discriminatory cultures, lack of adequate legal protections, increased socio-economic vulnerability and disparities in wellbeing levels (Scandurra et al., 2020). Within an heteronormative framework, as sex is assigned at birth, and as one is expected to have a “coherent” gender identity, any other identification becomes “unthinkable” (Butler, 1990): not simply repressed, but marginalized and constructed as unnatural.

Since gender is not truly the natural result of anatomy, maintaining a “conforming” identification requires constant surveillance (Foucault, 1976). In this light, violence against trans\* and intersex people can be understood as part of the institutionalized mechanisms of regulation, control, and teaching of the gender binarism that sustain power relations. In this terms, including in the definition of GBV discriminatory narratives about trans\* and gender non-conforming (TGNC) people, cisnormative medical standards, pathologizing legal procedures, and failures to respect the right to health of trans\* and TGNC people, allows for a deeper understanding of GBV as a corrective and policing apparatus.

Building on the theoretical framework of queer theory, the reflections presented in this paper are based on data collected through semi-structured interviews conducted between February and April 2022 with ten non-binary people who live in Italy. These individuals engage in activism – in associations, collectives, or

individually – around LGBTQIA+ issues and broader human rights concerns. One of the aims of this paper is to make space for non-binary self-narration, recognising that non-conforming knowledge and practices can be “a central location for the production of a counter hegemonic discourse that is not just found in words but in habits of being and the way one lives” (hooks, 1989). Lastly, I am personally an activist in an Italian trans\* and intersex association, so this reflection also draws on my experience of delivering trainings on gender stereotypes at a high school, both with students and the staff.

## THE EDUCATIONAL SYSTEM

As Rubin argues, “far from being an expression of natural differences, exclusive gender identity is the suppression of natural similarities” (Rubin, 1975), a repression that Mario Mieli defined “educastration” (Mieli, 1977). Shame and stigmatization (Goffman, 1963) play a significant role in the process of teaching and learning gender binarism, determining what forms of self-affirmation are acceptable, and what behaviours would provoke violent responses. This process requires a continuous work of gendered socialization, which shapes our interactions and perceptions so that we incorporate (Bourdieu, 1998) cis-hetero-normative categories, enacting them without reflexivity. As the writer and artist Alok Vaid-Menon wrote: “I learned about gender through shame (...) You no longer need the people at school telling you not to *dress like that*; you already do it to yourself” (Vaid-Menon, 2020).

In schools and educational environments, gender practices are often taken for granted, leading to the ignorance or denial of trans\* students’ identities. Acts of misgendering, the segregation of bathrooms and locker rooms by sex, and various physical and psychological violences affect their well-being (Bourelly, 2022). This is often due to a lack of awareness or consideration, which makes microaggressions and other forms of ‘unconscious’ violence more pervasive and difficult to dismantle. In other cases, identity denial may stem from a normative opposition. Bullying can occur not only from peers but also from the school staff (Datta et al., 2017), who rarely is adequately prepared to address LGBTQ+ individuals’ needs. According to data about LGBTI equality from the European Union Agency for Fundamental Rights (FRA, 2020), in Italy, 52% of trans\* respondents reported having been ridiculed, teased, or threatened during their time at school. When asked if anyone at school supported or defended them, 44% indicated “never” and 28% “rarely”.

Finally, it’s important to remember that schools are also workplaces for trans\*

adults, exposed to stigmatization and public judgment. This is exemplified by the well-known cases of the discriminatory dismissal of the teacher and poet Giovanna Cristina Vivinetto, and the tragic suicide of Professor Cloe Bianco after experiencing repeated discrimination and mobbing on the workplace.

## **CIS GAZE AND STEREOTYPES**

Another mechanism through which this state of surveillance operates is the pathologization of trans\* experiences and the production of discourses like the “wrong body” narrative. TGNC experiences are represented through the lens of cis gaze. Similarly to how the “male gaze projects its fantasy onto the female figure” (Mulvey, 1975), the cis gaze imposes cisgender ideas of femininity and masculinity onto trans\* and intersex subjectivities. This results in a hierarchy of legitimacy between trans\* and cisgender identities, and in a pyramid of validation within the queer community. TGNC people are held accountable to the hegemonic medical model, which treats being trans\* a psycho-pathological condition that requires to be “fixed” medically. For instance, some schools and universities in Italy still require a medical certificate diagnosing gender dysphoria to activate the alias career to change name on the badge and the register.

To be considered valid and “trans enough”, it is necessary to comply with the trope of being born in the wrong body, in order to access social and legal recognition as well as healthcare (Johnson, 2015). Even non-binary experiences are understood through a binary lens, depicted as a third identity, ignoring it is an umbrella containing infinite possibilities. Non-binary is frequently understood as something “in the middle”, 50% male and 50% female, an exceptional third category that reinforces and leaves intact the social order of the gender binary. There is an expectation that non-binary individuals present with an androgynous look as proof of their identity, “without the possibility to flow, even on the same day, or to contain within oneself different aspects” (T., interview). The “non-binary stereotype” is a queer identity coded to be understandable within the framework of gender social recognition – outside the norm, but in a conforming way. The stereotypical representation typically is white, assigned female at birth, with an androgynous aesthetic, short hair, and dressed eccentrically or “weird”.

The problem is that there is a non-binary stereotype, and if people (...) don't really know what being non-binary means, (...) they will see it as the third

gender. (...) but there are thousands of ways to be non-binary. (...) To be trans does not mean that you have to *cross* into another gender (G., interview).

Stereotypes rooted in the medical model have discriminatory consequences for the practical everyday lives of TGNC people. These include the worsening of living conditions and psychosocial well-being, minority stress (Hunter et al., 2021; Meyer, 2003; Scandurra et al., 2020), the so-called “impostor syndrome”, and gatekeeping practices that deny access to gender-affirming care when individuals fail to meet binary standards (Spade, 2003). Pathologization gets even harsher when someone is not only queer in terms of gender identity but is also non-heterosexual, neurodivergent and/or disabled.

My existence challenges existing rules, also rules made specifically for trans people. (...) The system for trans people, medical, legal, and legislative paths, it’s all extremely binary (...) so a non-binary person ends up trying to cling to the least worst of the situations for everything they want to do. It makes a lot of people invisible, because they’re not supposed to exist, there is no way legislation, laws, or even the medical sector decide that you can exist (A., interview).

Expectations become standards of visibility, causing social dysphoria when they are not met. This sense of inadequacy is often described as “impostor syndrome”, a phenomenon reported by all interviewed participants. It involves the feeling of “not being trans enough” – not experiencing enough dysphoria, not encountering enough violence (whether it corresponds to reality or not), or failing to conform to expectations of what it means to be trans. As M. said in the interview: “Sometimes I don’t feel trans enough (...) it almost seems like I haven’t suffered enough”. These criteria select who can be seen, standardising the complexity of feelings and desires.

It’s okay that I’m trans only if I feel that the way I am now is wrong. That is the only trans experience accepted and recognized by cis people. (...) I can’t solve this thing, because it’s not a problem (...) Our bodies are not equations to solve (L., interview).

[Dysphoria] is the result of an imposition that comes from the cis-hetero-normative universe we live in, so that when you’re not conforming to the normality, which means cis, they make you feel uncomfortable, wrong, not valid. Dysphoria doesn’t really exist, it’s a discomfort feeling that comes from an oppression, this feeling is called like that because weird and queer people like us need a scientific explanation (G., interview)

## CONCLUSIONS

Cis-sexist stereotypes cause numerous forms of violence beyond the examples presented here. According to TGEU, Italy has the highest rate of transphobia-motivated murders in Europe from 2008 to 2024<sup>1</sup>. In response to this violence, queer activism serves as a powerful means to reclaim their right to exist, through mutual aid, exchanging knowledge, and raising awareness to make a social change.

There is a sense of individual and collective liberation in activism that pushes me every day. (...) Beside what you've been through, it's a collective trauma. (...) It's a trauma we've been through as a society, a rape-culture society, an abusive society (...) So, my daily job is a little bit about that, finding common points to work together with people who want to free themselves from these chains (MG, interview).

Since educational systems are places of knowledge production and reproduction, it is crucial that the voices of TGNC people and activists – who are often marginalized and dismissed in their knowledge about social reality – are heard and valued.

[We should] push so that people can be educators in this field after studying gender studies, it would be fundamental (...) Who better than someone who experienced it on their own skin and also studied it, can teach it? (M., interview)

Collaboration between schools, universities, and activists is a crucial step to create a culture of equality and dismantle harmful stereotypes. This joint fight could also involve transgender students, by actively listening what support they need from educational institutions (Bourelly, 2023). The alias career, which in Italy remains at the discretion of single institutions, is a vital tool proven to improve mental health (Russell et al., 2018), and it must be implemented based on a self-determination approach to avoid reproducing a pathologized view of trans\* experience. Other necessary measures include the introduction of gender-neutral bathrooms and locker rooms, the integration of LGBTQIA+ history into curricula (Bourelly et al., 2022), the promotion of comprehensive sex and emotional education, and the recognition of all identities in institutional documents and certificates. Good practices like these should be implemented so that schools, universities, and educational systems can create a

participatory culture that fights the stereotypes causing GBV against the LGBTQ+ community.

# SOCIAL CONFLICTS AND THE PUBLIC SPHERE. THE USE OF GENDER STEREOTYPES BY POLITICAL PARTIES AND MOVEMENTS IN ITALY

Milena Meo<sup>a</sup>

Antonio Tramontana<sup>b</sup>

<sup>a</sup>University of Messina; <sup>b</sup>University of Messina

In a critical review of the model of public sphere designed by Habermas, Nancy Fraser invites us to read the conflictual feature that is determined by the plural context that characterizes contemporary publics. With respect to the progressive demand for recognition of new civil rights, there are real convergences that can be observed between movements and political parties whose aim is to re-establish cultural hegemony in the context of civil rights. The purpose of our analysis is to highlight the rise of such convergences in Italy. To this end, we focused on the one hand on the two main parties of the Italian radical Right (Fratelli d'Italia and Lega per Salvini Premier) and their respective leaders. On the other, we considered the Italian Men's Rights Activism (MRA). The result is highlighting principles on which links are established between the analysed groups based on an imaginary characterised by a view of traditional society, whose gender roles are conceived hierarchically and, therefore, establishing a misogynistic and sexist front with which to take action in the public sphere.

gender stereotypes; manosphere; men's rights activists; far-right parties

## 1. PUBLIC SPHERE AND SOCIAL CONFLICTS: RADICAL RIGHT AND GENDER ISSUES

In critically re-reading the model of public sphere designed by Habermas (1989), Nancy Fraser (1990) invites us to analyse the conflictual character of the contemporary context characterised by the rise of a plural context. According to Fraser, in fact, this model is based on the establishment of a "power base of a stratum of bourgeois men, who were coming to see themselves as a universal

class” (Fraser, 1990, 60). This universalist model, based on a process of (male) distinction, is characterised by a regulatory framework set on a series of gender exclusions. As participation in the public sphere is excluded, attention must be focused on the conflicts arising from the claims and recognition of rights by social groups and classes.

In this plural context, however, not only is the progressive demand for recognition of new civil rights becoming increasingly present in the political landscape. In fact, the conflictual character of the public sphere is characterised by the presence of a cultural backlash (Norris and Inglehart, 2019) caused by the belief that privileges taken away by the progress of gender claims are disappearing. In contrast to the demand for rights a series of movements and subcultures committed to the defence of male domination are rising. The attempt to re-establish a universalism based on male dominance therefore enters into the plural context of voices that are part of the contemporary public sphere.

The rise of such gender universalism is closely related to radical right-wing movements and parties (Ignazi, 1992; Mudde, 1996; Rydgren, 2007; Akkerman, 2015). While for such political groups the defence of the nation’s traditional culture is a decisive factor (Laruelle, 2022), gender issues represent a privileged field of political action (Spierings, 2020; Abou-Chadi et al., 2021; Hall, 2023; Meo and Tramontana, 2024). Moreover, the ways in which proposals, policies and campaigns are developed make gender a category through which – like a kind of empty signifier (Sauer, 2020, 34) –, to articulate a series of convergences with which to form a united front against the demand for rights by pluralist movements.

## **2. RADICAL RIGHT MOVEMENTS AND PARTIES IN ITALY AND GENDER ISSUES**

Starting from this context, Italy also knew first a gradual start, then the rise and finally the institutionalisation, of radical right-wing parties and movements. With the progressive centrality of the radical right in the public sphere, there has been an increasingly articulated use of gender issues to mobilise people and create large alliances (Mudde, 2020; Schmincke, 2020; Dietze and Roth, 2020). Establishing themselves as forces aiming at the revival of traditional gender distinctions, over the past decade they have built themselves as a constellation aiming to hegemonise the political field and finalise an identity politics (Saccà and Massidda, 2022). Since 2010, in fact, a complex combination of actors – consisting of family-rights associations, anti-abortion groups, religious

conservatives and far-right groups – united in ‘anti-gender’ campaigns has become increasingly clear (Kuhar and Paternotte, 2018). While initially, in the name of opposition to the LGBT+ movements, some coalitions whose aim was to oppose bills in favour of same-sex marriage rose, following the victory of the radical right in the general election of 2022, this coalition became an organic governmental alliance, where social actors and protagonists converged in the parliamentary majority and in the Government.

Besides organic alliances between parties, conservative Catholics and Pro-life movements, convergences also are evident with misogynist movements represented by the Manosphere. Understood as forums and online communities dedicated to a variety of male interests (Ging, 2017), the Manosphere is an articulated galaxy composed by Involuntary Celibates (Incels), Pick Up Artists (PUA), Men Going Their Own Way (MGTOW), and Men’s Rights Activists (MRA). Regarding this galaxy, MRAs, being “focus on men-related social issues and institutions, which they argue discriminate against men” (Horta Ribeiro et al., 2021), are the ones having more connections with political parties and movements of the radical right (Vingelli, 2019).

### **3. CONVERGENCES BETWEEN MISOGYNIST PARTIES AND MOVEMENTS: THE ITALIAN CASE**

In order to observe the ways in which convergences aimed at re-establishing the traditional character of gender relations are set in the public sphere, some results of a piece of research conducted on radical right-wing parties on the one hand and on MRAs in Italy on the other will be reported. Due to the peculiarities of the two groups examined, thematic cores dedicated to gender issues have been taken into consideration, based on recurrence and using the methods of Qualitative Content Analysis (Krippendorff, 2004; Schreier, 2012). In the case of the parties, we analysed on the one hand the 2022 general election programmes for Fratelli d’Italia (Fdi, 2022) and Lega per Salvini Premier (LSP, 2022). Since both are characterised by the personalisation of leadership (Viviani, 2024), Giorgia Meloni and Matteo Salvini’s Twitter profiles (now X) during the election campaign and their two autobiographical books (Meloni, 2021; Salvini, 2016) were analysed. In the second case, we analysed ‘La Fionda’ ([www.lafionda.com](http://www.lafionda.com)) – one of the most active MRA blogs in Italy – and extended the analysis to their Twitter profile, their YouTube page and their Telegram channel.

### **3.1 Traditional values and gender dichotomies**

Both analyzed groups propose a traditional view of society based on gender distinctions. In the case of traditional parties, family plays a central role. This centrality is emphasised in both election programmes by quoting the words of John Paul II (Fdl, 2022, 5; LSP, 2022, 69) to state the idea that family represents the basis of society, through which the biological, social and cultural reproduction of the nation is safeguarded.

In these two parties the reference to one of the highest Catholic authorities allows them to start a process of sacralisation of the heteronormative family and, consequently, a process of naturalisation of gender distinctions, and in the case of the MRAs the same process of naturalisation of differences through biological criteria takes place. In a video entitled 'The Paradox of Patriarchy'<sup>2</sup>, philosophical, anthropological, psychological and sociological theoretical references are brought together to legitimise gender distinctions from a natural point of view.

### **3.2 Gender stereotypes**

The image of a society based on gender binarism activates a number of characteristic uses of gender stereotypes. These stereotypes, in the case of parties, rise despite the attempt to appear more modern. This is particularly evident in the way gender equality is treated. In both election programmes (Fdl, 2022, 21; LSP, 2022, 121), the issue is introduced as a generic proposal for policies to prevent stereotyping. The progressivism put in play by the analysed parties is on the one hand strategic, since the way in which the issue of gender equality is conceived must be related to the idea of society based on the binary distinctions mentioned above. On the other, it starts a form of female empowerment based on the celebration of women detached from the structural causes underlying gender inequalities.

If in the case of the mentioned parties the celebration of women as such starts a process of neutralisation of claims, in the case of MRAs the denial of structural conditions takes the form of hostile sexism. Particularly significant from this point of view is the way in which the phenomenon of feminicide is framed. In this regard, a daily work of denial is carried out. On their homepage, in fact, there is a 'statistical observatory'<sup>3</sup> in which, by means of a debunking operation, on the one hand the phenomenon of feminicide is downplayed, on the other hand

---

<sup>2</sup> <https://www.youtube.com/watch?v=lmsYKcFVKjE&t=244s>

<sup>3</sup> <https://www.lafionda.com/losservatorio-statistico-de-lafionda-com/>

accusations that later ‘prove’ to be false, cases of female violence against men, the elderly and children, are narrated.

### **3.3 Polarisations**

The process of sacralisation and naturalisation of the family is based on the centrality of traditional values. The protection of these values is often emphasised as a struggle against the threat represented by pluralism. Parties and leaders analysed introduce themselves as forces whose aim is to defend the pillars and roots of national identity, in direct opposition to Lgbtqi+ movements and feminist activists (Meloni, 2016, 150; Salvini, 2016, 89).

In the case of the MRAs, the opposition front appears more narrowly circumscribed, but not different from parties. “Nazifeminists” and “Angri vigines” are described in their manifesto as categories able to embody all the evils of society. In fact, they claim that “Feminism is waging a war of annihilation against the figure of men and fathers, in order to gain privileges, primacies, and advantages for an ideological minority. They are the main source of imbalance and the greatest barrier to achieving full and harmonious gender equality”<sup>4</sup>.

## **4. CONCLUSIONS**

Although there are peculiarities among the analysed groups, complementarities are evident, on which possible convergences can be designed. Fdl and LSP, despite their openness, present an image of traditional women based on gender distinctions. For their part, MRAs promote a post-patriarchal image of masculinity based on the idea of a man whose aim is to re-establish positions of privilege and restore the traditional social order. In our opinion, both cases are an attempt to restore universalism of the public sphere based on gender exclusion.

A future line of research could build on these complementarities and analyse possible organic alliances between the two groups. A political integration of misogynistic expressions in society would involve a further process of radicalisation of society caused by a rightward shift of the political forces under examination.

## promoters and partners

As the **main organizer** of the conference, **Scuola democratica – Learning for Democracy** is a cultural association and academic journal dedicated to enriching the scientific and cultural debate on school, university, education, work, and lifelong learning in an organic and cross-cutting manner. Scuola democratica is supported by a scientific network of more than 100 scholars and aims to be a meeting ground, nationally and internationally, between the various disciplines concerned with issues in education and training.

**CIRD (Centro Interuniversitario per la Ricerca Didattica)** is the main research center in Sardinia on educational processes and policies of educational experimentation at school and university level, and in a multi- and interdisciplinary perspective. Its main objective is to foster school-university collaboration and to support the integration of the educational system as a whole.

**Fondazione di Sardegna**

The **Foundation of Sardinia** pursues the public interest and social benefit with special emphasis on the socio-economic development of the Region of Sardinia. It operates by allocating grants or funding to others' projects and initiatives, or by promoting its own projects and initiatives, including in collaboration with other entities.

**il Mulino**

Since its outset in the early 1950s in Bologna, the aim of **il Mulino publishing company** has been to contribute to Italian culture through a program of publications that drew significantly from the Anglo-Saxon social sciences, and was inspired by an explicitly empirical and reformist approach

**Dipartimento di Scienze politiche e sociali**

Established in 2012, the **Department of Political and Social Sciences of the University of Cagliari** is bearer of a tradition of studies and research characterized by interdisciplinarity. The Department of Political and Social Sciences promotes and coordinates research and teaching in social, communicative economic-statistical, legal, historical-political-international.
